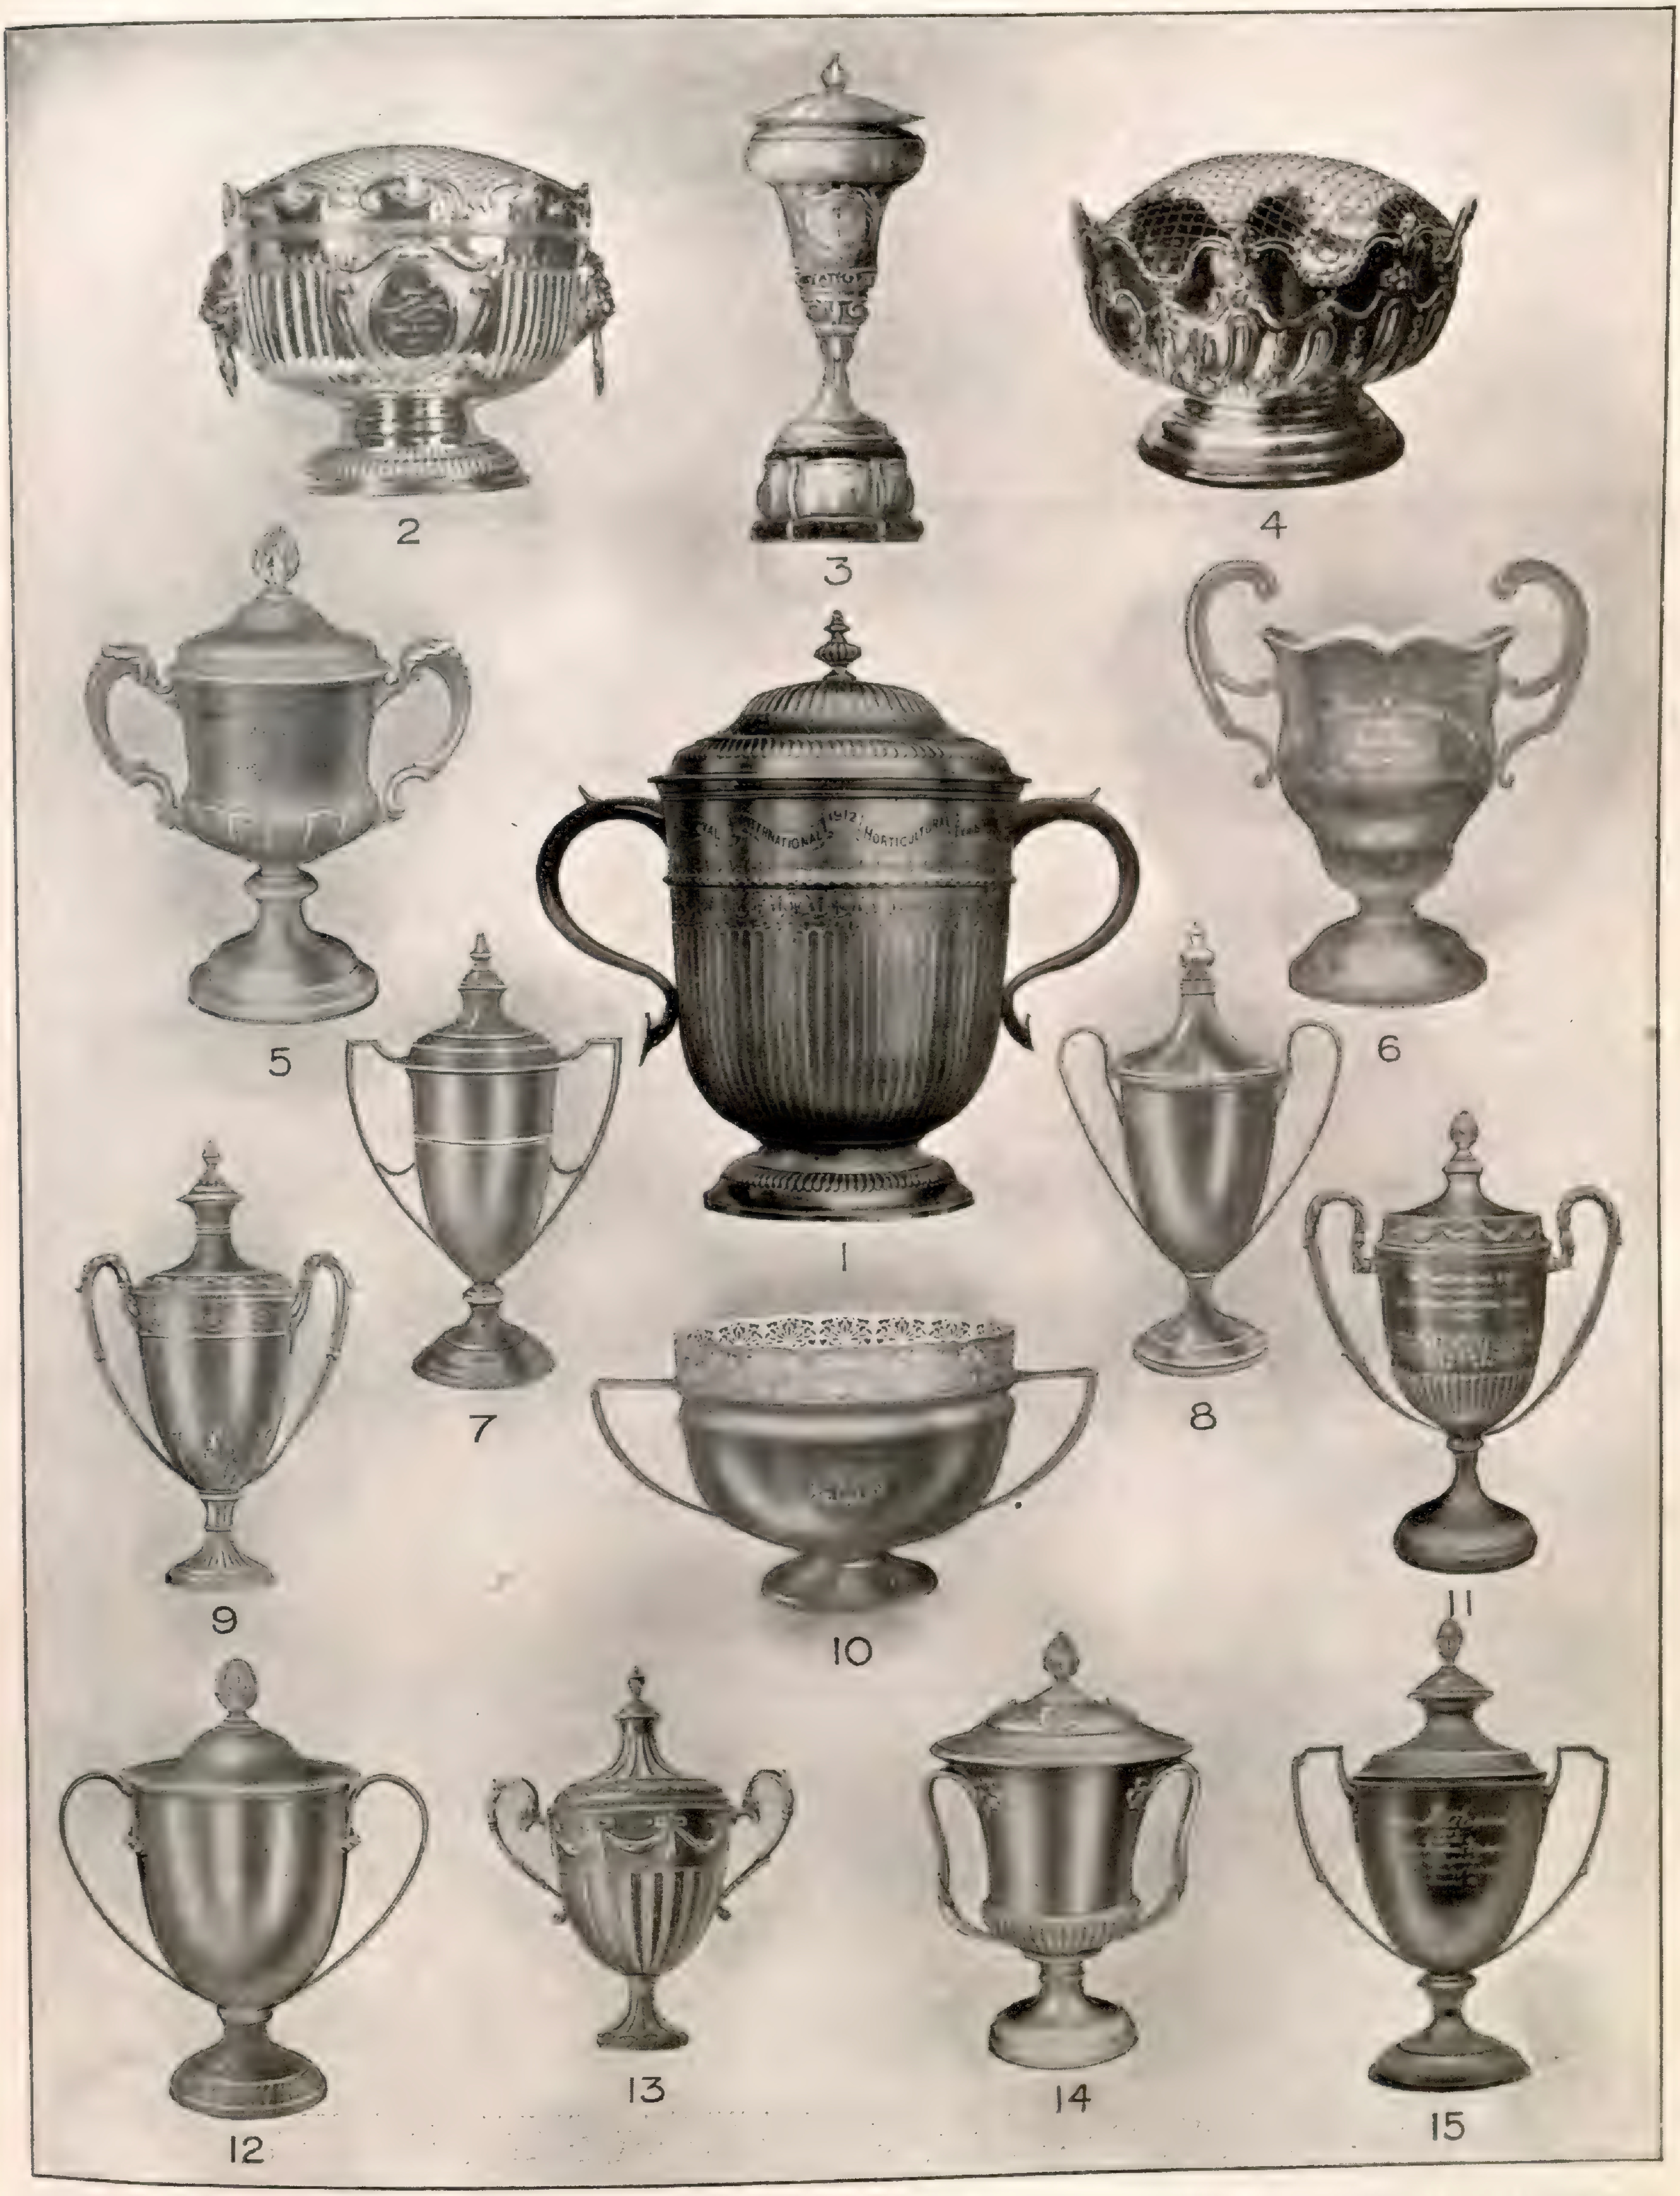
BENEATH the LIMES in the CENTRAL AVENUE.

W. H. & L. Collingridge, 148 & 149, Aldersgate Street, London, E.C.



SOME OF THE CUPS PRESENTED FOR COMPETITION AT THE ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.

The cups are as follows: 1, Royal Horticultural Society; 2, Somerset; 3, Fruiterers' Company; 4, Leicester and Rutland; 5, West Sussex; 6, Irish; 7, Dorset; 8, Cheshire and North Wales; 9, Messrs. J. Veitch and Sons; 10, Lancashire; 11, Shropshire; 12, Norfolk; 13, Herts; 14, Hereford and Monmouth; 15, Earl of Mount Edgcumbe and county of Cornwall.

## EXHIBITION PROGRAMME.

### MONDAY, MAY 20.

National Rose Society's Conference at the Holborn Restaurant, at 5 p.m., when the President, Rev. J. H. Pemberton, will deliver an address on "The Modern Development of the Rose." A Dinner will be offered to foreign rosarians, 7 p.m.

### TUESDAY, MAY 21.

Reception at No. 3, Grosvenor Square, by the Duke and Duchess of Portland (by invitation), at ——

### WEDNESDAY, MAY 22.

Jury meets in the Great Hall, Royal Hospital, Chelsea, at 7.30 a.m., and judging will commence at 8 a.m. prompt.

His Majesty the King, accompanied by Her Majesty the Queen, will open the exhibition at 12 noon.

At about 1.30 p.m. a Luncheon to the jurors will be offered in a large marquee in the show grounds.

The European Nursery Federation will meet at the Hotel Windsor, Victoria Street, Westminster, to discuss matters affecting international trade. There will be delegates from France, Germany, Belgium, Holland, Switzerland, and Luxemburg, and these will be entertained at dinner by the Horticultural Trades Association, at 8 p.m., at the Hotel Windsor.

### THURSDAY, MAY 23.

Exhibition opens at 9 a.m.

Conference on Horticultural Education, in the Recreation Hall, Chelsea Hospital, at 2 p.m. The Right Hon. A. H. Dyke-Acland will preside, and the speakers will be: Prof. L. H. Bailey, Cornell University, U.S.A., "Horticultural Education in America"; Herr. K. Weinhausen, Berlin, "Horticultural Education in Germany"; Mr. W. Hales, A.L.S., Chelsea Physic Garden, "The Education of a Gardener"; and Prof. A. Buyssens, School of Horticulture, Vilvorde, "Horticultural Education in Belgium."

Dinner offered by the Perpetual Flowering Carnation Society to foreign carnation growers, at the Holborn Restaurant; Mr. J. S. Brunton will preside, 6.45 p.m.

### FRIDAY, MAY 24.

Exhibition opens at 9 a.m.

Conference on Legislation in connection with Plant Diseases and Pests, at 9.30 a.m., in the Recreation Hall, Chelsea Hospital. The Right Hon. A. H. Dyke-Acland will preside, and the speakers will be: Prof. Ritzema Bos, of the Phytopathological Institute, Holland, "The Value of Importation Regulations as a Means of Preventing the Introduction of Plant Pests from Abroad"; Mr. A. G. L. Rogers, of the Board of Agriculture, "The Aim of Legislation in Great Britain"; Mr. H. Maxwell Leroy, M.A., F.Z.S., "Legislation in Connection with Insect Pests"; Mr. H. J. Güssow, F.R.M.S., "Legislation in Connection with Fungus Diseases" and Mr. A. W. Sutton, V.M.H., "Import Dues and Regulations."

Visit to the Royal Gardens, Windsor. Special train from Paddington at 11 a.m. Lunch at White Hart Hotel, 1.30 p.m.

Banquet offered by the Royal Horticultural Society at the Royal Horticultural Hall; 6.30 p.m. for 7 o'clock. By invitation.

### SATURDAY, MAY 25.

Exhibition opens at 9 a.m.

Dejeuner à la fourchette and Garden Party at Burford Lodge, Dorking, offered by Sir Trevor Lawrence, Bart. By invitation.

Perpetual-flowering Carnation Society's visit to Mr. W. E. Wallace's nursery, Eaton Bray; and to Ascott Gardens, Leighton Buzzard.

### SUNDAY, MAY 26.

Reception at Friar Park, Henley, by Sir Frank Crisp, President of the Horticultural Club. By invitation.

### WHIT-MONDAY, MAY 27.

Exhibition opens at 9 a.m.

Perpetual-flowering Carnation Society's visit to Mr. C. Engelmann's nursery at Saffron Walden.

### TUESDAY, MAY 28.

Exhibition open at 9 a.m.

Visit to the Royal Gardens, Kew.

Perpetual-flowering Carnation Society's visit to Mr. Robert Page's nursery at Hampton; to Windsor; Mr. A. F. Dutton's nursery at Iver; and Messrs. Lowe and Shawyer's nursery at Uxbridge.

Kew Guild annual dinner at the Holborn Restaurant at 7 o'clock; specially arranged for this date because so many old Kewites are expected to be in London for the great show. Lt.-Col. Prain, Director of the Royal Gardens, Kew, will preside.

### WEDNESDAY, MAY 29.

Exhibition opens at 9 a.m.

Perpetual-flowering Carnation Society's visit to Messrs. Stuart Low and Co.'s nursery, Bush Hill Park; Mr. Stevens' nursery, Cheshunt; and Messrs. Thos. Rochford's nursery at Broxbourne. Train from Liverpool St. to Enfield, thence by motor-car.

### THURSDAY, MAY 30.

Closing day of exhibition. Opens 9 a.m., and closes 10 p.m.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

CALANTHES.—In the warmest house the deciduous calanthes are in various stages of growth. Those unfolding their leaves are rooting freely towards the sides of the pots, and may now be given more water, the quantity being gradually increased as the plants make further progress, but allowing them to become dry between each application. Those that are more backward should be set by themselves, as great care must still be exercised in watering. Until the plants are thoroughly established it is advisable during bright weather to give them extra shade, in addition to that provided by the ordinary lath blinds; this is easily provided by laying strips of tiffany or thin canvas between the glass and the blinds during the hottest part of the day.

EVERGREEN CALANTHES.—Such species as C. vetratrifolia and C. masuca are not very often seen, but should now be opening their flowers, and well-grown specimens of either are an ornament to any collection. If they are taken from the warm house when about to open their flowers, and placed in a cool, shady position in the intermediate house, they will remain in full beauty for a considerable time. While in bloom the plants do not require as much water as when they are in full growth. An excessive amount of water at this stage will cause the flowers to become spotted and fall away prematurely. The proper time to repot is when the new growths are nicely advanced, which occurs about a month or so after flowering. Being strong, free-rooting subjects, they require rather large pots, which must be well drained. A compost as for the deciduous section will answer their requirements, and they may be potted moderately firm, space being allowed on the surface for sufficient water to thoroughly soak the whole compost.

THUNIAS, which have grown strong and are well rooted and about to produce their flowering racemes at the apex of the new growths, must have copious waterings at the root, and weak liquid manure about twice a week will be beneficial until the flowers expand. When in bloom the flowers will last longer if the plants are arranged in the cooler atmosphere of the cattleya or intermediate house.

CHYSIS.—Such plants as C. bractescens, C. aurea, and the hybrid C. Chelsoni, are now in full growth, and should any require repotting this must be done at once. These plants succeed in a compost like that provided for cattleyas, and should be potted moderately firm, and suspended in the lightest position in the house. Many grow the chysis in the cattleya house, but I have had the best results when growing them in the warm house with dendrobiums, and resting them much in the same way. C. bractescens and C. aurea are easy species to succeed with when newly imported. They will do well treated as intermediate orchids, but better still if treated like dendrobiums. All through the growing season chysis are subject to attacks of small yellow thrips, and when these minute insects get a footing low down in the peculiar funnel-shaped growths it is difficult to dislodge them. A good plan is to periodically dip the plants in some safe insecticide, afterwards rinsing them in clean soft water, laying the plants on their sides until the water has drained away.—J. T. Barker, West Hill Gardens.

## CONSERVATORY AND GREEN-HOUSE.

VALLOTA PURPUREA.—This, one of our most popular of greenhouse plants, will now need attention. The bulbs flower best if restricted at the roots, yet they must not be starved. One often hears it said, "Vallotas always flower better in cottage windows than they do in private gardens," and I admit this is often the case, yet it is not to be wondered at. Often in these columns I have spoken strongly against "coddling." All plants need rest, and the resting period generally follows the flowering season. But all plants do not rest in winter and grow in summer, neither can any line be drawn as to the nature of the plants which need rest at any given time. Thus the Nerine rests in summer, and the vallota grows in summer. Moisture is the principal agent which stimulates activity. Therefore to encourage growth we give moisture, and to allow the plant to rest we withhold it. Fresh air is life to all plants, and it works wonders when properly regulated. We sometimes see the vallota grown in a stove or vinery in a temperature of 80 degrees, coddled and forced to death, and people wonder why the bulbs deteriorate and fail to bloom. The cottage window provides a slight protection from frost, and in winter most housewives give their window plants little water until the spring, and active growth returns. They then water whenever the plants need it, and the result is a perfect rest in winter, a quick growth in summer, and a forest of spikes in August and September. We grow our vallotas here in slightly heated pits on an ash base, and after flowering they are not given water, but the cool base prevents them becoming dust-dry. When active growth sets in, as at present, the plants are examined. Bulbs that require a shift are potted, while others not requiring more root room are cleaned and top-dressed. They will need a quantity of water with liquid manure twice weekly until the flowers are over. The flower spikes will appear at the beginning of August, and the plants should then be moved to the conservatory to open their flowers. We grow them three and four bulbs in an 8-inch pot; large bulbs will easily produce two spikes each.

MALMAISON CARNATIONS.—These are by now at their best, and the quality of the blooms is very good owing to the light and sunny spring, when the buds were developing. It is most essential to propagate as soon as possible directly the flowers are over or cut. The plants should not be allowed to suffer from want of water, or red spider will make its appearance at once. Choose a cold frame, place therein a bed of soil, composed of loam, leaf-soil, and sand. Select some plants of each variety, choosing those with the least number of growths (the best plants should be selected for growing on), the growths to count as plants that will be required. Turn them out of the pots with the roots intact, and plant in the prepared beds. Trim the bottom leaves from each growth, and cut with a sharp knife below a joint well down the stem, and draw the knife towards you and upwards for about an inch to the next joint; bend the growth inwards and downwards so that the heel thus made stands out; peg each growth firmly in the bed with short wire pegs, and cover the centre of the old stool and stems with a sandy compost. The border varieties Cecilia and King Arthur are also best layered in this way. Keep the frames close and shaded for a few weeks, damp over frequently, and the layers will root in about six weeks. The best plants kept for specimens should be shifted into 10-inch pots and stood outside for a time.—Lewis Smith, Shotesham Park Gardens.

## HARDY FRUITS.

GOOSEBERRY CATERPILLAR.—This pest has already made its appearance on the gooseberry bushes, and, unless active measures are promptly taken to suppress it, the bushes will soon be stripped of every particle of foliage. Where gooseberries are more or less isolated, hand-picking is the most effectual remedy, but where a number of bushes are grouped together, and the attack is general, spraying with Hellebore powder, soft soap, and water, or dusting over the bushes (when damp) with Hellebore powder, are the best remedies. Another method I have practised with success is to knock off the caterpillars with a strong force of water, either by means of a hose-pipe or garden engine, and as each bush is cleared, a man follows with freshly slaked lime, and dusts the stem of the bush and the ground underneath. The lime kills the caterpillars and acts beneficially on the soil at the same time; it is necessary to apply the lime immediately the pest is removed. Red spider, one of the worst enemies to contend with, is early becoming troublesome; sulphide of potassium at the rate of one and a-half ounces to a gallon of water, with sufficient soft soap to make the mixture adhere to the foliage, will be found an effectual remedy for this pest; only with gooseberries is it advisable to spray with so strong a solution of sulphide of potassium.

GOOSEBERRY MILDEW.—It is at this season that the American gooseberry mildew can be recognised in its first stages by the white powdery appearance at the tips of the young growths, spraying the affected bushes and their immediate neighbours with the sulphide of potassium wash will check the spread of this disease, and should the weather be showery a second or third application may be necessary to effectually check further damage. If an attack is discovered it must be notified to the Board of Agriculture.

GOOSEBERRIES GROWN AS CORDONS should have all side growths pinched back to three or four leaves, only extension growths being left intact. An occasional syringing with clear water will prove beneficial and probably ward off an attack of red spider, and a good mulching will preserve moisture in the soil and assist the swelling fruits.

LOGANBERRY AND WINEBERRY.—The first-named usually throws up a number of young growths, and from four to six (according to space at command) of the strongest should be selected and tied in, the remainder being cut out. The wineberry is not so prolific in growth, but it may be necessary to thin out some of the weaker growths, retaining three or four of the best placed. Established plants require high feeding, and a rich mulch should be applied, while liquid manure, soot water, and guano are good stimulants, and if the mulching material is lacking, watering with either of these will materially assist the plants to carry a heavy crop of fruits.

WINTER MOTH AND OTHER LEAF-EATING CATERPILLARS.—When the apple blossom has fallen the trees should be sprayed; lead arsenate is the best poison for the pests, and 3lb. of lead arsenate to 100 gallons of water will be a safe quantity. Lead arsenate paste can be obtained, and is a useful form to use, as it is reliable in quality. If aphis are troublesome the lead arsenate may be used in conjunction with quassia extract or a similar preparation, and should the weather be showery a second spraying will be necessary.

PROTECTING MATERIAL FOR WALL TREES may now be removed. The borders should be kept moist and well mulched. Peaches and nectarines should be syringed freely during dry weather, and all insect pests must be kept under by frequent sprayings.—W. Messenger, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

THINNING THE CROPS.—Insufficient thinning is often a frequent mistake made in connection with vegetable crops. In a season so dry as the present a certain amount of care must be exercised, and thinning be done at two periods. At the time of writing we have had six weeks' drought. When thinning parsnips finally, leave them nine inches apart, carrots four to six inches apart, and onions the same, as many of these will be required in the young state. If dry weather prevails at the time of thinning, endeavour to water each line immediately, and ply the hoe through the crops afterwards. Peas and beans should be thinned where thick, using those that are pulled for filling up any gap that may occur; give a watering, and lightly dust with soot. Lettuce should be thinned as early as possible, the distance being governed by the variety; they should be frequently sown after this date, as planted-out specimens come thin, and are inclined to run to seed prematurely. Very little trouble is experienced in securing good germination of all small seeds during very dry weather, if deeper drills are drawn than usual, and these are watered, placing old potting soil along the drill, then sowing the seeds, and finally covering with the good soil before raking the beds level. Turnips will be difficult to obtain under ordinary treatment, so make frequent sowings on a northern border, and dust the seedlings with equal parts of sulphur, lime, and wood-ashes to ward off attacks of turnip fly. Make another sowing of savoys, cauliflowers, and late broccoli.

POTATOES.—Where these are well forward and now earthed up, protecting material must be kept in readiness, as sudden frost may come yet. Watch for the main crop varieties, and when these peep through draw the soil over them, and when the whole crop is three inches high, well hoe the plot and mould up. If any weakness in the growth appears give a sprinkling of sulphate of ammonia before hoeing, or use soot and burnt garden refuse.

CAPSICUMS will now need a final potting. Use a compost of loam with a little mushroom bed manure, sand, and mortar rubble added. Place near the glass in a pit, and maintain a moist atmosphere.

MUSHROOMS.—After this date the best mushrooms are obtained from outside beds placed behind north walls. Provided the horse droppings have been properly prepared and well sweetened, with the temperature receding, place the manure on a hard surface. Make the bed three feet six inches wide at the base, with the material made firm, and sloping towards the wall, the top reaching about three feet high. When completed, insert stakes to ascertain the temperature, and when the latter stands from 75 to 80 degrees, spawn the bed without delay. Insert the pieces of spawn eight inches apart, and three inches deep, covering them firmly. A little later cover the bed with two inches of finely-sifted loam, beating this with a shovel, and then give a good covering of long stable manure, so as to retain a steady temperature and natural moisture. Future attention will be governed by the weather as regards watering and damping. When beds show signs of exhaustion give a soaking of warm diluted liquid manure.—Geo. Ellwood, Swanmore Park Gardens.

---

**Blandfordias.**—The members of this Australian genus of liliaceous plants are not often met with in gardens, and they are not readily obtainable from nurseries. Unlike many of their immediate relatives, the Blandfordias do not form a tuber or even a pronounced root stock. They push up a number of grass-like leaves from a somewhat thickened base, and the flower stem, which reaches a height of 18in. to 2ft., bears on its upper part a number of drooping bell-shaped flowers of a thick wax-like texture. They are in most cases scarlet, tipped with yellow. The freest growing and the one that can be most readily increased by division, is B. nobilis (or grandiflora, as it is sometimes called). The name of grandiflora appears to be somewhat of a misnomer, as others, particularly B. Cunninghami and B. princeps, have larger blossoms. The entire genus appears, however, to be in such a confused state, that one is never sure of the correct nomenclature. One thing is certain, and that is they are all well worth growing. As might be expected of natives of Australia, a greenhouse temperature just meets their requirements. As far as my experience goes, they succeed best in a mixture of equal parts of turfy loam and peat, with a liberal admixture of rough silver sand. They need to be effectually drained, and at no time must the soil be allowed to get too dry, as these Blandfordias are all evergreen in character. —K.

## SPRING BEDDING PLANTS FROM SEEDS.

When the spring flower beds are at the height of their beauty, it is usual to take a survey of the general effect, and decide what alterations are to be made for the following scheme of arrangement. This being carefully thought out, the work of raising sufficient plants is a fairly simple matter. In many cases bulbs are utilised for spring bedding, crocuses, daffodils, hyacinths, tulips, etc., being relied on to provide the display, which is rather a costly proceeding. Although magnificent effects are to be obtained from a free use of bulbs, yet their flowering season is short, compared to that of the wallflowers, pansies, etc. It is wonderful what a profusion of blossoms can be obtained from the produce of a few packets of seeds. Raising the plants is comparatively easy, a cold frame being all that is required, and some subjects may be sown outside. The plants included in the following list will all be found most useful for spring flowering.

Alyssum saxatile compactum and A. citrinum are two extremely showy varieties, the former being a bright yellow colour, and the latter a beautiful lemon shade. These will be found valuable for edging purposes, and provide a beautiful finish to a bed of Blood Red wallflowers. The seeds are best sown in pots or boxes, in May, and placed in a cold frame to germinate. When the seedlings are large enough to handle they should be transplanted into other boxes, and placed in the frame until established, when they must be gradually hardened off. The same methods of cultivation applies to arabis and aubrietias. Of the former, we have Arabis albida compacta (white) and A. rosea (rose). Aubrietia græca (soft lavender), A. Hendersoni (purple), and Leichtlini (rose) are useful for edging purposes, and when bulbs are used they form excellent carpeting plants. Apart from these three mentioned, seeds can be obtained of named varieties, but it is advisable to propagate the latter by cuttings when the true colours are desired.

The giant forms of the double Daisy (Bellis perennis) produce an abundance of large blossoms, on stiff stems. The seeds should be sown early in June, in pots or boxes, and placed in a cold frame to germinate. Transplant the seedlings when large enough to handle into boxes, and allow them to remain in frames until established, when they should be gradually hardened off, and eventually planted out into nursery beds, until required. The erysimums are similar to the wallflowers, both in habit and growth. For dry sunny spots they prove a valuable addition to the list of spring bedders. The variety Golden Gem is the best to grow, and the seeds should be sown in June, and the plants afforded the same treatment as wallflowers. E. Arkansanum and E. Perofskianum should be sown in the early autumn for the spring display. Myosotis (forget-me-nots) are indispensable plants, and easily raised from seeds. The various forms of M. dissitiflora are the most suitable, but there are also some very fine forms of alpestris. Sow the seeds in boxes, and give cold frame treatment until the young plants are large enough to transplant into nursery beds. Seeds sown in the latter part of May produce fine material for autumn planting. The seeds may also be sown outside, in shallow drills, on a shady border during May with good results.

Although it is usual to raise violas from cuttings, there are many beautiful varieties which come true to colour from seeds if a good strain is obtained. These, with the pansies, prove of great value for the spring beds. The seeds should be sown in June to obtain good-sized plants by the autumn. Pans or boxes, filled with light soil, will be found most useful for sowing the seeds in, and cold frame treatment should be afforded until the plants are large enough to plant out into nursery beds. Among the pansies we have Emperor William, a large-flowered blue variety, and one of the most valuable for bedding purposes. Lord Beaconsfield is of a purple-violet colour, shading off in the top petals to pale lavender. The Peacock and Victoria strains are excellent, as are also the English, or Show varieties. The flowers of the frilled forms contain a wonderful combination of colours and the French and German strains are good. The dainty flowers of Viola cornuta and its varieties are highly appreciated, and are borne in such profusion as to literally hide the foliage; alba, lutea, Perfection, and Papilio are splendid examples of this miniature form. V. floriarensis is a very pretty variety, sent out by M. Correvon, of Geneva. This comes true from seeds, and is highly effective when massed.

During late years the polyanthus and primroses have been greatly improved, and there are now some fine forms obtainable. Apart from the usefulness of these plants for bedding purposes, magnificent results are to be had by liberally planting them in woodland glades and shady walks. The seeds must be sown early to secure a stock of good plants for planting out in the following autumn. In common with many of the members of the primula family, the seeds of polyanthuses and primroses are slow and irregular in germinating, hence the necessity of allowing them a good season to grow. The seeds are best sown in pans or boxes, and placed in a cold frame. Great care must be exercised with the seeds until they have germinated, and the plants have become a fair size. The soil should not at any time be allowed to become dry, or the seeds will fail to germinate. To prevent a too rapid evaporation, a sheet of glass should be placed over the seed box, and shaded with paper. When the seedlings have made two fair-sized leaves, they should be transplanted into boxes, and still afforded cold frame treatment. Here they should be shaded until established, and then be gradually exposed to open-air treatment. When the seedlings attain a good size in the boxes transplant them to shady and cool nursery beds. Polyanthuses and primroses delight in a rich moist soil, and when preparing the nursery beds it is advisable to incorporate a liberal quantity of well-decayed manure with the staple.

The pendula varieties of the silenes provide a useful class of plants for edging beds. The colours are of varying shades of rose, but there is a white form, called Snow King. The seeds are best sown in August, either in boxes or in the open border. Transplant the seedlings when they are of sufficient size to handle.

Wallflowers may be reckoned amongst the very best of all spring bedding plants. The numbers of plants which can be raised with a very small outlay is really wonderful, and such masses of colour obtained at such little cost. There is an opinion abroad than because a wallflower may thrive on the top of an old wall, that it is quite the thing to afford it poor soil, and little attention. This treatment results in poor plants, which often succumb to the first sharp frost. Early sowing, and a liberal treatment of culture all through the growing season, is the surest way to obtain good plants.

The most suitable season for sowing wallflowers is May. A good border or nursery bed should be chosen for the seed bed, shallow drills being drawn about nine inches apart for the reception of the seeds; should dry weather set in after sowing, occasional waterings should be afforded to assist germination. Transplant the seedlings, when large enough to handle, into nursery beds, allowing six inches from plant to plant. If possible, wet or dull weather should be chosen for this work. When the plants have filled the space allowed them, they should be again transplanted into a well-prepared piece of ground in the open garden. The object of twice transplanting is to obtain as many fibrous roots as possible, these being of great importance when the plants are put out into their flowering quarters. Regarding varieties, the following will be found to be useful amongst the older kinds: Vulcan has a good branching habit of growth, rather dwarf, and has crimson flowers; Harbinger, early flowering, brown; Belvoir Castle, dwarf, yellow; Primrose Dame, primrose; and Blood Red, a fine, dark-flowered variety. Among those of more recent introduction, Fire King stands foremost as being the most brilliant of all the wallflowers, and a mass of this variety creates a magnificent effect. Ivory White is a pleasing contrast to the dark varieties. The improved Cloth of Gold has large flowers of a good yellow colour, and should be extensively grown. Purple Queen, ruby; Eastern Queen, apricot, shading to pink; and Ellen Willmott, ruby, are all useful for those who appreciate their various shades of colour.

Gnaton Gardens. E. C. Pooley.

## BORAGE AND SAGE IN THE FLOWER BORDER.

Some readers of the Gardeners' Magazine may be amused at the idea of growing these two kinds of plants in a border for the sake of their flowers only. But I can assure all such that in certain circumstances they are very beautiful and effective when so grown. I once had a bed of young sage plants growing in a high, dry border, and one of borage in another. Both kinds were grown for herbal purposes, but the striking effect of the flowers in masses did not escape me, and I at once saw how beautiful they would be in a large herbaceous border which was nearly always very dry and hot in summer-time, and it required much careful treatment to maintain the plants in a satisfactory condition. Now, I am sure that there are many readers who possess very dry borders, and if they will put in fairly large clumps, plants of borage and sage (not too closely together), they will be quite satisfied with the results. The first-named flowers for the longest period, but both continue to do so for a fairly long time. When once established water is never needed. The sage plants must be young ones; old plants are useless. My young plants had flower-spikes more than one foot long. G. B.

**Oxalis floribunda.**—The question of furnishing hanging baskets for the greenhouse frequently crops up, and for the purpose early in the year lachenalias are often advantageously employed. To follow these and to come in before the bulk of summer-flowering subjects are at their best, this oxalis can be recommended, its trifoliate leaves, borne on long stems, are very pretty, while the loosely disposed clusters of charming pink flowers dispose themselves in a pleasing and informal manner. There is a white variety alba—which is also very attractive.—W. T.

SHROPSHIRE HORTICULTURAL SOCIETY.

OPEN CHAMPION CLASS FOR ROSES.

A SILVER CHALLENGE ROSE BOWL
(Value £31 10s. 0d.)
Presented by the President of the Society, 1912.
(W. G. Phillipps, Esq.)

In addition to above, Medals and Money Prizes value £32.

For a Collection of Cut Roses artistically arranged for general effect at the discretion of the Exhibitor. To occupy a space of 20ft. by 4ft.

(To substitute Classes 43 and 44 in Schedule for 1912.)

Conditions are being prepared, and will be forwarded on application to the Hon. Secretaries, Messrs. Adnitt and Naunton, Shrewsbury.

HANLEY PARK, STAFFORDSHIRE.
JULY 3rd and 4th, 1912.
SIXTEENTH
GREAT ANNUAL FLORAL FETE.

£500 in Prizes, Silver Cups, Gold and Silver Medals, Silver Challenge Cup, value £10 10s., offered for "Trade Exhibit" (for particulars see page 7 in Schedule).

Valuable Special Prizes offered by the Principal Firms in England.

Schedules post free on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

## EXHIBITIONS AND MEETINGS.

◆

### Royal Horticultural Society.

The hall at Vincent Square was well filled with exhibits on May 14, but not packed to the doors as of late. Tulips were much in evidence.

The cups and trophies to be awarded at the International Horticultural Exhibition were on view, and made a rare show, and attracted a vast amount of attention. There were no fewer than ninety-two items, and the centre of attraction was the massive King's Cup, while other fine trophies were those from Queen Mary, Duke of Portland, Sir J. Colman, Bart., Sir Trevor Lawrence, Bart., Baron Schroder, Messrs. Clay and Son, Messrs. Sutton and Sons, Messrs. J. Veitch and Sons, Messrs. Charlesworth and Co., Messrs. R. Wallace and Co., Wiltshire County, West of Scotland, Warwick, Ireland, Lancaster, York, and Veitch Memorial Trustees.

FLORAL COMMITTEE.

Tropæolum albiflorum (A.M.), from Mr. C. Fielder (gardener to Miss Willmott, V.M.H., Warley Place, Essex, is a pretty slender climber with pinky-white flower, coloured yellow at the base of the segments. The five-parted leaves, quite small and greyish, add not a little to its interest and beauty. Mr. A. Worsley, Isleworth, gained an A.M. for Phyllocactus Coopermanni, with vivid scarlet flowers, and for Cereus amecamensis with lovely large white blooms.

Very charming were the lovely sweet peas shown by Messrs. Dobbie and Co., Edinburgh. Here were beautiful vases of May Campbell, Inspector (a double standard Earl Spencer), Marks Tey, Chas. Foster, Dobbie's Scarlet, Afterglow, Melba, Mrs. Cuthbertson, and Dobbie's Cream. Mr. C. W. Breadmore, Winchester, presented a sweet and bright exhibit of sweet peas, and put up rare stands of May Campbell, Lavender George Herbert, the bright Aggie Elder, Princess Mary, intense blue, Melba, Mrs. R. Hallam, and Aurora Spencer.

Mr. Amos Perry, Enfield, showed tulips in good form, and also displayed a selection of bearded irises, I. Susiana, I. sibirica, and oriental poppies. A small rock garden was arranged by Messrs. Thompson and Charman, Bushey; and Mr. G. Reuthe, Keston, showed some fine Himalayan and other rhododendrons, choice alpines, etc. Trollius Orange Globe and a selection of aubrietias, auriculas, and phloxes came from Messrs. Phillips and Taylor, Bracknell. Messrs. J. Peed and Son, Norwood, submitted a small collection of alpines.

Irises from Messrs. R. Wallace and Co., Colchester, included many grand varieties, from among which we selected Pallida dalmatica, Miss Willmott, Isoline, Oriflamme, Bosniamac, Mist, Brionense, and Italia as of special worth. Anemones from Messrs. Reamsbottom and Co., Geashill, King's Co., Ireland, and early dahlias from Messrs. Carter, Page, and Co., London Wall, were interesting exhibits.

Messrs. J. Cheal and Sons, Crawley, submitted a little rock garden filled with Japanese maples, azaleas, aubrietias, phloxes, Primula japonica, and violas. From Mr. Maurice Prichard, Christchurch, came stately spikes of Eremurus Elwesi, E. himalaicus, pyrethrums, kniphofias, Cheiranthus Allioni, a wide colour range of varieties of Scilla campanulata, and bearded irises. Mr. G. W. Miller, Wisbech, submitted the pretty pink pyrethrum Queen Mary and other good things. A bright exhibit from Messrs. G. and A. Clark, Dover, contained Anchusa italica Dropmore var., Geum Mrs. J. Bradshaw, and a selection of pyrethrums and irises. Spanish irises were splendidly shown by Mr. R. d'E. Day, Sutton Scotney; Belle Chonoise, Excelsior, King of Blues, and Blanche Fleur were all very fine. Mr. L. R. Russell, Richmond, put up a famous lot of fine varieties of both single and double pyrethrums. Mr. Jas. Box, Lindfield, confined his attention chiefly to fine ranunculuses and poppies.

A corner of the hall filled with lilacs by Messrs. Paul and Son, Cheshunt, was a great attraction, and the fragrance of the flowers was very grateful; Viviand Morel, Souv. de Louis Spathe, Miss Ellen Willmott, Congo, Mdme. Legrange, Pres. Carnot, Mdme. Lemoine, and Mdme. Casimer Perier were all varieties worthy of special note. Messrs. W. Cutbush and Son, Highgate, were represented by a big group of flowering shrubs, in which Rhododendron Pink Pearl, Hydrangea Mdme. Mouillere, azaleas, wistarias, cytisus, laburnums, and roses were pleasingly associated. Mr. Chas. Turner, Slough, showed some fine sprays of lilacs, making up a fragrant display of Mdme. F. Morel, Charles X., Belle de Nancy, Mdme. Lemoine, Michael Buchner, and Chas. Joly.

Roses were superbly shown by Messrs. George Mount and Sons, Canterbury, the large, clean, fragrant flowers on long stems making up a glorious exhibit. Mrs. J. Laing, White Killarney, Ulrich Brunner, Frau Karl Druschki, Lady Pirrie, and Capt. Hayward were the leading varieties. Roses in great variety, from Messrs. B. R. Cant and Co., Colchester, included William Allen Richardson, and such fine climbers as White Dorothy Perkins, Hiawatha, and Minnehaha.

Messrs. W. and J. Brown, Peterborough, submitted heliotropes and other greenhouse flowers, and gained an A.M. for Petunia Brown's Purple, a big single variety of deep violet-purple shade. A bright exhibit of calceolarias from the St. George's Nursery Company, Harlington, made a brave display of brilliant colouring. Mdme. Andre, Lord Roberts, and Argus are fine heliotropes, as shown by Messrs. H. B. May and Son, Edmonton, who also submitted good hydrangeas, swainsonias, and a capital selection of named varieties of lobelias. Mr. Vincent Slade, Taunton, showed a bank of zonal pelargoniums that seemed almost too bright for so hot a day. Pelargoniums were also excellently well shown by Mr. P. Ladds, Swanley Junction, who also contributed fragrant East Lothian stocks.

Carnations were again well shown by Mr. H. Burnett, Guernsey, whose chief varieties on this occasion were Mikado, R. F. Felton, Marmion, Orpheus, and Mrs. C. F. Raphael. Messrs. Young and Co., Hatherley, showed such carnations as Cecilia, Marmion, Duchess of Devonshire, Robert Craig, and Cheltonia, finely. Messrs. Wm. Cutbush and Son, Highgate, submitted carnations, and presented Countess of Lathom, Mikado, White Enchantress, R. F. Felton, and Lady Elphinstone in fine condition.

The carnations from Messrs. S. Low and Co., Enfield, were well set up, and included Cinnator, Empire Day, Lady Alington, Mrs. C. W. Ward, and Beacon, as well as the new pinks Progress and Gloriosa. The same firm exhibited boronias, including the rare B. polygalifolia, hydrangeas, and metrosideros. The carnations from Messrs. Allwood Bros., Haywards Heath, included fine examples of La Rayonnante (the big yellow variety), Mikado, Marmion, and fire Glow.

### ORCHIDS.

Messrs. J. and A. McBean, Cooksbridge, submitted some lovely forms of Odontoglossum crispum, Odontioda Charlesworthi, and Cattleya Mossiæ. The fine Cymbidium Woodhamensis Fowler's var. (C. Lowianum × C. eburner O-Lowianum )was well shown by Mr. Davis (gardener to J. Gurney Fowler, Esq.), Glebelands, South Woodford, and gained a F.C.C.; the bright yellowish green flowers, marked on the tip with deep red-brown, were very attractive.

Lælio-cattleya Apollo (A.M.), with salmon-buff sepals and petals, and pink, yellow-throated-lip, was shown by Mr. Duncan (gardener to C. J. Lucas, Esq.), Warnham Court, Horsham. Mr. Chapman (gardener to Mrs. Cookson), Oakwood, Wylam-on-Tyne, showed fine forms of Odontoglossum crispum and O. Solon.

Mr. H. A. Tracy, Twickenham, presented a quite good group, wherein were various odontoglossums, varieties of Cattleya Mossiæ and Lælia purpurata. Messrs. Hassall and Co., Southgate, exhibited deep-hued forms of Cattleya Mossiæ, Odontioda Chelsensis, Lælio-cattleya Fascinator, Maxillaria Sanderiana, and the pretty Oncidium pulchellum.

Mr. R. G. Thwaites, Streatham, exhibited both light and blotched forms of Odontoglossum crispum, various odontiodas, etc. Mr. Stables (gardener to De Barri Crawshay, Esq.), Sevenoaks, submitted Odontioda Rosefieldiensis, O. Honolulu, and the very attractive Odontoglossum volatella. Mr. R. T. Pitt, Rosslyn, Stamford Hill, put up a group of choice orchids, and made a brave show with Miltonia vexillaria, Angulosa Clowesi, Cattleya Mossiæ, Brassia Lawrenceana, Cœlogyne purpurata, etc.

### TULIP COMMITTEE.

A beautiful display of Darwin and May-flowering tulips from Messrs. Barr and Sons, Covent Garden, provided a dazzling display of colour, and served once more to demonstrate the usefulness of these gorgeous flowers. These were splendid bunches of Goldfinder, Mr. Farncombe Sanders, Rev. H. H. D'Ombrain, La Tulipe Noir, Nora Ware, Cordelia, Clara Butt, Inglescombe Yellow, Louis XIV., Salmon King, Don Pedro, Suzon, Inglescombe Scarlet, Fairie Queen, and Viola. Messrs. Jas. Veitch and Sons, Chelsea, made up a good group of late tulips, their Gala Beauty, Mrs. Moon, Lucifer, Mr. Farncombe Sanders, Blue Fly, Inglescombe Yellow, and Baronne de la Tonnaye, being especially good.

Messrs. Alex. Dickson and Sons, Newtownards, set up a large and interesting collection of tulip, Darwin and May-flowering varieties. These were arranged in vases and in bamboo stands, and the latter rather spoiled the general effect. Rev. Harpur Crewe, Bartigon, Grand Master, Sensation, Inglescombe Yellow, Flora's Ornament, Monument, Bonfire, and Moonlight were varieties that took our fancy. Mr. Butler, gardener to Walter Winans, Esq., Surrenden Park, Pluckley, showed a fine Darwin tulip named Walter Winans, but this the committee considered identical with Mr. Farncombe Sanders.

Messrs. Hogg and Robertson, Dublin, put up a bold and beautiful group of late tulips, the blooms of large size and rare colour; Caledonia, Berthold Schwartz, Arizona, Millet, Loveliness, Mrs. Moon, and Daybreak were a few very striking varieties. Messrs. J. Jefferies and Son, Cirencester, also contributed a goodly collection of Darwin and May-flowering tulips, putting up a fine selection of varieties. Messrs. R. H. Bath, Lim., Wisbech, displayed tulips in fine form and colour, some of their best varieties being The Fawn, Inglescombe Yellow, Picotee, Parisiana, Erguste, Isis, and Mrs. Moon.

### CERTIFICATES AND AWARDS.

First-class Certificate.—To Cymbidium Woodhamensis Fowler's var., from J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

Award of Merit.—To Tropæolum albiflorum, from Miss Willmott, V.M.H. (gardener, Mr. C. Fielder, V.M.H.), Great Warley; to Petunia Brown's Purple, from Messrs. W. and J. Brown, Peterborough; to Phyllocactus Coopermanni, and to Cereus amecamensis, from A. Worsley, Esq., Isleworth; and to Lælio-cattleya Apollo, from C. J. Lucas, Esq., Warnham Court, Horsham.

### MEDALS.

Silver-gilt Flora.—Messrs. Barr and Sons, Covent Garden, for tulips; to Messrs. Dobbie and Co., Edinburgh, for sweet peas; to Messrs. George Mount and Sons, Canterbury, for roses.

Silver-gilt Banksian.—To Messrs. Hogg and Robertson, Dublin, for tulips; to Messrs. R. H. Bath, Lim., Wisbech, for tulips.

Silver Flora.—Messrs. Alex. Dickson and Sons, Newtownards, for tulips; to Mr. H. T. Pitt, Rosslyn, Stamford Hill, for orchids; to Mr. H. A. Tracy, Twickenham, for orchids; Mr. C. W. Breadmore, Winchester, for sweet peas; to Messrs. Wm. Cutbush and Son, Highgate, for flowering shrubs and carnations; to Messrs. Stuart Low and Co., Enfield, for carnations, etc.; to Messrs. H. B. May and Sons, Edmonton, for flowering plants; and to Mr. Chas. Turner, Slough, for lilacs and maples.

Silver Banksian.—To Messrs. Jas. Veitch and Sons, Chelsea, for tulips; to Mr. H. Burnett, Guernsey, for carnations; to Messrs. Paul and Son, Cheshunt, for lilacs; to Messrs. Hassall and Co., Southgate, for orchids; to Messrs. J .and A. McBean, Cooksbridge, for orchids; to Mr. R. G. Thwaites, Streatham, for orchids; and to Mr. Stables (gardener to De Barri Crawshay, Esq.), for orchids.

Bronze Flora.—To Mr. Day, Sutton Scotney, for irises; to St. George's Nursery Company, Harlington, for calceolarias; to Messrs. Wallace and Co., Colchester, for irises.

Bronze Banksian.—To Messrs. Allwood Brothers, Haywards Heath, for carnations; to Messrs. F. Cant and Co., Colchester, for roses; to Mr. P. Ladds, Swanley, for pelargoniums; to Messrs. Carter Page and Co., London Wall, for dahlias; to Mr. A. Perry, Enfield, for irises, etc.; to Mr. M. Prichard, Christchurch, for hardy plants; to Messrs. Reamsbottom and Co., Geashill, for anemones; and to Messrs. Young and Co., Hatherley, for carnations.

---

## National Auricula Society.

### NORTHERN SECTION.

It has been a trying season for auricula growers. The dry, sunny days of April, and the late frosts, formed a combination of unfavourable conditions that has been difficult to resist. Selfs and polyanthuses were mostly over. There were good alpines, considering the season, and in the edged flowers the green edges, once so scarce a class, were very well represented; but whites and greys were much below the average. There were not many novelties of note amongst the show varieties, but new and good alpines were very numerous.

Messrs. Sutton, of Reading, had a charming exhibit of Darwin and May-flowering tulips.

Auricula novelties were not numerous; the best were three seedlings from Mr. Simonite, a green-edge called Cyril Simonite, a grey called Majestic, and a white called Mollie Shipman. In alpines there were many promising varieties, among which may be mentioned Majestic, Vestal, Blue Bell, Evelyn, Miss Molly, Marjorie, Horace Grindrod, Exquisite, and Mildred Jay.

### AURICULAS (ALPINES EXCLUDED).

For Six Dissimilar Varieties.—First, Mr. F. Simonite, with Fanny Mearbeck, Olympus, Rachel, Majestic, H. Wilson, and Ruby; second, Mr. W. M. Shipman, with Ruby, A. Barker, Molly S., Hy. Wilson, Acme, and G. Lightbody; third, Mr. F. J. Dickens, with Seedling, R. Headley, Ruby, Mrs. Potts, Dr. Hardy, and A. Barker; fourth, Mr. J. W. Bentley, with Mrs. Phillips, Beauty, Orpheus, Orient, Lancashire Hero, and Mrs. Potts; fifth, Mr. Alfred Yates; sixth, the Rev. C. E. Bell. For Four Dissimilar Varieties.—First, Mr. W. M. Shipman, with Acme, Richard Headley, Ruby, and A. Barker; second, Mr. F. Simonite, with Molly Shipman, Fanny Marbeck, Majestic, and Ossian; third, Mr. Ken. Thompson; fourth, the Rev. C. E. Bell; fifth, Mr. F. J. Dickens; sixth, Mr. J. W. Bentley. For Three Dissimilar Varieties.—First, Mr. F. Simonite, with A. Barker, Fanny Mearbeck, and Rachel; second, Mr. Wm. Barker, with Heather Bell, Mrs. Henwood, and Ruby; third, Mr. Geo. Lord, with Gerald, R. Headley, and Orient; and fourth, Mr. J. Stelfox, with G. Chadwick, Ruby, and Dido. Two Dissimilar Varieties.—First, Mr. W. M. Hyslop, with Rev. F. D. Horner and Shirley Hibberd.

For Pairs.—First, Mr. Geo. Lord, with Geo. Lightbody and A. Barker; second, Mr. Wm. Yates, jun., with Ruby and A. Barker; third, Mr. Wm. Barker, with Rev. F. D. Horner and Seedling; fourth, Mr. W. M. Hyslop; fifth, Mr. A. Preston; sixth, Mr. C. F. Faulkner; and seventh, Mr. G. D. A. Hall. For Pair for Maiden Growers.—First, Mr. W. M. Hyslop, with Richard Headley and H. Wilson.

For Single, Green-edge.—First and second, Mr. Alf. Yates, with Shirley Hibberd; third, Mr. W. M. Shipman, with Abbe Liszt; fourth, Mr. Wm. Grindrod, with Shirley Hibberd; fifth, Mr. Wm. Yates, jun., with A. Barker; sixth, Mr. F. Simonite; seventh, Mr. W. M. Shipman; eighth, Mr. F. J. Dickens. Single, Grey-edge.—First, Mr. F. J. Dickens; second, the Rev. C. E. Bell; and third, Mr. W. M. Shipman, with Geo. Lightbody; fourth, Mr. F. Simonite, with Marmion; fifth, Mr. Wm. Grindrod; sixth, the Rev. C. E. Bell; seventh, Mr. W. M. Shipman; eighth, Mr. Geo. Lord. Single, White-edge.—First, Mr. F. Simonite, with Rachel; second, Mr. W. M. Shipman, with Acme; third, Mr. Alf. Yates, with Rachel; fourth, Mr. Geo. Lord. Single Selfs.—First, Mr. J. Stelfox; second, Mr. F. J. Dickens, with Mrs. Potts; third, Mr. Stelfox; and fourth, Mr. Dickens, with Ruby; fifth, Mr. Bentley; sixth, Mr. Barker; seventh, Mr. A. Yates.

For One Seedling.—First and second, Mr. F. Simonite, with Sedling and Cyril Simonite; third, Mr. W. M. Shipman.

Premier show auricula, Mr. W. M. Shipman, with A. Barker. Challenge cup winner, Mr. W. M. Shipman, Altrincham.

### ALPINES—SHADED.

Six Dissimilar Varieties.—First, Mr. W. M. Shipman, with Majestic, Clio, Janet, Dr. Harris, Exquisite, and J. F. Kew; second, Mr. G. A. Wright, Majestic, Lady Jeune, Dreadnought, Minnie, Duke of York, and Argus; third, Mr. F. J. Dickens, with Mis Baker, Thetis, Perfection, Duke of York, and Blue Zingari; fourth, Mr. John Tonge, with Blue Peter, Lady Jeune, Patience, J. F. Kew, Seedling, and W. A. Albright; fifth, Mr. Ken. Thompson, with Mrs. Lord, Ullswater, Mrs. R. C. Cartwright, Thetis, Prime Minister, and J. F. Kew; sixth, Mr. J. W. Bentley, with Mrs. Lord, Genevieve, Audrey Grace, Cynthia, Vestal, and Aurora. For Dissimilar Varieties.—First, Mr. Ken. Thompson, with Phyllis Douglas, Rookwood, Ullswater, and J. F. Kew; second, Mr. W. M. Shipman, with Seedling, Majestic, Exquisite, and Dr. Harris; third, Rev. C. E. Bell, with Rosy Morn, Ganymede, Mr. Markland, and Argus; fourth, Mr. J. Edwards; fifth, Mr. G. A. Wright; and sixth, Mr. Jas. Calder.

For Pair Dissimilar Varieties.—First, Mr. Wm. Stringer, with J. F. Kew and Evelyn; second, Mr. C. F. Faulkner, with Majestic and

Mrs. J. Douglas; third, Mr. J. Edwards; fourth, Mr. Wm. Barker; fifth, Mr. T. Sharpe; sixth, Mr. J. W. Bentley. Pair for Maiden Growers.—First, Mr. Thos. Sharpe, with Dean Hole and Attraction; second, Mr. N. Brownhill, with Pluto and Clio; third, Mr. Wm. Hyslop, with Blue Bell and Uranie.

One Yellow Variety.—First, Mr. W. M. Shipman, with Exquisite; second, Mr. G. D. Hall; third, Mr. W. M. Hyslop; fourth, Mr. G. A. Wright; fifth, Mr. G. D. A. Hall; and sixth, Mr. John Tonge. One Light Variety. —First, Mr. John Tonge, with Lucreece; second, Mr. W. M. Shipman, with Argus; third, Mr. C. F. Faulkner, with Mildred Jay; fourth, Mr. G. Geggie; fifth, Mr. John Stelfox; and sixth, Mr. G. D. A. Hall.

Three Dissimilar.—First, Mr. John Stelfox, with Miss Baker, Rosy Morn, and Argus; second, Mr. John Tonge; third, Mr. David Johnson; and fourth, Mr. G. Geggie. Seedling.—First, Mr. W. M. Shipman, with Miss Molly; and second, with Marjorie; third, Mr. John Tonge, with Horace Grindrod.

The premier alpine in the show was Vestal, shown by Mr. J. W. Bentley. Challenge cup winner for alpines, Mr. W. M. Shipman, Altrincham. Certificates for seedlings were granted to the Rev. C. E. Bell for Xenophon; to W. M. Shipman for Miss Molly and Marjorie; and to Mr. John Tonge for Horace Grindrod.

### LACED POLYANTHUSES.

For Three Dissimilar, Black Ground, Polyanthuses.—First, Mr. J. W. Bentley, with Exile, Tiny, and Mrs. Holden; second, Mr. David Johnson, with N. Brownhill, Mrs. Brownhill, and Coronation; third, Mr. N. Brownhill. Three Dissimilar, Red Ground, Polyanthuses.—First, Mr. David Johnson, with Master Fred, Nellie, and King Alfonso; second, Mr. Norman Brownhill, with Red King and two seedlings; third, Mr. J. W. Bentley, with King, Middleton Favourite, and George IV.; fourth, Mr. Wm. Grindrod. Single, Black Ground, Polyanthuses.—First, Mr. Wm. Grindrod; second, Mr. Geo. Lord; third, Mr. Wm. Grindrod; and fourth, Mr. D. Johnson, with Mrs. Brownhill; fifth, Mr. Wm. Stringer, with Mrs. Holden; sixth, Mr. J. W. Bentley with Tiny. Single, Red Ground, Polyanthuses.—First and second, Mr. J. W. Bentley, with George IV.; third, Mr. Wm. Grindrod, with Mrs. Holden; fourth, Mr. David Johnson, with Nellie; fifth Mr. Norman Brownhill.

Premier polyanthus in the exhibition, Mrs. Brownhill, shown by Mr. W. Grindrod. Challenge cup winner, Mr. James W. Bentley, Stakehill.

---

## National Tulip Society.

The annual exhibition of this society was held under the auspices of the R.H.S. at Vincent Square, on May 14. The show could not be deemed a large one, but the competitors, though few in number, could not be accused of lack of interest, for they had entered freely. The quality of the flowers was decidedly good, though the comments of a fashionable crowd could not be taken into account, or one might be led to think otherwise.

The premier class for twelve dissimilar rectified tulips: there were four exhibitors, the first prize falling to Mr. A. D. Hall, Harpenden, who staged fine examples of George Hayward, Annie McGregor, Bob Morley, Samuel Barlow, Mrs. Collier, Sir Jos. Paxton, Mabel, Talisman, Mrs. Maurice Tweedie, Modesty, Elizabeth Pegg, and Jas. Mackintosh. The premier feathered flower was George Hayward in this stand. Mr. C. W. Needham, Hale, was second, having good examples of Sir J. Paxton, Duchess of Sutherland, Samuel Barlow, and Mrs. Sharp as his best examples, while Mr. J. W. Bentley, Castleton, was third with nice neat flowers. Mr. W. Dunn, Cambridge, was fourth, having the premier flamed flower with a fine example of Samuel Barlow.

In the sixes there were but three exhibitors, Mr. C. W. Needham leading off with Stockport, Sir J. Paxton, Annie McGregor, Talisman, Masterpiece, and Mrs. Collier. Mr. A. D. Hall followed with good examples of Talisman, Samuel Barlow, and Mabel. Mr. J. W. Bentley was third.

For three feathered varieties we had three exhibitors, Mr. A. D. Hall winning well; Garibaldi, Elizabeth Pegg, and Mrs. Collier; while Mr. C. W. Needham followed with Wm. Wilson, Adonis, and Mrs. Collier, and Mr. J. W. Bentley was a good third. The class for three flamed varieties appeared to be better supported, Mr. W. Dunn being well ahead with fine blooms of Samuel Barlow, Annie McGregor, and Duchess of Sutherland, Mr. W. Peters was second, and Mr. C. W. Needham third. The management do not consider it necessary to give the exhibitors' addresses. For two varieties, one feathered, one flamed, for the Samuel Barlow prizes, Mr. W. Dunn was placed first with Sir J. Paxton and Lord Lilford. Mr. J. W. Bentley was second, and Mr. A. D. Hall third.

The breeder class was most interesting, and there were four entries. Mr. C. W. Needham won first with good, solid flowers of Goldfinder. Beauty of Litchurch, Loveliness, Alfred Lloyd, Glory of Sparkhill, and Annie McGregor. Mr. A. D. Hall was second with larger flowers, in which were Mrs. M. Tweedie, Alcestis, Sigurd, Tuleiki, and two seedlings. He also won the premier prize for the best breeder with Sigurd. Mr. W. Dunn was a capital third.

For three breeders Mr. C. W. Needham was first, Mr. A. D. Hall second, and Mr. W. Dunn third. The classes open to growers of less than four hundred flowering bulbs secured four entries, Mr. W. L. T. Loat, Paignton, being first for six varieties, staging Sir J. Paxton, Annie McGregor, and Jane in good form. Mr. A. E. Chater was second, and Mr. R. W. Hall, Cambridge, third.

Mr. H. C. Bartlett was first for three breeders, followed by Mr. W. L. S. Loat. Mr. A. D. Hall was first with Mabel, in the flamed rose flowers, also first in the feathered rose, with Mrs. Collier. Mr. C. W. Needham was first with a flamed byblœmen, with Chancellor; while Mr. C. W. Needham was first for a single bloom of feathered byblœmen with Stockport; while Mr. W. Dunn won first for a feathered bizarre with a fine flower of Lord Lilford. Mr. C. W. Needham won first for the rose breeders with Annie McGregor, also first with the best byblœmen breeder, staging Talisman, and first with Dr. Hardy as a bizarre breeder. The Rev. J. Jacob, Whitchurch, was the only exhibitor of six vases of garden tulips, and was deservedly awarded the first prize. The varieties staged were Innocence, Hammer Hales, Yellow Spencer, Glare of the Garden, Toison d'Or, and Soloman.

The same exhibitor was also first and only exhibitor for six vases of Darwin tulips.

---

## Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 7th inst., when, under the title of "Some Impressions of America and its Horticulture," Mr. James Whytock, Dalkeith House Gardens, gave an account, with lantern illustrations, of a tour he made last summer through parts of Ontario and New York State, but more especially of the fruit-growing districts of the former. Mr. Massie, the president, was in the chair, and there was an attendance of 110 members.

Fruit-growing is one of the most important rural industries in Ontario, and on the borders of Lake Ontario is one of the most productive fruit-growing tracts on the American continent; in fact, between Toronto and Hamilton one may travel continuously through orchard lands for 80 miles. The chief fruits grown are apples and peaches, and the latter find a ready market in the large cities. Several large commercial horticultural establishments were visited. In one of these, the Dale Estate, at Brampton, there were 22 acres under glass, each of the houses, which were span-roofed, and heated by steam, being 800 feet long by 25 feet wide, and in these roses, carnations, chrysanthemums, etc., were grown by hundreds of thousands, all planted out on benches running the full length of the house. Large private horticultural establishments, which are such a familiar feature here, are practically non-existent in Canada. Much attention is given to decorative gardening, and to street trees in the large cities. The public parks of Toronto, including ornamental water, cover over 1,600 acres, and £64,000 is spent annually upon these and the street trees. The public parks and gardens of New York extend to 7,223 acres, and the annual cost of upkeep is £166,000, and, in addition to this, £8,000 is spent annually on the street trees.

On the motion of Mr. McHattie, Mr. Whytock received a very cordial vote of thanks.

The exhibits were: Fifteen vases of the newest varieties of sweet peas, including Lavender George Herbert (fixed), Lady Miller, Dobbie's Scarlet, and Mrs. Cuthbertson, from Messrs. Dobbie and Co., Edinburgh (awarded a silver-gilt medal); eighty vases of Darwin and late-flowering tulips, from Mr. D. W. Thomson, Edinburgh (awarded a silver-gilt medal); fourteen vases of tulips (various), from Messrs. James Grieve and Sons, Edinburgh (very highly commended); Rose Prince of Bulgaria, from Messrs. Todd and Co., Edinburgh; hardy rhododendrons, from Mr. A. Johnstone, Hay Lodge, Edinburgh; Echium sp., from Mr. Thos. Nicholson, Joppa; auriculas, from Miss Burton, Polton; aquilegias (seedling) from Mr. J. Thomson, Craigiehall, Cramond Bridge; myosotis and varieties of daisies, from Mr. C. Comfort, Broomfield, Davidson's Mains.

The meeting on June 4 will be devoted to the reading of short papers by junior members.

---

## Bournemouth Gardeners.

At a recent meeting of members, a paper on "Strawberries," by Miss C. Agnes Rooper, was read. This lady is a great lover of gardening in all its branches, and takes a great interest in the Bournemouth Gardeners' Association.

The lecturer said she supposed there was no fruit more generally liked than the strawberry, nor one more useful from the housewife's point of view. The first attempt to cultivate the strawberry was in England, and this fruit was mentioned in the year 1440 in an old song by one Master Jan Gardener, and in the time of Richard III. strawberries were hawked about the street. The first horticultural variety, of which there is any account, is "The Fressant," which dates from the year 1660. The lecturer said that the cultivated strawberry was probably from our own wild variety, and the same wild variety was found in France, too, but England led the way in its cultivation. Two hundred years ago there appeared in both England and France a new variety named the Pine Apple strawberry which made a great sensation at the time, and it became the parent of all our large-fruited varieties. It was named Pine Apple because of the distinctive flavour of its fruit, but no one ever knew from whence it came. The first best

→ Syringes ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No. 1 Four Oaks Undentable, 1½ × 20in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1½ × 20 in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 3C, Sutton Coldfield.

known variety produced from it was Keen's Seedling. The lecturer referred to all the best varieties to date and their cultivation; also to packing and market matters.

A good discussion followed, and one member said he lost thirty thousand plants in 6in. pots once through eelworm; the soil had been taken from old, well-worn ground. The only way to free the soil was to sterilise it before putting any plants in it. Members who had lived in different parts of Great Britain gave their experiences as to the effect various soils had on the flavour of the fruits.

Some very fine cut blooms were staged in the competition classes. Mr. Heath had grand lily of the valley, zonal pelargonium Ian McLaren, and schizanthuses; Mr. Pearce very fine tulips, Picotee, Gesneriana, and Loveliness; Mr. Pavey contributed show pelargoniums, stephanotis, and schizanthuses; and Mr. Evans, Bougainvillea glabra, sweet peas, and zonal pelargoniums. Mr. C. Pearce presided, and hearty votes of thanks were accorded the lecturer and chairman.

[Assuming our reporter is correct on this occasion, and we have no reason to assume otherwise, we should be glad to learn on what authority or authorities Miss Rooper based the foregoing remarkable statements concerning the history of cultivated strawberries. If our reporter was under a misapprehension with regard to these statements we have to have an opportunity of saying so. —Ed., "G.M."]

## Royal Gardeners' Orphan Fund.

About a hundred and twenty friends of this charity dined together at the Hotel Cecil on Wednesday, May 8, under the presidency of Sir Edwin Durning Lawrence, Bart. The occasion was the annual festival of the charity, when, under the influence of good things, pleasant company, and sweet music, hearts are warmed and pockets are opened so that a large sum is raised to carry on the work during another year.

After the usual loyal toasts had been duly honoured, the Chairman proposed "The Royal Gardeners' Orphan Fund," and in so doing referred to the excellent institution of getting folks to dine together. He instanced the Master Skinners' and the Merchant Taylors' Companies, which were always fighting each other until some sensible person persuaded them to dine together annually instead of fighting, the one company to take precedence on the toast list in the even years, and the other in the odd years; the result being that for two or three hundred years there had been a peaceful rivalry. He expressed his pleasure that the Orphan Fund had no large institution or high-salaried officials to maintain. The orphans were brought up in homes by friends and relatives, an allowance of 5s. per week being allowed for their maintenance, whereas every workhouse child cost at least 7s. 6d. per week. The home training was excellent, and the child was a human being, a girl was "Mary Jane" perhaps, but not "No. 242." At present 130 orphans were being maintained, and fourteen waiting for election were being assisted. The production of beautiful flowers and luscious plants, especially the exotics, was hard and exacting work, and lives were risked and sometimes lost in it. Therefore it seemed only right that all who enjoyed gardens and flowers, and were all the better for the refining influence of those things, should assist as far as possible to maintain the orphans of gardeners. He referred to the tragic disaster of the "Titanic," and pointed out that possibly it might be made an excuse for smaller contributions to the Orphan Fund; but he suggested that those who usually made excuses of this kind were not seldom endeavouring to hide their own meanness. He urged a larger increase of annual subscriptions, and pleaded for generous gifts so that the work carried on by the committee might not be curtailed.

Mr. Edward Sherwood, the treasurer, when responding, reminded those present that the Fund had been established twenty-five years, and that £25,634 had been expended during that period on the maintenance of orphans. They had £12,533 invested, and the income from this went to pay management and special expenses, so that the Festival was the great source of income for carrying on the work of caring for the children. He thanked the chairman for his presence and support, and very strongly urged gardeners generally to regularly subscribe to the charity.

Mr. N. N. Sherwood, V.M.H., proposed "The Visitors" in his usual hearty fashion, and to this toast Lieut.-Colonel the Right Hon. Mark Lockwood, M.P., responded in a humorous speech, while paying tribute to the beauty of the floral decorations in the room, and the very excellent work of the Fund.

Mr. H. B. May, V.M.H., chairman of Committee, proposed "The Chairman," to which Sir Edwin Durning Lawrence made a suitable reply.

The subscription list amounted to £1,056, and included: 100 guineas from the chairman, £100 from Mr. Sherwood and his sons, £50 from Messrs. Sutton and Sons, and £10 from Mr. Leonard Sutton; £59 19s. from Mr. G. Cuthbert; Mr. Reynolds, £36; Mr. J. F. McLeod, £40; Mr. Anthony Waterer, £35; Messrs. Rothschild, 25 guineas; Sir Edward Stern, 21 guineas; Sir W. Lever, 21 guineas; Mr. D. W. Thomson, £21 7s.; Mr. R. W. Leech, £19 19s.; Mr. W. Nutting, £16 5s.; Mr. R. H. Pearson, £16; Messrs. Barr and Sons, 10 guineas; Mr. J. C. Eno, 10 guineas; Mr. T. W. Sanders, £10; Messrs. J. Carter and Co., £10; Messrs. J. Veitch and Sons, £10; Mr. Howe, 8 guineas; Mr. H. B. May, 7 guineas; Mr. A. Watkins, 10 guineas; Mr. W. P. Thompson, £10; Messrs. Wm. Cutbush and Sons, 5 guineas, etc., etc.; and £184 from Covent Garden friends, collected by Messrs. W. Ingamells, F. Wright and W. Poupart.

The toasts were only three in number beyond the loyal ones, and the speeches were brief and good. Floral decorations were delightful, and excellent music was provided under the able direction of Mr. Turle Lee.

## East Anglian Horticultural Club.

At the recent meeting of this club, held at Norwich, there was a very large assembly, and a most practical and interesting discourse was given by Mr. W. Smith, gardener to Sir Forrest Fulton, K.C., Sheringham, upon "Asparagus." To evidence his success with this vegetable, Mr. Smith brought up some wonderful sticks, the largest 18 inches long and 4½ inches in circumference, and practically the whole of it edible. Situate as the garden is, in close proximity to the sea, no doubt the saline mists have something to do with the success, and he also stated that a heavy dressing of seaweed is put upon the beds at the fall of the year. Crude salt, Mr. Smith said, did not have the beneficial effects upon asparagus that was generally supposed; he thought it was better far to apply some potash salts. Construction of beds upon various soils, and planting, were points ably dealt with. A good discussion followed by Messrs. Lewis Smith, J. Powley, F. Williams, H. Perry, F. Graveling, and D. Howlett.

The exhibits, as usual, were of a varied and bright array. Mr. Frank Neave, Lingwood, brought up a beautiful collection of brooms, including a new pink variety, and some fine May-flowering tulips. The charms of Fortune's Yellow rose were ably depicted by a large bunch, brought up by Mr. J. W. Chapman, Ashwelthorpe Hall Gardens.

A great boon was bestowed upon the district by the special prize offered by Mr. J. Forder for the most queen wasps. A total of 1,074, and two queen hornets, were brought up. One gardener brought up 336, all caught during the past few weeks in a garden of seven acres.

## GARDENING ENGAGEMENT.

Mr. G. A. Bruton, of Horley, Surrey, has been appointed head gardener to T. B. Forwood, Esq., Frimhurst, Frimley Green, Farnborough, Hants.

## ANSWERS TO CORRESPONDENTS.

CULTURE OF WATER MELONS.—C. C. W., Clapham Park: Kindly give me any information you can with reference to the cultivation of water melons. The seeds I have came from Japan. Where ought the plants to be grown?—The water melon (Citrullus vulgaris) is a native of Africa, and, as in the case of the melons in general cultivation, is of climbing habit, and is well suited to the conditions that obtain in warm climates where the insipid pulp is regarded as refreshing, and appreciated accordingly. This melon is not grown to any considerable extent in Europe, except on the shores of the Mediterranean, and in the southern parts of Russia. In this country it requires glass culture, and the aid of artificial heat, as in the case of the melons generally grown in this country. Practically speaking, the only detail in which the culture of water melons differs from that of the other kinds is the vines are not stopped, but allowed to grow unchecked. In America, where the summers are much hotter than ours, water melons are largely grown in the open, and the fruits much appreciated; but, according to experience and observation, they are not worth growing in this country. If you decide to grow them, devote a spacious pit to their culture, and proceed as you would in growing the melons with which you are familiar, except that the growths be not stopped.

HOW TO REACH THE ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.—M. T., Bude: Some of your readers are coming, I expect, like myself, from the provinces to see the great show at Chelsea. We are not well acquainted with the geography of London, therefore if you could give a few brief suggestions for reaching the exhibition quickly and cheaply, from the principal termini, some of us would be very grateful.—We had already arranged to give the information here asked for, and particulars will be found set forth in the present issue.

WORKMAN'S COMPENSATION.—S. E. G., Warwick: Will you kindly tell me the general lines on which to proceed in the case of a claim for compensation for injury received during employment?—An injured workman desiring to obtain compensation must give formal notice of the accident to his employer, and make a claim on the employer for compensation. The notice must be sent to the employer in writing as soon as practicable after the accident happens, and before the workman has voluntarily left the employment; it should give the name and address of the workman, and should state in ordinary language, the cause of the injury and the date on which the accident occurred. The claim for compensation must be made within six months from the date of the accident, or, in case of death, within six months from the time of death. After notice of an accident has been given, the workman must, if so required by the employer, submit himself for examination by a doctor provided and paid by the employer. If he refuses, his rights under the Act are to be suspended till the examination has taken place. All claims for compensation may be settled by agreement between employer and workman and, excepting in cases of death the compensation may be paid by the employer direct to the workman. If the claim is settled by agreement, a memorandum of the terms of the agreement is to be sent to the Registrar of the county court for registration. When registered, the agreement becomes enforceable as a county court judgment. In cases where an agreement is made, either in the first instance or subsequently, for payment of a lump sum down instead of weekly payments, the agreement will not relieve the employer of his liabilities to make weekly payments, unless it has been registered. To prevent agreements being made for lump sums, which are unfair to the workman, the Court is now given power, if it thinks that an agreement ought not to be registered by reason of the inadequacy of the sum, or by reason of its having been obtained by fraud or undue influence or other improper means, to cancel the agreement, or make such other order as it thinks just. In default of agreement, a claim for compensation can be settled in one of the following ways: (1) by proceedings in the county court; or (2) by arbitration before a private arbitrator, agreed to and appointed by the parties; or (3) if a committee, representative of the employer and his workmen, exists with power to settle matters under the Act, by arbitration before such committee.

ORANGE-COLOURED CYDONIA.—N. C., Lowestoft: We have a very beautiful cydonia growing against the house-wall. The plant is not very large, but its bright orange and orange-scarlet flowers are very attractive. It is not the common C. japonica, but we hope you will be able to tell us the name from this poor description; the leaves and stems seem to be darker than the common form. We would have sent specimens, but have been so long getting our garden into shape since we took possession.—The cydonia is probably C. japonica Sargenti, a beautiful plant for a wall or a rock garden. Send us a specimen next spring if the flowers are now all over.

MARGUERITE MRS. F. SANDER.—J. J. W., Liverpool: Can you tell me whether the beautiful double or anemone-centred Marguerite Mrs. F. Sander has ever gained honours from the Royal Horticultural Society, and if so, when?—This fine marguerite was exhibited by Messrs. Sander and Sons, St. Albans, at the Temple Show of 1910, and gained an Award of Merit. It was figured in our issue of June 4, 1910, p. 429.

SWEET WILLIAMS.—L. W. P., Peterborough: We do not succeed with sweet williams, and now that these old-fashioned flowers have been so greatly improved, we are anxious to try again. Our soil is heavy, and remains rather damp during winter, and this doubtless has something to do with our comparative failure. Any suggestions will be welcomed.—Secure the best possible strain of sweet williams, as poor strains give poor results, no matter how good the site and cultivation. Sow the seeds at once, thinly in a little bed in the kitchen garden, and add some crushed mortar rubbish and old potting soil to the heavy staple. If the soil is dry give it a thorough watering a few hours before drawing shallow drills to receive the seeds. Prick out the seedlings six inches apart each way as soon as they are large enough, and place the plants in their flowering quarters in early autumn. Sweet williams love a warm, rich soil, containing plenty of lime.

COTONEASTERS FOR THE ROCK GARDEN.—M. M., Batheaston: Your help in deciding which are the best cotoneasters for planting in a rock garden will be greatly appreciated.—In a rock garden where there are some very large boulders Cotoneaster horizontalis would be suitable; but if the garden is small and the stones of quite moderate size, the best kinds to plant would be C. adpressa, which produces a fine effect in autumn; C. microphylla glacialis (C. congesta), one of the finest of rock garden shrubs; and C. rupestre, which produces clusters of small hawthorn-like flowers at this season of the year.

## NAMES OF PLANTS.

W. C. S., Rottingdean.—Tilia platyphillus laciniata.

J. T. T., Stowmarket.—1, Kerria japonica; 2, Spiræa confusa.

E. S. G., Derby.—A form of Prunus padus, the Bird Cherry, a native plant.

P. T., Cambridge.—1, Cytisus albus; 2, Diervilla amabilis; 3, Cytisus biflorus.

M. E. A., Wallingford.—1, Clematis montana; 2, Anagallis fruticosa; 3, Hippophæ rhamoides; 4, Pinguicula vulgaris.

E. G., Weymouth.—1, Celsia arcturus; 2, Odontoglossum ardentissimum; 3. O. crispum, a very poor form; 4, Cattleya Mossiæ; 5, Cotyledon umbilicus.

GERBERA HYBRID

is unprecedented for her beauty, her wealth and great variety of colours, which range from pure white to yellow, orange, pink, scarlet, crimson, and all the intermediate shades.

A most charming table decoration. The cut flowers keep fresh for about a fortnight and even longer.

SEEDS CROP May / June.
CUT BLOOM September—May.

THE FREESIA HYBRID

The strikingly beautiful, sweet-scented blooms are daintily coloured with the most delicate hues of pink, red, violet, blue, orange, etc.

MESSENGER & CO. LTD
HORTICULTURAL BUILDERS & HEATING ENGINEERS
LOUGHBOROUGH LEICESTERSHIRE
London Office 122 VICTORIA ST S.W.

**MODERN GLASSHOUSES**

as supplied by MESSENGER and CO., Ltd., are made of the best materials, and only capable and reliable workmen are employed in the erection thereof.

The following letter was recently received by us on the completion of a contract for a well-known Member of Parliament.

*February, 1911.*

"I should not be doing my duty to your workmen if I did not at once tell you, on the completion of your work, how pleased I have been with each and all of them.

"They have been most obliging throughout the whole job, and have endeavoured to do everything in an efficient and thoroughly workmanlike manner, and I must congratulate you upon having such capable employees."

Printed and Published by W. H. & L. COLLINGRIDGE, City Press, 148 & 149, Aldersgate St., London, E.C., and sold by all Newsagents, and at all Railway Bookstalls.

## ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION—SECOND SPECIAL NUMBER.

# THE GARDENERS' MAGAZINE.

No. 3,056. Vol. LV. (Reg. at the G.P.O. as a Newspaper, and for Canadian Magazine Post.) SATURDAY, MAY 25. 1912. (10/6 per Ann. Post Free. To Foreign Countries, 15/-.) Twopence.

BARR'S SEEDS FOR MAY AND JUNE SOWING.—Finest strains of Antirrhinums, Aquilegias, Campanulas, Canterbury Bells, Calceolarias, Cinerarias, Delphiniums, Hollyhocks, Lupins, Pansies, Primulas, Stocks, Wallflowers, etc. Special list on application. BARR and SONS, 11, 12, and 13, King Street, Covent Garden, London.

GISHURST COMPOUND is harmless in use; its soluble Sulphur, etc., has for 40 years cured blight and fungus on plants, and is good for washing unhealthy dogs. Gishurstine keeps boots dry in all weathers; they will polish. Good for harness. Wholesale from
PRICE'S PATENT CANDLE CO., LIM., LONDON.

JAMES GRAY, LTD., HORTICULTURAL BUILDER, CHELSEA, S.W., is arranging this spring for a large selection of BLINDS for Conservatories, Greenhouses, Private Houses, Verandahs, etc., and will be happy to send samples, prints, and prices on receipt of postcard, telephone call (201 Western), letter, or wire, "Gray, Chelsea, London."

COOPS, COOPS for the Season.—The Keepers' Coop. Best on the Market, 5s. 6d. each; 60s. per dozen, carriage paid. Runs, 2s. 6d. each extra. Send for List showing numerous other designs. BOULTON and PAUL, LTD., Rose Lane Works, Norwich.

FERNS, FERNS, FERNS, etc.—Foliage and Blooming Plants for stove, greenhouse, and garden. 100,000 large garden Ferns, 20s. 100. 5,000 cases sent off yearly. Amateur Catalogue free. J. E. SMITH, London Fern Nursery, Loughborough Junction, S.W.

RICHARDSON'S for GLASSHOUSES and HEATING APPARATUS, for full advertisement see page viii., Darlington.

ZONAL PELARGONIUMS.
Catalogue of New and Choicest Varieties.

From V. SLADE, Zonal Specialist,
Staplegrove Nursery, Taunton.

DAHLIAS. — PÆONY, CACTUS, POMPONE AND SHOW,
From 4s. 6d. per dozen.
Best varieties only. Catalogues free.

SUTTON'S FIRE KING WALLFLOWER.
Vivid orange, a new and beautiful colour in this favourite spring flower.
Per packet, 1s. 6d.
W. G. Burstow, Esq., Curator, Wallasey, U.D. Council, writes: "Your Fire King Wallflower is a great success here. It has been eulogised by our local press, and rightly described as a new departure. We grow over 4,000 of all the leading varieties."
Post free.

SUTTON AND SONS, THE KING'S
SEEDSMEN, READING.

THE MODERN HERBACEOUS BORDER.
Full particulars and prices of Kelway Borders, packed, arranged for planting, to flower in tasteful schemes of colour, from
KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.
——, Esq., Bolton Crescent, Windsor.
"All the plants, etc., arrived in good condition, and appear to be thriving well. The Gaillardias, etc., purchased in 1907, were much appreciated during the summer."

NOW IS THE TIME TO PLANT KELWAY'S NEWEST GLADIOLI.—These new Gladioli are a revelation. They should be planted by all who want glowing effect of colour in their beds and borders, and flowers for the house in July, August, and September. We recommend trial of a selection of our "Cream of the World" Collection of named varieties, flowering bulbs, for instance, one dozen for 9s., per 100 £3 10s. Other choice collections, 30s. and 45s. per 100. Full descriptive list on application. Carriage free for remittance with order.
KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

NOW IS THE TIME TO PLANT KELWAY'S GAILLARDIAS, which are among the most brilliant and the most easily grown of the hardy herbaceous perennials; they give abundant bloom in the same year that they are planted, and blossoms profusely from June to November. The flowers are on long stems, and last in water for a fortnight. Choice named collections, 12s. a dozen. From pots.
Carriage and packing free for remittance with order.
KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

IRON and WIRE FENCING for Gardens, Tree Guards, Gates, Arches, Espaliers, Rose Stakes, and Ornamental Garden Iron and Wire Work of every description. Send for Illustrated Catalogue, free.—BOULTON and PAUL, Ltd., Manufacturers, Norwich.

FRESH SEEDS NOW READY.—Asparagus plumosus nanus, 1,000 seeds, 8s. Gerbera Jamesoni hybrids, 1,000 seeds, 10s. Apply price for large quantity. R. DIEM, Antibes, Sud. France.

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.
XL ALL NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant; both Liquid and Cake.
XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.
XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are XL ALL WEED KILLER, XL ALL FERTILISER, XL ALL ROSE MANURE, RICHARDS' GREEN SUNSHADE, finest powder shading on the market, 1s. packet does 100 feet of glass. Don't forget to ask your Nurseryman or Seedsman for my small pink list.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Progress 1866-1912.

The great international exhibition that is now being held in the extensive grounds of the Royal Hospital, Chelsea, is not only a splendid demonstration of British horticulture, but is so great a success horticulturally as to far surpass in magnitude and interest the most successful gathering associated with gardening that has been held within the boundaries of the United Kingdom. It is of special interest to those who take a broad view of the various aspects of the practice and science of horticulture to have evidence in a walk through the show, that, while our own countrymen have made strenuous endeavour to maintain the high reputation this country has so long enjoyed for its devotion to the pursuit of gardening, our foreign friends have not been sparing in their efforts to contribute of their best to the exhibition, and thereby render it truly international in character, as well as in name. To ourselves it has been a great pleasure to meet under the wide-spreading tents that shelter the marvellous displays of plants, flowers, fruits, and vegetables, or in the leafy and delightful Ranelagh Gardens, friends from distant parts of our own country, and also to renew the friendships that have been made at the international gatherings that have been held at Ghent, Antwerp, Haarlem, Hamburg, Paris, and some other centres of horticultural activity across the seas. It has also been of intense interest to find, in walking through the exhibition and bestowing something more than a superficial glance on the various objects, proofs well-nigh innumerable of the great progress that has been made in the improvement of the products of the garden and in methods of procedure since the 1866 exhibition. Numerous classes of plants, fruits, and vegetables have been improved by selective culture, and several quite new races have been obtained as the result of the activities of the hybridist. One of the most remarkable examples of the success that has been achieved in the creation of new races of plants by the art of hybridisation is afforded by the tuberous begonias, which have for many years contributed to the attractions of both flower garden and plant house. The great diversity in the growth, in the size and form of the flowers, and in the colours is well known, and to be in a position to appreciate the splendid work accomplished by those who have been engaged in bringing about such magnificent results, it is only necessary to remember that they have been derived from six comparatively insignificant species. These were Begonia boliviensis, B. rosæflora, B. Pearcei, B. Davisi, and B. Clarkei, all of which are natives of South America, and were mostly introduced to this country in 1895 and the two following years. Thus the race of tuberous begonias obtained from the hybridisation of the six species mentioned has been created since 1866. The new race of streptocarpus, now so popular for conservatory decoration, have also been raised since the year last-named, and afford another proof of the possibilities of creating new groups of plants by hybridisation when skilfully conducted along well-defined lines. A further proof of the marvellous results that may be obtained by the blending of the distinctive characteristics of closely allied species, otherwise hybridisation, and also of the progress that has been made in the development of orchids, is found in the numerous collections of these exquisitely beautiful plants that form so important and attractive a feature of the exhibition. Forty-six years ago not more than half a dozen hybrids had flowered, and, so far as we know, none were shown at the international exhibition which was then held, but now there are many hundreds of hybrids possessing merit of the highest order, and a very large proportion of these are represented in competitive and non-competitive collections. The hybrid cypripediums, odontoglossums, odontiodas, lælio-cattleyas, brasso-cattleyas, sophro-cattleyas, and dendrobiums provide us with almost a new race of orchids, and we owe them all to the activities of raisers at home and across the seas. Not less noteworthy in their way are the hybrid nymphæas, which have been raised in the interval of time between the two international exhibitions, and constitute a quite new class of much importance. The lover of hardy water lilies had for some time after 1866 to be satisfied with the white species that is unquestionably one of the most beautiful members of our native flora, but now he has at his command varieties

THE DUKE OF PORTLAND, K.G., G.C.V.O.
President of the Royal International Horticultural Exhibition.

bearing flowers from the purest white to glowing crimson, and differing sufficiently in growth to enable cultivators to select plants that are specially adapted to the pool or lake in which they are to be grown. If we turn from the plants that we owe to the hybridist's art to those whose development has been effected by selective culture for further proof of progress we have not far to seek. As a notable example of evolution by selection and cross-fertilisation the Chinese primula may well be mentioned. In 1866 the varieties of this highly appreciated plant were few, the flowers of medium size, and the range of colours limited, but now there is a wide range of colours in both single and semi-double forms and flowers of immense size and superb form. In addition there are the star primulas in various hues. Not less remarkable is Primula obconica, which, as in the case of the Chinese primrose, has had its flowers increased in size and improved in form, and the range of its colours greatly extended without having been influenced in the process of development by the pollen of other species. Some cultivators have during the past fifteen years claimed to have effected crosses between P. obconica and P. sinensis, and they have been supported in their views by several scientists of repute; but, failing to find the slightest proof of hybridisation between P. obconica and P. sinensis, or indeed, any other primula, we have throughout contended that its improvement is wholly due to selection, and our view is now accepted as the correct one. We find another remarkable example of the possibilities of selective culture in plant improvement in the sweet peas which are so strongly represented at Chelsea. At the time of the 1866 exhibition they were practically non-existent for competitive purposes, and certainly none were then shown. Now they not only form a delightful feature of the present exhibition, but have several societies wholly devoted to them, and are contributed with the utmost liberality to all the summer and autumn exhibitions. If the development of the dahlia during the period under review has not been equal to that of the sweet pea, it is sufficiently noteworthy to justify some reference to the flower. The only sections that obtained attention in 1866 were the show, fancy, and pompon varieties, and not one of these had a place in the international exhibition of that year; but now we have, in addition to the older sections, the cactus, collarette, pæony-flowered and singles; and dahlias have a place in the present exhibition. Great as the progress has been in various directions, it is especially marked by the perpetual-flowering carnations, and their creation may well be regarded as one of the most important events in the progress of floriculture during the past fifty years. Their value for the production of delightful colour effects at exhibitions is proved to demonstration at Chelsea, their value for beautifying the cool plant house throughout the year and the flower garden during the summer is generally acknowledged, and the utility of thei flowers for floral arrangements is indicated by the important industry that has arisen for the purpose of supplying the markets with them. The progress that has been made with hardy flowers of all kinds has been so great during the past half-century as to revolutionise the methods of beautifying the flower garden. In 1866 tender bedding plants were in the ascendant, and occupied so much space in beds and borders that there was very little room for hardy perennials, and, as a matter of fact, few were the gardens in which there was a really good border of them. Now there is hardly a garden in the United Kingdom in which they are not more or less satisfactorily represented. To indicate the remarkable extension in their cultivation, it will suffice to say that at the 1866 exhibition there were two classes for hardy plants, with one entry in each, and that the present exhibition there are 104 classes, with 169 entries. While these flowers have been increasing in popularity, rapid progress has been made in their improvement, as evidenced by the many fine varieties of delphiniums, early-flowering chrysanthemums, irises, Michaelmas daisies, narcissi, pæonies, pentstemons, phloxes, pyrethrums, late-flowering tulips, to mention but a few that have been introduced and placed at the disposal of cultivators. As the result in a large measure of the immense increase in the number of beautiful hardy plants thriving under the most divergent conditions, rock and water gardening has undergone a marvellous development, and in popularity is probably unsurpassed by any other feature of the flower garden. The high degree of perfection to which these two forms of garden adornment has attained, and the great diversity and beauty of the plants available for growing on the ledges and slopes of the rock garden, or luxuriating in the moisture of the bog garden, or converting silent pool or running stream into a garden of great beauty is admirably represented in the exhibition. As with hardy plant culture, so with rose growing, the progress has proceeded with leaps and bounds, and the eighty collections of plants and flowers included in the present exhibition present a striking contrast to the few groups of giant specimens that were shown forty-six years ago. There is not only a difference in the character of the plants shown, but also in the types of flowers, for during the period several classes that are wholly new have been introduced, notably the hybrid teas, the Penzance briars, and the Wichuraiana roses, which are of special interest, as showing that the raisers have constantly kept in view the importance of a vigorous habit and abundant flower production. Much progress has been made with trees and shrubs, more particularly with those grown for the beauty of their flowers. Many of great value have been introduced from China and other parts of the world, while considerable numbers are, as in the case of the rhododendrons, lilacs, and philadelphus, the products of hybridisation and cross-fertilisation. Not less remarkable has been the progress with fruits and vegetables. As evidence of the improvement that has been effected in fruits, it will not be necessary to do more than to direct attention to large numbers of peaches, nectarines, plums, and pears, with which the lists of fruits have been enriched during the past fifty years. The development of fruit culture, both in private gardens and commercial establishments and improvements of methods of procedure have been great, an outstanding feature being the development of commercial establishments for the supply of the markets. Vegetables have shared to the full in the improvement in the garden. All classes have been immensely improved, as the result chiefly of the enterprise of the leading seed firms, and the methods of cultivation and of presenting them to public notice have undergone a marked change for the better. From forty to fifty years ago vegetables were so indifferently shown as to contribute but little to the attractions of an exhibition, but now, as so well exemplified at Chelsea, they are staged in a manner that obtains for them a full share of attention. It has not been possible to do more than briefly refer to a few of the more prominent occupants of the garden as evidence of progress, but sufficient has been said to show that during the past forty-six years there have been immense advances in all branches of horticulture—advances that have greatly added to the charm, interest, and usefulness of the garden, which now forms so essential a part of the life of this country.

---

**The Duke of Portland, K.G., G.C.V.O.,** whose portrait we have the pleasure of giving herewith, is so generous a supporter of movements that have for their object the advancement of horticulture, and, moreover, takes so keen an interest in all that relates to the garden, that it is only fitting he should be the president of the Royal International Horticultural Exhibition that is now being held at Chelsea. We have ample proof of the great interest which the Duke of Portland takes in horticulture in the immense improvements that have been effected in the gardens of Welbeck Abbey, since he succeeded to the title and estates. The glass structures have been remodelled to bring them in line with modern ideas and requirements, and the extensive pleasure grounds which have long been regarded as an important part of the environment of the famous abbey, have had their interest and attractions increased at least a hundredfold. Roses in their various classes and methods of training contribute their full share to the beauty of the grounds, and the magnificent borders of herbaceous plants have no equals in this country. These were illustrated and described in the GARDENERS' MAGAZINE of June 11, 1910, and it was therein mentioned that the Duchess of Portland, who possesses a wide knowledge of hardy flowers and taste of the highest order, had taken a leading part in the designing and arrangement of these wonderful borders. That a nobleman who fully appreciates the responsibility of his high position should take an active part in the promotion of horticulture, in the district of which Welbeck Abbey is the centre, goes without saying, but it should be mentioned that when the National Vegetable Society was formed, the Duke of Portland accepted the position of president, and thereby, conjointly with generous financial support, has contributed in no small degree to the success which that useful organisation has achieved.

**Hybridisation of Œnotheras.**—In commencing his second course of lectures on "Genetics" at the Royal Institution, Mr. W. Bateson, F.R.S., dealt with the results of recent investigations in the hybridisation of plants, more particularly with those obtained by De Vries, in the course of his experiments with evening primroses. Mr. Bateson said that the common Evening Primrose (Œ. Lamarckiana), with its bewildering varieties, many of which have all the outward appearance of true species, is probably a hybrid between some species not yet ascertained. It is not found in a wild state anywhere, and its introduction to Europe is unknown. He stated the theory held by De Vries that the difference between species is not a mere difference between aggregations of units, but that, beyond the qualities of the component units, there is a distinctive character attaching to them in combination; and he explained the discovery of the same investigator that though varieties, when crossed, produce segregation, the crossing of species results in a definite form, which form subsequently breeds true. De Vries also found a constant influence of sex characters in cross-breeding. Thus, taking the two species of Œnothera—namely, Œ. muricata (M) and Œ. biennis (B), he said that if the female M be fertilised by the male B, the result is a form (MB) which is clearly distinguishable from the form (BM) produced by crossing the female B with the male M. If these be crossed again, the female MB with the male BM, the result is all M (or muricata) again. If, on the other hand, the male MB be crossed with the female BM, the result is pure B (or biennis). A few years ago, Mr. Bateson observed, this would have seemed to us pure mystery, but we now know that the male and female germ-cells contain different factors. Not only is this the case where the male and female are separate organisms, but we can see in hermaphrodite plants that the male and female cells carry different characters. The lecturer explained this by the examples of petunias and stocks, and showed why the latter bred only from single plants, while in the former the double plants also made pollen, which was employed in fertilisation to produce double plants in the next generation. He considered this an extremely important field of investigation.

**Proposed Honour to a Great Gardener.**—A committee has been formed in France for the purpose of erecting a statue to Le Nôtre, who obtained much fame as the designer of the Versailles gardens. Le Nôtre's father and grandfather were both gardeners of distinction, but he was trained to be a painter, and only took up the profession of his ancestors when convinced by a philosophic friend that Nature's irregularities were to be overcome. On taking up his father's position in 1637 as gardener at the Tuileries, Le Nôtre stated that his choice was due to the fact "that gardening gives exactly the same opportunities as painting." He made rapid progress in his new profession, and at the age of twenty-seven received the appointment of Designer-in-Chief of gardens to the King. He designed many great gardens in France, but his greatest achievement was the creation of the gardens at Versailles. In perpetuating the memory of Le Nôtre, the horticulturists of France are doing honour to a great gardener and evincing judgment of a high order.

**Distribution of Oxydases in Primulas.**—In a paper contributed by Dr. F. Keeble and Dr. E. F. Armstrong to a recent meeting of the Royal Society on the distribution of oxydases in the plant and their rôle in the formation of pigment, it was suggested that the methods of investigation in general use do not admit of the determination in detail of the distribution of oxydases in the tissues of plants and animals. Hence the hypothesis that pigments are produced by the action of oxydases in colourless chromogens, though rendered probable by recent researches, cannot, in the opinion of the authors, be regarded as established. Methods are now described which allow of the macroscopic and microscopic recognition of plant oxydases. By the application of these methods it is shown that in the Chinese primrose (Primula sinensis) the distribution of oxydases in the tissues coincides with that of the pigments of the flower and other parts of the plant. Thus, the hypothesis with respect to the rôle of oxydases in pigment-formation receives confirmation. It is proved that P. sinensis contains two peroxydases, which differ from one another in their chemical reactions and in their localisation. It is proved definitely that dominant white flowers contain a substance which inhibits, but does not destroy, peroxydase. Experiments with recessive white flowers, the genetical behaviour of which indicates that they lack either peroxydase or chromogen, show that they contain peroxydase. Inasmuch as recessive whites contain no inhibitor of oxydase, failure to form pigment is to be attributed to lack of chromogen. The distribution of peroxydases in P. sinensis is to be regarded as typical of that in flowering plants generally, and the method appears to be capable of wide application in the study of the distribution of oxydases.

**Gardening in the Seventeenth Century.**—A northern contemporary reminds us that La Quintinie, the celebrated gardener to Louis XIV., "did all that is accomplished to-day. During the month of December, 1669, he produced asparagus for the table of the King. In the following January, he had raised red radishes and lettuce, in March cauliflowers, peas in May, and melons by the end of June, so the table of the French King nearly two centuries and a-half ago could compare favourably with the Royal tables of to-day." Yes; but what about our forced strawberries, roses, and carnations at Christmas, peas in April, and French beans still earlier. There are other things, also, to prove that gardening has advanced materially since 1669, but they are so obvious to those with open eyes and a knowledge of the past, that there is no need to particularise.

**Australian Fruit Export Trade.**—The export of fruit from the Australian Colonies continues to increase, but there have been so many complaints with regard to the financial results that the Commonwealth Government have appointed a Royal Commission to enquire into the present position, and the prospects of the export trade in fruit. The Commission consists of seven members, and the Federal Minister for Customs has very plainly stated that there is to be no trip to this country in connection with the investigations, and that the evidence to be taken here will be on commission. There is no difficulty in understanding the disappointment of the growers when they send consignments to this country, and receive returns showing a loss on the transaction, and the cause of the loss is readily understood by those who are acquainted with market conditions. On more than one occasion the supplies have been in excess of market requirements, and a considerable quantity of fruit has come to hand in a rather poor condition. For apples of high quality there is invariably a good demand, especially during the London season, and Western Australian growers who have been careful to market suitable fruit in the best possible condition have obtained satisfactory returns.

**Dwarf Forest of Southern California.**—Among the sclerophyllous woodlands recognised by Dr. Schimper as a feature of those regions situated in the warm temperate zone where the rainfall coincides with winter is the chaparral, or dwarf forest of southern California. An account of this formation by Mr. F. G. Plummer, indicates, we learn from "Nature," that it is a truly natural type, occurring between the altitudes of sea-level and 8,000 feet, and confined to the littoral district from Monterey to San Diego. True chaparral consists primarily of dwarf trees—not shrubs—stunted by reason of an insufficient rainfall. It is economically important as a ground cover for the watershed whence the water supply is obtained for irrigation and municipal purposes. About forty different species of trees are combined in the formation; the most desirable are those which produce good shade, are not inflammable and make vigorous growth, such as Rhus laurina, Prunus ilicifolia, Heteromeles arbutifolia, and species of Quercus; less desirable, but dominant are species of Adenosteoma and Ceanothus.

## ATTRACTIVE FLOWER BEDS.

In some gardens the same kinds of plants are put out in the same positions year after year, and with good effect, too. For a period of more than ten years I had to bed out about thirty thousand plants every year, a large percentage of them occupying the same positions year after year, as it was my employer's wish. But I was free to fill many beds as I thought best, and in their case fresh arrangements were made every year.

For the benefit of those readers who are inexperienced in the filling of flower beds, I will give a few hints on the subject.

Sweet-scented beds are generally much appreciated in a garden, and more so when plants with fragrant foliage are associated with sweet-scented flowers. For a large bed the following are suitable, namely: Jasmine officinale, scented-leaved geraniums, Eucalyptus globulus, heliotrope, Nicotiana affinis, scented-leaved verbenas (Lippia citriodora), liliums, and clove carnations. The plants should be of various sizes, some 3ft. high, and not be overcrowded. A distinct bordering is not needed, the carnations should be planted in groups nearest the edge of the bed, and a few seeds of mignonette be also sown there. Such a bed will be a great source of pleasure throughout the season. Small plants of the scented verbena put in rather close together, and the shoots pegged down so as to form a dense carpet six inches high, or at most eight inches high, with dot plants of heliotropium 3ft. apart all over the bed, will prove very attractive. The verbena may be cut back several times during the summer, when its young shoots will be very pleasing to the eye. The heliotrope plants should be about 2ft. in height, and those in the centre of the bed a few inches higher. Another effective bed is one planted with Lilium melpomene, rubrum, and album; Nicotiana affinis, Zea japonica, the caster-oil plant, Eucalyptus globulus, and Plumbago capensis. If the bed be a large one, a bordering of Perilla nankinensis would look well. Celosias and Lilium album and L. melpomene form a beautiful combination.

Fuchsia President Grevy, with a groundwork of blue violas, produces a charming effect. The fuchsias should be half-standards or neat pyramids. Viola Blue Bell as a groundwork, with ivy-leaved pelargonium Madame Crousse is very pleasing, as also is a combination of Fuchsia Mrs. Marshall and Madame de Bussey heliotropium. Fuchsia fulgens on a groundwork of Coleus Verschaffelti. These three combinations, respectively, are highly effective

A pleasing effect in a border may be obtained by filling it with Zonal pelargonium King of Denmark, give plants a distance of 2ft. apart, with mignonette, and just a few plants of the night-scented stock (Mathiola bicornis) to fill up. The seeds of the mignonette and stock should be sown on the surface of the soil, and then lightly raked in, after the pelargoniums are planted.

In some gardens there are large imitation baskets, about 9ft. long and 3ft. wide, with handles of ivy four feet high. The ivy is trained over an iron rod. If the ivy is well established it must be cut before any plants are put in. The bed should be raised 2ft. high, with three bands of stones to retain the soil in position. The centre may be planted with Zonal pelargonium Henry Jacoby, then comes a band of Centaurea candidissima, and an outer one of gazanias. I feel sure that those who have once tried this combination of plants will wish to have it many years in succession. G. B.

## ARUNDO CONSPICUA.

The New Zealand Reed (Arundo conspicua) is one of the most graceful of all the grasses, bearing slender, arching, plume-tipped shafts ten or twelve feet in length when planted in deep soil. By those whose knowledge of gardening lore is limited, it is usually styled Pampas Grass, but the true Pampas Grass (Cortaderia argentea) bears erect and not arching shafts, and lacks the delicate grace of Arundo conspicua, whose bending plumes spread outward far beyond the furthest limits of its narrow, drooping leafage. The New Zealand Reed attains its fullest beauty about the close of July, whereas the Pampas Grass is not at its best until October and November, so that in northern gardens its beauty is often destroyed by wintry storms almost before it flowers.

ARUNDO CONSPICUA.
A handsome species, with large feathery plumes.

Arundo conspicua is not so hardy as the Pampas Grass, and in very cold districts may be killed in the winter, but a clump has withstood 20 degrees of frost uninjured, though growing in deep, retentive loam of a clayey nature, and in close proximity to water, which has, on one occasion, during a prolonged autumnal downpour, covered its roots to a depth of two feet. This grass suits any position where the Pampas is admissable, and in selecting a place for it, it should be remembered that it is quite as stately in character as the Pampas Grass. It should not be crowded. The best place for it is an isolated position on the grass, where it will at all times present a handsome appearance. For planting in masses, in open spaces, on the margins of woods or drives, especially when viewed at some distance, this fine plant is very effective, and it is equally eligible for planting by the margins of streams, to which it would give character.

We are rather neglectful of really good and distinct ornamental grasses. Even those most graceful of all grassy shrubs, the bamboos, are not planted so largely as they should be. So it is with the eulalias or miscanthus, graceful Japanese grasses, of which there are green, barred and striped forms, all hardy, all graceful, all beautiful. The Siberian Melic Grass, again, is a noble plant, stately and fine in colour during the late autumn months, but as yet rarely seen in the best of gardens. The same may be said of the Pheasant's-tail Grass (Apera arundinacea), one of the best of all grasses for cutting, but it requires a warm, sandy border, or a sheltered position. Arundo conspicua is slow in making growth, and when small plants are put in they take six or seven years to form specimens in the proper sense of the word, and plants some years in age should be obtained. In cold districts it is a valuable plant for growing in boxes or tubs, so that the specimens can be sheltered in the winter. It was introduced into this country in 1843.

Wyndham Fitzherbert.

---

**Kennedya coccinea.**—This is a pretty leguminous climbing plant of a woody character, native of Australia. Compared with such species as Kennedya Marryattæ, K. rubicunda, or K. nigricans, it is of slender growth. The flowers, which are borne in compact rounded heads, are coloured scarlet, with a magenta suffusion in the centre. It blooms usually during late spring and summer. As a rafter plant for a small structure or twining around a few sticks, it is very pleasing.—T.

## PRUNUS SUB-HIRTELLA.

One of the finest species amongst small-flowering trees that bloom early in spring at Kew, is this Japanese cherry. Examples are to be seen in several parts of the gardens, but the largest and best-flowered specimen stands on the Pagoda Vista between the Palm House and Temperate House. It is there represented by a tree 15ft. or so in height, with a large rounded head, every branch of which is clothed with white rose-tinted flowers, each one being about three-quarters of an inch across. P. sub-hirtella is a comparatively new tree in this country, for it is less than twenty years ago that its cultivation was commenced, although it had been known before from descriptions and herbarium specimens. One glance at the specimen referred to is sufficient to reveal its value as an ornamental tree, and it might well be allowed to take the place of Prunus cerasifera var. atropurpurea (P. Pissardi), which is becoming too common in some places, more particularly in small suburban gardens. As is the case with other single-flowered kinds, the flowering season is rather restricted, for the flowers are rarely in good condition for more than a fortnight. Cuttings root more easily than those of many species of prunus, therefore it is an easy tree to increase.

W. D.

---

## VALUE OF SHADE.

The month of April was particularly sunny for the time of year, and unless precautions were taken to have plants under glass shaded from its direct rays, much harm was probably done. Small, tender seedlings specially needed shade after the sunless March we experienced, as their foliage was very soft. Often, however, shading unless done with care, is harmful, for, if overdone, it causes the plants to be drawn up weakly, and when this happens it is seldom they give satisfaction afterwards. The time for shading must depend on the position of the glass structures and the kind of plants grown in them.

Fruit houses, as a rule, do not need shading, though sometimes in the case where the trees were recently planted a little shade from the direct sun in the middle of the day would do no harm. It is, however, the more tender subjects that need care. More especially those that had been recently pricked out or potted, as such are more liable to suffer than those that are well established. Shade is beneficial in several ways, for it not only prevents evaporation, and thus saves a great amount of watering, but it prevents a too great range of temperature; for, no matter how much ventilation is given when the sun is bright, even if the atmosphere is saturated with moisture the temperature rises abnormally.

The density of shade should be in accordance with the class of plants under cultivation. Fixed shading is often very injurious, for when we get a spell of wet, sunless weather, the temperature sometimes falls too low, and unless fire-heat be applied to expel the damp the plants suffer accordingly. In most cases it is not advisable to shade unless the sun is shining brightly, but where a permanent shade is employed this cannot be regulated, and, in my opinion, should not be used unless in places where it is difficult to shade otherwise, or on houses whose occupants require to be always shaded, such as some palms and ferns.

Many plants when in bloom will retain their freshness much longer if kept shaded from the sun, but are liable to damp off when this is carried to an excess. H. C. P.

# *The* ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION

A·D 1912

**In the GROUNDS of the ROYAL HOSPITAL, CHELSEA, *May 22nd to May 30th, 1912.***

## AN ILLUSTRATED AND DESCRIPTIVE ACCOUNT.

The great exhibition to which we have all been looking forward for so many years, an exhibition to demonstrate our high position in the realm of horticulture and to mark our progress in the art, science, and practice of the most ancient of professions, has at last come into being. The first questions asked are, "Is it a success?" "Does it demonstrate all we desire it to?" "Are we satisfied with the whole affair?" To the first question the answer is an emphatic yes, judged purely from an horticultural standpoint; the financial question must remain unanswered for a few days. To the second and third questions the affirmative answer is not so emphatic, for, after all, there is nothing with which we can compare this monster display, and any disappointments felt serve the useful purpose of subduing our insular pride and pointing to the possibility of higher achievements. Some of the exhibits were quite commonplace, but the great majority gave ample evidence of months, and even years, of forethought. To all who have done anything towards the success of this great undertaking we tender our heartiest congratulations; mistakes almost always occur when great things are attempted, and in this instance they have been chiefly those that result from lack of experience and a want of a full appreciation of the greatness of the undertaking. In other words, we must not wait for fifty years ere we hold another giant horticultural exhibition.

The immensity of the exhibition is the one thing that quickly forced itself upon the mind and body of every spectator during the opening days of the show. We have a show that is great in more senses than one. Even our Continental neighbours, used to big horticultural events, have lavished unstinted praise upon the array of rock and water gardens, the wonderful development among greenhouse flowers, the size and variety of our carnations and sweet peas, the skilful cultivation of our roses and stove foliage plants, the gracefulness of our ferns, and the gorgeousness of our orchids. We have enjoyed their praise, and in our heart of hearts felt it was well deserved.

THE KING'S CUP

For the most meritorious contribution to the Exhibition.

Won by Sir GEORGE HOLFORD, K.C.V.O., C.I.E.

Entering from the main gates on the Embankment at Chelsea, the immediate effect was not so fine as it might have been. To the left a delightful garden of gay annuals, backed by graceful treillage, in the centre, round the Chilianwallah Monument, a glorious hill of colour, created by cinerarias, begonias, etc.; and in the distance a long array of brilliant groups of annuals and the brightest of greenhouse plants, marked where Messrs. Carter, Sutton, and Webb had respectively staked out their claims. Immediately to the left the end of a wonderful bank of ferns came into view, and then the eye travelled along the rather sombre greenery of huge specimens of scented pelargoniums from Gunnersbury House, above which one caught glimpses of oranges and peaches, ripe and glowing on the trees. Turning to the left the wonderful pergola of fruiting vines, with flanking orchards of peaches, nectarines, figs, cherries, and other luscious fruits, from Mr. Leopold de Rothschild's Gunnersbury House Garden, arrested attention. Passing on through this, high banks of graceful ferns came into view, with Laxton's strawberry garden hard by, and tempting one to stay. We see roses in exquisite grace and beauty father afield, but we pass onwards to where the Messrs. Veitch, of Chelsea, have set out an array of plants newly introduced from China; but even this does not arrest attention like the magnificent 2,000ft. group of superbly-grown ornamental stove plants set out in bold and striking fashion by the same Chelsea firm. Leaving this wonderful array of form and colour in leafage, we proceed at once to the mollis and Ghent azaleas, a riot of oriental colouring, arranged by the Messrs. Cuthbert, of Southgate, and then turn to the softer hues of the huge rhododendron garden, in the making of which many firms have contributed of their best. More roses appear, with here and there a little garden of well-cropped fruit trees, that bring us to the end of the great tent.

Now we turn about, but first we notice Messrs. Barr's long herbaceous border along the northern end, this joining on to the roses from Messrs. Frank Cant and Co. Now we traverse the longest side of the great tent, passing between large banks of roses and carnations from the Messrs. Cutbush, passing a wealth of clematis from Woking, and a brilliant bed of crotons from Sheffield. Away to the left banks of zonal pelargoniums from Lewisham, etc., blaze out quite fiercely, and it eases one's eyes to turn from their brilliance to the central fountain where the falling water produces a delightfully cooling effect.

Onward again, and we are in a great garden of roses, where the Paul's and the Cant's and Hobbies and others have surpassed themselves and provided a scene of sweet beauty and fragrance. Around the roses, carnations have been grouped by noted growers. Then we come to the splendid statuary group that personifies the beauty and lavishness of Gardening—and all the figures are of feminine beauty, and the grace of childhood—the artist had evidently cast out the gardener Adam from his conception of an horticultural paradise. A fine setting for this notable group was found by the belt of choice trees and shrubs, along the end of the tent arranged by Messrs. Fisher, Son and Sibray, and by the finest group of ferns that ever Messrs. H. B. May and Sons have set up.

Now we hark back across the road by the main entrance to where a long tent of enormous dimensions houses a bewildering array of hardy flowers, chiefly cut blooms. The colouring is dazzling, but the fragrance of the carnations and the scent of glorious sweet peas, set up by such leading lights as Messrs. Dobbie, Breadmore, Sydenham, E. W. King, etc., is delightful. From this tent lovers of hardy plants have some difficulty in tearing themselves from the triumphs its contains.

Turn we now aside, and peep in to the Dutch section, where the Netherlands Horticultural Federation has brought together a beautiful display of azaleas, great sheaves of lilac, and regiments of eremuri, and broad breadths of astilbes. Hard by is the Belgian section, where early fruits and vegetables have been set out, but somehow or other our Belgian friends have not scored such a triumph as their neighbours of Holland, or of France. The latter happy country has a gay section, where we would fain linger to inspect the mounds of annual flowers, the gerberas, the beds of new roses from Pernet-Ducher and other celebrities, and the wonderful flower paintings by Marguerite Fruchart. Behind the foreign sections yet another big tent, filled to overflowing with hardy flowers in competitive classes—a tent that many will miss altogether if they are not careful. Down this we pass, and out into the open, and then turn along the north end of the great tent until we reach the entrance to a big marquee where Messrs. Langdon and Blackmore and the Messrs. Ware have some glorious begonias on view, and where the choicest vegetables from Welbeck and Aldenham and Chelsea—to mention but three of the exhibitors—vie in effectiveness with the choicest of fruits spread out, in all too tempting a fashion, by the cleverest of cultivators. Back again a little, and crossing over we come to a broad and shorter tent, where Sir Eric Hambro and others have staged the choicest of alpines, and where new pæonies and azaleas hob-nob with the newest of carnations from the leading growers.

Passing out of and round this tent, we enter another of large size where have been gathered together an unsurpassed collection of orchids that would not be dear at £250,000. Was there ever such a gorgeous and beautiful scene? Never. Sir George Holford, Sir Jeremiah Colman, Mr. Leopold de Rothschild, Mr. F. W. Moore, and the Messrs. Charlesworth and Co., Sander and Son, S. Low and Co., Mansell and Hatcher, Armstrong and Brown, J. Cypher and Sons, and many others whose names are found in our notes on this section, have contributed lavishly of their best to the show. Orchids and amaryllis alone filled this great tent with a grace of form and richness of colouring that will remain long in the memory of all privileged to see it, but which beggars description.

By the time one has finished an inspection of the orchids, a fair idea of the extent, value, and importance of this International Show will have been obtained. Already we have seen more than a Temple Show, a Shrewsbury Fête, and a Ghent Quinquennial rolled into one, and yet only about half of the undertaking, the larger half, certainly, has come under notice. It is a serious business, this great show. And now, passing down the lime avenue, with its kiosks, and its array of garden furniture, we come to the Tudor garden so ably and finely designed and constructed by Messrs. J. Cheal and Son, and pass on to inspect rock gardens carried into effect by Messrs. T. S. Ware, Messrs. Baker's, Messrs. Kent and Brydon, and Messrs. Jackman and Co., and then pass into the wonderful Japanese garden, which rumour says has cost Messrs. Carter and Co. nearly £2,000 to bring into being during the last four or five weeks. In this lower end of the Ranelagh grounds the designers of rock and alpine gardens have surpassed themselves, and have taken full advantage of the splendid opportunities the sites have afforded. We need not particularise here, because the visitor cannot miss and will not want to hastily pass over the effective and beautiful gardens so splendidly arranged by Messrs. Pulham and Son, Whitelegg and Page, A. Hemsley, M. Prichard, Wm. Cutbush and Son, Backhouse and Son etc., while by general consent the palm for rock and water gardening in these acres of gardens is accorded to the finely conceived and admirably executed design by Messrs. R. Wallace and Co. Unquestionably the rock and water gardens make this great show altogether distinct from any other horticultural function hitherto held—the section is a great triumph for our nurserymen.

What else? Topiary work, in abundance, from Cutbush and Piper, gardens of trained fruit trees from J. Veitch and Sons and the Laxton Brothers, giant bays, Canada's contribution of fruits, Japan's exhibit, a whole host of horticultural tools, furniture, and other things comprehensively called "sundries," these forming a ring of exhibits, right round the Ranelagh grounds, and lastly, but not least, the exhibits of great value and interest brought together by the Science and Education Committee, arranged near the East Gate, through which we

A CHARMING ROCK AND WATER GARDEN.
Arranged by Messrs. T. S. Ware, Lim., Feltham.

# ROBINSON'S ARTIFICIAL MANURES, INSECTICIDES, SYRINGES & SPRAYING MACHINES

## The vital essentials for the full development of plant life

Nitrogen — potash — phosphates — soluble — available, derived from unique sources are contained in Carmona Fertilizer in well-regulated quantities. Carmona does not merely stimulate plants nor does it gorge them. Carmona feeds naturally—rapidly developing root systems and establishing vigorous growths. Carmona the Guaranteed Fertilizer is the greatest triumph of modern Horticultural Chemistry. It is pure — sure — available — and more, it is clean to use — economical to use — and nearly odourless.

# CARMONA THE GUARANTEED FERTILIZER

1 cwt, **20/–**; ½ cwt., **12/6**; 28 lbs., **7/6**; 14 lbs., **4/6**. Every package contains free entrance coupon availing the purchaser to enter, FREE, One Exhibit at the Grand **£350** Guaranteed Gardenalities Exhibition at the Botanical Gardens, Birmingham, August 28, 29.

### VELVAS LAWN SAND.

The Guaranteed Weed Destroyer and Grass Reviver. Kills dandelions, daisies, plantains, moss. One dressing, 3 to 5 ounces to the square yard, is ample. Results visible in twenty-four hours. Weeds shrivel and die. Effect upon grass apparent in a few weeks, when it attains a much richer colour and more vigorous growth.

Price: 1cwt., 20s.; ½cwt., 11s.; 14lbs., 3s. 6d.

### ERADIWEED,

Weed Free Paths for Twelve Months or More after one application of Eridiweed, the guaranteed cent. per cent. Weed Killer.

One part to 100 parts of water is the strength in which to use Eradiweed.

Instead of laboriously removing deeply embedded weeds from garden paths by hand, and disturbing the firmness of the surface, apply Eradiweed, 1 gallon of 1 to 100 solution to each three or four square yards, and destroy all vegetation entirely, and prevent its reappearance over the whole of the treated area from 12 to 18 months.

Prices: Tins (with measure attached): To make 12 galls., 1s.; 25 galls., 2s.; 50 galls., 3s. 6d. ERADIWEED, the Guaranteed Cent. per Cent. Weed Eradicator.

### CLIFT'S FLUID.

The Guaranteed Insecticide Soil Sterilizer and Germicide destroys wireworms, leather-jackets, and all other injurious soil insect pests. Absolutely harmless to plant life. Clift's Fluid has been established by a series of exhaustive experiments and by growers as the very finest preparation for the destruction of insects in the soil.

It is economical and easily applied. One gall. makes 100 galls. for use. Prices: Pint tins, 1s.; 1 quart, 2s.; ½ gall., 3s. 6d.; 1 gall., 6s.

## Are you entering an exhibit for the GUARANTEED GARDENALITIES SHOW ?

**The prizes are among the handsomest, send for schedule at once. £350 in all.**

### EASY SPRAYING.

### EFFECTIVE SPRAYING.

The Alpha No. 3 Hand Sprayer is an ideal garden and greenhouse machine. The Royal Horticultural Society express the opinion that it is one of the best machines they have ever seen. Compressing the air in the sprayer by means of an ordinary cycle foot pump, appealed to them on account of the simplicity of the method and the consequent lack of intricate parts. The reversible spraying arm provides for the alteration of the direction of the spray, up or down. The spray itself is extremely fine and issues from the machine with considerable force. Prices—No. 1, capacity about 1 quart, 15/- No. 2, 2 quarts, 16/6. No. 3, 3 quarts, 17/6. No. 5, Knapsack 3½ gallons, fitted complete with delivery hose, spraying arm, nozzle, tundish strainer, and powerful foot pump, 60/-. Pumps for Nos. 1, 2 and 3, 4/6 each. ALPHA SPRAYERS (Patent No. 24637), Winners of 18 Gold and Silver Medals (including the Northern Fruit Congress Gold Medal) since Sept., 1909.

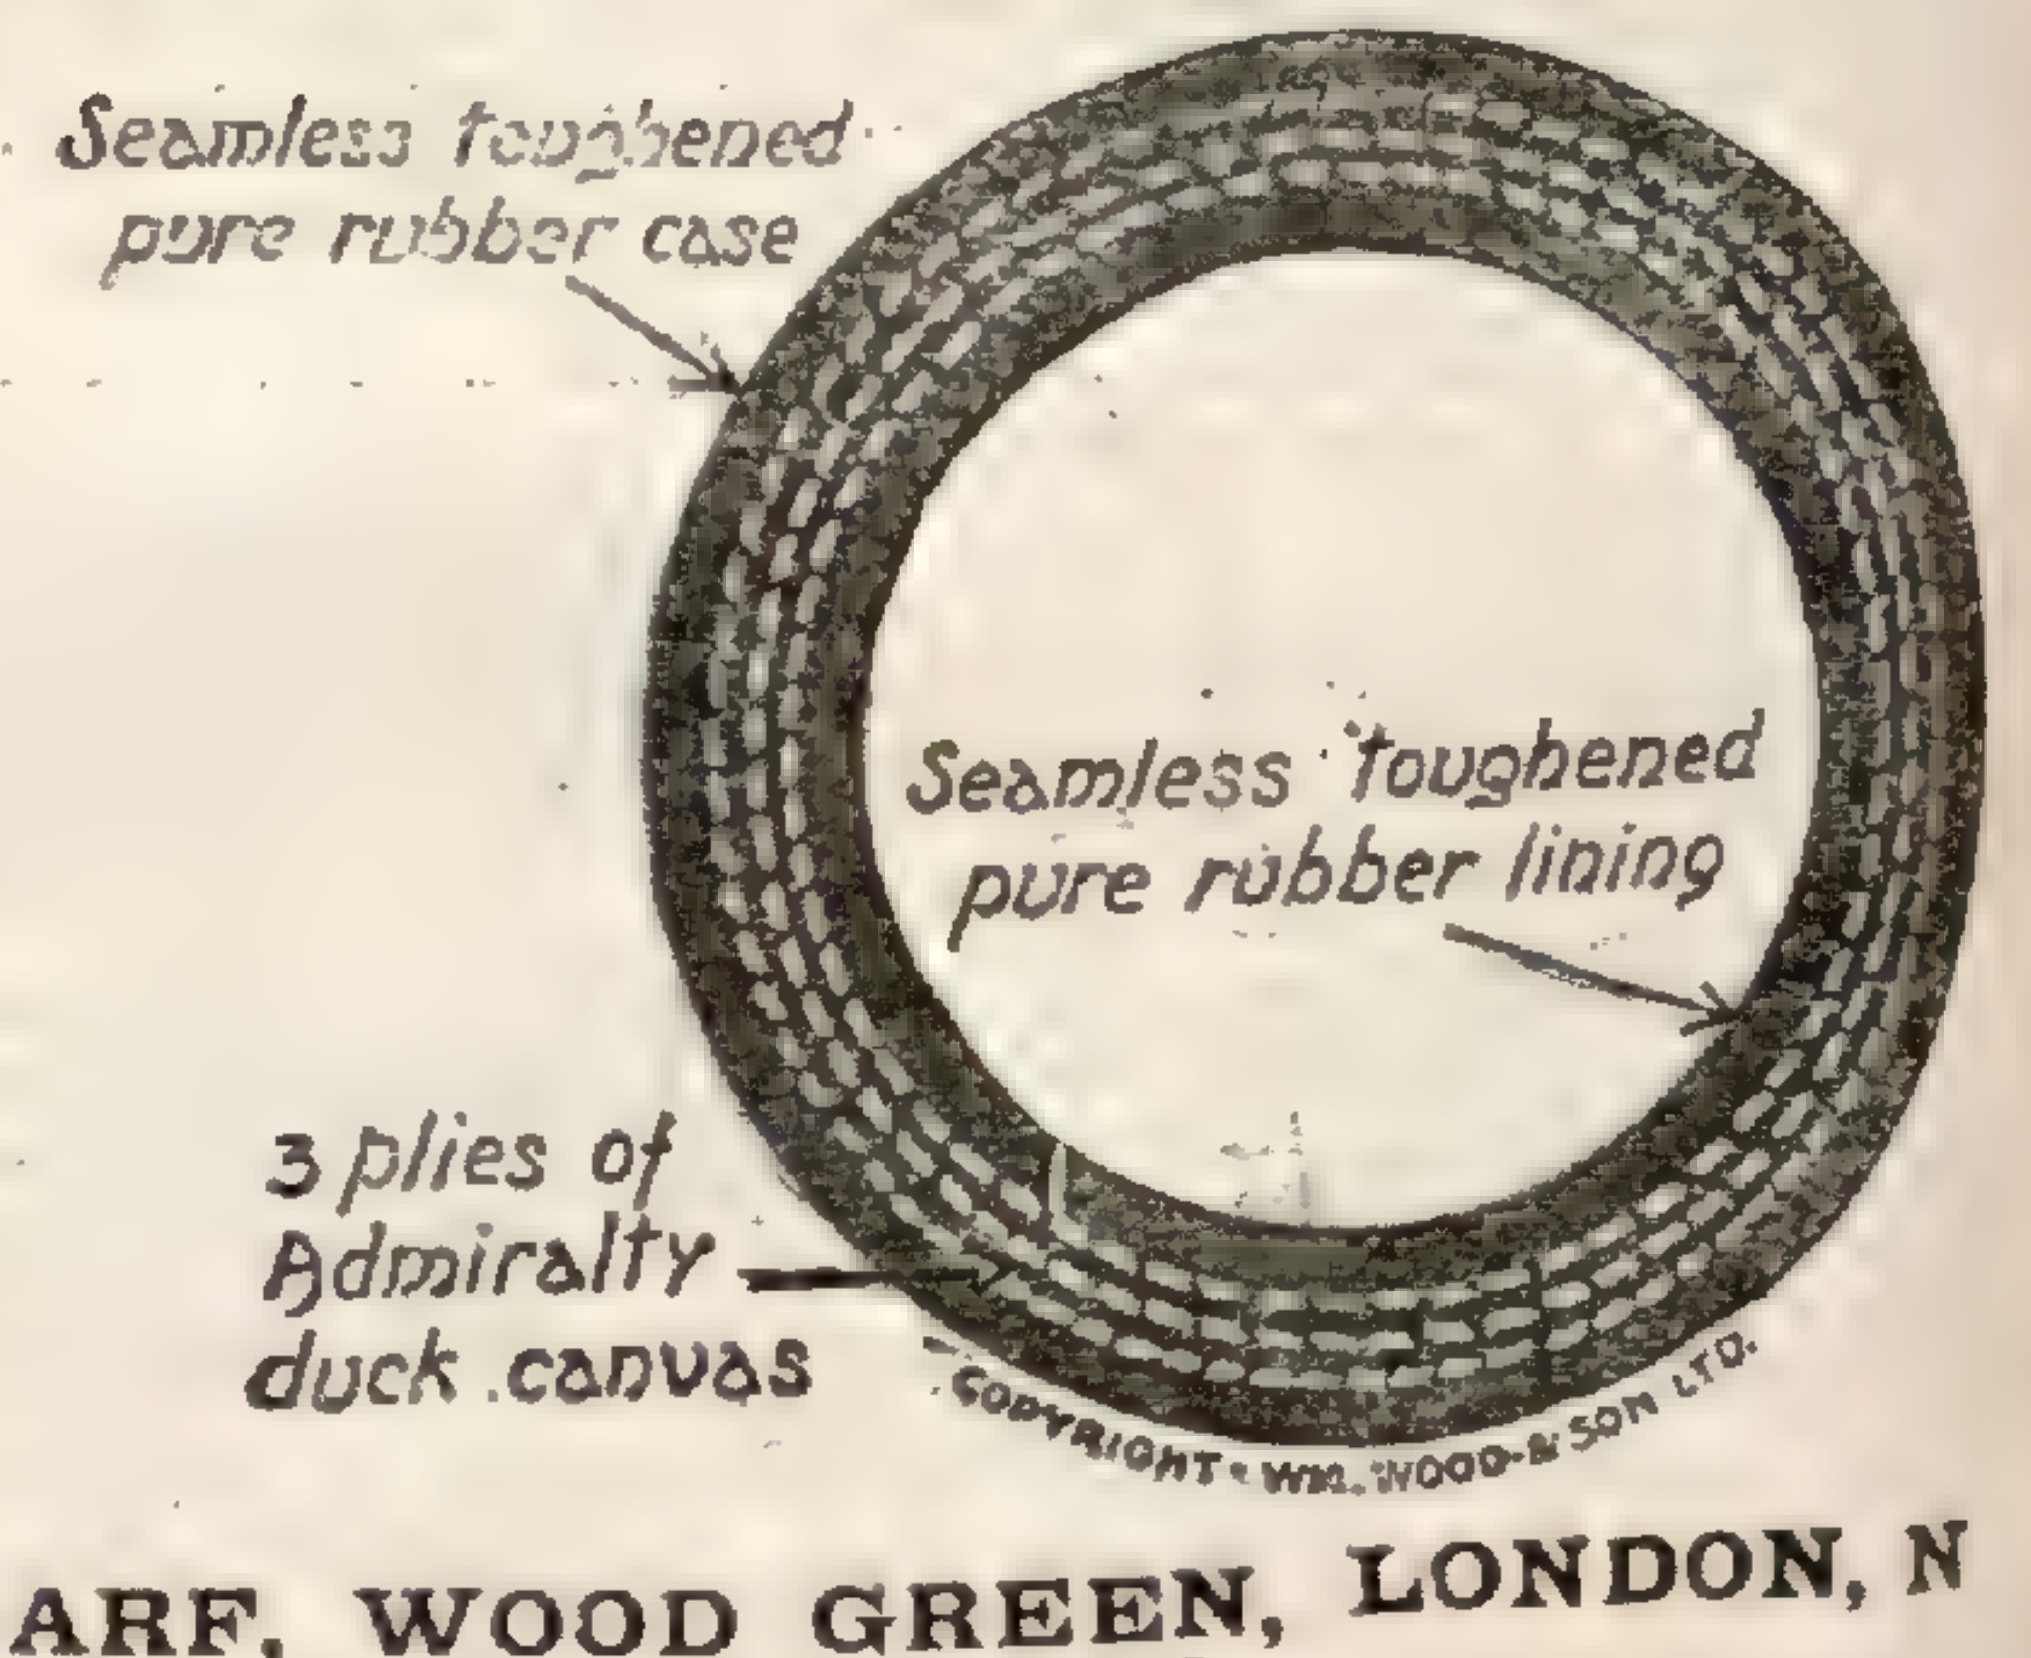
WITH A TEN YEARS' GUARANTEE.

## Rhinohide Hose

This Hose is built to our special specification, from th purest materials, without the admixture of any makeweights whatever; colouring matter is even excluded, preserving the natural light grey colour. The inner lining is SEAMLESS, of the purest toughened rubber procurable, thoroughly frictioned to and covered with three plies of ADMIRALTY STANDARD Quality Duck Canvas, the whole encased in the outer cover of purest toughened rubber. The ends of each length are rubber sealed, uniting the inside lining and outside cover, preventing any moisture or grit working into the plies. With absolute confidence WE CLAIM THIS TO BE

## The Best Hose in the World and back it with the following 10 Years' Guarantee

If any length of RHINOHIDE HOSE shall burst at any less water pressure than 200-lbs. per square inch, or shall leak and let water through on account of faulty material, or shall not be reasonably serviceable, having been subjected to only fair wear and tear during the whole period of ten years from date of purchase, we undertake to replace that length free of charge.



Seamless toughened pure rubber case
Seamless toughened pure rubber lining
3 plies of Admiralty duck canvas

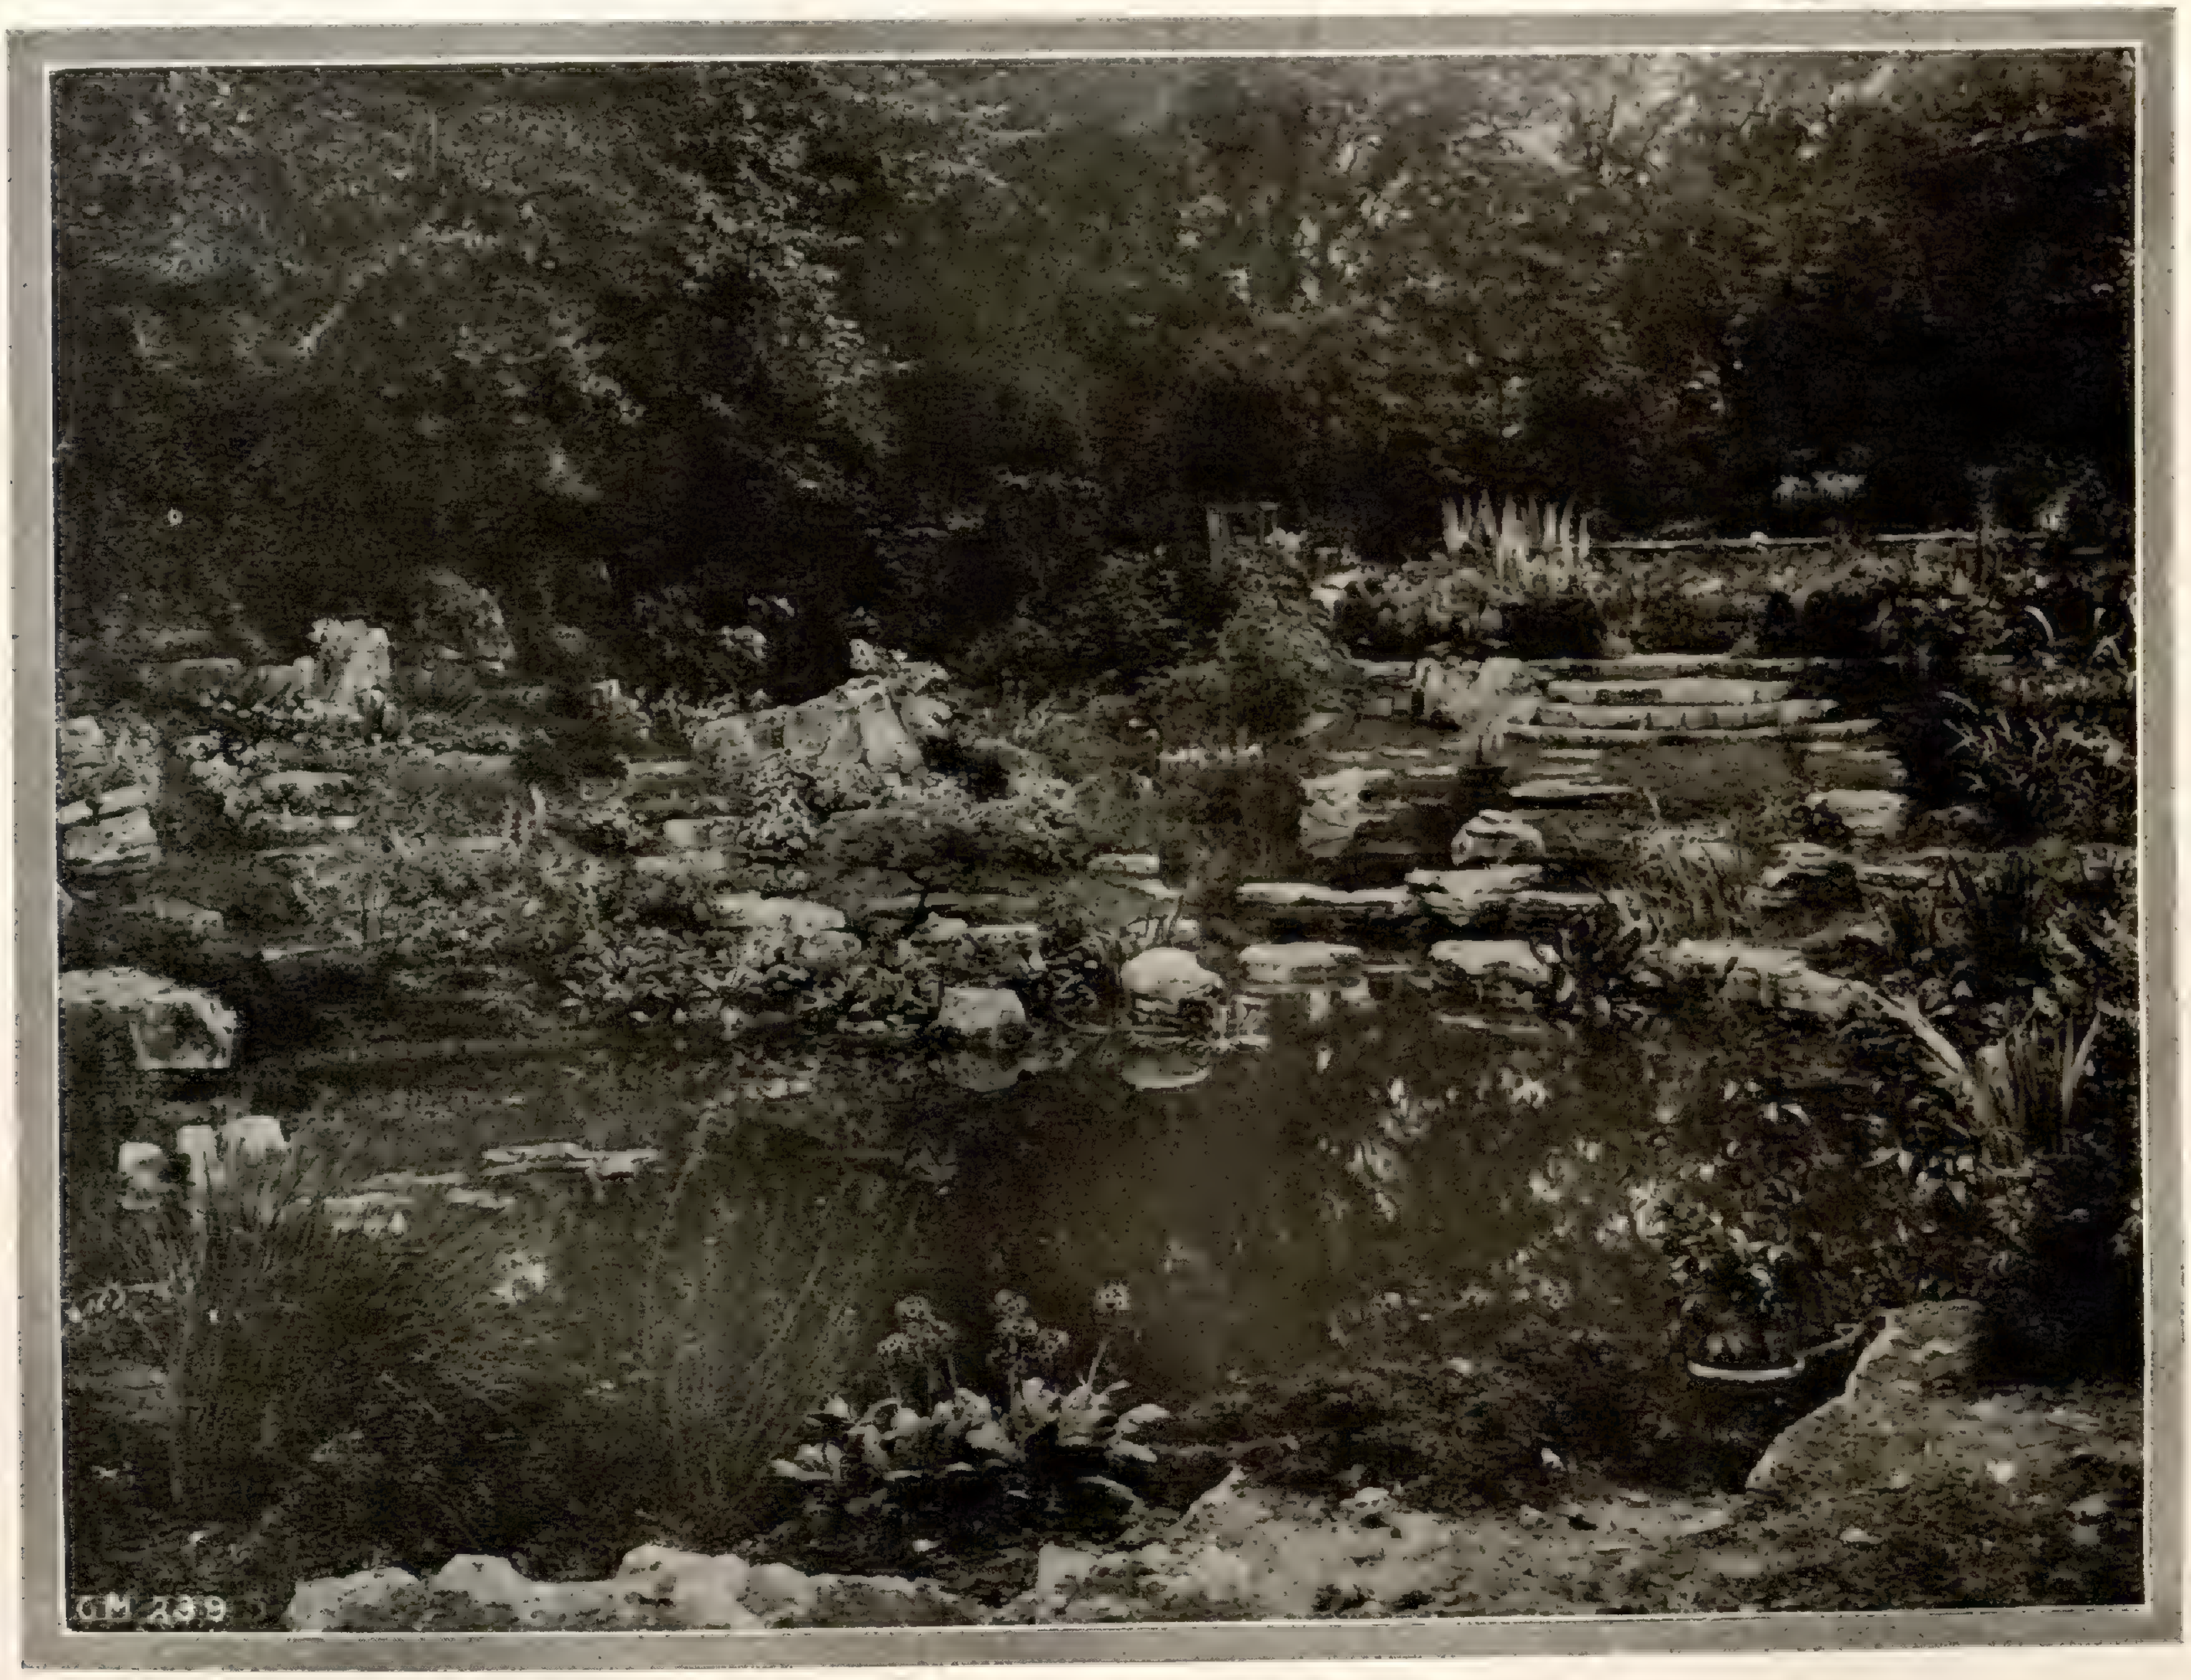
presently pass, fully convinced that if we are a nation of shopkeepers, we are also a great nation of garden lovers, and we can stand comparison with any of our neighbours on the broad matter of horticulture.

Such is a brief and very imperfect, general impression of the show. Below we deal with the various sections, and in our next issue we propose to discuss the novelties and sundries. We ask for the kindly consideration of our friends, because in such a gigantic exhibition it is quite impossible to mention every exhibit or every exhibitor, and quite possible to inadvertently omit reference to some good friend or fine exhibit. Anyhow, we have done our best.

The King and Queen visited the exhibition between eleven and twelve o'clock in the forenoon of the opening day. They were accompanied by a considerable party, including their Royal Highnesses Princess Christian, Princess Mary Louise, Princess Victoria of Schleswig-Holstein, and the Duke and Duchess of Somerset and the Right Hon. Walter Runciman. Their Majesties were received by the Duke of Portland, president; the Board of Directors, Sir T. Lawrence, Bart., Lieut.-Col. Sir G. Holford, and at once proceeded to make a tour through the exhibition. They, with the Royal party, spent a considerable time in the exhibition in examining the many objects of interest, and on leaving His Majesty expressed his satisfaction with the scope and excellence of the exhibition.



A BEAUTIFUL ROCK AND WATER GARDEN.
Arranged by Messrs. R. Wallace and Co., Colchester.

### ROCK AND WATER GARDENS.

Probably in no part of the great show at Chelsea is the difference between 1866 and 1912 more marked than in the Ranelagh Gardens, where rock and water gardens are constructed on a scale that would be in keeping with a ducal estate, on the one hand, or a modest private garden on the other. These particular styles of gardening had not achieved the popularity that now attends them when the previous international show was held. It is not too much to say that, as a section of the show, this was the most popular of all, chiefly because of the variety of design, utter lack of sameness, excellence of construction, and the wondrous grace, beauty, and brightness of the plants utilised. A natural or tasteful combination of rock and water is always attractive, and when myriads of plants add their charm to the scene, then "the art that doth mend nature" is seen at its best.

Turning away from the south end of the shady avenue of pollard limes, one saw a stream of water tumbling down a cascade into a miniature pool below in which were aquatic plants of different kinds, looking as natural as if they had been growing there for years. This was the rock garden arranged by Messrs. T. S. Ware, Lim., of Feltham, and the effort was in every way creditable to the firm. Though the chief feature was the waterfall, the arrangement of stone steps, and winding paved ways was a happy one, and the various plants of the alpine section looked quite at home in the temporary crevices prepared for them.

The rock garden arranged by Messrs. Baker's, of Wolverhampton, can best be described as bold. Large rugged stones were used to form the background, and the ferns growing by the water that trickled down a channel prepared for it, presented a cool and extremely natural appearance. Round the edges of an ornamental pool were growing clumps of irises, primulas, and other plants, while the patches of alpine phloxes, iberises, brooms, etc., arranged amongst the stones helped to complete what was an artistic idea very well carried out.

There was an old and weathered look about the stones that were used in the formation of the rock garden arranged by Messrs. Kent and Brydon, Darlington. This rather added to the effect of the scheme, and gave the rockery an extremely natural look. Dwarf shrubs were dotted about along with acers, and the visitors were able to closely inspect the alpines growing in the crevices from the winding paths that ran in and out amongst the stones. This garden was in no way overdone, and not the least pleasing bit of it was a quaint little crevice filled with hardy ferns.

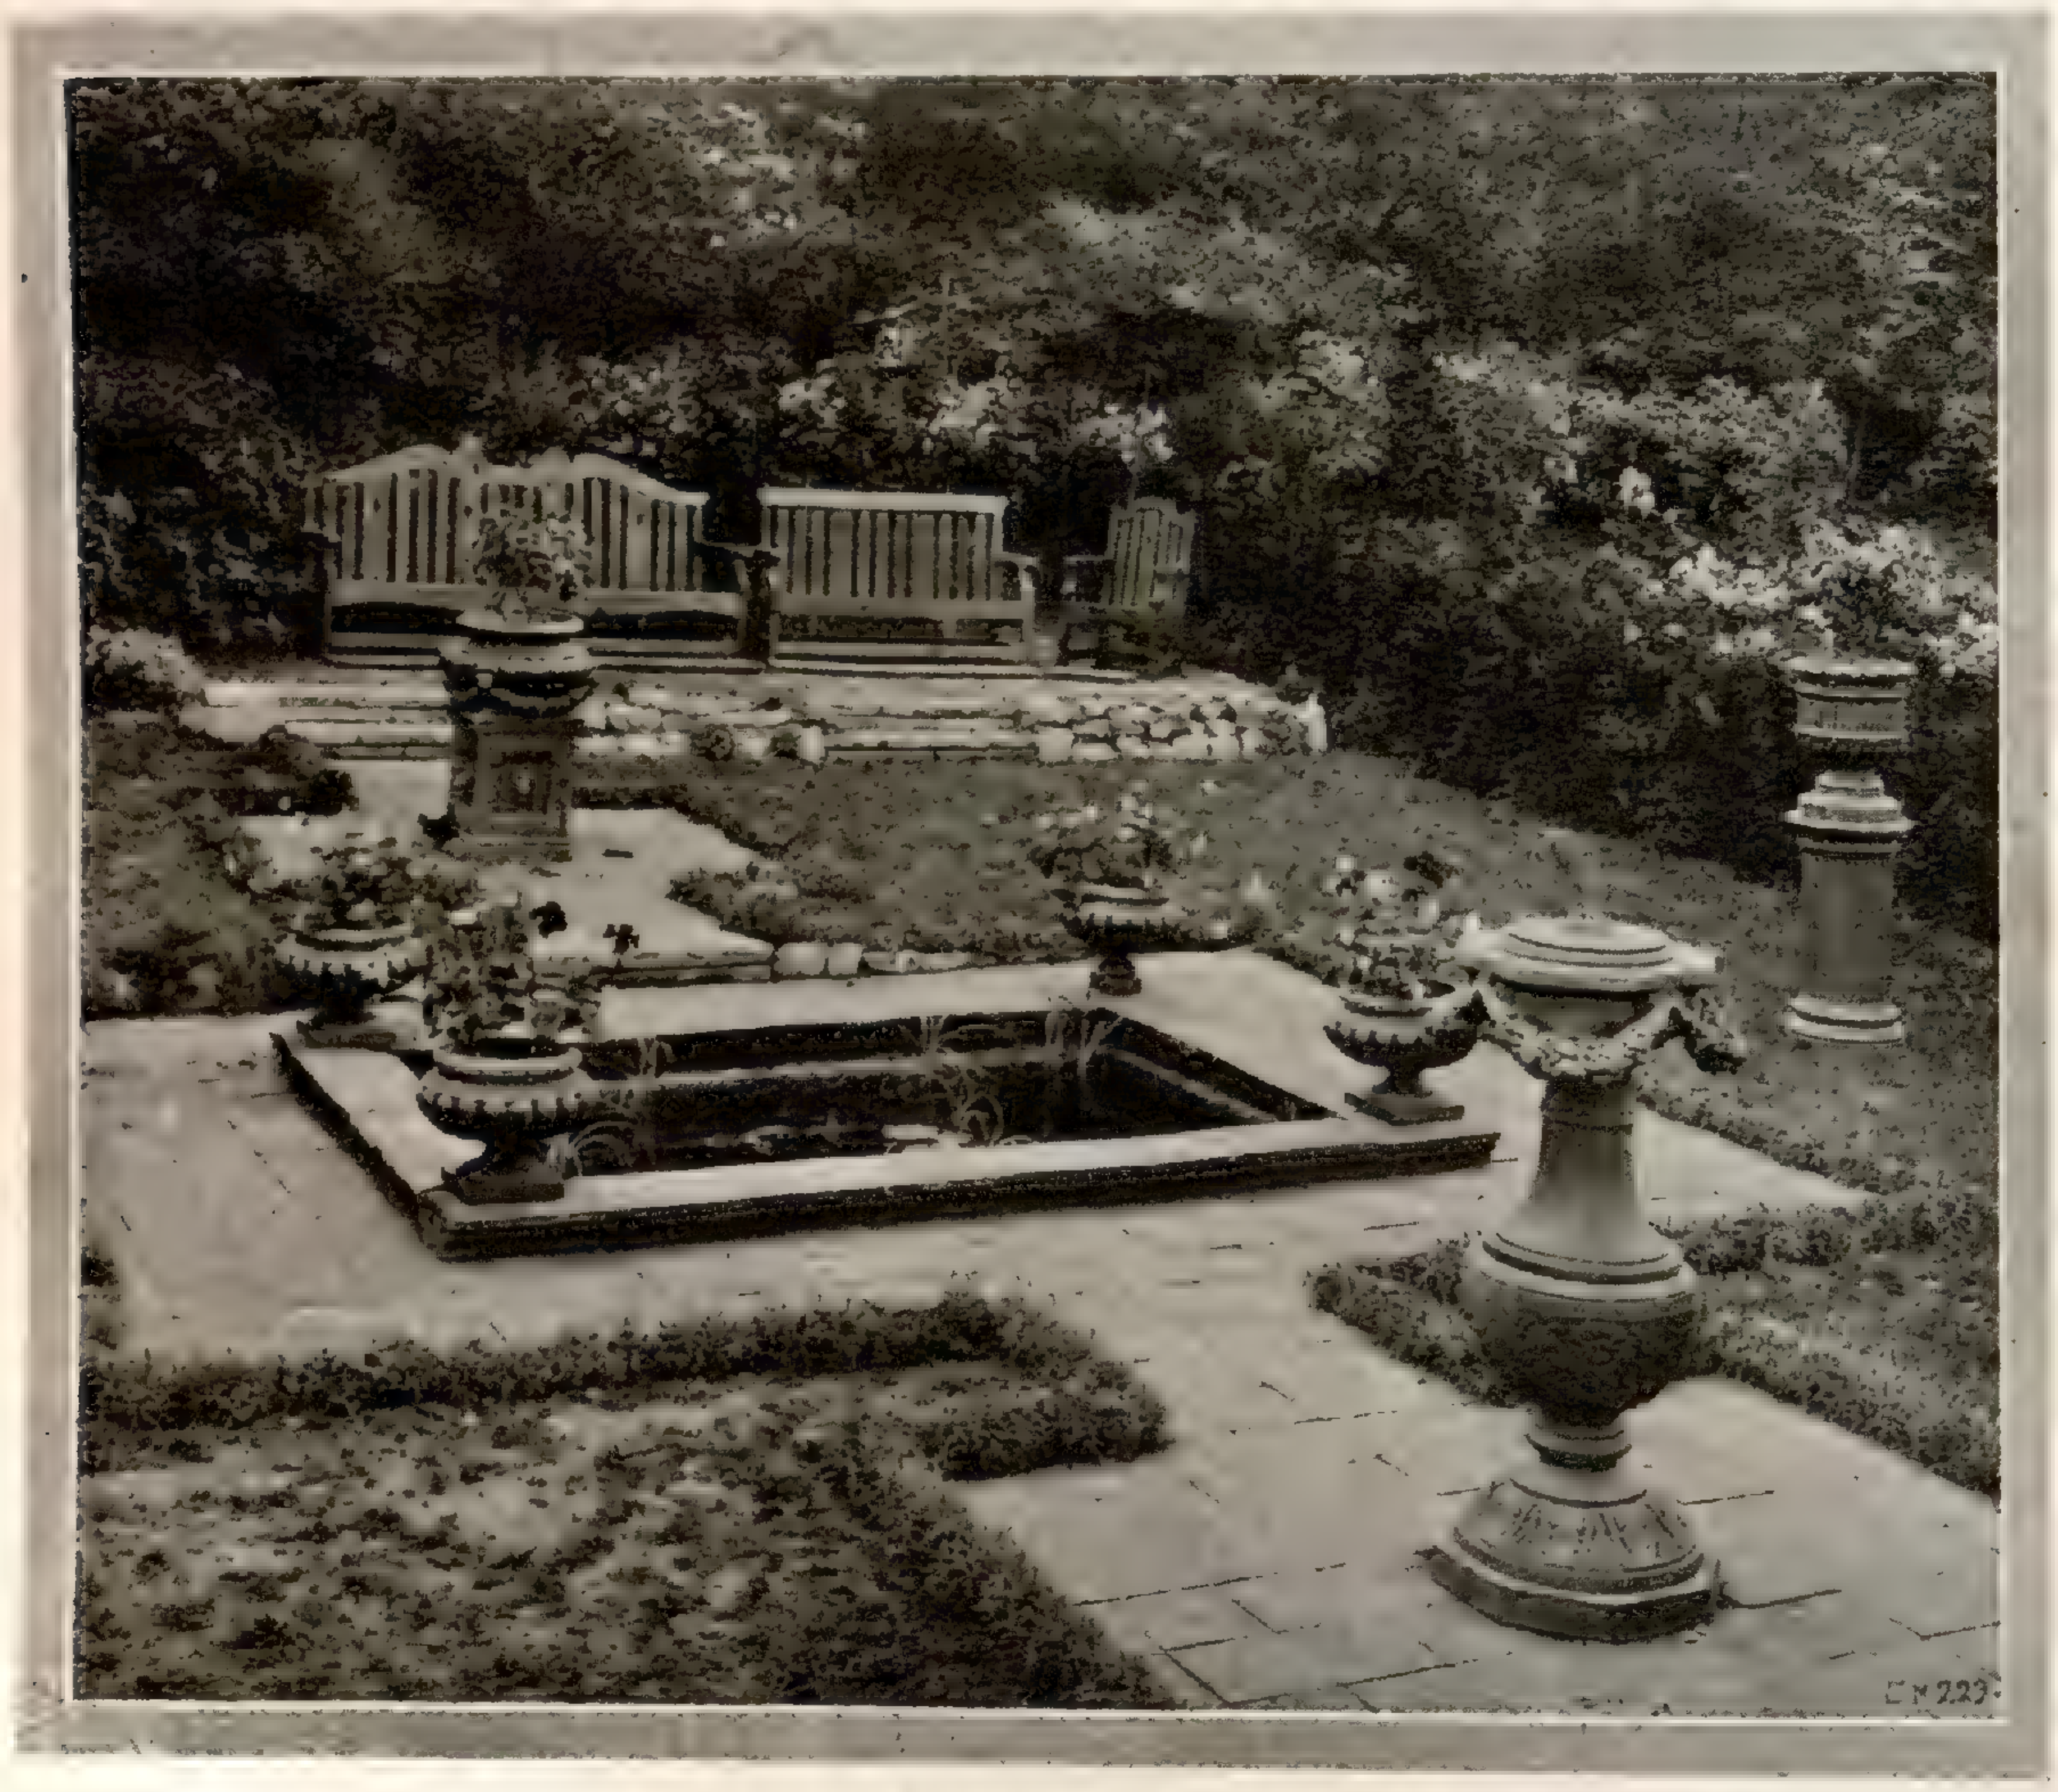
There was something distinctly unique about the formal garden arranged by Mr. A. Hemsley, of Crawley. At the back was a low terrace wall with teakwood seats behind, and from this terrace two steps led down to a plot of grass, in the centre of which was a square water basin, furnished with aquatics, and a tiled pathway all round. Pedestals with vases on the top added to the ornamentation, and the sundial was just in the position where one would expect to find it in such a garden. Near at hand the same exhibitor had an arrangement of rockwork and water that was effective in point of design, but the new stone used looked somewhat glaring, and, if anything, there was rather too much of it. Many interesting rock plants filled the crevices, the bright colours of which were much admired.

A quaint looking cavern, built with immense stones, in the crevices of which grew ferns and echeverias, was the central feature in a rockery arrangement set up by Messrs. Piper, Bayswater. Under the roof of the cavern, and in front of it was a rock surrounded and very natural-looking pool, the bottom of which was a bed of water-washed pebbles. A beautiful white wistaria drooped over the water and in between the stones were golden-yellow lilies, sky-blue aquilegias, and Azalea rosæflora. A bold promontory above the cavern was charmingly furnished, and the stone steps ascending this added much to the effectiveness.

Acers and evergreen shrubs were freely used in the rockery arranged by the Guildford

Hardy Plant Company, but there was no want of colour, and many gems of the rock plant family were seen nestling in the crevices between the stones, which were not employed extravagantly. There were shallow pools of water, winding stone-paved pathways, and a pretty little cavern, the inside of which was furnished with fresh-looking ferns.

Graceful bamboos clothed the grass banks which formed a pleasing continuation of the rock and water garden, arranged by Mr. M. Prichard, Christchurch, Hants. A big bed of the beautiful blue Anchusa Opal was a feature in itself, and arranged on the sloping bank it looked very effective. As for the rock garden proper this was a pleasing arrangement of miniature pools, paved pathways, and rough stone steps ascending grassy banks. The pretty alpines and other plants arranged mostly in groups set themselves off to advantage, and we were much impressed by the deep crimson colour of a dianthus called Napoleon III., the blue of Iris orientalis sanguinea, and the white, upstanding spikes of Saxifraga pyramidalis. Not the least pretty feature of this exhibit was a miniature rock-surrounded pool furnished with water lilies in flower, and sedges.



A TYPICAL FORMAL GARDEN.
Tastefully arranged by Mr. A. H. Hemsley, Crawley.

Messrs. Pulham, Newman Street, W., followed out their well-known style in their arrangement of rock, water, and turf. The garden makers took advantage of the position accorded to them, and the big pieces of reddish-brown stone, from close to Sandringham, that the firm uses so largely, were so arranged as to give the impression that they were protruding here and there in a perfectly natural manner out of the ground. There were ingeniously arranged caverns, furnished with hardy ferns, and flowers and foliage plants were very judiciously blended. On the right of the rock garden there was another very distinct feature in the shape of a very substantial-looking stone and timber-built summer-house on a terrace of stone pavement. Steps led down from the front of the summer-house with a continuation of paved walk into the road. As one looked at this fine display of garden art one could not help thinking that this rockery might be left as a permanent feature. Nearly 100 tons of stone were used, and the water was used again and again during the exhibition by means of a petrol pumping engine.

In the arrangement of rock and alpines set up by Mr. C. Elliott, of Stevenage, one was reminded of the Temple Show, as the rockery was accommodated on tabling and cocoa-fibre was freely employed. The masses of pretty alpines in between the stones, however, showed themselves up very conspicuously.

In one secluded corner, there was a rockery arrangement set out by Messrs. Thompson and Charman, Bushey, Herts. A little pool in the centre with a paved walk round it, was ingeniously devised, but the whole effect of the garden would have been more pleasing if the background had been raised rather more.

There is no doubt that one of the finest efforts in the whole of this magnificent exhibition was that made by Messrs. Wallace and Co., Colchester. The position was unique, and the firm is to be commended for taking every advantage of it. As one stood and looked at this beautiful arrangement of water, rock, and flowers, it was difficult to believe that the whole thing was the growth of but a week or two, so natural and permanent did it look. Standing at the edge of a pool in front one looked on another pool just above, beyond that a flight of circular stone steps, leading to a formal garden, backed by a low terrace wall. The beauty of the whole idea seemed to be that there was a variety of perfectly distinct features, and each one of them was ingeniously hidden until you came almost unexpectedly upon it. From the entrance of the garden at the front one passed round the pools by a paved pathway and admired, as one went, clumps of bright-looking primulas growing by the water and the graceful flowers of white and violet wistarias, hanging over the same. Looking across the second of the pools one peeped into a perfectly natural-looking cavern, from the roof of which there dripped water into the basin underneath, and the ferns growing in between the stones had a delightfully fresh appearance. Passing on up the circular flight of steps into the paved garden with its green grass plot, its box hedge on the top of the terrace wall, and its fountain and basin in the centre, one observed a great array of German irises in bewildering variety, furnishing the surrounding borders, with lines of sweet-smelling cat mint and a host of other flowers. Past a group of Japanese maples and shrubs at the base of the circular steps a cunningly-devised walk led round the above garden, and this seemed to lose itself in the shrubbery beyond, as it would have done had the garden been permanent. Mounting the steps from the formal garden one passed at the back of the upper terrace wall along another paved walk flanked with German irises, to a rustic summer-house, half hidden away amongst the trees. Behind this building one came across a unique bit of woodland garden with lilies and bamboos, and then followed a winding woodland path, flanked with mollis azaleas, tree lupins, rhododendrons, etc., until one again came to the winding steps leading by the cavern into the rock garden. Most conspicuous amongst the flowers employed were Aster alpinus, Double Welsh poppy, Cypripedium spectabile, Primula pulverulenta and Forresti, trolliuses, Saxifraga pyramidalis, and Chelone barbata, phloxes and violas. Speaking as a whole, the idea was not only ingenious, but cleverly carried out, and it is quite safe to say that the equal of this particular type of exhibit has never been seen before in Great Britain.

Mr. G. Reuthe, Keston, filled a fair space of ground with rocky mounds furnished with alpines, grass in between, and a small but rather artificial-looking pool in the centre, which was somewhat overcrowded with aquatic plants. One of the prettiest things on the mounds was Aster alpinus himalaicus, and several clumps of scarlet anemones were striking.

Messrs. Whitelegg and Page, Chislehurst, constructed a neat and pretty little rock garden dell, with a little central pool into which the water came tumbling down over the rocks above. Rocks were freely used, and the whole dell was closely and brightly planted. Colonies that especially impressed us were those of Geum Mrs. Bradshaw, selections of Primula japonica, the brilliant P. Lissadel hybrid, P. sikkimensis, P. Cockburniana, P. Bulleyana, Ajuga repens purpurea, Viola gracilis, Dianthus zonatus, Lithospermum Heavenly Blue, and the lovely Aquilegia cærulea Mrs. M. Nicholls, this latter a very beautiful and useful plant, free flowering, free growing, and effective.

Messrs. Barr and Sons, Covent Garden, built a rock garden on a rather sharp slope, and arranged a seat on top to overlook the whole. It was a simple design, and the grey, weathered Yorkshire stone served well to show off the colonies of late aubrietias, helianthemums, cerastiums, Oxalis enneaphylla (very fine), Lithospermum Heavenly Blue, Phlox pilosa, Onosma taurica, Genista hispanica rara (a cloud of gold), Cytisus scoparius Daisy Hill (deep cream and salmon), Primula japonica in a wide range of colours, erigerons, Oxalis violacea, Viola pedata bicolor (a choice plant), lupins, and the blue-flowered Cynoglossum vernosum.

Mr. J. Wood, Boston Spa, contributed a very effective rock garden exhibit, in which the grey weathered stone was a subdued and excellent feature. Water was freely and pleasingly introduced in this garden, and so moisture loving plants were very prominent, notably the selections of Primula japonica, P. sikkimensis, Trillium grandiflorum, choice hardy ferns, hemerocallis, funkias, and irises in great variety.

A delightful little rocky dell, contributed by Messrs. W. Fells and Son, Hitchin, was especially notable for the rivulets of flowering plants charmingly disposed. Aster alpinus began with a colony on a little plateau and trickled down to the ground. Iberis sempervirens Snow Flake formed a little central cascade, and Aster alpinus albus gave a snowy effect on a high corner. Veronica alpestris, Phlox canadensis Perry's var., Saxifraga lantoscana superba, Viola gracilis, were all similarly disposed. Convolvulus cneorum, an œnothera-like shrub with whitish flowers, the blue Ceanothus Veitchi, Helianthemum venustum plenum and neat little conifers provided the necessary shrubs; while maples and cypresses formed a suitable background. A little

SOUTHWELL ∴ NOTTS.

colony of edelweiss was also a pleasing feature.

Messrs. G. Bunyard and Co., Maidstone, converted a high bank into a simple rock garden, and planted it freely with flowering shrubs and alpines. Saxifrages were a very prominent feature, and were very graceful. At the foot of the rock garden a little bridge-spanned pool served to show off aquatics, while the water margin was freely planted with choice hardy ferns, Iris Kaempferi, I. sibirica, astilbes (pink and white), trolliuses, liliums, funkias, and bamboos.

In the competition section Mr. R. Tucker, of Oxford, contributed a pleasing rock garden with a winding path ascending from the lowest level on either side of a bold central portion. A wide range of subjects was introduced, and a few especially bright ones were Rrododendron Ping Pearl, Phlox Laphami, Primula japonica, Onosma taurica, asphodels, and camassias, saxifragas, helianthemums, and Aster alpinus.

A large corner site was occupied by Messrs. Wm. Cutbush and Son, Highgate, with a rock and water garden exhibit of considerable extent. Bold planting was the order, and among the subjects that made a brave show on the rocky banks there were Edraianthus serpyllifolius, Saxifraga pyramidalis, S. calabrica (very fine and graceful), Conandron ramondioides, Anemone sulphurea, Dianthus Napoleon III., Ononis rotundifolia, and the golden low-growing Œnothera ovata. Liliums were represented by L. Grayi, the rare L. Kellogi, L. Humboldi magnificum, L. Browni, L. Parryi with yellow blooms, L. martimum, L. giganteum, L. Martagon album, L. Marhan Miss Willmott, and with these were associated a fine lot of Watsonia Ardernei and eremurusis. Around the water pool were colonies of Primula sikkimensis, P. Cockburniana, pink astilbes, Meconopsis sinuata, gunneras, bamboos, sarracenias, a fine batch of Cypripedium spectabile, funkias, and hardy ferns, the latter dipping their fronds in the nymphæa-studded water.

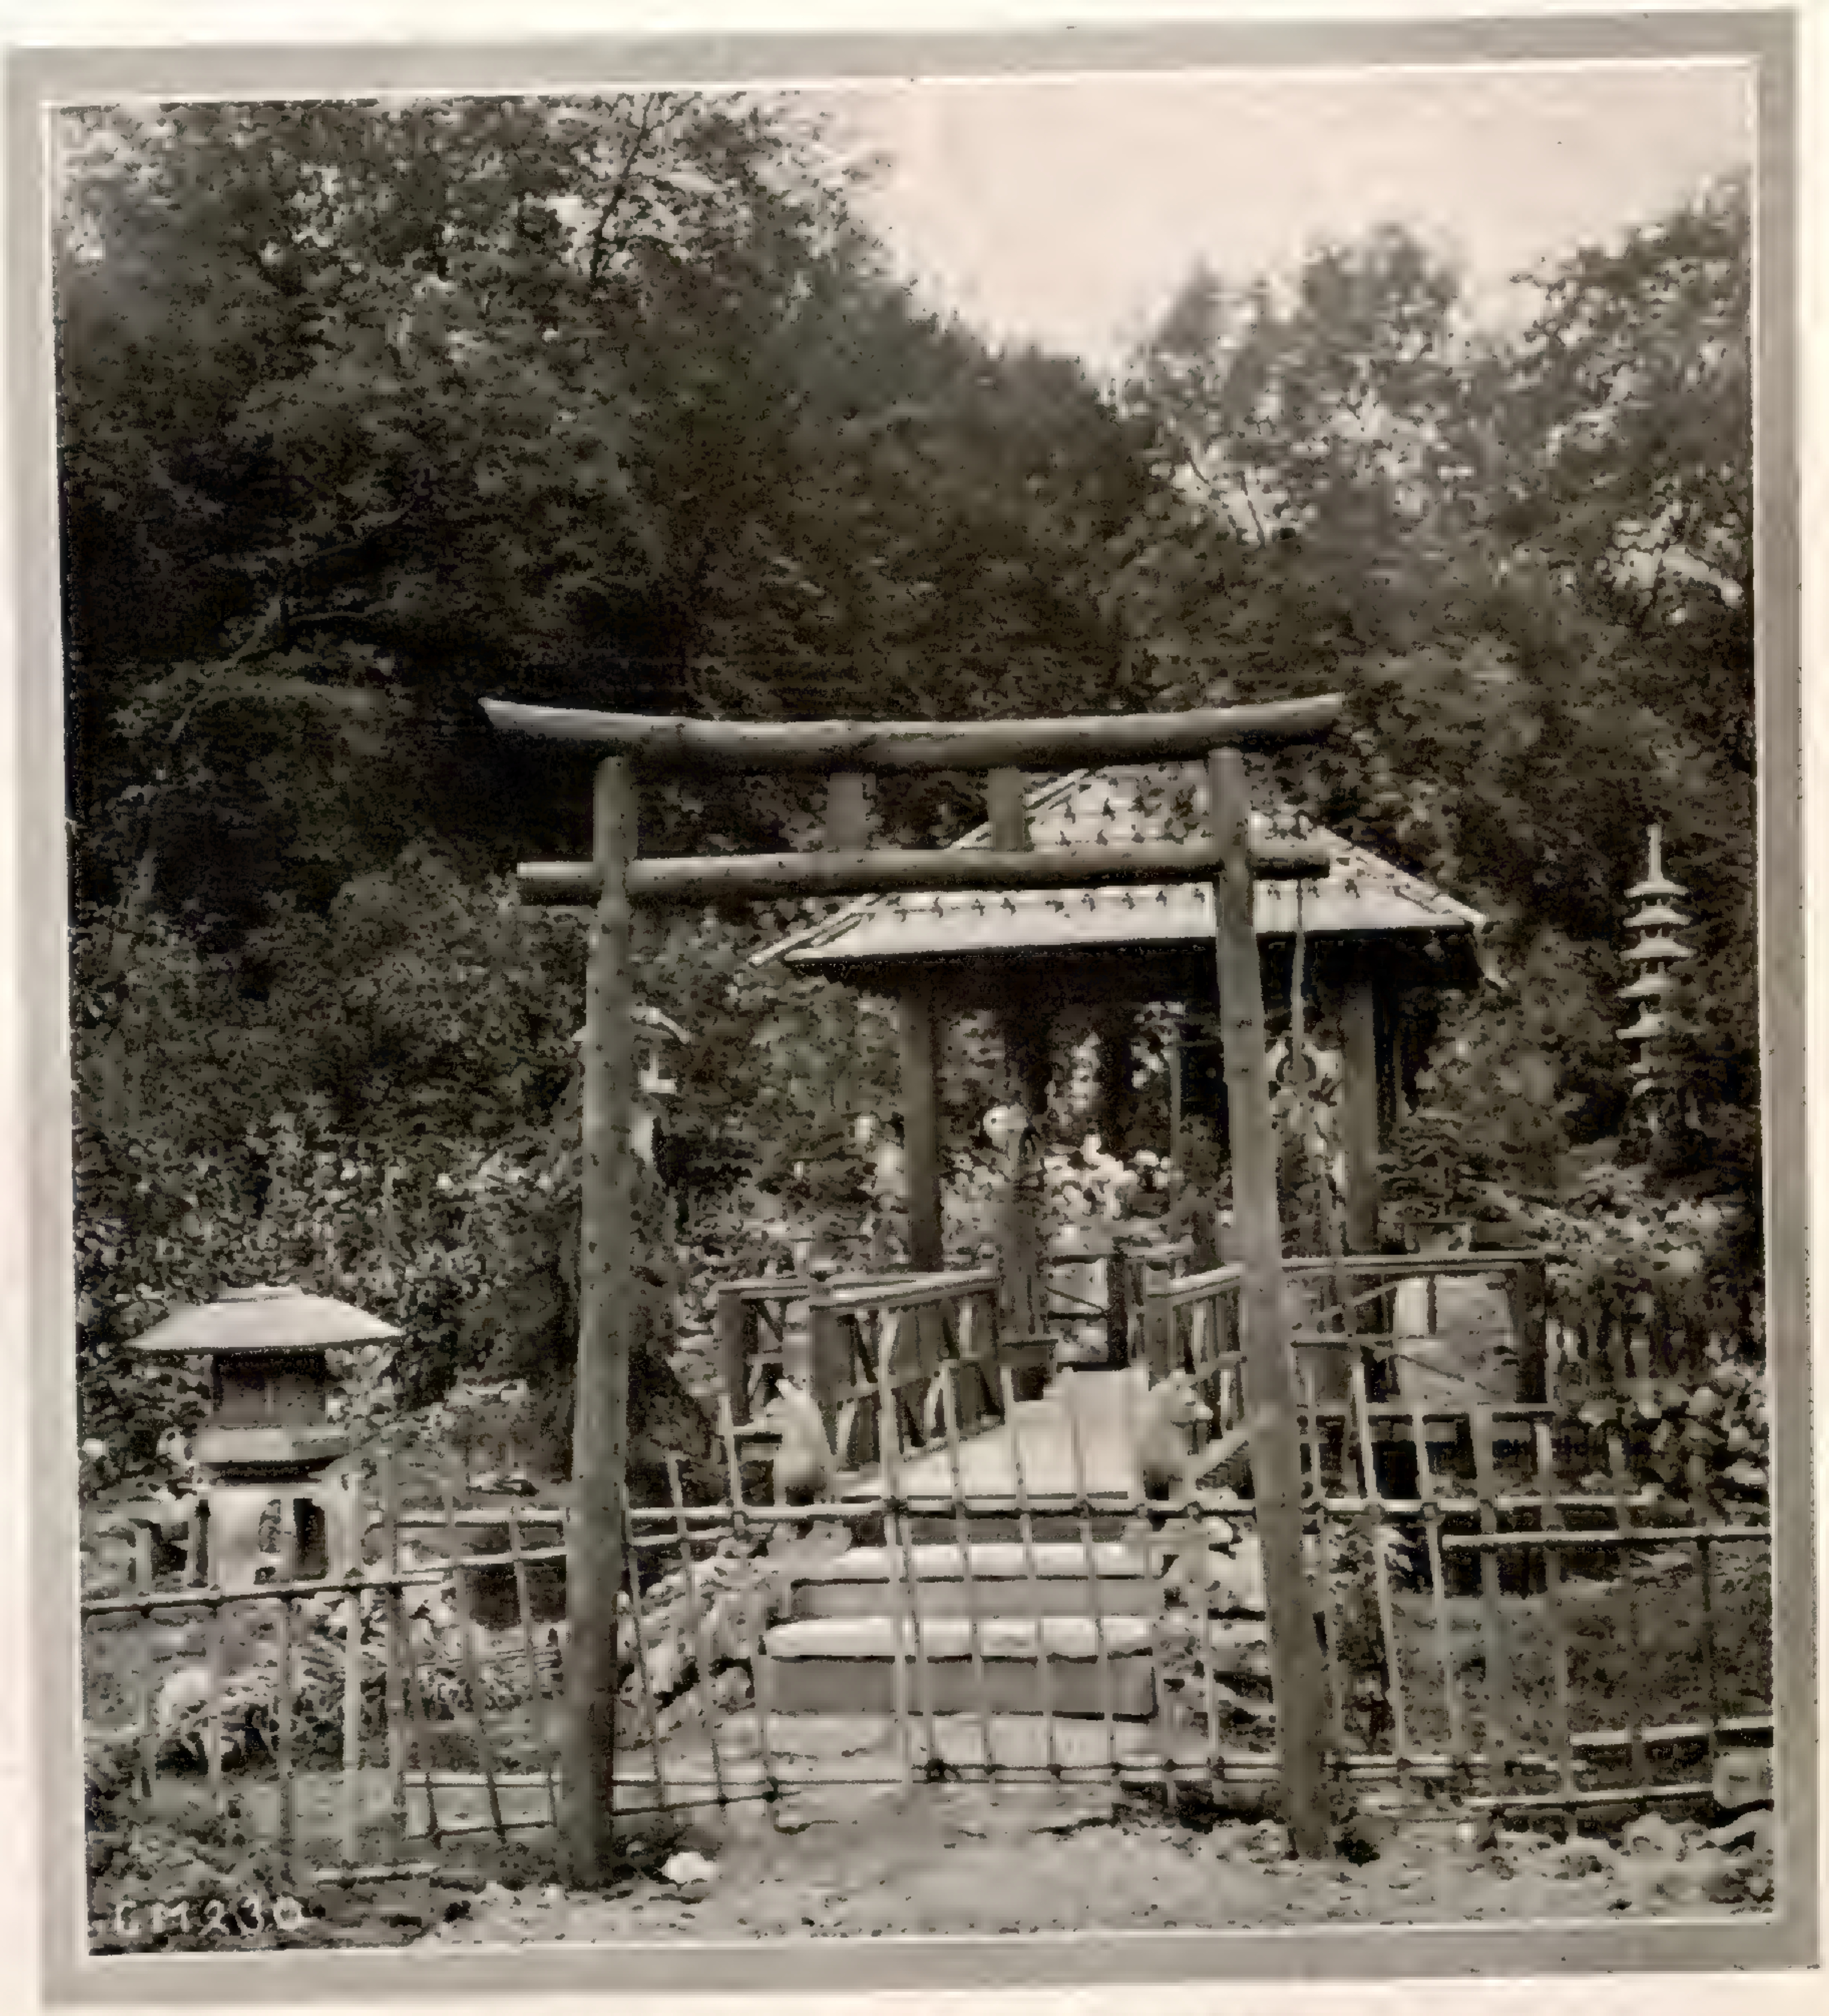
The Misses Hopkins, Shepperton, presented a neat little rock garden at a point where some old box trees gave them a good background. Little alpine pathways were constructed up the slope, and a lower pathway gave visitors a fine opportunity of inspecting the bold plantings of such charming plants as Phlox canadensis, Ajuga Brockbanki, Incarvillea Delavayi, Lithospermum Heavenly Blue, Viola gracilis, golden helianthemums, Welsh poppies, Aster alpinus, Meconopsis Wallichi, various saxifragas, and edelweiss.

An extensive low rock garden, constructed and planted by Messrs. G. Jackman and Son, Woking, served very well to show that an exceptionally elaborate arrangement is by no means necessary. Dwarf alpine shrubs were utilised to great advantage, while helianthemums, cytisus, saxifragas, veronicas, and lithospermums were freely planted in colonies. Viburnums and the graceful Buddleia variabilis Veitchi were capital in the background.

So many of the positions in the Ranelagh Gardens seemed especially designed for the accommodation of rock gardens. One of these "eligible sites" was occupied by Messrs. J. Backhouse and Son of York, a firm long famous for its alpine gardens. In a capital setting of trees they filled the end of a valley with a rock garden, that had the special merit of being designed so that every part of it could be comfortably inspected. The pathways were not obtrusive, but they were amply sufficient for their purpose. Glorious rhododendrons and glowing azaleas, Japanese maples and conifers were planted on the banks, while through the middle of the site was the rock garden proper, ending in a bold design at the end, well filled with ramondias, phloxes, saxifragas, Japanese azaleas,, and hardy ferns in the shady corner. In the moist spots, primulas were splendidly congregated, and a fair batch of Cypripedium spectabile was a prominent feature. In the immediate foreground the firm had a bog and water garden, and here the elegant spiræas, trolliuses, funkias, and bamboos were freely and skilfully planted, the bamboos and Japanese maples serving to mask a bold piece of terraced rock gardening where saxifragas and sedums in endless variety, combined with Viola gracilis of deepest purple, alpine phloxes, gay double Welsh poppies, incarvilleas, and a whole host of dainty and rare alpines, the names of which would easily fill a column of print.

## JAPANESE AND TUDOR GARDENS.

A prominent and attractive exhibit in the Ranelagh grounds was the very extensive Japanese garden laid out in the lower end of the Ranelagh Gardens by Messrs. Jas. Carter and Co., Raynes Park. Surrounded by a bamboo fence, backed by the tall trees already in position, and with a very undulating site, an elaborate design was carried out. The several entrance gates had thatched porch-like coverings with handsome bronze or stone lanterns guarding the way. Devious pathways and little rough stone tracks led over pretty pools or up the low pine-clad hill sides. Over the streams depended weeping cherries and birches, with a setting of bamboos and elegant Japanese maples. Rhododendrons were grouped along the banks and around fine examples of Sciadopytis verticillata and of weeping deodars, while here and there wonderfully carved bronze eagles and giant bowls of rare workmanship, held dwarfed trees and cycads. By the water margins, hydrangeas, various irises, Lilium auratum, L. longiflorum, and L. speciosum were tastefully grouped with dwarf bamboos and more maples. From a rocky eminence water poured down, forming a pretty cascade; falling into a pool below it passed under several quaint little bridges to the large lower pool, over which a Japanese teahouse was pleasantly and coolly situated. In the background a tea-house of bamboo-work lent realism to the scene, while around it were rhododendrons, viburnums, and a cool bank of hardy ferns. At special points of vantage there were some rare old examples of wistarias in Japanese vases. Small low rock gardens, with a full complement of flowering plants occupied special and suitable positions while weeping willows, standard prunuses, and viburnums relieved the whole from the least suggestion of flatness, and gave the garden the effect of some age. A complete Japanese garden about 4ft. by 3ft., in the tea-house over the little lake, provided one of those curious scenes for which the Japanese are famous. Much money, time, labour, and skill went to the making of this remarkable exhibit, which Her Majesty Queen Alexandra so greatly admired during her private view of the exhibition on the Monday afternoon prior to the opening of the show.



VIEW IN JAPANESE GARDEN.
Designed and formed by Messrs. James Carter and Co.

As one stood in front of the exhibit sent by Messrs. J. Cheal and Sons, Crawley, it was difficult to realise that it was but an exhibit and temporary, as it all looked so natural, real, and permanent. It is doubtful whether anyone has ever presented a Tudor garden at an horticultural exhibition before, and though Messrs. Cheal were ambitious to attempt it, there is no question about their succeeding, and no feature in the whole show elicited more expressions of approbation than this. Leaving the lime avenue, on the opposite side of which were the tents, you passed up a few stone steps, which had an ornamental peacock in cut yew on either side, into a paved courtyard, with grass and more cut yews. Two fountains threw up jets of water, which returned to an ornamental pool in the centre, and at the back another stream of water burst out from a lion's mouth, set in the stone terrace wall, into a basin prepared for its reception. The terrace walls and steps looked as if they had been there for years, dainty plants grew in the crevices between the stones, and even the freshly-laid turf looked almost as if it had grown there. Looking over the terrace wall from the fountain basin, the eye rested on an ornamental summer-house at the back with pyramid bays on either side of the door, and a very permanent looking pergola leading away to the right and the left. The latter, of course, was furnished in keeping with the idea and the period, and through the pergola one looked on a bank furnished with beautiful specimens of acers, rhododendrons, etc. Having taken in the details of this charming old-world sort of garden scene, you passed out of the courtyard on the left and down some rough-cut steps through a bit of bold rockery-work that looked almost as if it had been cut out of solid stone. Little alpines grew in the pockets, presenting bright splashes of colour, and at the bottom of the steps you looked into a little pool of water, round the sides of which grew spiræas, irises, primulas, and other things. This pool was fed by a trickling stream out of the stone, and advantage was taken of this happy position for planting a few hart's tongue and other ferns. The steps on the right side of the courtyard led along a paved path to a point at which another scheme of rock gardening was displayed. There was no water here, but an open-fronted bower, set back in the bushes, approached by rough stone steps, and flanked on one side with Japanese maples, and on the other with flowering shrubs. From this bower one looked out over a pretty scene of rock and flowers that were delightfully in keeping with the surroundings, and no matter where you looked you saw a happy mixture of flower and foliage, and a nice blending of colour. It was not surprising that this really cleverly-designed garden was one of the chief centres of attraction in the show.

DWARF JAPANESE TREES,
Exhibited by Messrs. Barr and Sons.

## ORNAMENTAL TREES AND SHRUBS.

Forming a good break in amongst a maze of rock gardens was a big group of evergreen shrubs, exhibited by Messrs. Paul and Sons, Cheshunt. At the back was a belt of large green and variegated hollies with yews of different types in front. The whole of the shrubs were planted out, and they looked as if they were part of the garden, rather than brought there for exhibition.

On the side of one of the main walks in the Ranelagh grounds a fine collection of hardy trees, mostly evergreen, in tubs, was exhibited by Messrs. Jackman, of Woking. Amongst the specimens were some finely-grown pines and cedars, as well as hollies and yews, and at one end there was a group of yews and box cut in the orthodox shapes, i.e., pyramids, peacocks, globes, pillars, and so forth.

There was something very unique about the collection of cut yews and box exhibited by Messrs. Piper, Bayswater, near the rock and water gardens, largely because the fence which enclosed the specimens was made of closely-cut living box. The big specimen trees in tubs within the enclosure were comprised of box and yews cut into various fantastic shapes. Originality in the shape of cut trees was introduced by Messrs. Wm. Cutbush and Son, Highgate, who showed a fully-rigged ship in box, a very good representation of a stag at rest, a sitting squirrel, hen and chickens, and a few other novelties, including, of course, the inevitable peacock. These were in box, but big specimens of yews at the back of the group were fine illustrations of topiary work.

Quite unique in its way, and interesting in its variety, was a group of ivies in pots sent by Mr. L. Russell, Richmond. The silver variegated forms as low standards were very pleasing, as also was a row of dwarf plants in front, with bushy specimens of a green-leaved variety behind. The same firm also set up a large collection of mixed flowering and foliage trees and shrubs, and a very fine lot of graceful bamboos, the latter being in competition. Altogether this was a highly interesting and educational exhibit.

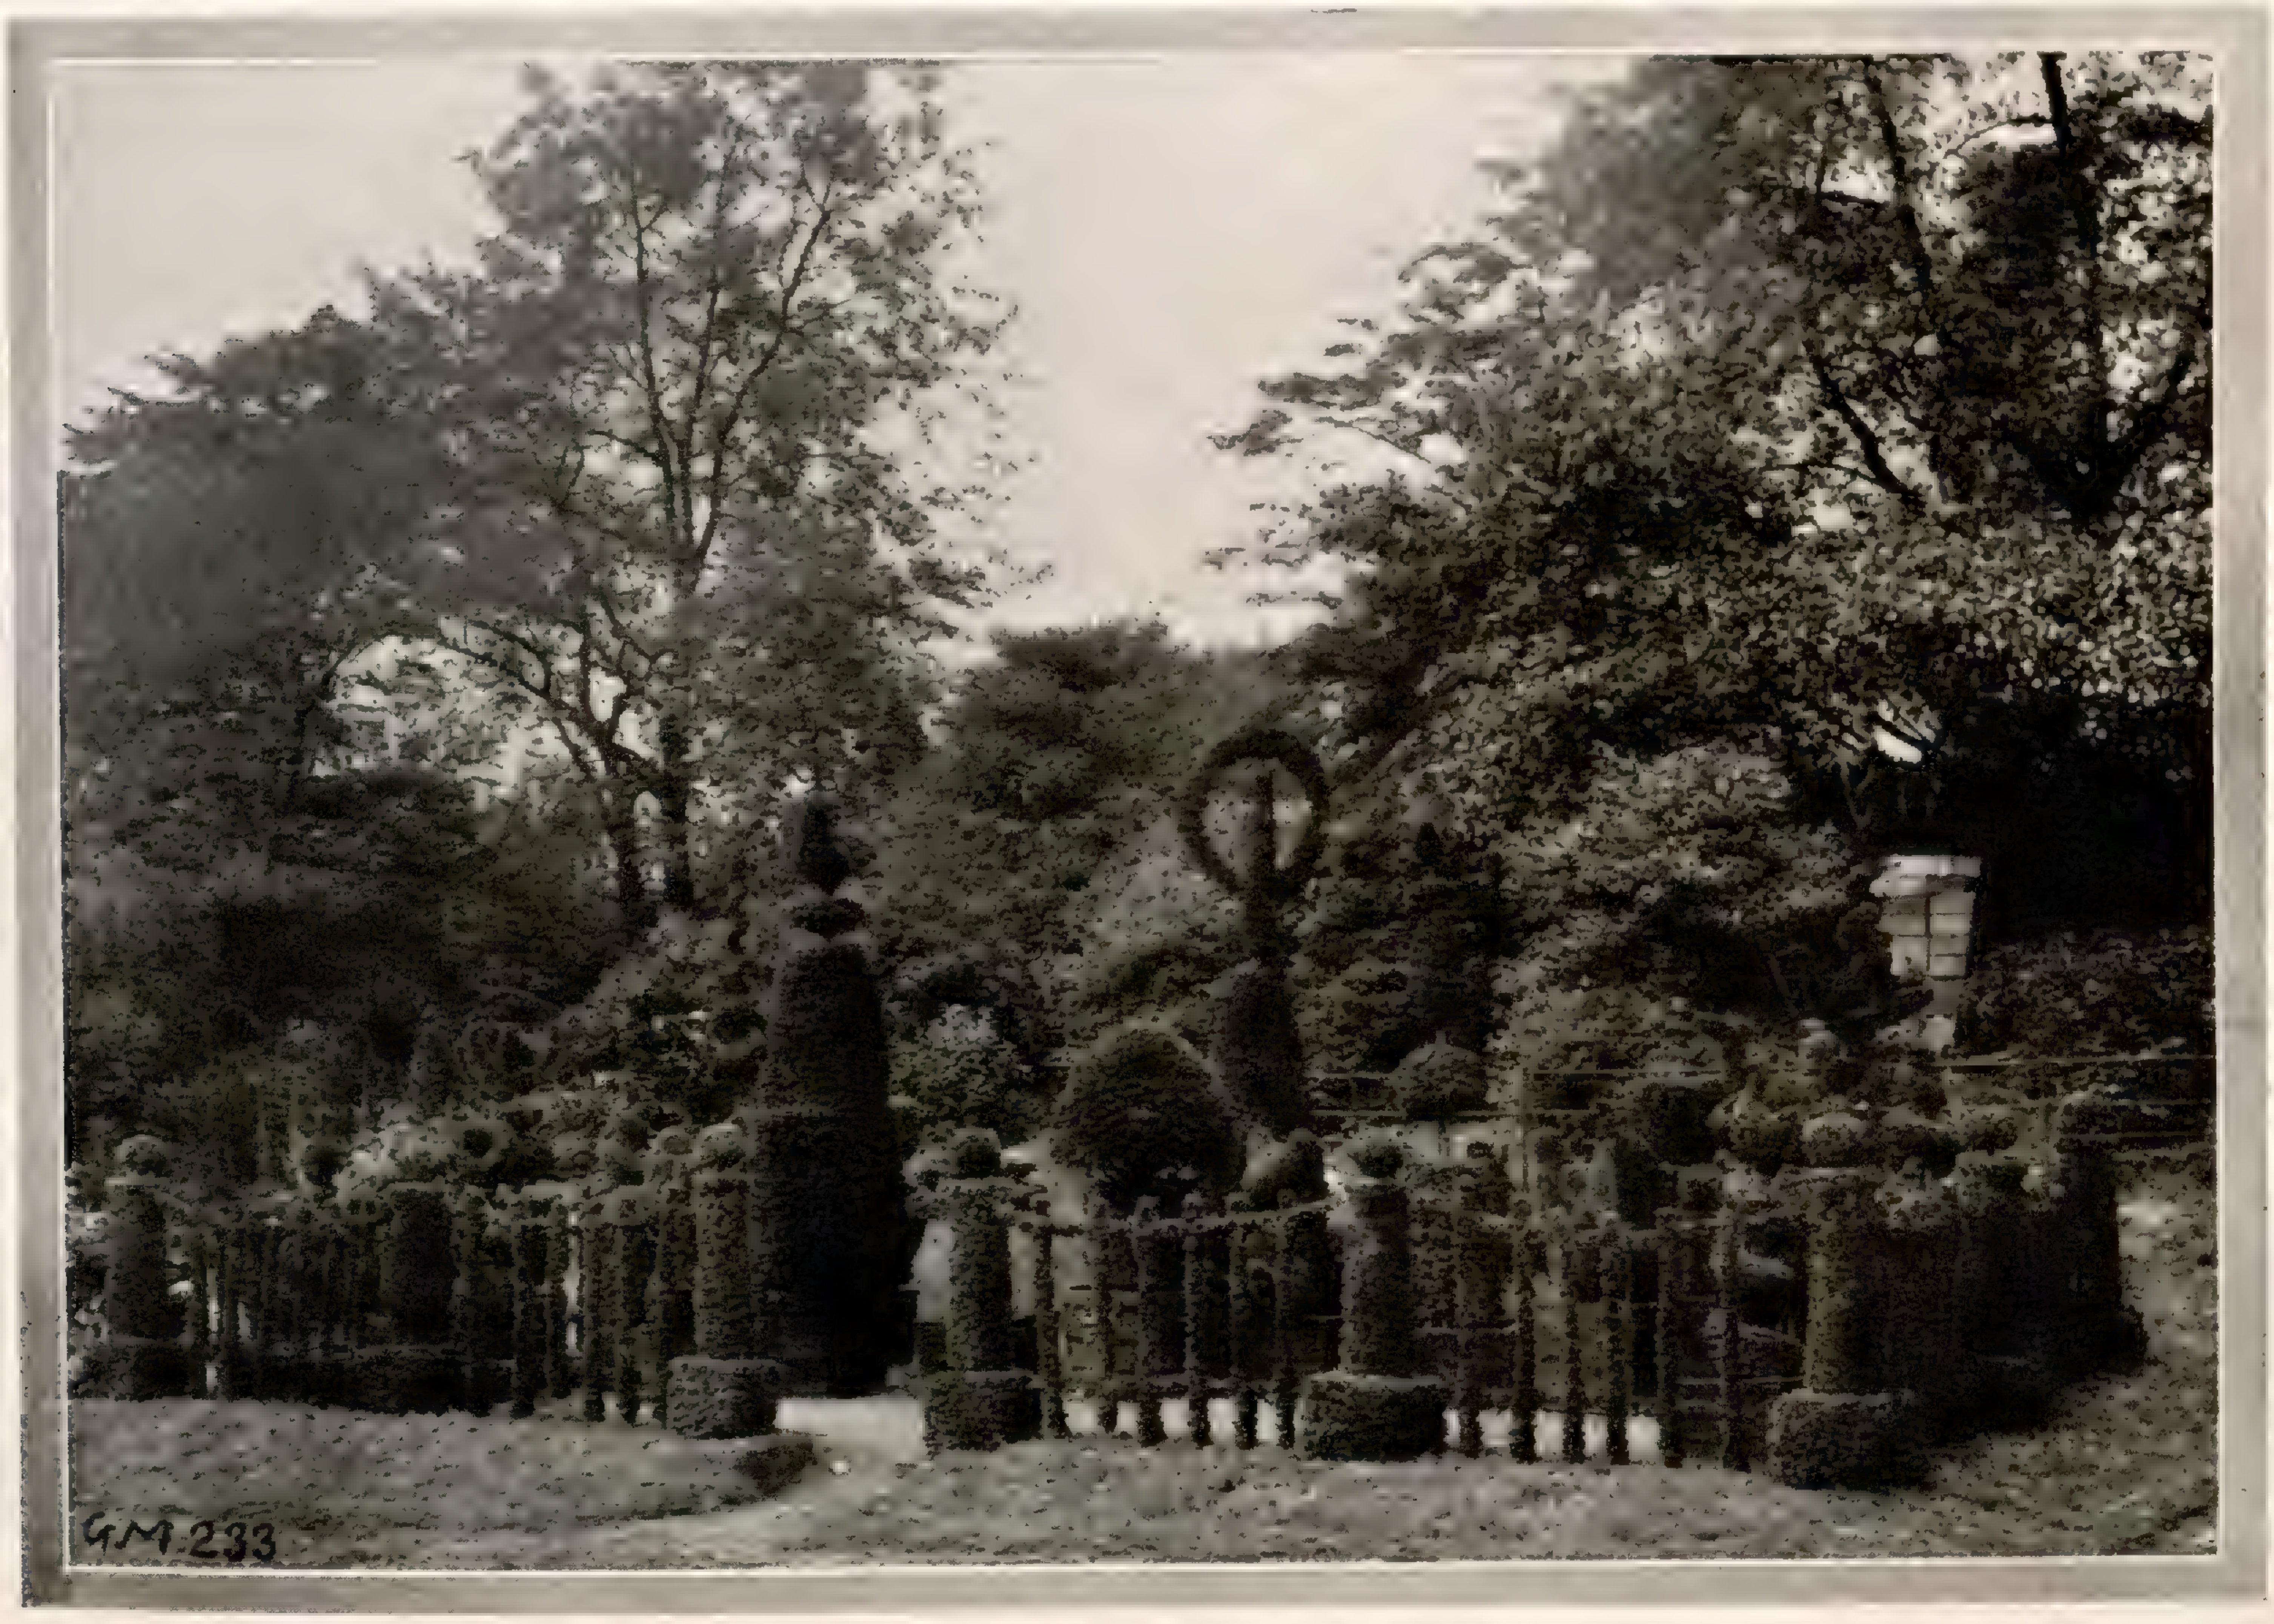
A large semi-circular belt of the choicest trees and shrubs was arranged by Messrs. John Waterer and Sons, Bagshot, and fixed as they seemed to be in a setting of the surrounding rock gardens, they gave an element of variety that was particularly pleasing. Japanese maples were remarkably fine, as were hollies and yews, and flower was provided by Kalmia latifolia, Viburnum plicatum, and mollis and Ghent azaleas. The stamp of quality, characteristic of this well-known firm, was apparent on every specimen in the group. A magnificent group of bay trees in tubs was shown by Messrs. Jas. Veitch and Sons, Chelsea, in the Ranelagh grounds, and they fully demonstrated the value of these trees for decorative purposes. Amongst the specimens were some very fine tall pyramids clothed from top to bottom with healthy green foliage, and others of standard form with mop-like heads presented a strikingly massive appearance.

In a sheltered spot in the Ranelagh Gardens, Messrs. Barr and Sons, Covent Garden, set out several hundred quaint dwarfed Japanese trees, these ranging in size from tiny grizzled plants in fancy jars, and that would easily go into one's pocket, up to ancient specimens a yard or so high. Not only were larches and Cupressus obtusa represented, but there were wistarias, cherries, oaks, retinosporas, pines, hollies, and myrtles. Some of the pines were specimens of old trees that might have braved the storms of hundreds of years on some wind-swept hill. Some of the larches were trained to form huts and porches, others to represent birds and beasts, the whole collection forming an unique and interesting exhibit. Twenty-six footballs, two dogs, a dozen peacocks, a dozen or more chanticlers on spire tops, half a dozen corkscrews, a few umbrellas, some pillars, three or four baskets, one dancing bear, some sitting hens, and table tops, about sums up the extraordinary collection of clipped trees, wholly in evergreen box, exhibited by Messrs. Carlton-White, New Bond Street, W.

## ORCHIDS.

The most wonderful collection of orchids ever put up by an amateur filled the end of the big orchid tent and was, as a glance at the fine cultivation showed, contributed by Lieut.-Colonel Sir G. Holford, whose clever grower, Mr. H. Alexander, surpassed himself on this occasion with a glorious and gorgeous exhibit that covered 1,100 square feet. Splendid palms formed a grand background, and right up under the palms were magnificent dendrobiums, associated with fine arching spikes of many oncidiums that threw their golden flowers well out. The whole of the great central feature was filled with magnificent specimens of Lælio-cattleya Bedouin, L.-c. Canhamiana with lovely flowers, L.-c. Aphrodite, the splendid L.-c. Britannia, L.-c. Dr. R. Schiffman, and a L.-c. Canhamiana with about fifty grand flowers. Among the several dozen superb specimens of these large-flowering orchids appeared graceful odontoglosums and the bright L.-c. Golden Glory, with giant spikes of Phalænopsis rising above the whole. Around the front Odontioda Bradshawiæ, O. Lambeauianum, O. Bradshawiæ, Holford's var., almost scarlet, a noble Odontoglossum illustrissimum, and some splendid miltonias were added. To the left appeared a forest of odontoglossums, oncidiums, Renanthera Imschootiana, Cymbidium Lowianum, with extraordinary specimens of L.-c. Aphrodite, Dendrobium Dalhousianum, and Brasso-cattleya Digbyano-Mossiæ, Westonbirt var., with a dozen glorious flowers, standing clear of the rest. To the right a somewhat similar scene was presented, and notable specimen plants were Cattleya Skinneri alba, C. Dusseldorfei, Undine, a grand L.-c. Britannia, and a superb backing of lovely dendrobium. Odontoglossum crispum Solum, Sophro-lælio-cattleya Marathon Vesuvius, the white O. crispum xanthotes Charlesworthi, and O.-c. Bumble Bee were a few other rare beauties among a host of fine things. Altogether it was a marvellous display, and, as a single group, was unsurpassed in the whole exhibition. Wondering crowds stood before it every day. To Sir George and his able grower we beg to extend our hearty congratulations upon their achievement, which was worthy of the great occasion.

We have seen most of the great exhibitions at home and on the continent during the last quarter of a century, and have reviewed most of the glorious displays made at the leading horticultural events of that period, but we do not remember in that time to have seen so superbly wonderful a group for colour as the one put up on this occasion by Messrs. Charlesworth and Co., Haywards Heath. It occupied half one side of the centre of the great orchid tent. Such a galaxy of rare and beautiful plants, such a blaze of colouring, and such a fine effect of clever massing and arrangement it is difficult to describe. Bedded in ferns and backed by graceful palms, over a thousand plants were set out in bold bays. In the centre Phalænopsis Rimestadiana threw its graceful spikes of big white blooms over a base of scarlet and crimson Odontioda Charlesworthi, O. Bradshawiæ. O. Cooksoni, and others, the spikes of bright colour predominating at the base of the pyramid. To the right and left of this came Lælio-cattleyas Aphrodite, Canhamiana, Canhamiana alba, and other large-flowered hybrids, and then, working outwards, came pyramidal mounds of Miltonia vexillaria, M. Bleniana, and M. B. nobilior, huge assemblies of thousands of blooms. In the flanking groupings we noted glorious Brasso-cattleya Princess Elizabeth, B.-c. Digbyano-Schröderæ, B.-c. Digbyano-Mossiæ, and wonderful odontoglossums, such as O. Lambeauianum, O. ardentissimum, the new and fine O. Her Majesty, one of the gems of the group, O. Maria, O. Dora gigantea, O. Hamelini, of grand purple colour, and O. illustrissimum, gorgeous in purple, and the yellow O. luteo-purpurea Vuylstekeanum. Other excellent things were Eulophiella Hamelini, Cattleya Lawrenceanum Mary Regina (a feature of the Temple Show of 1910), Dendrobium acuminatum, in grand form, the wonderful Odontoglossum crispum Solum with its blackish lip; Odontioda Queen Mary, glorious crimson and purple, and one of the finest secondary hybrids yet raised; Odontioda Edna, Brasso-cattleya Vilmoriana, and Odontoglossum eximium Princess Mary.



EXAMPLES OF THE TOPIARY ART.
Exhibited by Messrs. Piper, Bayswater.

A sweetly pretty exhibit of Vanda teres and light forms of Odontoglossum crispum was set up by Mr. G. Reynolds, gardener to Leopold de Rothschild, Esq., Gunnersbury Park, Acton. Probably no one grows the graceful Vanda teres better than Mr. Reynolds. They are grown in large boxes, and there were seventeen, besides these, some pot plants, and in the whole set there were no fewer than 640 spikes of mauve and white and purple flowers. This exhibit was one of the masterpieces of orchid culture, as Vanda teres is not an easy orchid to flower year after year as Mr. Reynolds manages it.

M. Chas. Dietrich, Anderghen, had some lovely odontiodas, odontoglossums, and miltonias, and so had M. Firmen Lambeau, whose Odontioda Ajax, O. Chanticler, and the superb O. Coronation were the pick of many grand orchids. M. Jules Hye brought some splendid odontiodas and miltonias, not labelled. Mons. Vuylsteke, Loochristy, Ghent, showed the splendid Odontioda Queen Mary, Odontoglossum illustre, O. L'Aiglon, and the purple O. azureum Enchantress—very distinct.

Messrs. Stuart Low and Co., Enfield, secured a first prize with a grand group of orchids, which had Phalænopsis Rimestadiana as a central feature; this was flanked by groups of Oncidium Marshallianum, the brilliant Renanthera Imschootiana, masses of Cattleya Mossiæ, and such good things as C. O'Brienianum alba and C. Skinneri alba. Messrs. J. Cypher and Co. came second, and they had Cattleya Mossiæ in fine form, and Vanda teres, with miltonias, Cattleya Skinneri, and Lælia purpurata associated with cymbidiums, yellow oncidiums, Cœlogyne purpurata, and Phalænopsis Rimestadiana. This firm was also successful in another class, and here they had a grand lot of hybrid odontoglossums, Lælio-cattleya Wellsiana, L.-c. Fascinator, L.c. Aphrodite, and many other lovely things.

A premier award fell to Messrs. Armstrong and Brown, who filled two bays with Lælio-cattleyas Aphrodite and Fascinator, and had a glorious lot of beautiful unnamed odontoglossums of hybrid origin in the centre overhung with oncidiums and cymbidiums. Along the front odontiodas were a great feature, their glowing colours and graceful spikes arresting attention. Another premier award fell to the same firm for a bank of orchids that was very graceful by reason of the splendid spikes of Cymbidium Lowianum and Phalænopsis Rimestadiana. Odontoglossum crispum Solum, with its very dark lip, was prominent, and so were Cattleya Skinneri alba, Cœlogyne pandurata and Miltonia vexellaria Leopoldi, with its butterfly lip.

Messrs. Sander and Sons, St. Alban's, filled a huge space with a glorious contribution of orchids, and filled it gorgeously and elegantly. At either end they massed the finest of cattleyas and lælio-cattleyas; in the centre, miltonias led up to sheaves of Phalænopsis Rimestadiana, while intervening bold masses were composed of this fine white phalænopsis and the bright Renanthera Imschootiana. Two big bays were filled with the choicest of choice things, each plant set out alone. Here we noted the wonderful Odontoglossum crispum Solum, O. amabile Princess Mary, O. eximium, the splendid O. Jasper Superb, the dark O. eximium King George V., and such glorious odontiodas as O. Cooksoniæ, O. c. magnificum, and O. ornata—very lovely. Overhead along the back the firm had Cymbidiums Lowianum and insigne, oncidiums galore, and Lælio purpurata.

Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, won a second prize with a famous exhibit of odontiodas and odontoglossums, very prettily disposed. Odontoglossums were a great feature, and Lælio-cattleya Phœbe, fine forms of Cattleya Mossiæ, and brasso-cattleyas were included, but the mound of odontiodas and white odontoglossums was the great feature. Mr. F. Menteith Ogilvie (gardener, Mr. Balmforth), The Shrubbery, Oxford, beat Sir Jeremiah Colman, and with a splendid exhibit, in which Cattleya Mossiæ, Lælio-cattleya Aphrodite, L.c. Fascinator, L.c. Dominiana, L.c. Wellesleyana, and many white cattleyas were boldly massed. Odontoglossums were finely represented, and included O. Harwoodi, O. Ossulstoni, and O. ardentissimum Carmen. Cypripedium callosum Sanderæ, L.c. Golden Glory, Odontioda Charlesworthi, O. Keighleyensis, O. Bradshawiæ, and the lovely large-flowered Odontioda Mrs. F. M. Ogilvie were just a few other splendid things noted.

An elegant and glowing display of orchids from Messrs. Mansell and Hatcher, Rawdon, Yorks, was very greatly admired. Here there were an abundance of fine specimens of Lælio-cattleya Fascinator, L.-c. Aphrodite, L.-c. Canhamiana alba, L.-c. Dominiana, all massed towards the centre. In the bays were Phalænopsis Rimestadiana and Renanthera Imschootiana, with dendrobiums, Cattleya Skinneri alba, and cypripediums;

while at either end were grouped beautiful odontoglossums, odontiodas, Miltonias, Vanda teres, the wonderful Cypripedium Edithæ, Anguloa uniflora, and heaps of other lovely orchids.

Mr. J. Macartney, Hey House, Bolton; Mr. W. A. Manda, New Jersey, U.S.A.; Mr. F. Wellesley, Woking, also showed orchids. Mr. H. A. Tracy, Twickenham, put up a good bank of odontoglossums and odontiodas, and Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford, staged some fine odontoglossums among specimen selaginellas. The best plant was Odontoglossum illustre Europa, dark purple, and very showy.

### ROSES.

By way of a moss-covered path under a pergola leading up to a bower in the centre, one entered the veritable garden of roses exhibited by Messrs. Hobbies, of Dereham. The pillars of the pergola on either side were clothed with beautiful roses of the Dorothy Perkins family, and the weeping standards of this section were a charm in themselves. From another side of this group one looked through another pergola which ran at right angles to the first-named, and a neat little green fence which enclosed the whole group gave it a neat and finished appearance.

A MAGNIFICENT COLLECTION OF ORCHIDS.

Exhibited by Lieut.-Col. Sir G. Holford, Westonbirt (Mr. H. G. Alexander, grower). This was awarded the King's Cup for the finest exhibit in the show.

A blaze of beautiful rose colour best describes the superb group set up by Mr. George Mount, of Canterbury. There were great masses of Dorothy Perkins, Lady Gay, Excelsa, and White Dorothy towering up in rank profusion, and in between you saw huge bunches of perfect flowers of Mrs. Sharman Crawford, Frau Karl Druschki, and many another. There was Mrs. John Laing with stems a yard long, and Ulrich Brunner simply beautiful. Rarely indeed has the British public been given an opportunity of looking upon such a feast of the queen of flowers.

Standing a few yards away from the group of roses exhibited by Messrs. Paul and Son, of Cheshunt, we almost lost ourselves in admiration, for the beautiful weeping roses which formed the feature of the group. Long drooping clusters of flower nearly reached down to meet the beautiful blooms on the pot bush roses that formed a groundwork beneath; and amongst the colours, pinks and whites and crimsons stood out conspicuously. The front view of the group was delightfully effective, and nothing took our fancy more than a mixture on the same weeping standard of Excelsa, White Dorothy, Lady Godiva, and Dorothy Perkins.

Leaving the above group one turned round and faced a remarkably fine collection of roses set up by Messrs. W. Paul and Son, of Waltham Cross. Weeping standards were not so numerous here, but they were very beautiful, especially Paradise and Tausendschon. Hiawatha furnished two pillars of the great tent, and underneath the tall weeping standards were roses of many shades of colour, all fresh, mostly sweet, and the plants were as healthy as plants could be. It was a fine effort, and the longer you looked at it the better you liked it.

In its own particular way, there was not a group of roses in the whole show more effective than that exhibited by Messrs. Wm. Cutbush and Sons, Highgate. The ground of the triangle on which the roses stood was a carpet of such gems as White Pet, Mrs. W. H. Cutbush, Baby Tausendschon (a sweet little pink rose), Jessie, and others. Standing above the groundwork were great bushes of Mrs. W. W. Flight, Hiawatha, American Pillar, and Dorothy Perkins.

A circular group of roses with a big palm towering above the centre was set up by Mr. Charles Turner, of Slough, but it struck us as being rather too crowded. Weeping standards were also the feature here, but had they been used a little less freely in a group of this kind they would have shown themselves off to better advantage.

At one point there was a group of roses apparently made up by a number of exhibitors. On a collection of nine pot roses we saw the name of Messrs. Paul and Son, Cheshunt, Herts. This firm sent nine weeping standards, the best of which was Lady Gay, and these seemed to be something out of the common in seeing the group of thirty-six standard roses, in which, in accordance with the schedule, there were no weeping varieties. Messrs. Paul and Son was the exhibitor here. The bare ground in this space looked rather unsightly, except just one corner that was furnished with a collection of 100 polyantha dwarf roses, shown by the last-named firm; Mrs. Cutbush, Maman Levavasseur, and Jeanne D'Arc were the most predominating varieties here.

Five exhibits appeared in the class for a group of pot roses and cut flowers, and each one was distinctively good in its own way. Messrs. Frank Cant and Co., of Colchester, made the most of their space with beautiful ramblers at the back, and equally beautiful cut flowers of numerous varieties in the front, amongst which Lady Roberts was a predominating feature. There was no need to ask who the next group belonged to, for there was George Mount, of Canterbury, written all over it in the glory of the Frau Karl Druschki, Mrs. John Laing, and Ulrich Brunner. We cannot praise this collection in higher terms than this.

Quite of a different type, but very beautiful nevertheless, were the roses staged by Messrs. Hugh Dickson, Belfast. Here we feasted our eyes on pillars of Blush Rambler, Lady Gay, and others in weeping form, and cut flowers of Lady Hillingdon and others. Mr. G. Prince, Oxford, had a thick background of rambling roses with cut blooms in between, but we thought the exhibit was rather overcrowded. Messrs. W. and J. Brown, of Peterborough, had masses of cut flowers built up in bamboo stands.

A hundred polyantha roses intermixed with maidenhairs, which did not seem to be quite the most suitable material for the purpose, were shown by Mr. J. Pegg, Royston, and near at hand were a few odds and ends of roses, evidently put there to fill a vacant space that would have been very much better on the outside of an International tent. Some good specimens of rambling roses made a suitable background to a collection of mixed plants put up by Messrs. Dickson, Lim., Chester.

There was a good deal of the country village flower show aspect about a number of competitive classes of roses that were accommodated under the centre of one of the arches of the big tent, and in the general arrangement of the plants one expected something better at an international show. We noticed that Mr. G. A. Hammond, of Burgess Hill, won a silver cup for ten roses with excellent plants, and the same exhibitor had a second prize for twenty distinct roses, which, to say the best of them, were commonplace. Mr. James Brown, Manchester, won in this class with fairly good plants. The last-named exhibitor had really good plants, which won for him first prize in the class for six pillar roses, and he also won the King's Acre Nursery Cup with a nicely-arranged group of roses. In the class for ten pot roses, distinct, Mr. Charles Turner won first prize, and we were rather struck with a group of single-flowering roses shown by Messrs. Frank Cant and Co. For twelve roses, sent out since January, 1909, Messrs. Frank Cant and Co. won, and the same firm showed a nice group of 100 polyantha roses, in which class also Mr. Charles Turner exhibited a nice collection. A gold medal was won by Mr. Charles Turner in the class for thirty-six distinct standards, weeping varieties included, and the specimens were very well grown and flowered.

AN EXTENSIVE AND BEAUTIFUL COLLECTION OF ORCHIDS.
Exhibited by Messrs. Charlesworth and Co., Hayward's Heath.

We have nothing but praise to give for a group of rambler and polyantha roses, with which Messrs. Stuart Low and Co., Bush Hill Park, furnished a corner of their miscellaneous group. In the arrangement there was a cunningly devised pathway, flanked on this side and that with some of the finest specimens of pillar and weeping roses we saw in the show, standing up above a groundwork of dwarf polyantha varieties.

The boxes of cut roses in competition reminded one of the rose season rather than May, but we must give them a brief word. Mr. Geo. Mount got first for thirty-six blooms, followed by Messrs. F. Cant and Co. The Canterbury grower was also to the front with eighteen blooms, followed by Messrs. G. and W. H. Burch; and for eighteen, G. A. Hammond, Esq., was first.

Inside a neat yew hedge, Mr. R. C. Notcutt, Woodbridge, arranged a formal rose garden, with a rough flagged pathway running down the centre and across the middle, an old sundial marking the intersecting point. On either side of the path weeping standards of Dorothy Perkins, White Dorothy, Hiawatha, and other roses were gay with flowers, and in the four large sunken beds tea and hybrid tea roses, dwarfs, and standards gave of their fragrance and beauty over a groundwork of violas.

Messrs. F. Cant and Co. won a cup with a group of cut roses that stood conspicuously alone on the table, but on the other side was a fine bank of ramblers, and others from Messrs. B. R. Cant and Sons, Colchester. The last-named firm had first for the best six blooms of any rose not in commerce, and for a climbing rose not in commerce Mr. Charles Turner won with a seedling called Ophelia.

Messrs. G. Mount and Sons showed some very fine specimens of roses in the class for bunches. Conspicuous amongst them were Frau Karl Druschki, Liberty, White Killarney, and Mrs. John Laing. The second award was won by Messrs. A. Dickson and Sons, Newtownards, whose Alexander Hill Gray and Carine were extremely fine flowers. Messrs. Mount won a first prize with a magnificent collection of cut roses.

Mr. H. R. Darlington, Potter's Bar, was a successful amateur exhibitor of roses, and Messrs. A. Dickson and Sons secured a premier award for beautiful flowers of Alexander Hill Gray.

In between two large exhibits of hardy flowers, Messrs. D. Prior and Son, of Colchester, set up a fine group of roses, the most conspicuous features in the collection being fine specimens of rambling varieties. Messrs. R. J. Barnes and Son, Malvern, set up a compact little bank of roses, which was composed of nicely-flowered plants.

## HIPPEASTRUMS.

Hippeastrums in the orchid tent were splendid, but the most gorgeous lot was staged by Mr. Chapman, gardener to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester. Here the culture and the colouring were superb; every flower was of the highest excellence, and the soft rosy forms, like Lady Howick, Castor, Cassandra, Cardinal Wolseley, and Pinkie were charming among the scarlet, orange, crimson, and white forms. Among the latter White Wings stood out conspicuously good. It was a great exhibit, and deserved its premier award. Messrs. Wm. Bull and Sons, Chelsea; Mr. A. H. Kenrick, Berrow Court Gardens, Birmingham; and Messrs. R. Ker and Sons, Liverpool, each showed a fine group, the latter firm coming a good second in the competition, and in their set were lovely new shades seen in Cherry Plum, Magenta Queen, Rose Perfection, King George, and Ruby King. The Messrs. Ker presented a splendid set.

## STOVE PLANTS.

In various parts of the great exhibition splendidly-grown stove plants, elegant in habit, and many of brilliant colouring, were set up, but by far the most prominent contribution in this department was one from Messrs. Jas. Veitch and Sons, Chelsea. This huge contribution occupied a fairly central position in the big tent, and it was a superb display of fine plants, finely grown, and admirably disposed in the form of an ellipse. The central features were tall palms, and tree ferns, Medinella magnifica, giant crotons, pandanuses, heliconias, and aralias. Around these were grouped a magnificent set of about seventy-five varieties of caladiums resplendent in green and gold, crimson and silver; a few of the finest of these were Louis van Houtte, Mdme. J. Box, Pantra Ralli, Mrs. Harry Veitch, Mrs. McLeod, Leonard Bause, Oriflamme, Raymond Lemoinier, King Edward VII., and Lady Wigan. Tall single-stemmed crotons, finely furnished from base to summit with leaves of gold and brown and green, rose here and there well above the general surroundings, and especially fine were the examples of Baron Alphonse de Rothschild, Johannis, Thomsoni, Warreni, Reidi, Golden Ring, Golden Chain, and Dayspray. Nepenthes Burkei, N. Curtisi, N. Sir Thisleton Dyer, and others swung their quaint pitchers above glowing groups of anthuriums or Flamingo flowers, these carrying big spathes of cream, red, scarlet, or crimson. A few especially remarkably fine subjects included were the exquisite bertolonias, Leea amabilis, Aglaonema picturata, Rex begonias, the excellent Dracæna Bruanti variegata, Tillandsia tessellata with its vivid scarlet-bracted spikes, T. zebrina major, Cyanophyllum magnificum, and showy-leaved marantas. Groups of Kalanchoe flammea, of Clianthus Dampieri with glowing scarlet and black flowers, of gorgeous cannas, added further colour and brilliance to an already grand display that covered an area of 2,100 square feet.

Mr. Manda, New Jersey, U.S.A., brought over about a dozen and a-half stately palms, all grand specimens, of kentias, cocos, and phœnix, from twelve to twenty feet high, and every one a perfect example of that grace which only palms can give.

In an oval group Messrs. Fisher, Son, and Sibray, Handsworth, Sheffield, disposed a beautiful lot of medium sized crotons, splendidly coloured and perfect from pot to top. Golden Ring, Warreni, Thomsoni, Duke of Portland, Countess Donoughmore (quite new), and Mrs. Joe Grace (another graceful new seedling, with golden-centred leaves). Behind the crotons some splendid anthuriums were staged, and, besides the Scherzerianum forms, we noted Fisher's variety of A. Andreanum with gorgeous spathes about nine inches across; A. Andreanum Handsworthensis, pink; and A. A. Lord Fitzwilliam, with salmon-red spathes. There were many other things, but with a mention of Musa sapientum rubrum, with purplish leaves, we must pass on.

Messrs. J. Cypher and Sons, Cheltenham, were the only exhibitors of twelve specimen stove and greenhouse flowering plants, and their huge specimens of Clerodendron Thomsoni, Statice profusa, ixoras, ericas, and Indian azaleas were reminiscent of old times; some of them measured nearly six feet across, and were smothered with flowers. Backing on to the specimen was one of the tasteful groups of orchids, excluded, for which they are famous; here crotons, caladiums, kalanchoes, liliums, crotons, alocasias, yellow arums, and palms were associated delightfully so as to form a bright, elegant, and pleasing scene.

A FINELY-FLOWERED COLLECTION OF TWELVE STOVE AND GREENHOUSE PLANTS.
Exhibited by Messrs. J. Cypher and Sons, Cheltenham.

Messrs. J. Peed and Sons, Norwood, put up a group of caladiums that attracted a good deal of attention, as it included handsome specimens of the new pink and green King George, the scarlet Rufus, a superb Silver Queen, and equally good Golden King, with the giant crimson John Peed behind in company with Adolphe de Rothschild, and the lovely pink J. Pierpont Morgan.

From the School of Pomology and Horticulture of Firenze, Italy, came a wonderful collection of new hybrid anthuriums of the Andreanum section, some of huge size and fine colour. Mr. L. R. Russell, Richmond, won the coveted award for alocasias, and a premier for the lovely-leaved bertolonias.

## FERNS.

It was quite relieving in the great marquee to turn the eye from the maze of brilliant flowers to the soft green of the great banks of ferns, which were amongst the distinctive features of the exhibition. For a long time now those great fern specialists, Messrs. H. B. May and Sons, Edmonton, have been waiting for an opportunity to show what they can do in the way of putting up a group of ferns, and when it came, at the International, they certainly took every advantage of it. To say that the exhibitors surpassed all their former efforts by no means does them justice, and one could have spent a long time inspecting the many beautiful gems contained in the group. We use this word in description, but there was nothing bank-like or solid about the exhibit, for, on the other hand, the ferns were ingeniously arranged, and there were winding paths in amongst the plants just as there might be in a tropical forest. We cannot pretend to describe one-half of the types represented. They were so very numerous, but big tree ferns stood up in relief above the mass of other forms. A considerable amount of taste was displayed in the arrangement, and very charming were the masses of Nephrolepis Marshalli compacta, and the specimen plants of Nephrolepis Duffi, Nephrolepis elegantissima cristata, and Nephrolepis exaltata multiceps. Little gems of the fern family were exhibited under glass domes, and at one end were some forms of Osmundas regalis and spectabilis, along with other ferns, suitable for cool culture. It is quite fair to say that such a group of ferns has never been seen before under canvas in this, or probably any other, country.

Tastefully arranged on a bank of fibre was a collection of hardy ferns, sent by Mr. Amos Perry, of Enfield, Middlesex, and amongst them we noticed lovely forms, such as Athyrium plumosum elegans, Athyrium purpureum, Scolopendrum vulgare crispum Grayi, Osmunda japonica, Adiantum pedatum, and Onoclea sensibilis, the latter being a very graceful plant.

Mr. W. A. Manda, New Jersey, U.S.A., brought from across the Atlantic a number of magnificent specimen ferns. Very fine indeed were the examples of Davallia epiphylla, Dicksonia Baronetz, Polypodium Knightæ, Davallia fijiensis robusta, and Polypodium quercifolium. The same exhibitor also set up another effective group of ferns, and in this collection the most attractive feature was a new bold fern called Polypodium Mandaianum. A very compact group of ferns was exhibited by Messrs. J. Hill and Son, Lower Edmonton, and in it was a large number of interesting forms, amongst which we noticed Cibotium Scheidei, Gleichenia dicarpa longipinata, Platycerium Veitchi, Lygodium scandens, Blechnum brasiliense, Polypodium linqua corymbiformus, and a number of others.

A BEAUTIFUL GROUP OF RAMBLING AND OTHER ROSES.
Exhibited by Messrs. W. Paul and Son, Waltham Cross.

The competitive fern classes were nicely set out, and amongst the prize-winners was Mr. W. B. Cranfield, of Enfield Chase, who had the best twelve hardy ferns, and the same exhibitor also won with twelve British ferns and twelve British scolopendriums. He was again to the front with twenty-four British ferns, showing fine specimens in this class. Magnificent, indeed, were the twelve stove and greenhouse ferns that won a silver cup for Messrs. J. Hill and Sons, Edmonton, and Mr. W. A. Manda showed some very fine specimens in this class. By no means few were the favourable comments passed on the group of stove and greenhouse ferns in the amateur section with which Mr. W. Howe, Streatham Common, won a silver cup. They were a good lot, and nicely arranged. On a space occupying 200 sq. ft., Messrs. Artindale and Sons, Sheffield, showed a nice lot of hardy ferns that were tastefully arranged. In the amateurs' class for a group of stove and greenhouse ferns Miss C. M. McIntosh, of Havering Park, put up a nice collection, which deservedly won first prize.

## SWEET PEAS.

A glorious lot of sweet peas from Messrs. Dobbie and Co., Edinburgh, provided a striking exhibition of the progress made in late years with these fragrant, elegant, and lovely flowers. The Edinburgh firm had a background of single-stemmed plants, 9ft. high, carrying a glorious lot of flowers; Brunette, Inspector, Dobbie's Thos. Stevenson, Lady Miller, Dobbie's Lavender, Decorator, Marks Tey (a nice purple and bronze), Mrs. Cuthbertson, Melba in glorious colour, and May Campbell were all splendidly shown, while the plants represented Inspector, Elfrida Pearson, Lavender George Herbert, Lady Miller, Thos. Stevenson, Dobbie's Lavender, Dobbie's Scarlet, and Dobbie's Cream—all splendidly clean and abundantly bloomed. Mrs. Cuthbertson had plenty of "fives."

Mr. Stevenson, Poole, was an extensive exhibitor of sweet peas, and put up a display of rather small flowers of up-to-date varieties, such as Flora Norton Spencer, Clara Curtis, Punch, Anglian Blue, America Spencer, Etta Dyke, and a number of promising seedlings. Mr. Robert Sydenham, Birmingham, contributed a pretty collection of sweet peas, and disposed the flowers pleasingly; chief among the varieties were Barbara, Lilian, Chas. Foster, Scarlet Emperor, Thos. Stevenson, Iris (in glorious colour), Maud Holmes, and the striking finely-waved Helen Pierce Spencer.

Messrs. E. W. King and Co., Coggeshall, displayed sweet peas elegantly, and put up Anglian Pink, Anglian Blue, and many other fine varieties in capital style. Messrs. G. Stark and Son, Great Ryburgh, showed some fine sweet peas, staging their George Stark, Florence Wright, Hercules, and other specialities in good form.

Mr. C. W. Breadmore, Winchester, had sweet peas on view, as might have been expected, and in his stand he set up lovely bunches of Aggie Elder, Princess Mary, King Alfred, an improved Helen Lewis, Lord Curzon, Helen Lewis, a fine strain of Countess Spencer, Elsie, Clara Curtis, Flossie Jeffery, Maud Holmes, and Mrs. C. W. Breadmore, all the flowers being of lovely substance and colour.

The Sherwood Cup for sweet peas was finely won by Mr. C. W. Breadmore, whose exhibit contained grand bunches of Countess Spencer, Nettie Jenkins, Aggie Elder, Lavender George Herbert, Helen Lewis, May Campbell, Melba, and Dazzler. Mr. W. E. Alsen, Waterlooville, came second, and Messrs. W. Lumley and Co., Hayling Island, were third. Sir Randolph Baker, Bart., Ranston, and Mr. L. H. Hatting, Hornchurch, were also prize-winners in sweet pea classes.

## CARNATIONS.

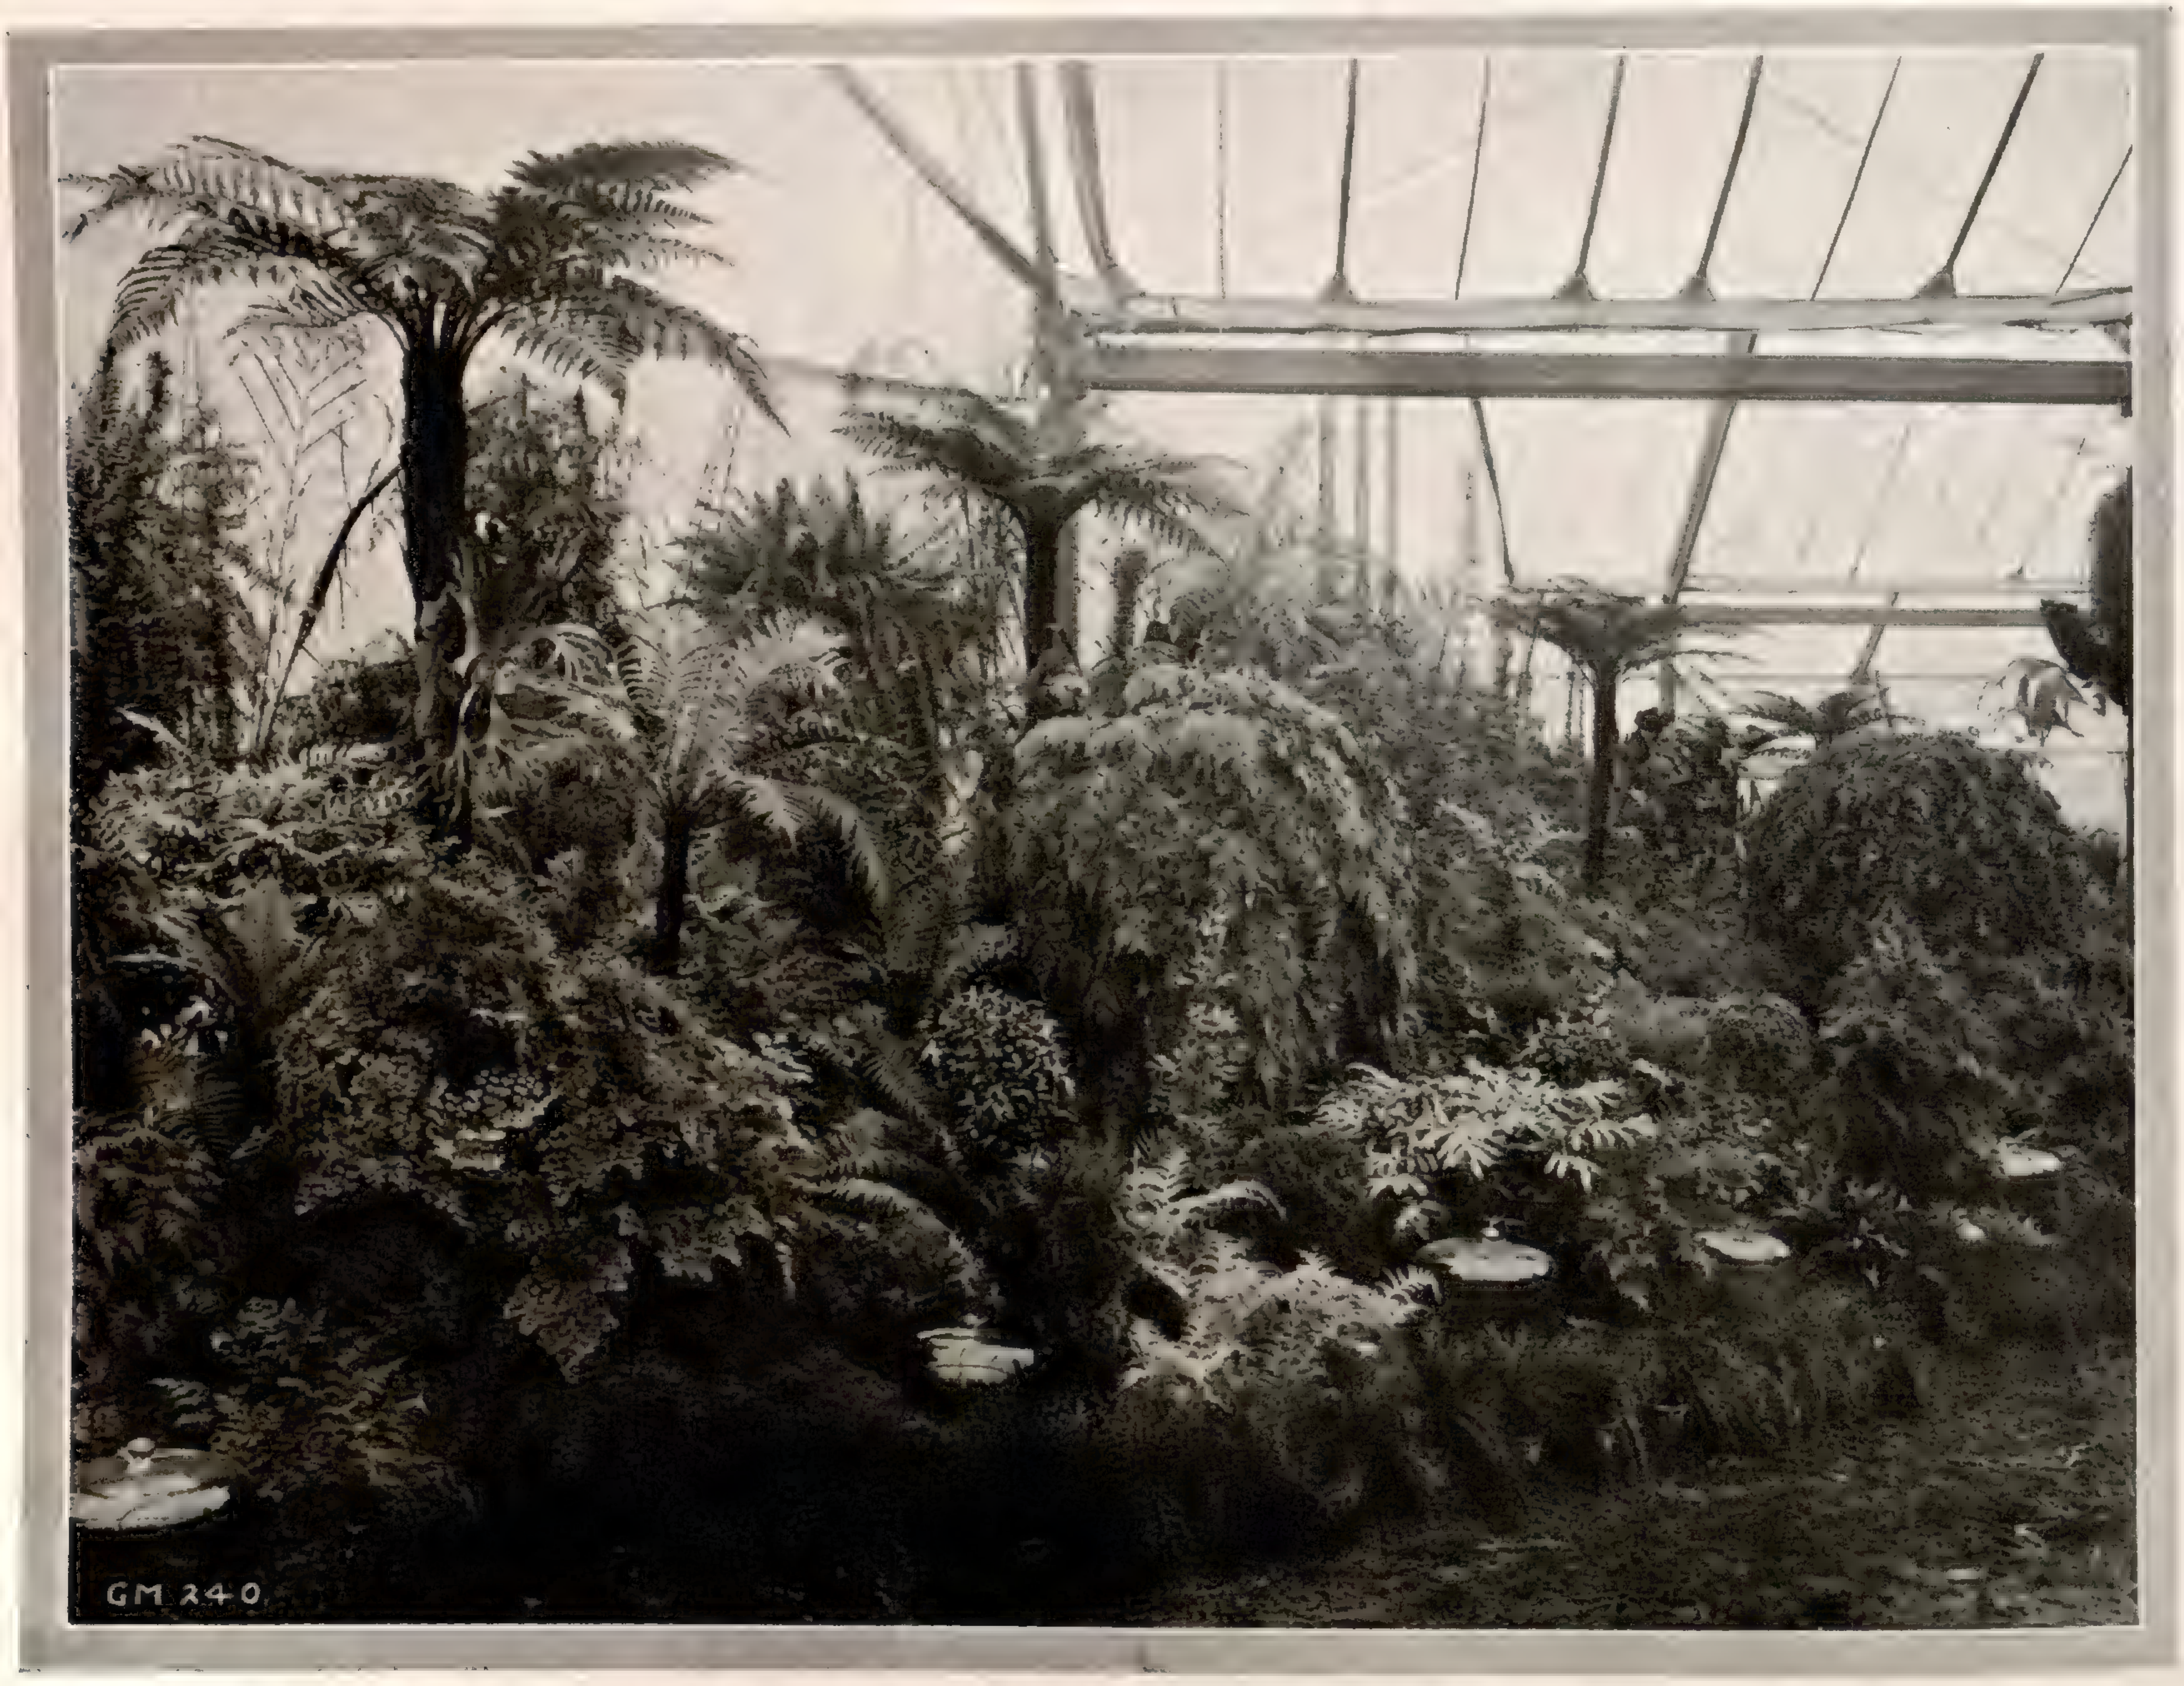
It is not sufficient to say that carnations were well shown, and that all the best varieties were represented, for it behoves us to put on record that there were staged the finest lot of these flowers we have ever seen, embracing American and British perpetuals, malmaisons, and borders, despite the early date for the last-named section. Scarcely a name that is known among the specialists was absent from the list of exhibitors, and, as might be expected, everybody had brought of their very best.

Mr. R. F. Felton, Hanover Square, London, had a very imposing group, arranged in bold but tasteful style. Massive vases and large baskets were filled with such varieties as R. F. Felton, Elektra, Sunstar, and Lady Northcliffe, the colours of the flowers being well set off by a groundwork of ferns and foliage plants. Mr. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, showed very effectively. He had plants of the good old blush malmaison, and also Lady Coventry, Duchess of Westminster, and other of the most popular perpetuals.

Another good exhibit was that from Mr. A. E. Usher, gardener to Sir Randolph Baker, Randstone, Blandford, who had well-grown plants of the leading perpetuals, arranged in effective mounds over a carpet of small ferns. In the extensive group put up by Messrs. Stuart Low and Co., Bush Hill Park, there were Baroness de Brienen, Lady Alington, Cinnabar, and a number of other good things. Mr. Chas. Turner, Slough, showed borders, among which Queen Mary, Ruby, Lady Desborough, and The Pearl may be mentioned as being among the most pleasing. Messrs. Young and Co., Hatherley, Cheltenham, showed, as usual, in splendid style, their flowers of Cecilia, The Hon. Lady Audley Neeld, Duchess of Devonshire, and other varieties being especially good. The pretty mauve flowers of Greswolde Williams, and Golden Glory were other distinct sorts shown by this firm.

Mr. Chas. Blick, The Warren Nurseries, Hayes, Kent, showed both perpetual and border varieties, his flowers bearing witness to splendid cultivation. King George, a lovely pure white border, and Lady Hermoine, a clear rose pink, were specially good. Mr. G. Lange, Hampton, had a very nice exhibit, and Mr. Burnett, of Guernsey, brought over a capital lot, including the remarkably fine Wodenethe, Mrs. C. W. Ward, Rex, and Alma Ward.

Mr. J. Douglas, Edenside, Great Bookham, had a lovely lot of new and very beautiful border varieties, among which Virginia, Mrs. Henwood, Jean Douglas, and Hercules were, if not the best, exceedingly good.



A COMPREHENSIVE AND REMARKABLY FINE COLLECTION OF EXOTIC FERNS.
Exhibited by Messrs. H. B. May and Sons, Edmonton.

The laced pinks class was won by Mr. C. H. Herbert, Acocks Green, who showed Ida, Iona, Fair Maiden, and Princess Mary. His competitor was Mr. J. Douglas.

Messrs. G. Mount and Sons, Canterbury, proved that they can grow and show other things well besides roses, for they exhibited a grand lot of carnations in one of the tents where the competitive classes were accommodated. Another nice lot of flowers came from the nursery of Messrs. G. and W. H. Burch, Peterborough, and we were very much impressed by the carnations shown by Sir Randolph Baker. Mr. G. F. Waters, Balcombe, made a fine effect with carnations, and another good collection was set up by the Clurry Nursery Company, Berks. Some beautiful flowers were seen amongst the carnations staged by Mr. A. F. Dutton, Iver, Bucks, and charming also were the flowers sent from Locksheath Nursery, Southampton. Effective in every respect were the carnations from Mr. G. Engelmann, Saffron Walden, and Mr. B. E. Bull,

### FRUIT TREES.

Messrs. Laxton Brothers, of Bedford, filled a corner of the grounds with a collection of trained fruit trees in pots and tubs. On the fence at the back were trained peaches and nectarines, carrying good crops of fruit, and in front of these were good specimens of espalier apples and pears, cordons, and peaches and nectarines in pots. All the trees were well grown and healthy in appearance. Messrs. Stuart Low and Co., Enfield, also sent a small collection of trained trees, but several of the specimens betrayed signs by the flagging of the foliage, that they had not appreciated being lifted.

It is questionable whether a finer specimen of a complete fruit garden at an horticultural show has ever been seen than that exhibited by Messrs. J. Veitch and Sons. It was conveniently placed in a sheltered corner, and loganberries in flower, climbing over arches, were the first indication of its presence. A line of fan-trained pears, cherries, peaches, nectarines, and plums ran round the back, interspersed with single cordons, to convey the idea of furnishing an outside garden wall, and next to this was a broad path encircling the group. Through the centre of the latter ran a path with vertical cordons on either side, and some capital specimens of what may be described as one-sided espaliers, suitable for planting at the ends of walls that are furnished with vertical cordons. That the trees came from Veitch's means to say that they were well-grown and trained, in the pink of condition as regards health, and, in addition to leathery foliage, the majority of the trees were furnished with good crops of fruit. In between the standards, bushes and pyramid apples, pears, plums, etc., were gooseberries and currants, figs and nuts in the course of training, and in front was a line of cordon gooseberries thickly studded with berries. All the trees were in pots and tubs sunk into the ground, and the carpet of green turf with which the soil between the trees was covered gave this unique fruit garden a most natural appearance. Apart from being interesting, this exhibit, as a demonstration of fruit culture, pruning, and training, was distinctly educational. Two standard apples in front, having luxuriant bunches of mistletoe growing in their heads, attracted much attention, but it is hardly necessary to say that the people who appreciated these specimens were not gardeners.

Inside the large marquee Messrs. Veitch and Sons were once more represented, but this time with a magnificent circular group of fruit trees in pots. Peaches and nectarines were the conspicuous feature, and most of the specimens were well covered with fruit. A treble cordon plum in a tub simply laden with fruit was much admired, and golden-yellow against a setting of green leaves, were the little oranges shown in baskets. Standard figs were a feature, and the specimens of standard and fan-trained peaches and nectarines in the group were remarkably well cropped. Altogether this was a very fine exhibit, and worthy of the reputation of the Chelsea firm. It may be added that this fine group was margined by a collection of finely-grown strawberries in pots.

Mr. Jas. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury, struck a new line in the idea of arrangement respecting his display of fruit. There were vines in the exhibit, trained over a series of bamboo arches, which formed a kind of pergola, and the bunches of black and white grapes hanging from the horizontal cross-pieces reminded one somewhat of an Italian scene. At the base of the pergola pillars hung melons which were shown in a growing state in pots, and fruiting vines in pots, as well as specimens of those peaches and nectarines in pots which Mr. Hudson grows so well, were also represented. Fruiting specimens of the famous Gunnersbury figs in pots were also included, and very tempting in appearance were the dark-red cherries, which hung from the branches of what looked like miniature orchard standard trees in pots. There were golden-yellow plums of the gage type nearly ripe, and altogether this was a fine collection of fruit trees to come from a private garden; and lastly there was hardly less credit due to the exhibitor for the picturesque method of arrangement as for the excellence of the material.

AN EFFECTIVE GROUP OF STELLATE CINERARIAS, CALCEOLARIAS, SCHIZANTHUS, ETC.
Exhibited by Messrs. Sutton and Sons, Reading.

Messrs. Laxton Brothers, of Bedford, had a very interesting circular exhibit of growing fruit inside the large tent. There were loganberries growing over arches, and underneath them fine fruiting specimens of the new Laxton berry, which, as it was exhibited, is a very promising-looking fruit. Variety was added by a mixture of peaches and nectarines, standard gooseberries, and currants in pots, all bearing good crops. There were strawberries, of course, and choice and tempting did the finely-coloured fruits appear. The chief varieties exhibited by the firm on this occasion were King George, which Laxton's claim to be an improvement on Royal Sovereign, and Maincrop, a very large, wedge-shaped fruit. A very striking novelty in the exhibit was a variety called the Earl, which produces deep and very striking-looking fruits. A very fine exhibit of much educational value are words that justly describe the group.

Messrs. Thos. Rivers, of Sawbridgeworth, were, of course, represented by those magnificient fruit trees in pots with which visitors to the Temple Show are familiar, but for this occasion notable additions were made. Peaches were very fine, particularly the Duke of York and Kestrel, and brightly red were the cheeks of the Cardinal nectarines, which peeped out from amongst the healthiest of green leaves. In addition to the above, there were some very fine fruiting trees of Lady Sudeley apple, Pitmaston Duchess pears, and Early Rivers plums, just changing colour. An old gnarled tree of the cherry Guigne Annonay, which stood in the centre in a pot, and well furnished with fruit, suggested the question as to whether Messrs. Rivers are attempting the art of growing dwarf orchard trees in pots after the manner of the Japanese pigmy conifers. Novel and extremely effective was the collection of oranges and lemons in pots, exhibited by this firm. There were massive citrons, almost as big as melons, white lemons, Maltese blood oranges, variegated oranges, egg oranges, all more or less large, and tiny little baby oranges. In fact, this exhibit was quite a demonstration of the material there is contained in the orange and lemon family.

All the way from Hereford came a very interesting collection of growing fruits set up by the King's Acre Nursery Company. We noticed pyramid and cordon gooseberries bearing good crops, and Comet red currants growing in the same form, simply roped with bunches of fruit. Peaches looked healthy, but the fruits were not yet ripe; and figs in pots were quite a good feature. Apples of James Grieve and other varieties in pots were very well cropped, as also were specimens of Pitmaston Duchess pear, and Jefferson plum. There was something novel about the umbrella-shaped peaches in pots, and the trained gooseberries and currants were much admired.

Messrs. Storrie and Storrie, of Glencarse, mixed fruiting trees in pots with flowers and foliage plants and ferns, but we cannot commend this as being the best way of exhibiting fruit trees to advantage. There were some shapely and well-fruited gooseberry bushes in pots, also currants, some fair cherries, and good specimens of peaches, pears, and plums.

Messrs. T. Rivers and Son easily won first prize with half a dozen cherries in pots, and Baron E. O. von Ernsthauson, Ditton Hill, was given a second for twelve peaches and nectarines. The Marquis of Salisbury had the best twenty strawberry plants, and the King's Acre Nursery Company won with six plums in pots, Messrs. T. Rivers and Son being second. The last-named firm had the best figs, and they also showed four fruiting vines in pots. Messrs. W. Seabrook and Son, Chelmsford, sent a few plum trees in pots, and a few specimen apples.

### FRUITS.

It was quite a relief to turn from the flowers and plants to the fruit section, and here we found Mr. N. F. Barnes, of Eaton, winning for the Duke of Westminster first prize for a collection of twelve dishes of fruit. Black Hamburgh and Madresfield Court grapes were very good, but it seemed a pity that the Muscats should have been cut at the unfinished stage they were in. Peaches were fine, also nectarines, there was a good dish of Lady Sudeley apple, and one of Transparent plum. The Marquis of Salisbury was second in this class with a collection in which grapes were weak, but strawberries and peaches were very fine.

In the class for a collection of nine dishes, his Majesty the King, Windsor, came in first. In this exhibit there were some good pieces of Black Hamburgh and Foster's Seedling grapes, as well as good nectarines and peaches. The second prize was awarded to the Duke of Portland, Welbeck, and the third prize was given to Mr. F. B. J. Wingfield Digby, Sherborne Castle, Dorset, for a collection which did not compare with the one mentioned above.

The best of the fruit classes was that in which prizes were given for a collection of fruit decorated with plants and flowers, and at the moment we were reporting the King and Queen came to inspect the exhibit from the Royal Gardens at Windsor that won the first prize. Conspicuous in the collection were fine Black Hamburgh and Madresfield Court grapes, Duke of York peaches, nectarines, and figs. Odontoglossums made up the floral decorations, with trailing smilax between the dishes. The Duke of Westminster had the second award, and here we thought the floral decoration was better, but the fruit, particularly the grapes, was not up to the standard of that which came from Windsor, though peaches, nectarines, and figs were very good. The Marquis of Salisbury was third, and here carnations provided the decorative material.

Lady Wantage, Lockinge Park, appeared to be the only exhibitor in the class for twelve bunches of grapes, and the first prize was richly deserved, as the Hamburghs, Foster's Seedling, and Madresfield Court were very good, and the bunches were set out in a highly decorative manner. The Trustees of the Duke of St. Albans, Bestwood Lodge, had the best dish of nectarines, showing Early Rivers, while the Duke of Portland won with a dish of peaches, and the trustees of the Duke of St. Albans for a collection of three dishes of peaches and three of nectarines.

Melons were sparsely scattered over a long length of tabling. The Horticultural College had the best pair, and they also won with a scarlet-fleshed specimen, and a green-fleshed melon. A. J. Thornhill, Esq., Huntingdon, had the best white-fleshed melon, and the Marquis of Salisbury won with a dish of figs.

For two bunches of black and two of white grapes, the Marquis of Salisbury won with very moderate samples, and all the exhibits in this class were second rate. The Trustees of the Duke of St. Albans had the best pair of Black Hamburghs, but the colour was deficient, and for Foster's Seedling Sir W. Greenwell won with bunches that were by no means finished. The Duke of Portland was the only exhibitor in the class for a pair of Buckland Sweetwater bunches, and won first prize. The name of the Duke of Portland appeared over a collection of several fine dishes of peaches and nectarines, and in the strawberry classes the Earl of Lytton had the best dish of twenty; while the Marquis of Salisbury won with a collection of nine varieties. The Duke of Westminster was the only exhibitor of plums, and won first prize with two good dishes of Golden Gage.

A GROUP OF PYRAMIDAL AND STANDARD BAYS.

Exhibited by Messrs. J. Veitch and Sons, Chelsea.

In further reference to melons, the Horticultural College at Swanley set up a nice collection of fruits, but the first prize in this class, which was for twenty-four fruits, was easily won by Mr. C. H. Beckett, Chilton Gardens, Hungerford, who displayed some magnificent fruits. The Duke of Westminster was a capital second in this class, and Mr. C. F. Raphael, Shenley, third, with quite a creditable lot. The Duke of Portland was the only exhibitor in the class for two dishes of cherries, and was awarded first prize.

It seemed more like September than May when one looked on the collection of apples shown by Messrs. G. Bunyard, of Maidstone, but everybody remarked how well the fruits had been kept, particularly the dishes of Smart's Prince Arthur, Sandringham, Alfriston, Northern Greening, Blue Pearmain, Sturmer, Wellington, and Newton Wonder.

### BEGONIAS.

Double tuberous begonias, more like giant dahlias in point of size, were shown by Messrs. Blackmore and Langdon, Bath, and the collection deservedly won the first prize. The colours were excellent, the flowers simply magnificent, especially Princess Victoria Louise, salmon-pink, and Mrs. Peter Blair, white. For the time of the year this was a really wonderful display. Messrs. T. Ware, Feltham, set up a very fine lot of double tuberous begonias, for which they were awarded second prize. Some of the flowers here were remarkably fine, and the colours rich and striking. Messrs. Blackmore and Langdon won the silver cup for a collection of single tuberous begonias with a group of fine plants, some of the fringed flowers being remarkably good; and the firm had the same honour in the class for fifty double tuberous begonias. In this collection the varieties Duchess of Cornwall, Winsome Partner, and Mrs. J. Booth were very good. Mr. W. S. Edwardson, of Sidcup, set up an interesting collection of tuberous begonias, which won first prize in their class; and Mr. F. Davis, of Pershore, set up a group that was quite creditable.

### CHINESE, JAPANESE, AND OTHER RARE PLANTS.

An immense collection of trees and shrubs, all raised by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, from seeds collected in Western China by Mr. E. H. Wilson, attracted the careful attention of all lovers of new, rare, and choice hardy plants. A very large number of kinds represented the genera rubus and vitis, but there were a few conifers, and a whole host of other things, and a few of outstanding merit were Salix magnifica, which has leaves eight inches by six inches; Juglans cattleayensis, Deutzia Veitchi, Deutzia longifolia, Cotoneaster divaricata, Potentilla fruticosa, Ailanthus Vilmoriniana, the graceful Cotoneaster Zabeli, Spiræa Wilsoni, Lonicera Maacki, the interesting Hydrangea Sargenti, the fine Cotoneaster salicifolia rugosa, with graceful pendulous branches, and Stranvaesia Davidiana undulata. This also was a wonderful collection, and one more evidence of the enterprise and potriotism of the private patrons of horticulture.

Messrs. W. Fromow and Sons, Chiswick, put up a goodly set of Japanese maples, but crowded these graceful plants rather much. The finely cut-leaved Acer japonicum laciniatum, A. palmatum linarifolium, A. p. roseum marginatum, and A. dissectum purpureum were a few of special merit in a fine set.

Messrs. J. Veitch and Sons, Chelsea, submitted a large group of no fewer than two hundred and forty species of Chinese plants, all introduced by them through their collector, Mr. E. H. Wilson, V.M.H. Climbing vitis and rubus were plentiful, while berberis, ilex, aralias, viburnums, osmanthus, and spiræas were quite numerous, many of them as yet unnamed. Here was material from which to add in future years to the attractions of our gardens. A few of the plants were in flower, and of these we made note of the pink Rosa Willmottiæ; Styrax Hemsleyanum, with drooping white flowers; Cotoneaster Harrowiana, Dipella ventricosa, with its green seed pods, Buddleia variabilis Veitchiana, Celastrus latifolius, the lovely pink large-flowered Deutzia Veitchi, and Hydrangea Sargenti and Stranvaesia undulata.

Messrs. Fisher, Son, and Sibray, Handsworth Sheffield, made several fine exhibits in the great tent, displaying the choicest of ornamental trees and shrubs, chiefly those with coloured foliage and elegant leafage. One of their groups was of Japanese maples, and it was a capital effort.

Mr. Fielder, gardener to Miss Willmott, V.M.H., exhibited a number of new shrubs, chiefly of Chinese origin. Rhododendron microphyllum, Berberis Gagnepaini, Deutzia longifolia, and Hydrangea Bretschneideri were the best of the flowering subjects.

The Rev. A. T. Boscawen, Ludgvan, Cornwall, staged a very pretty set of varieties of Leptospermum scoparis; the crimson-flowered L. s. Nicholi (F.C.C.) was especially fine, the whole plant thickly studded with its small red flowers; and L. s. Boscaweni is white (A.M.) Both these should prove very acceptable to lovers of such plants.

SOME OF THE FINELY-FRUITED ORCHARD HOUSE TREES
Exhibited by Messrs. T. Rivers and Son, Sawbridgeworth.

Messrs. F. Sander and Sons' new plants included the very graceful Adiantum Siebertianum, Mussænda Sanderi, with large white bracts; Alocasia Micholitziana, the variegated Eriobotraya japonica variegata, and Trevesia Sanderi of aralia-like habit; this set secured a first prize.

Roscœa cautilioides, a yellowish flower, was one of the prettiest of new flowers, and it was shown by Messrs. Bees, Lim.

### VEGETABLES AND SALADS.

One hundred square feet of tabling is a good deal of space to fill with vegetables, but this was well done by the Mempes Fruit Farming Company, Purley, and they well deserved the gold medal they won. We do not particularly favour cucumbers and tomatoes exhibited in boxes, but the produce was very fine, and along the front were dishes of the whitest of cauliflowers and the greenest of peas, crisp-looking lettuces, young carrots, and clean potatoes. The French beans in this exhibit were also very good.

There was a fair amount of taste in the arrangement of the collection of vegetables which won first prize for the Thatcham Fruit and Flower Farm, Newbury, and, except for the very small potatoes, the quality was of a good standard. Cauliflowers were quite a good feature, and growing peas, festooned in the background, looked very effective. The tomatoes, though small, looked very fresh, and the same may justly be said of all the dishes which lay on a bed of parsley on the stage.

We expected something good from that king of vegetable growers, Mr. E. Beckett, of Aldenham, at an International Show, but the collection set up exceeded our expectations. To say that the vegetables came from Aldenham House Gardens is equal to the expression that the arrangement was tasteful, and every dish on the table bore the stamp of good quality. The Duke of York, May Queen, and King Edward VII. potatoes, for the time of the year, were superb, and the clusters of peas carried the deepest of bloom. On a green board at the back were pearly-white cauliflowers, red and white celery, beet, cabbage lettuce, and marrows, and on raised stands in front one could not fail to admire the fresh, green cucumbers, the giant asparagus, fruits of the long purple egg plant, turnips, tomatoes, and butter beans. Carrots were as fresh as paint; turnips as white as snow, with butter beans of a lemon-coloured tint. It was a fine exhibit, and worthy of the man who grew and staged the produce.

Mr. C. F. Raphael won a first prize in a space of 50 feet with a collection of vegetables that was highly creditable. The best dishes were Sutton's Silver beet, potatoes in variety, early giant peas, cauliflowers, and marrows, and most of the dishes were displayed on wooden stands elevated above a white groundwork on the table. The second prize here was won by Mr. A. B. H. Goldschmidt, Mildenhall, and the exhibit was arranged somewhat similar to the above, but the third prize display, sent from the St. Vincent's Industrial School, Dartford, was only third-rate by comparison, and there was far too much greenery used in setting up the dishes.

The Duke of Portland won in the class for twenty-five dishes of vegetables with specimens that bore the Gibson stamp of quality. Fine indeed were the conical mounds of cauliflowers, lettuces, and marrows, and in front, raised above a groundwork of purple velvet folds, were grand dishes of green peas, broad beans, potatoes, cucumbers, the finest of marrows, and the freshest-looking of spring cabbage. A fine exhibit without a doubt.

In our opinion there was a little too much parsley used in the collection of vegetables which won first prize for W. H. Myers, Esq., Swanmore Park, but we have nothing but praise to give to the fine dishes of Centenary peas, Ideal potatoes, Red Milan turnips, and Perfection tomatoes. Late Queen broccoli, too, was very good, and Flower of Spring cabbage was nicely hearted. The Marquis of Northampton was a very good second, and T. H. Tatham, Esq., Kendall Hall, Elstree, third; but all through this class parsley was employed with a liberality that bordered on extravagance.

We liked the collection of vegetables that won the premier award for E. Biggs, Esq., Fleet House, Weymouth, the Early Gem carrots being especially good, and the arrangement tasty; but in describing the collection from W. B. M. Bird, Esq., Eastham House, Chichester, which was placed second, we again use the expression, too much parsley in the garnishing. J. A. Bigge, Esq., Frome, Dorchester, had the best six dishes, cauliflowers being the best feature; but Mr. H. Bradshaw's exhibit from The Grange, Steeple Aston, was not set out to the best advantage, though the vegetables were good.

Mr. S. Mortimer, of Farnham, won a first prize with the cucumbers for which he is famous; Mr. W. E. Alsen, Hants, second; and the Duke of Portland third. A. J. Thornhill, Esq., Huntingdon, also won a prize with six cucumbers; and Baron E. O. von Ernsthausen, Ditton Hill, was to the front with three.

A FINE COLLECTION OF STRAWBERRIES, CHIEFLY NEW VARIETIES, AND OTHER FRUITS.
Exhibited by Messrs. Laxton Brothers, Bedford.

Potatoes were not a great show, as might have been expected, but Mrs. Dennison, Berkhamstead, showed six nice dishes, which won a first prize; and for three varieties W. H. Myers, Esq., Swanmore, exhibited some very nice examples. We have not for a long time seen a prettier arrangement of salads than that which was set up by Mr. E. Beckett, and won first prize; W. H. Myers, Esq., was second, but this exhibit would have looked better without the wood-wool between the dishes. Tomatoes were both numerous and good, the Duke of Portland being a splendid first with six dishes; and the specimens shown from Swanmore in the three-dish class were equally good. Giant asparagus was shown by Mr. A. J. Harwood, Colchester; and Mr. J. Garland, Exeter, also showed some good heads.

In point of numbers, French beans were rather weak, and H. W. Myers, Esq., won with very tender pods. A few dishes of broad beans appeared, and here Mr. W. B. M. Bird took the chief honours. In the beet section, Mr. E. Biggs was to the front, and the Duke of Portland had by far the best cauliflowers. In the carrot class the Duke of Portland was the leading prize winner, and Messrs. Tigwell and Sons, Greenford, had the best exhibit in the mushroom class. Green and well-filled were the pods of green peas with which Mr. W. H. Myers was first, and for a single dish of potatoes the Duke of Norfolk won with Sutton's Balmoral Castle, the same exhibitor also being on the top with a dish of a variety not in commerce, showing a potato called Sutton's New White. There were a few lots of radishes, in this class Mr. W. H. Myers being the winner; and in the rhubarb class Mr. E. J. Preston showed sticks of enormous dimensions. White, fresh-looking turnips won a prize for Mr. W. H. Myers; and the Duke of Portland was the only exhibitor of three pairs of marrows. The Halliford French Garden, Shepperton, sent a lot of vegetables and salads from their establishment, and conspicuous amongst them were carrots, lettuces, cauliflowers, turnips, and radishes.

Quite a big expanse of tabling was filled with vegetables from Messrs. Carter's, Raynes Park. Everything staged was fresh and good, and conspicuous in the multitude were cauliflowers, cabbage, tomatoes, and new potatoes. The length of tabling filled with vegetables from Messrs. Veitch's, of Chelsea, was loaded with fine, clean specimens. Growing peas in pots made a suitable centrepiece, and other conspicuous features were some grand cauliflowers, mushrooms, tomatoes, cabbage, turnips, and lettuces; the vegetables were tastefully displayed in neat wicker baskets. Gigantic stalks of rhubarb were staged by Mr. T. E. Dawes, Norfolk. Very effective banks of spring cabbage, and a beautiful lot of lettuces were shown by Mr. E. Beckett, from the Aldenham Gardens.

## HARDY RHODODENDRONS AND AZALEAS.

These two important classes of hardy shrubs were contributed in large numbers, and arranged in bold groups in the various parts of the large tent they produced a rich and tasteful display of colour. Prominent among the several exhibitors were Messrs. J. Waterer and Son, of Bagshot, who had a tastefully arranged group, remarkable alike for the splendid development of the plants and the high quality. The colection consisted of finely-flowered bush specimens interspersed with equally well-bloomed standards. The exquisitely beautiful Pink Pearl was prominent, as also was the equally beautiful pink Mrs. Sterling, which also is one of the fine varieties distributed by the firm. Especially noteworthy among the bush specimens were the glowing carmine Dorothy Fortescue, the lovely lavender-pink Lady Hillingdon, the brilliant red Marquis of Waterford, the rose-tinted white Mrs. John Clutton, the rich scarlet Prometheus, the deep scarlet Michael Waterer, the white Duchess of Connaught, the purple-blotched Sappho, the deep pink Stutagart, the bright carmine Cynthia, the deep pink Kate Waterer, the bright orange red Mrs. Holford, and the blush Miss Clementine Walsh. Very fine in the group were the standards of Pink Pearl, Marquis of Waterford, and Gower Waterer. Messrs. J. Waterer and Son also had a huge group, in which big bushes and standards of Pink Pearl were predominant, and produced a delightful effect. In this group were also fine examples of the pure white Mrs. Tom Agnew Everstianum, one of the oldest of the rhododendrons, and one of the best in its colour, which is an exquisite shade of lavender-rose; and Charles Bagley, an effective variety, bearing large trusses of deep rose-coloured flowers. A glorious display of colour was produced by the great group

# Canary Guano

**"THE BEST IN THE WORLD."**

There is no Fertilizer that gives such good all-round results as Canary Guano. It is used by the leading Amateur and Trade Growers all over the country. A postcard to the Manufacturers will ensure full particulars. . . . . .

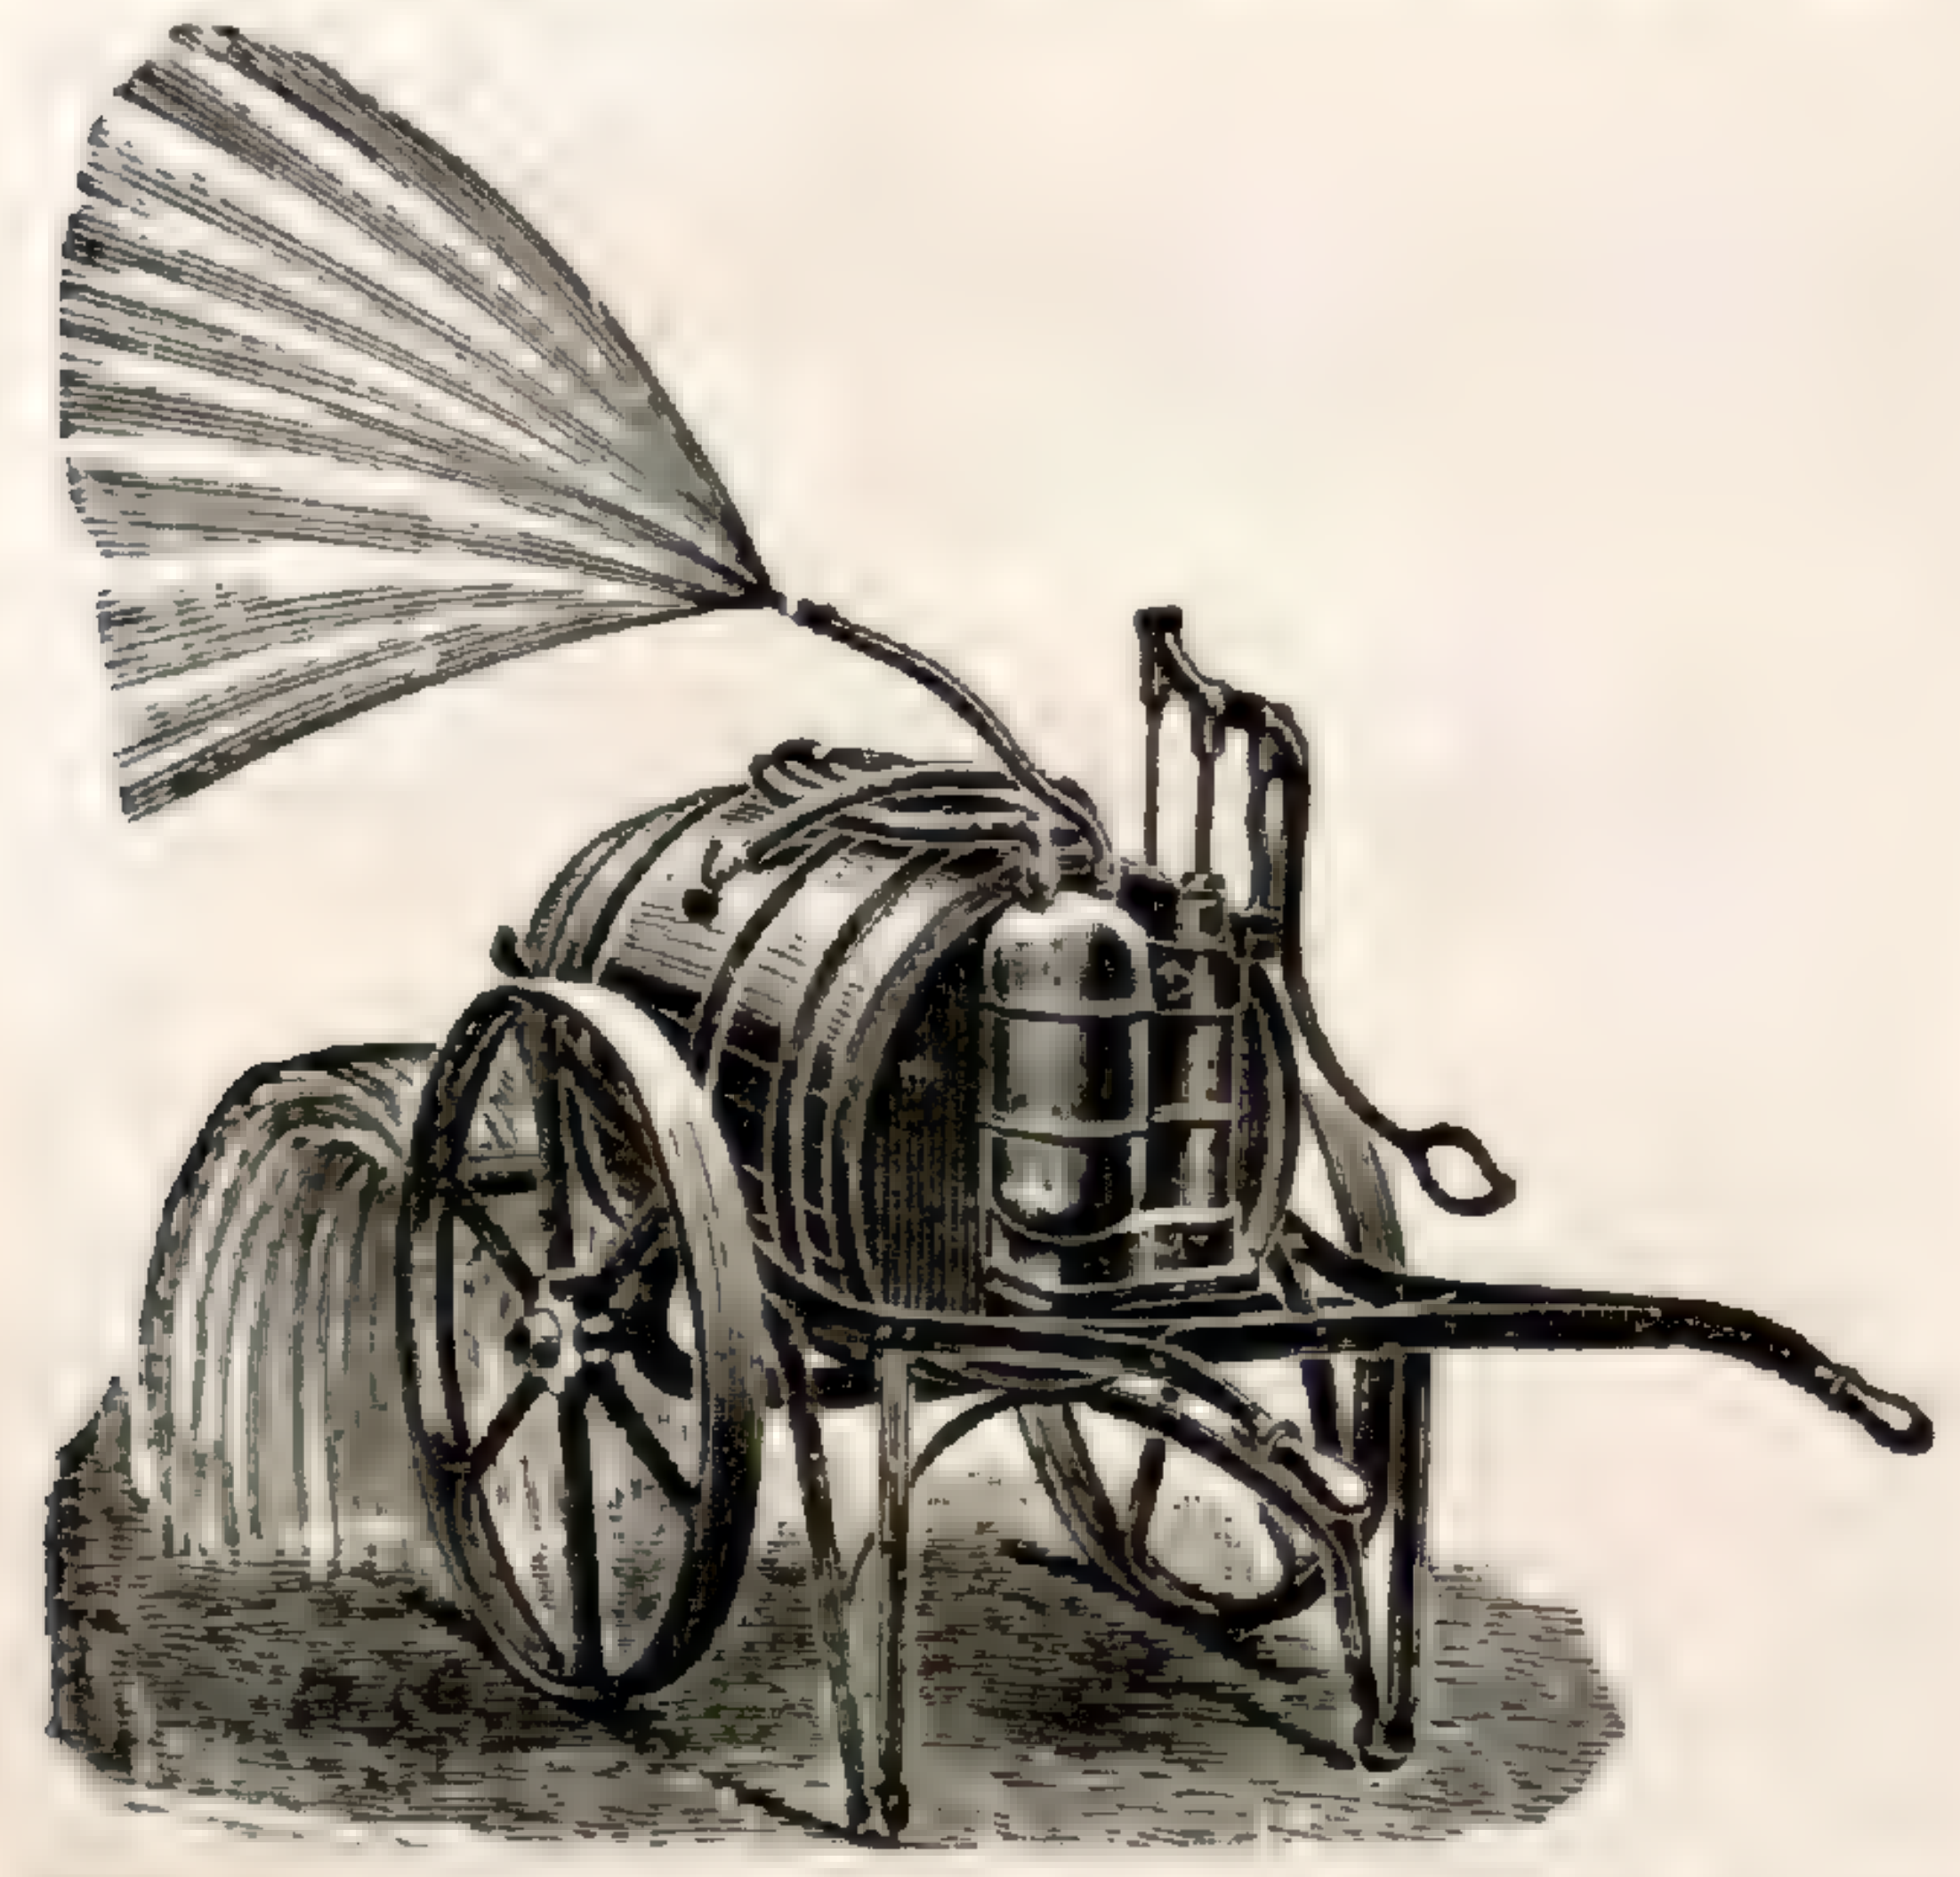
**Sold by practically all Seedsmen in Tins, 6d., 1s., and 2s. 6d., and in Bags (14lb.) 3s. 6d.; (28lb.), 6s.; (56lb.), 11s., and 1 cwt., 20s. each.**

**Manufactured by:**

**The Chemical Union,**
**IPSWICH. Ltd.**

# An Indispensable Spraying Machine

*No. 87a.—Spraying Machine fitted with Powerful Pump and Automatic arrangement for keeping insecticide preparations well mixed during use.*



Will throw water a distance of 60 feet; a most valuable Implement for destroying Garden Pests in Rose or Fruit Trees.

CASH PRICE, CARRIAGE PAID, to hold 36 gallons, with galvanized spreader, extra powerful pump and two ⅝ in. delivery hoses, each 6 ft. long with spreaders. Complete **£8 16 0**

**HOSE AND HOSE REELS.**

# THE FLOWER GARDEN

A practical, up-to-date work on the Formation, Planting, and Management of the Flower Garden, and the Cultivation of Flowers and Plants adapted for outdoor culture. By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening," etc.

CONTENTS.

FASHIONING THE GARDEN.—Aspect, Soil, and Methods of Levelling and Designing.

BEDS AND BORDERS.—How to Form and Plant Them to the best advantage.

WALKS AND PATHS.—Mode of Formation and General Management.

LAWNS AND TENNIS COURTS.—Formation from Seeds or Turves and Maintenance.

SHRUBBERIES. — How to Lay Out and Plant Effectively with Trees and Shrubs.

ROCKERIES AND FERNERIES.—Their Construction, Planting, and Management.

WATER GARDENS.—Arrangements, Selection, and Culture of Water-loving Plants.

ARBOURS, SUMMER-HOUSES, ARCHES, AND PERGOLAS.—Position, Style, Construction—Selections of Suitable Plants.

EDGINGS.—Turf—Tiles—Burrs—Box—Ivy, etc.

WILD GARDENS.—Their Arrangement and Suitable Plants and Flowers.

FENCES. — Brick Walls—Stone Walls—Wooden Fences—Privet—Holly—Box—"Quick-thorn" Hedges, etc., with approximate cost.

GARDEN PRACTICE.—Planting—Transplanting—Pruning—Watering—Mulching — Manuring—Weeding, etc.

PROPAGATION.—By Seeds — Cuttings—Layering—by Division—Budding—Grafting, etc., described and illustrated.

COLOUR ARRANGEMENT.—Schemes for Planting for Effect in Sunny and Shady Beds and Borders, with Plants and Lists of Suitable Plants and Flowers.

BEDDING.—How to Plant Beds Effectively so as to ensure a pretty garden during the year.

ANNUALS AND BIENNIALS.—All the best kinds described, with full cultural details.

BULBS.—The Best Bulbs and Tubers for Outdoor Culture, with modes of Cultivation.

PLANTS AND FLOWERS.—All the General Species and Varieties worthy of Cultivation, with the modes of Culture described.

CLIMBING PLANTS.—A Complete List of Evergreen, Deciduous, and Annual Climbers, and their adaptability for various positions.

TREES AND SHRUBS.—The most Suitable Kinds for Shrubberies, or as Specimens on Lawns—Culture—Management, etc.

PESTS AND DISEASES.—Insect, Animal, and Fungoid Pests, which are injurious to flower garden plants, fuly described.

WEST, Higham Hill, London, N.E. Please ask your seedsman for West's Patent Garden Sundries.

of medium-size and splendidly-flowered dwarf specimens contributed by Messrs. Fletcher Brothers, Ottenshaw Nurseries, Chertsey; the arrangement was bold, and the colours contrasted with good effect. Immensely attractive were the hardy azaleas arranged in bold groups in their rich red, orange, and yellow hues. Occupying a prominent position in the big tent was the immense group arranged by Messrs. R. and G. Cuthbert, Southgate. On many occasions have this firm presented these useful and richly-coloured shrubs to public notice, but in no case were they in finer form than on this occasion. Dwarf and bush specimens were equally good, and conspicuous among the many fine varieties were the deep golden Nicholas Beets, the light orange President George, the soft red Frau van der Bour, the rich pink Fairy Queen, the soft yellow Anthony Koster, and other of the leading varieties.

A liberal contribution to the colour effects in the great tent was made by the effectively arranged group of mollis azaleas, arranged by Messrs. J. Veitch and Sons. Messrs. W. Cutbush and Son exhibited hardy azaleas in fine form, the varieties being chiefly the fragrant Ghent varieties. A rich display of colour was provided by the fine group arranged by Messrs. Jackman and Son, Woking. The varieties were of the best, the plants well bloomed, and the colours tastefully arranged. Ghent azaleas were also well shown by this firm.

## GREENHOUSE PLANTS.

Messrs. J. Carter and Co. decorated the left-hand side of the entrance, and they did it in their very best style. There is hardly need to say anything more, but there were glorious banks of schizanthuses, beds of stocks and petunias that were worth going miles to see, and the latter stood out from a temporary lawn of the greenest of grass. Beautiful in every particular were the banks of cinerarias, and suspended from the roof were well-furnished flower-baskets. Up the pillars climbed pink roses; palms and conifers formed the background, and—well, the exhibit was Carter's; we need add no other word.

Right in front of you as you entered this great exhibition was a mountain of Cineraria cruenta encircling a column inscribed with the names of fallen British soldiers, and as we approached it we heard a policeman observe that he did not suppose anything like it had ever been seen before. We were inclined to agree with the man in blue, and are rather at a loss for words to describe this magnificent display from the nurseries of Messrs. Sutton and Sons, Reading. The chief part of it was set out in a square, the cinerarias referred to in the middle, a mass of schizanthuses at this corner, then a bed of glorious begonias, a corner of wonderful gloxinias, another of calceolarias, a third of Primula obconica in many shades of colour, and circular masses of rose-coloured clarkias. The sloping sides of the square were edged with green turf, and every item bore the stamp of Sutton all over it.

Further on to the right you saw another grand exhibit from Messrs. Webb and Son, Stourbridge, in the form of an oblong. The schizanthuses, calceolarias, and cinerarias in huge mounds almost dazzled you with their brightness; but the green ferns beneath gave relief, the white lily of the valley were chaste and sweet, the hippeastrums showy, and the white Lilium longifolium pure and spotless. Graceful bamboos and palms gave a finish to an exhibit of surpassing beauty.

On the left as you entered the big tent, Messrs. Cannell and Sons, Swanley, were represented by a glorious bank of showy cannas, calceolarias in beauty, trusses of zonal pelargoniums, and other flowers, which were backed with a collection of rambler roses. A very pretty little collection of Saintpaulia Ionantha were shown by the Marquis of Salisbury.

Rather flat in arrangement, but nevertheless effective, was the group of well-grown gloxinias that won a cup for Messrs. J. Peed and Son, Norwood; and Messrs. R. Kerr and Son, Liverpool, sent up a nice lot of hippeastrums.

The one and only group of sarracenias came from Mr. A. J. Bruce, Manchester, and it deservedly won the gold medal, for the quaint plants were arranged in a delightfully tasteful manner, water and green moss being artistically used in putting up the group.

Messrs. Stuart Low and Co., Enfield, had a wonderfully interesting group in the big tent, which was full of surprises, for you came first on a bank of greenhouse plants in which hydrangeas and ericas predominated; and the next thing to claim attention was a big collection of bottle-brush plants that were much admired. Just round the corner was a very interesting collection of pillar and rambler roses that are described under that section.

Valley lilies and William Iceton, of Putney, are inseparable, and a whole bank of these sweet, spotlessly white flowers peeping above a groundwork of pale green foliage attracted the eye, and the scent was delicious.

The name of Messrs. Geo. Jackman, of Woking, and clematises go together, and the group of these beautiful flowers staged in the big tent was worthy of the firm. We have not space to describe them, but it is doubtful whether the firm has ever shown a finer lot of plants.

THE PRESIDENT'S CUP.

For the most meritorious contribution to the Exhibition, exclusive of Orchids.
Won by Messrs. VEITCH and SONS.

Quaint, pretty, some sweet, others pepperminty in their scent, are adjectives which describe one or other of the scented pelargoniums exhibited in the solid-looking group from the Hon. Vicary Gibbs, Aldenham House; but for those who had time to examine them the plants were highly interesting.

A group of standard acalyphas that were remarkably well grown came from Colonel the Hon. Mark Lockwood, Romford, and next to them was a blazing of zonal pelargoniums that were dazzling in their brightness. Mr. Phillip Ladds, of Swanley, had the first prize for these with finely-grown plants, and Mr. W. A. Page, Hampton, had some striking mounds of flowers.

Great wings of pillar fuchsias clothed with pendant flowers stretched to the right and to the left over the group of greenhouse plants that came from Messrs. J. Veitch and Sons, Chelsea, and underneath were solid banks of beautiful gloxinias, gerberas, or Barberton daisies, pretty little dwarf cinerarias, and schizanthus hybrids. There were also hippeastrums in variety, a grand lot of streptocarpus, and the whole made up one of the finest collections in the show. Mr. Philip Ladds, Swanley, sent some fine specimens of the salmon Paul Crampel zonal.

A nice bank of calceolarias was set up by H. Buckston, Esq., Sutton-on-the-Hill, Derby, which were given a first prize in the class for twenty plants. A collection of a fine strain of large-flowered Primula obconica was set up by Messrs. W. Artindale and Son, Sheffield, and Messrs. Stuart Low and Co. showed some hybrid gerberas.

Some fine specimens of Bottle-brush plants, Metrosideros floribunda, were shown by the Marquis of Ripon, Kingston, and one thought of the shows of other days when one looked at the conical azaleas, all well flowered, that were shown by Mr. Charles Turner, of Slough, who appeared to be the only exhibitor.

Splendidly grown and flowered were the tall pyramid fuchsias exhibited by Mr. Jules Friedlander, Reading, and they deservedly won the first prize that was awarded to them. Half a dozen standard heliotropes, which came from Aldenham House, were quite effective, and Mr. Chas. Turner won with a specimen azalea.

Show pelargoniums in quantity came from Mr. A. Brandt, Bletchingley; also from Mr. W. Tresedar, Cardiff; and the Hon. Vicary Gibbs, Aldenham House, set up some nice specimens of scented geraniums, which won a first prize. The first prize for a collection of Bottle-brush plants was won by Messrs. Stuart Low and Co., Enfield.

A very fine bank of lilacs in full bloom was exhibited in the big tent by Messrs. Jas. Veitch and Sons, Chelsea; and Messrs. Godfrey and Son, Exmouth, made a fine display with show pelargoniums and Oriental poppies. Not the least conspicuous feature in the large tent were the fine specimen plants of scented geraniums that were sent by Mr. J. Hudson, of Gunnersbury. A big collection of quaint cacti was shown by Mr. H. N. Ellison, West Bromwich, who also exhibited a pretty lot of ferns.

Mr. Philip Ladds, Swanley Junction, made a pleasing display with a group of plants, amongst which were fuchsias, pelargoniums, and hydrangeas.

Messrs. J. Peed and Sons, Norwood, were large exhibitors of spotted and self gloxinias, of fine form and substance, and for these they secured a premier award, as they also did for a considerable exhibit of freely-flowered and bright streptocarpuses. Near by the Hon. J. Ward, Hungerford, put up a large group of streptocarpuses, and gained a second prize therewith.

Calceolarias shown by Mr. Goatly, gardener to Lord Northcliffe, Sutton Place, Guildford, formed a bright display, but the cinerarias from the same garden were of higher excellence and merited a first prize; the pink shades were charming. Mr. Goatly was also first for a stellate cineraria with a pretty bank of elegant plants. Yuccas and many succulents from Mr. W. A. Manda, New Jersey, won several prizes.

Miss Troyte Bullock, Yeovil, contributed an interesting collection of scented and Cape pelargoniums, the group containing no fewer than 126 varieties; here was material to help in the elucidation of the nomenclature of these interesting plants at the Wisley trials.

Messrs. W. Wells and Co., Merstham, showed what could be done with chrysanthemums in May by putting up excellent flowers of Queen Mary, Mrs. W. Wells, and early singles; with these they showed their fine new Carnation Wodenethe. In one of the classes the Messrs. Wells and Co. secured first prize with a quite bright collection, chiefly early varieties; Mr. J. E. Knight, Wolverhampton, came second.

## HARDY PLANTS AND FLOWERS.

The wonderful display of hardy perennials for border, rockery, and wild garden was bewildering in extent and variety, and full of absorbing interest. Surely in no feature of the exhibition was there so sharp a contrast between the 1912 exhibition and that of 1866. The vast strides that have been made in raising all manner of hardy flowers of pleasing form, colour, and habit were demonstrated in no uncertain manner, and the heart of the hardy plant enthusiast rejoiced amid the glorious banks of herbaceous and the less imposing but equally fascinating alpines. Would that we could convey to those of our readers who had not the privilege to see for themselves a fair idea of what these exhibits were really like, but, as we hastily pen our notes, we realise that it is impossible in cold print to do full justice to the grand display or to any individual exhibit.

Competition was keen in the class for herbaceous plants, excluding pæonies, for which Sir Trevor Lawrence's cup was offered. This award went to Messrs. G. and A. Clark, Lim., Dover, who showed clean, well-grown plants in big masses tastefully arranged as to colour and natural style. Lathyrus pubescens was one of the uncommon plants included in the exhibit, which was remarkably good throughout. Messrs. Jackman and Sons staged well in this class, but unfortunately disqualified themselves by including pæonies. Second prize went to Messrs. W. Artindale and Son, Sheffield, who also had some good things, among which Geum Heldreichi magnificum and some of the newer verbascums figured largely. Another great bank of the best perennials of the season came from Messrs. Bunyard and Co., Lim., Maidstone; and Messrs. Kelway and Son, Langport, brought choice pyrethrums, pæonies, and gaillardias, which, needless to say, were all of the highest possible quality.

In one of Messrs. Bees, Lim.'s several exhibits were staged some of the new primulas which the firm have introduced from China. P. Beesiana, P. Bulleyana, and P. malvacea were accompanied by the dainty white form of P. malacoides. Oriental poppies of uncommon colours were the strong point in Mr. W. J. Godfrey's exhibit, some of the terra-cotta and fawn shades being very charming.

Messrs. John Forbes (Hawick), Lim., put up a collection of pentstemons and phloxes, together with a few delphiniums, violas, and antirrhinums. Of the pentstemons Mrs. Michie, King George V., and Dr. E. Behring, a pure white, were grand. From the Lissadell Nurseries, Sligo, came a big batch of their very attractive hybrid primula, named the Lissadell hybrid. It is a good-habited, pretty coloured, and very showy variety that has a more vigorous constitution than P. × Unique, to which it is somewhat similar in form and colour.

Messrs. Wallace and Co.'s group of liliums was extremely choice. There were such old favourites as L. testaceum excelsum, L. Browni, L. Krameri and umbellatum, and also the less familiar L. tenuifolia Golden Gleam, L. rubellum, and others. The outstanding feature of Messrs. Cocker and Sons' exhibit was Anemone alpina sulphurea, which was put up in big baskets, the plants carrying great numbers of their pleasing flowers. Trollius and gentians were also good on this stand.

Dr. Macwatt, Morelands, Duns, N.B., brought an exhibit of hardy primulas that was surely as choice and varied a collection as has ever been exhibited in Britain. To name the novelties and rarities in this group would be to compile a catalogue of the best primulas in cultivation, but we must mention P. Listeri, P. Watti, P. Winteri, and P. geranifolia, which has never, to our knowledge, been staged before.

A plant of more than ordinary interest was Calceolaria Veitchi, exhibited by Messrs. R. Veitch and Son, Exeter. It is a very elegant plant, with loose heads of creamy tinted flowers, and it has proved hardy in the Southern Counties. Bronze Age is a fine variety with richly-coloured flowers.

It was a splendid group of primulas that was exhibited by the Right Hon. Lord Northcliffe, Sutton Place, Guildford. P. japonica varieties and pulverulenta hybrids were beautifully flowered, and the nodding yellow flowers of P. sikkimensis were very sweet. Hybrid gerberas from Messrs. S. Low and Co., and also from Mr. H. N. Ellison, West Bromwich, came in for a good deal of admiration. Messrs. Seagrave and Co., Sheffield, and Mr. Chas. Turner, Slough, were exhibitors of twenty-four varieties of violas in pans, baskets, and boxes. Their exhibits were very creditable, and another capital exhibit of violas in pans came from Messrs. Whitelegg and Page, Chislehurst, their varieties being of the latest and best.

Mr. Amos Perry's exhibit was of a varied and very interesting character, the bulk of it being in the form of batches of plants suitable either for cultivation on rockeries or on the margins of ponds or streams. Veronicas, violas, and irises were strong, and the lovely Ixiolirion tartaricum was also well shown. A good length of staging was filled with liliums, and splashes of vivid colour were provided by Oriental poppies, among which a new fringed variety was very attractive. A magnificent collection of rock plants and flowering shrubs was arranged by Mr. J. Grandfield, gardener to Sir Everard Hambro, Hayes Place, Kent. There were represented the choicest of encrusted saxifrages, the brightest of dianthus, and the most elegant heucheras. Among a great many rarities Jankea Heldreichi macedonia was a centre of attraction to all the specialists.

MESSRS. SUTTON AND SONS' CUP.
Offered for the most meritorious collection of Vegetables.

A class for alpine plants on a table of fifty superficial feet brought some very good entries. Messrs. Thompson and Charman, The Nurseries, Bushey, had some good plants of Ramondia pyrenaica alba, Dianthus subacaulis, and, in fact, a host of choice gems. On Messrs. Bees' stand a little group of Roscoea-cautilioides, a novelty from China, was quite distinct from anything else—a plant with a future before it. Messrs. Artindale and Son, Sheffield, made a feature of hardy cypripediums, and they also had a choice assortment of primulas, saxifrages, etc. Mr. Andrew Campbell, Ardross, Pannal, Yorks, had a tastefully arranged group that showed a good deal of merit in arrangement, the plants being of a quiet but pleasing character.

Tree pæonies from Messrs. Artindale and Son were really magnificent, Queen Elizabeth being of particularly attractive colour and large size. Messrs. Fred Smith and Co., Woodbridge, made a bold display of bright flowers such as heucheras, Rehmannias, geums, and aquilegias. The same firm also showed annuals and biennials in pots, the clarkias and schizanthus being very beautiful.

## HARDY CUT FLOWERS.

Messrs. Barr and Sons occupied about 600 square feet across the end of the big tent, filling this great space with batches of distinct classes of hardy flowers, among which the German irises, the lupins, and anchusas were as effective as anything, although the eremuri were very noble in aspect. Worthy of note were some excellent polyanthus and auriculas, which Messrs. Storrie and Storrie, Glencarse, Perthshire, staged among their fruit trees and bushes. They also showed their pretty hybrid poppies in a delightful range of colours. Messrs. G. and A. Clark, Lim., Dover, had an effective group of irises, pyrethrums, Oriental poppies, and other bright subjects, arranged in mounds finished off with good spikes of eremuri. Mrs. Lloyd Edwards, Bryn Perog, near Llangollen, showed her set of heucheras, and the rich-coloured Aubrietia Lloyd Edwards.

Mr. G. W. Miller, Wisbech, put up a big mass of his now well-known and popular pyrethrum Queen Mary, and also several other attractive varieties, both single and double. Violas in bold masses constituted the chief feature of one of Messrs. Dobbie and Co.'s stands, and aquilegias of rich decided colours were also staged in great quantity by this firm. Messrs. Gunn and Sons, Olton, Warwick, brought some good phloxes and a mass of their viola Cornuta purpurea.

Messrs. Dickson's, Lim., Chester, had a striking mass of Delphinium Persimmon, also Astilbe Arendsi Vesta, and a great variety of alpines in full flower that made an attractive show.

Violas were shown in quantity, the class for twenty-four varieties bringing three strong entries, among which the winner was Mr. F. J. Bell, Crescent Nursery, Whitley Bay. Second went to Messrs. Seagrave and Co., Sheffield; and third to Messrs. Bastock and Sons, Birmingham. Each stand made a great point with Moseley Perfection, and other good varieties were Lady Grant, Countess of Eglinton, A. J. Bastock, Mother Bastock, and Agnes Kay.

Messrs. J. Harkness and Sons, Bedale, took the lead for a collection of cut herbaceous, covering 200 square feet. Its most telling subjects were Verbascum Miss Willmott, Trollius Triumph, some fine pink lupins, and gorgeous Oriental poppies. Messrs. R. H. Bath, Lim., Wisbech, were large exhibitors of tulips, the flowers being very large and fresh. The varieties embraced many of the best in cultivation. The same may be said of the excellent group put up by Messrs. Barr and Sons, Covent Garden, W.C.

Mr. W. T. Ware, Bath, showed the clear, bright-yellow tulip named Inglescombe Yellow, a capital variety that appeals to everyone, so rich is its colour.

A grand lot of Darwins were shown by Messrs. Alex. Dickson and Sons. Lim., Dublin. Don Pedro, a very distinct bronze-coloured variety was attractive. An unnamed seedling of a darker, mahogany shade was promising, and Orange Globe, Moralis, and Klondyke were all good. Messrs. Hogg and Robertson, Lim., Mary Street, Dublin, showed Darwin tulips in quantity, and a vase of the flaked cottage tulip Scotia was very attractive. The same firm put up early gladioli, ixias, and bulbous irises, all of which were good.

Messrs. W. and J. Brown, Stamford, had a miscellaneous exhibit, among which the border flowers predominated. Gaillardia Lady Rolleston and a number of fine seedlings from that variety were conspicuous. St. Brigid anemones, from Messrs. Reamsbottom and Co., Geashill, Ireland, were a source of great attraction; and the ever-popular centaureas, from Messrs. Jarman and Co., Chard, made another fine display, aided as they were by Viola cornuta. aquilegias. clarkias, and other seasonable flowers. Messrs. Bees, Lim., showed a miscellaneous group of border flowers of the usual early summer subjects, their lupins and single pyrethrums being fairly good.

## CANADA AND AUSTRALIA.

The elegance of the Canadian display was the talk of the show. In a beautifully-furnished tent the Government staged huge glass urns, containing splendid samples of apples, pears, peaches, and grapes. It was

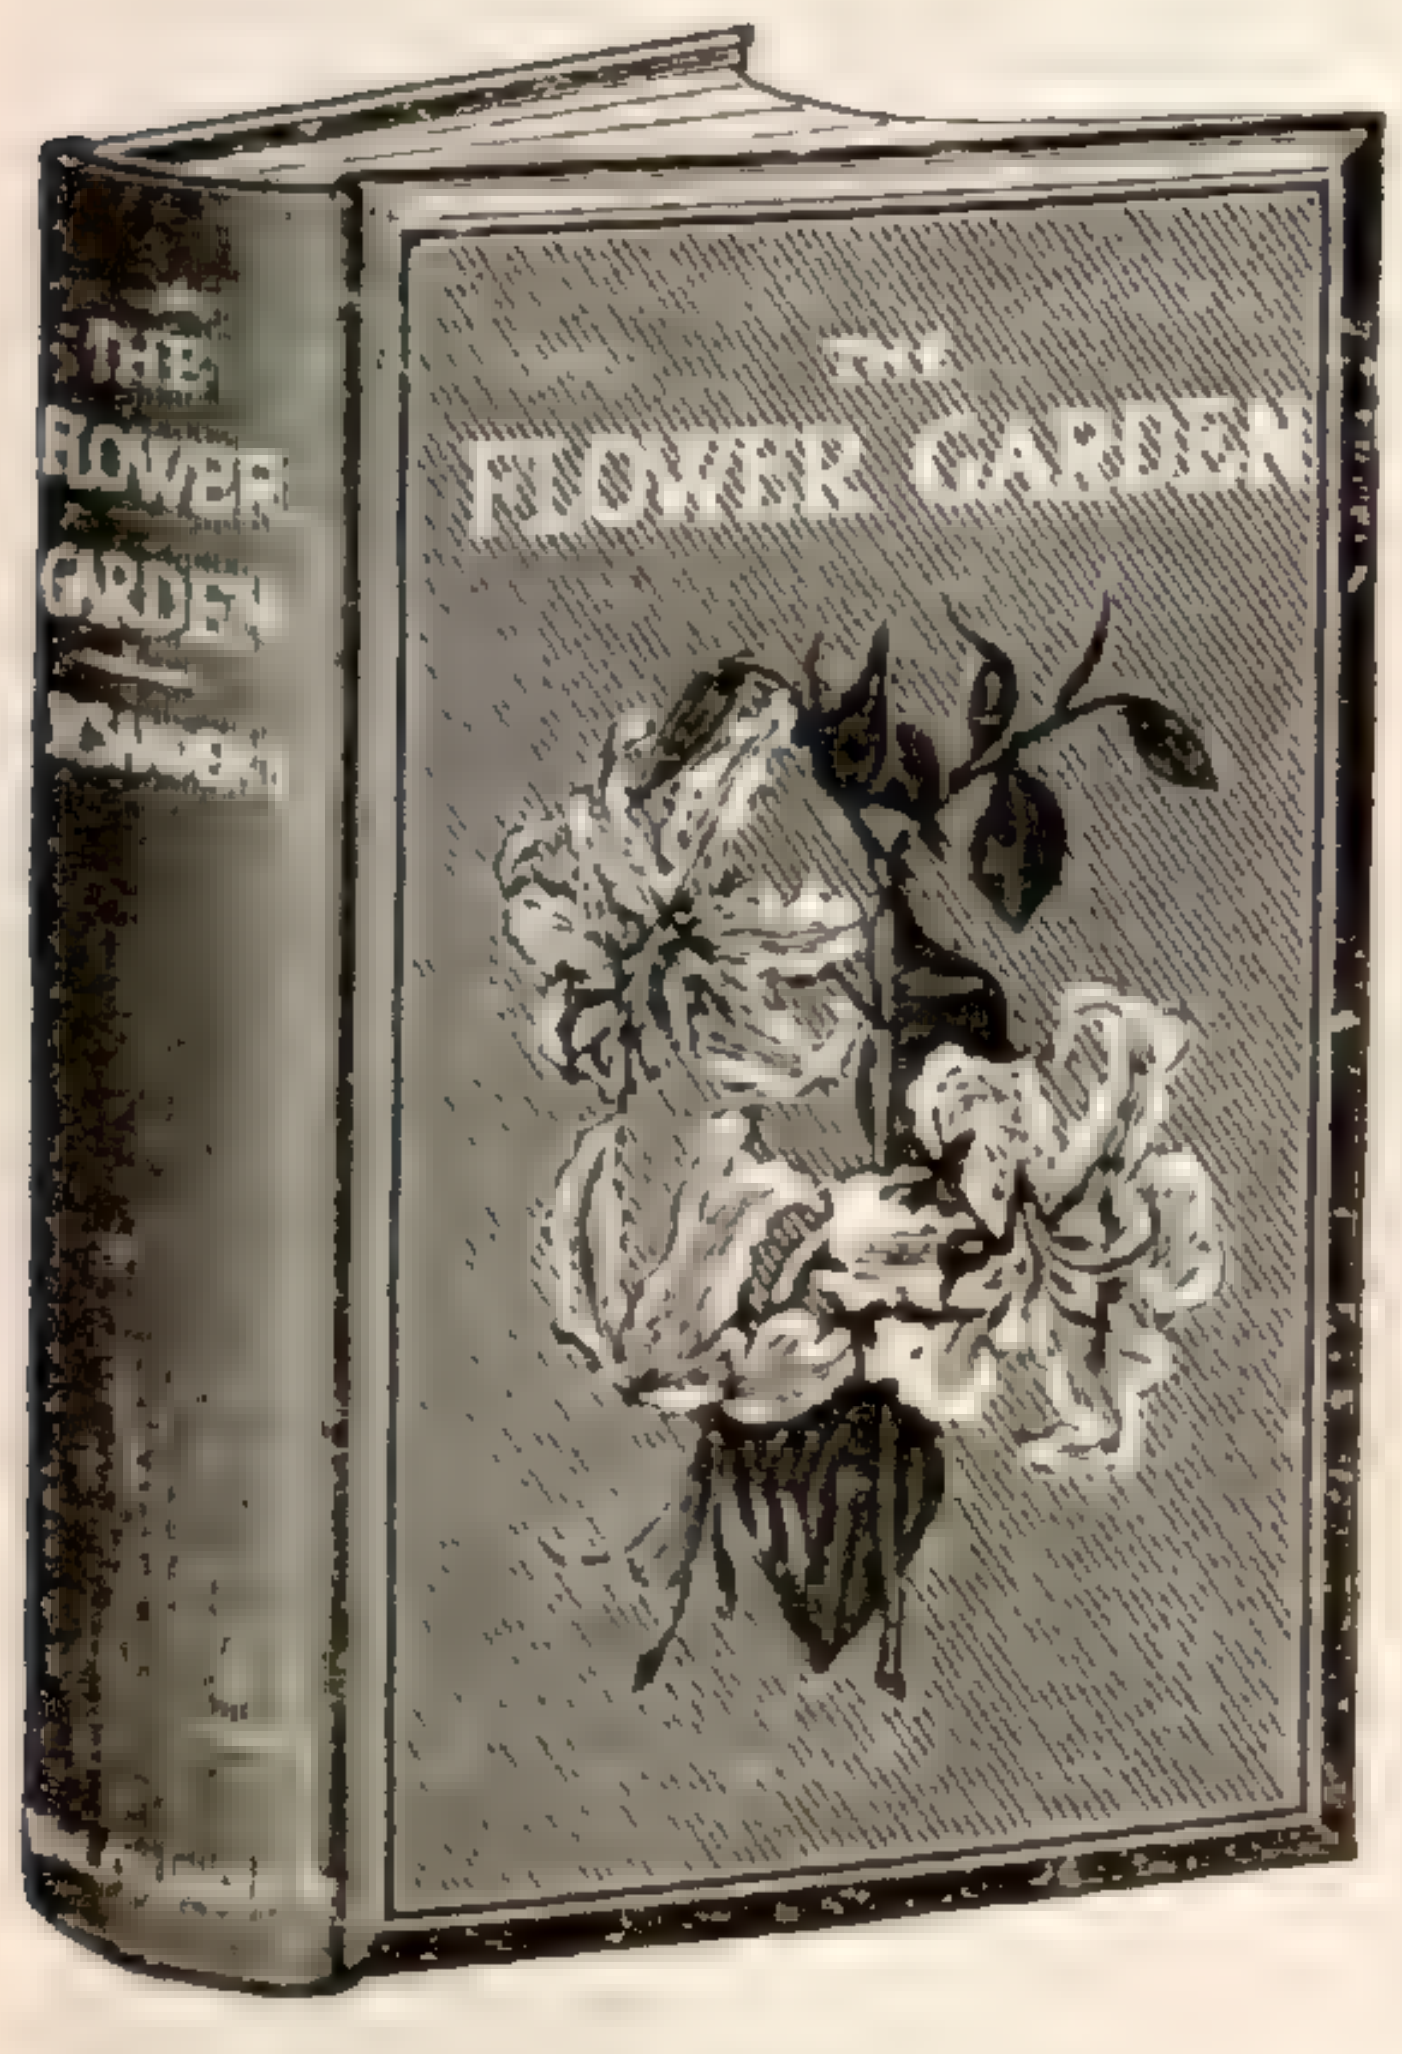
# THE FLOWER GARDEN,



By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

**A Complete Guide to Planting and Management of the Flower Garden and the Cultivation of Flowers, Plants, Trees, &c., adapted for Outdoor Culture.**

THE CONTENTS INCLUDE—

- Fashioning the Garden.
- Beds and Borders.
- Walks and Paths.
- Lawns and Tennis Courts.
- Rockeries and Ferneries.
- Arbours, Summerhouses, Arches, and Pergolas.
- Edgings.
- Walls and Fences.
- Garden Practice.
- Propagation.
- Colour Arrangement.
- Bedding.
- Annuals and Biennials.
- Bulbs.
- Hardy and Tender Border Plants and Flowers.
- Climbing Plants.
- Trees and Shrubs.
- Pests and Diseases.

**480 PAGES, ILLUSTRATED BY 64 PLATES OF BEAUTIFUL GARDEN SCENES, PLANTS AND FLOWERS, AND MANY EXPLANATORY DIAGRAMS.**

**Price 7/6 net; by post, packed in box, 8/-**

**WELWYN HERTS**

an altogether wonderful display worthy of the great Western Country.

Australia brought a splendid lot of apples and pears, as well as corn, and showed that she is no mean contributor to our food supplies.

### JAPAN.

A very pretty and interesting display from Japan was housed in a pretty tent in the Ranelagh Gardens. Dwarfed Japanese trees in great variety, bamboo rods of all heights and sizes, beautiful bamboo screens, paintings, dried persimmons, and lots of other novel exhibits, were contributed, chiefly by the Yokohama Nursery Company and the Japanese Horticultural Society, with Mr. Dimmock in charge of affairs.

### HOLLAND AND BELGIUM.

The splendid displays brought together by the Netherlands Horticultural Federation, which includes some 20,000 members, formed a beautiful scene. In the central part of the tent they had grouped great sheaves of lilac in huge golden baskets, set up on high white pillars, while between these were lower masses of roses and lilacs of wondrous beauty, also in baskets. At one end Messrs. M. Koster and Sons, Boskoop, arranged a collection of new seedling mollis azaleas in all shades of gold, yellow, and salmon. To the right were eremus spikes and astilbes, ranunculuses, and a collection of foliage suitable for floral arrangements. At the bottom end of the tent a marvellous array of vegetables was set out, great pyramids of cucumbers and cauliflowers towering above peas, carrots, and a whole host of salading subjects. Following round we came to hydrangeas, variegated aspidistras, more lilacs, and a grand lot of eremuri, irises, and wonderful Turban ranunculuses, from Messrs. E. H. Krelage and Son, Haarlem. All around the great tent were suspended baskets of Begonia Gloire de Lorraine, that added materially to the general effect; but the vegetables, lilacs, and azaleas were the great features.

Our Belgian friends scarcely did themselves credit. They showed blanched asparagus in large bundles, hosts of cauliflowers and cucumbers, and a goodly display of grapes, strawberries, peaches, and nectarines. The plants were chiefly primulas, lilacs, and azaleas, with the new Adiantum Farleyense Glory of Moordrecht.

### FRANCE.

The French section was particularly gay. The corner beds were filled with cinerarias, hydrangeas, carnations, and petunias. In the centre the Messrs. Vilmorin and Co., of Paris, arranged a wonderful display of annuals and rare vegetables, while along one side M. Lachaume, of Paris, arranged examples of delightful floral art. M. Rivoire, of Caluire, showed new pæonies, and M. Pernet Ducher brought over a fine lot of new roses, in which the salmon and red Mdme. Edouard Herriot was the most conspicuous, and succeeded in winning the "Daily Mail" cup for the best new rose in the show. Lt. Chaure, Sunburst, and Souv. de Gustave Prat (pale cream), were other good things. A combined exhibit of French products, such as French beans, new potatoes, asparagus, giant Globe artichokes, and marrows, strawberries, and cherries, filled one side of the large tent. French horticultural literature, floral paintings by Mdlle. Marguerite Fouchart, and a lot of scientific exhibits filled the top end. Of great merit were the pink and blue hydrangeas from M. G. Fargetson, Angers, France, and among the pink ones we noted Mdme. Chantaud, Souv. de Mdme. Raoult, Mont Rose, Mdme. A. Riverain, and Mousseline as being particularly lovely. The Gerbera hybrids from Antibes also formed an attractive part of this display.

### THE JURY LUNCHEON.

At 1.30 p.m. the general international jury, having finished its work some time previously, met on the terrace in front of the Hospital for luncheon. There was a company of about four hundred, under the presidency of the Duke of Portland, with whom were the Right Hon. Walter Runciman, President of the Board of Agriculture, and notable horticulturists from the four countries of the Kingdom, from distant parts of the Empire, from the United States, and from many Continental countries. After lunch the loyal toasts were heartily acknowledged, Mr. Runciman gave "Success to the Royal International Horticultural Exhibition" in a brilliant speech, which expressed sympathy and assistance for those who are endeavouring to raise the standard of horticultural education, and provide for diplomas in horticulture. Mr. J. Gurney Fowler replied and paid a great tribute to Mr. H. J. Veitch and Mr. H. B. May, and the other members of the Board of Directors, not forgetting a few words of praise for Mr. Edward White and Mr. Geoffrey Henslow.

Sir Jeremiah Colman, Bart., proposed "The Jurors," and to this toast Mons. Jules Hye de Crom and Herr Fritz Benary responded. "The Exhibitors," very ably proposed by Jonkheer Van Doorn, President of the Netherlands Horticultural Council, was humorously responded to by the Hon. Vicary Gibbs. Then Sir Trevor Lawrence proposed "The President," and musical honours accompanied the reception of this toast.

This completed the printed programme, but as the company rose it was felt something was wanting, and there were cries of "Veitch!" Veitch!" and so insistent were the cries that the President promptly seized the opportunity for proposing the health of Mr. Harry J. Veitch. Much moved by this spontaneous call, Mr. Harry Veitch responded in a few words, and expressed his great appreciation of the reception given him. Not yet satisfied the Jury called loudly for Lieut.-Col. Sir George Holford, and the ever-popular and gallant owner of Westonbirt responded to the call with a bright little speech that was enthusiastically received.

### NEW PLANTS.

First-class Certificates.—To Odontoglossum amabile var. Duke of Portland, and to Odontoglossum eximium var. King George, from Messrs. Sander and Sons, St. Albans. To Odontioda Queen Mary, and Odontoglossum Her Majesty, from Messrs. Charlesworth and Co., Haywards Heath. To Odontoglossum eximium var. Excelsior, from Mons. Chas. Vuylsteke, Loochristi, Belgium. To Odontioda Mrs. F. M. Ogilvie, from F. Menteith Ogilvie, Esq., Oxford. To Miltonia Hageana var. Vogelzang, from Messrs. Stuart Low and Co., Enfield. To Cattleya Mendelli Queen Mary; to Brasso-cattleya The King; to Dendrobium Dalhousianum; and to Cattleya Dirce magnifica, from Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester. To Lælia purpurata Schröderiana, from Messrs. Armstrong and Brown. To Miltonia Jules Hye de Crom, from Mons. Jules Hye de Crom, Belgium; and to Lælio-cattleya Lustre von Lavingo, from Lieut.-Colonel Sir George L. Holford. To Leptospermum scoparium Nicholi, from Rev. A. T. Boscawen, Ludgvan, Cornwall.

Award of Merit.—To Calceolaria Veitchi, from Messrs. R. Veitch and Son, Exeter. To sweet peas Melba, Brunette, and Mrs. Cuthbertson, from Messrs. Dobbie and Co., Edinburgh. To Lastrea patens, var. Mayi; and to Polypodium Vidgeni, from Messrs. H. B. May and Sons, Edmonton. To Begonia Princess Victoria Louise, from Messrs. Blackmore and Langdon, Bath. To Lilium myriophyllum, and Eremurus Tubergeni, from Messrs. Wallace and Co., Colchester. To Celmisia spectabilis argentea, from Messrs. Bees, Lim., Liverpool. To Hydrangea Sargenti, from Hon. Vicary Gibbs, Elstree, and Messrs. J. Veitch and Sons, Chelsea. To Oxalis enneaphylla rosea, from Mr. C. Elliott, Stevenage. To Deutzia Veitchi, from Messrs. J. Veitch and Sons, Chelsea. To Leptospermum Boscaweni, from Rev. A. T. Boscawen, Cornwall. To Pyrethrum Queen Mary, from Mr. G. W. Miller, Wisbech. To Iris squalens Libelungen, and Iris variegata Ossian, from Messrs. Barr and Sons, Covent Garden. To Lilium dahuricum luteum, from Mr. A. Perry, Enfield. To Papaver orientale Perry's White, and Papaver Edna Perry, from Mr. A. Perry, Enfield. To Odontoglossum ardentissimum von. Carmen, from F. Menteith Ogilvie, Esq., Oxford. To Cattleya Mossiæ Madame Jule Hye, from Mons. Firmin Lambeau, Brussels. To Odontioda Bradshawiæ, var. Vogelzang, from M. Firmin Lambeau. To Lælio-cattleya Lustre, var. Buddah, and Lælio-cattleya Gladiator, from Sir George Holford. To Odontoglossum amabile Princess Mary and Odontoglossum crispum James McNabb, from Messrs. Sander and Sons. To Lælio-cattleya Ulysses, and L.-c. Ulysses alba, from Messrs. Charlesworth and Co., Haywards Heath. To Zygopetalum Armstrongæ, from Messrs. Armstrong and Brown, Tunbridge Wells.

### SPECIAL CUP AWARDS.

The King's cup, offered for the best exhibit in the show, was awarded to Lieut.-Col. Sir George Holford for his superb exhibit of orchids.

The Duke of Portland's cup was the next highest award. and this fell to Messrs. Jas. Veitch and Sons for their magnificent display of stove plants.

Sir Jeremiah Colman's cup, of no less importance, fell to Messrs. George Mount and Sons, Canterbury, for a grand lot of roses.

The Queen Alexandra Cup for the best rock and water garden fell to Messrs. R. Wallace and Co., Colchester.

The Sherwood Cup for sweet peas was won by Mr. C. W. Breadmore, Winchester; and Messrs. Dobbie's cup for sweet peas went to Sir Randolph Baker.

F. Menteith Ogilvie, Esq., Oxford, Messrs. Sander and Sons' cup for orchids, and Sir Jeremiah Colman won Messrs. Charlesworth and Co.'s cup for orchids.

Baron Bruno Schroeder's cup for orchids fell to Messrs. Armstrong and Brown, Tunbridge Wells; and Messrs. W. Bull and Son's cup for the best hybrid odontoglossum was won by J. Gurney Fowler, Esq.

The Worshipful Company of Gardeners offered a cup for the best display of pot roses, and this was won by Messrs. Paul and Son, Cheshunt.

Jas. Brown, Esq., won Messrs. Paul and Son's cup, and The King's Acre Nursery cup for roses.

Lady Colman's cup for Malmaison carnations was awarded to C. F. Raphael, Esq.

Sir Trevor Lawrence's cup for herbaceous plants went to Messrs. G. and A. Clarke, Dover; and Mr. Speer's cup for annuals to Messrs. F. Smith and Co., Woodbridge; while Sir Trevor Lawrence's cup for alpine plants was won by the Craven Nursery Company, Clapham.

Messrs. G. Bunyard and Co.'s cup for choice dessert fruits was won by His Majesty the King (gardener, Mr. A. Mackellar, V.M.H.), Windsor—a popular win.

The foregoing is not a complete list of the cup winners, as the special jury had not finished its duties when, early in the evening of Wednesday, we were compelled to go to press. The county cups had not been awarded, and so we hope to publish the winners' names in our next issue.

---

In our next issue we propose to give descriptions with illustrations of the new plants that received awards at the Royal International Horticultural Exhibition, a report of the scientific and educational conferences, and descriptions of the exhibits of horticultural implements, structures, and accessories.

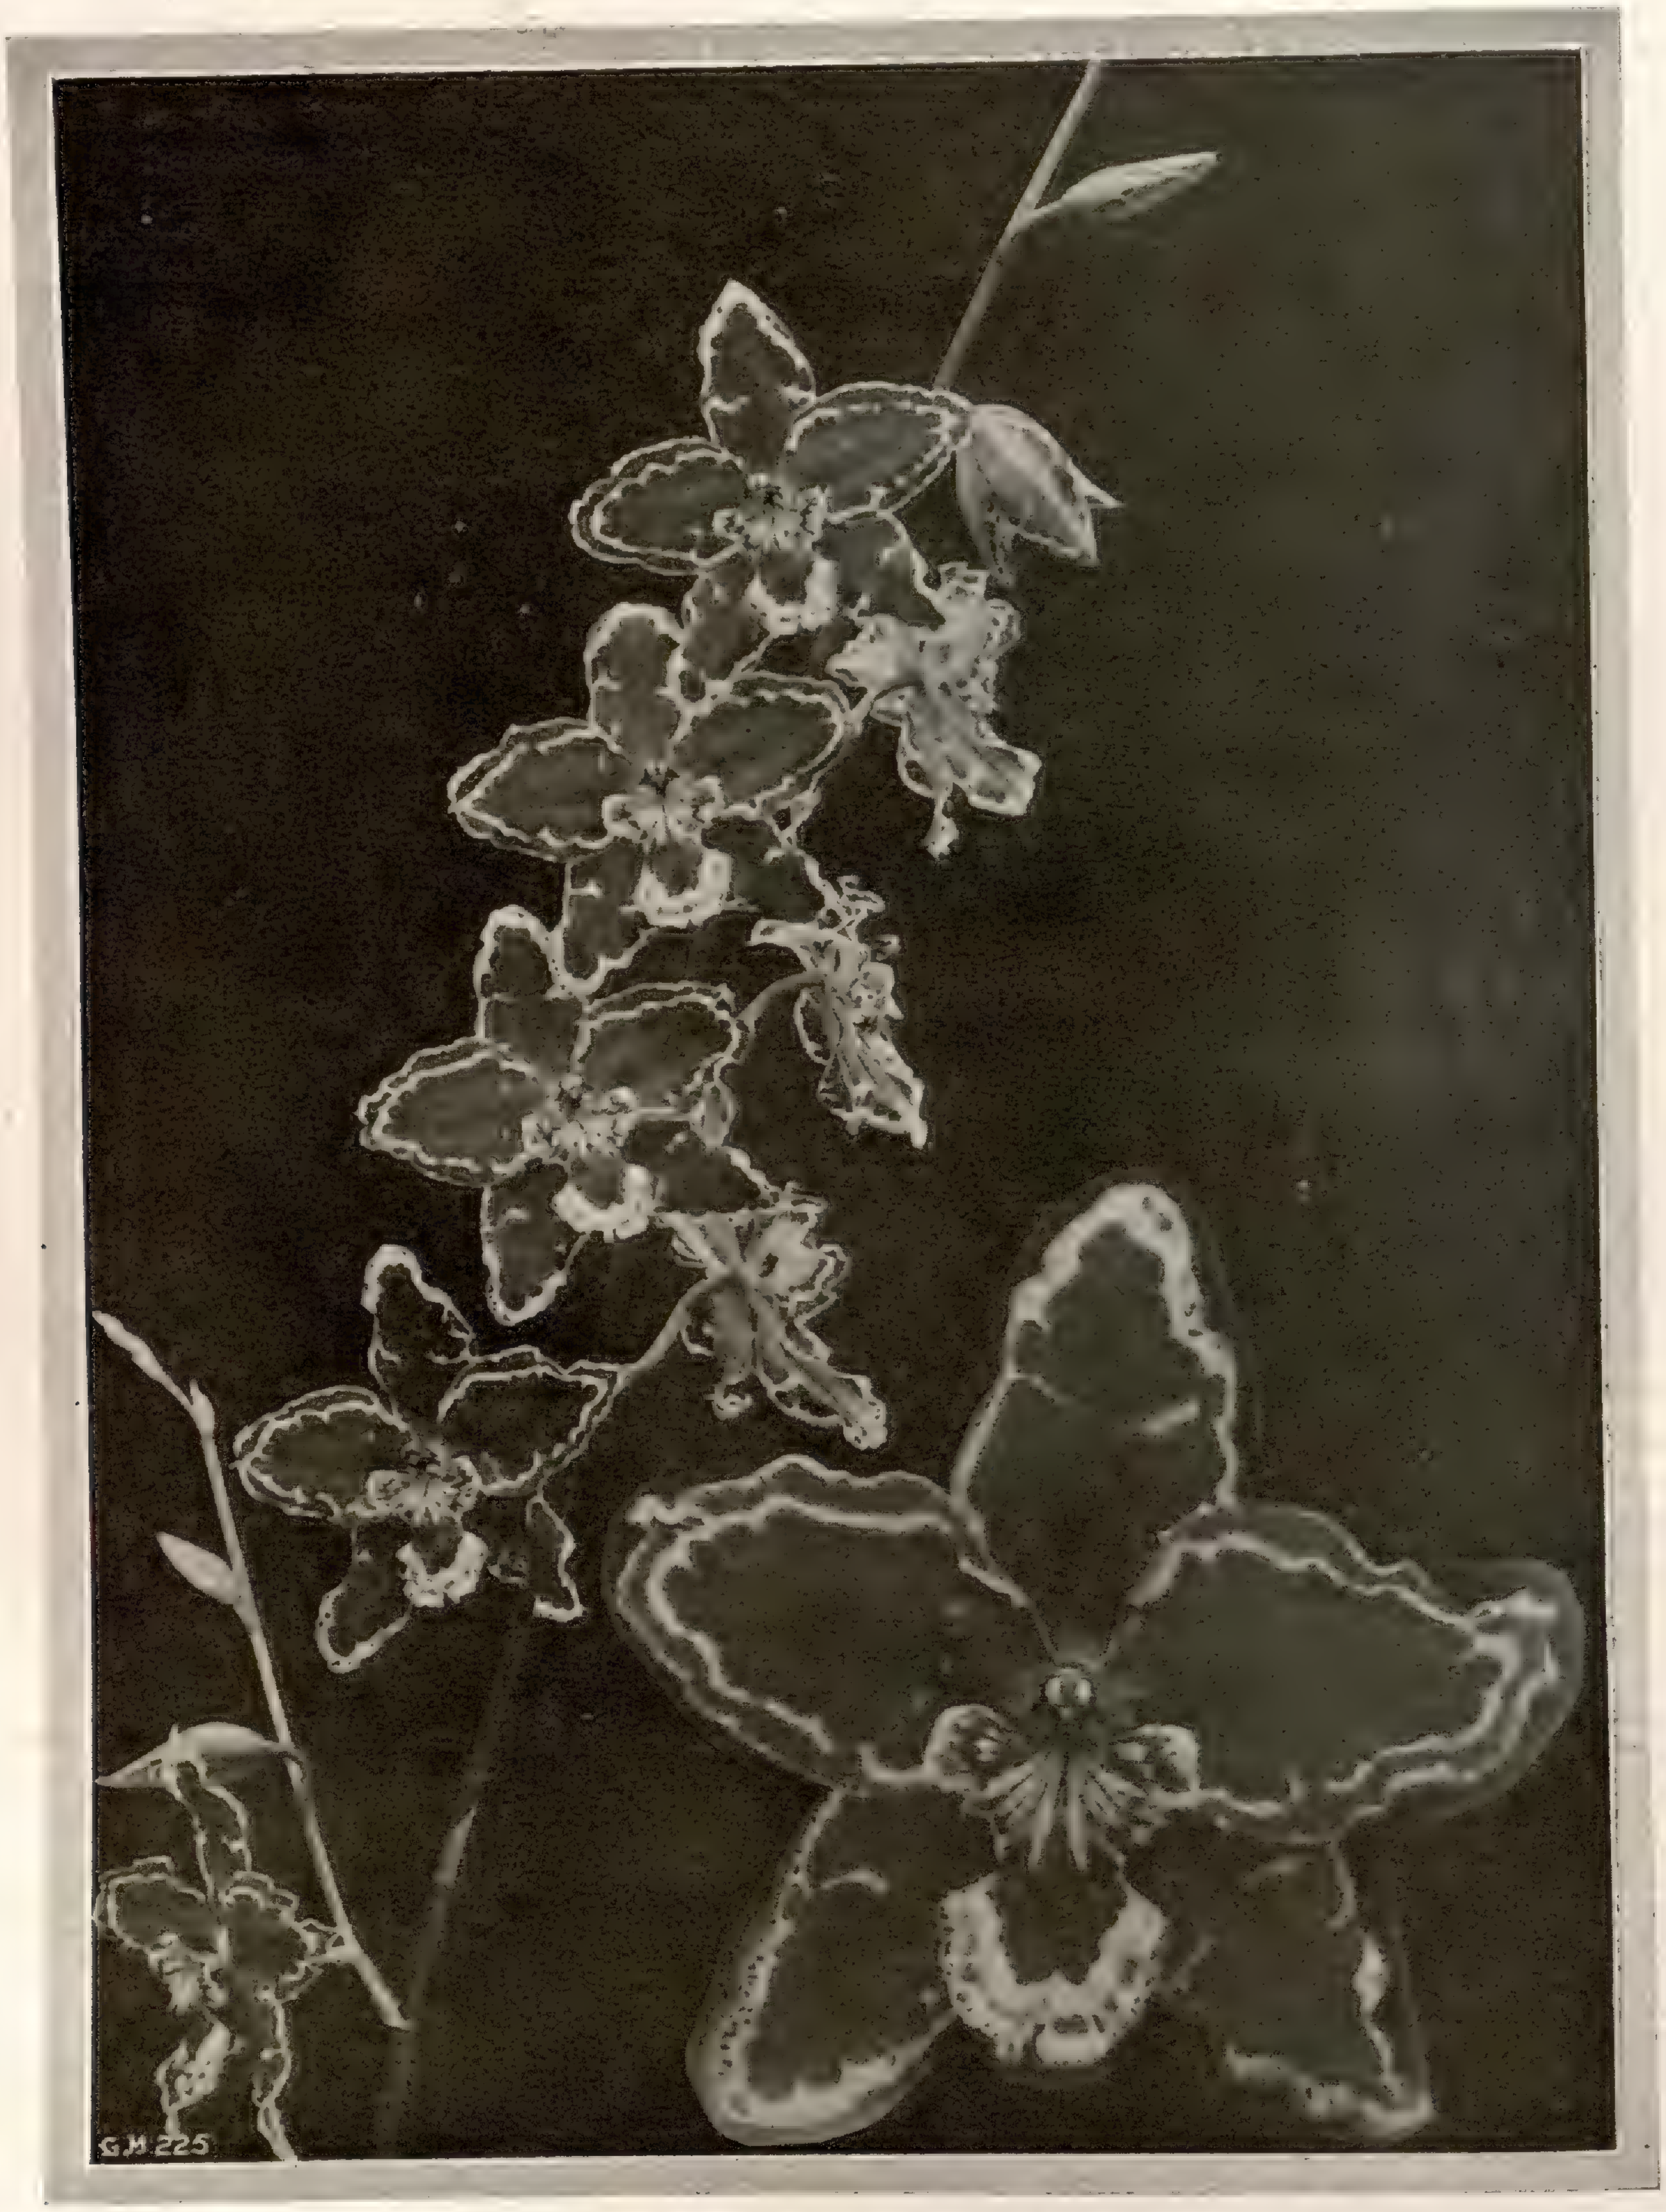
---

## MEMBERS OF JURY.

### COMPETITIVE CLASSES.

Continued from last week's supplement, p. 10.

Lindsell, E. B., Mr., Bearton, Hitchin.
Looymans, Herr, Oudenbosch, Holland.
Low, Stuart H., Mr., Bush Hill Park, Enfield.
Lunt, T., Mr., Keir Gardens, Dunblane, Perth.
Lynch, R. I., Mr., Botanic Gardens, Cambridge.
Lyne, J., Mr., Foxbury Gardens, Chislehurst.
Mackellar, A., Mr., Royal Gardens, Windsor.
Markham, H., Mr., Wrotham Park Gardens, Barnet.
Maron, C., Monsieur, Brunoy (Seine et Oise), France.
Marshall, W., Mr., Auchinraith, Bexley.
Mawley, E., Mr., Rosebank, Berkhampstead.
May, H. B., Mr., The Plas, Chingford.



ODONTIODA QUEEN MARY.

A remarkably fine hybrid, exhibited by Messrs. Charlesworth and Co., Haywards Heath, and awarded a First-class Certificate at the Royal International Horticultural Exhibition.

McHattie, J. W., Mr., Public Parks Office, City Chambers, Edinburgh.
McLeod, J. F., Mr., Dover House Gdns., Roehampton.
Mease, Mr., The Gardens, Downside, Leatherhead.
Metcalfe, A. W., Mr., Luton Hoo Park Gardens, Luton, Beds.

Soupert, Monsieur, Rose Grower, Luxemburg.

(To be continued.)

## SUMMER BEDDING.

The bedding-out season is upon us, and I propose to offer a few remarks as to the arrangement and disposition of the plants. It may be of service to furnish particulars of combinations that were noted last season in a number of large public parks, and that produced a very fine effect. Many gardeners are strictly localised, and it is not too much to say that our leading public parks point the way, and are largely copied with regard to bedding arrangements.

Carnation Britannia, a splendid variety in glowing scarlet, and arranged at about 15 inches apart in a very large bed, with Koeniga maritima as a groundwork, was fine indeed, while the wide framework of Viola Maggie Mott did much to enhance the beauty of the whole. Among cannas Florence Vaughan is a superb variety for bedding purposes. It has ample foliage, a robust constitution, and large yellow, crimson spotted flowers that produce a striking effect. In this case Pelargonium Verona did duty as a groundwork or carpet, Verbena venosa being fittingly employed as an edging.

Very fine was a combination of Lilium lancifolium rubrum, cockscombs, and Dimorphotheca Ecklonis, and the last-named demonstrated very clearly its value as a carpet plant. Fine specimens of Acalpha musaica, Cineraria maritima, three feet in height; a foot wide belt of Iresine Lindeni as an edging, and a mass of Amaranthus bicolor in the intervening spaces, struck a very rich note, and I have nothing but praise for alternately arranged specimens of Calceolaria Burbidgei and Fuchsia Marinka, which were associated with Anthericum variegata and Veronica Andersoni variegata. The last-named is an acquisition for a framework around flower beds, and the most effective method is to arrange a 12 or 15-inch. belt on sloping ground. Three feet high standards of Pelargonium Paul Crampel, with fine plants of Artemisia arborescens of the same height, and a very bold edging of Veronica Andersoni variegata and Iresine Lindeni arranged alternately, produced a telling effect. Heliotropium President Garfield in standard form, associated with white begonias, and with Verbena Defiance, forming a fine finish as an edging, was also good.

A great mass of Begonia Major Hope, a delicate and charming variety, over Chlorophytum Browni, thinly interspersed, and fine plants of Eulalia gracillima variegata, with an edging Dactylis glomerata variegata struck me as being quite the most exquisite example of bedding seen in a large London park last season.

Another first-rate combination consisted of specimen Solanum jasminoides and Plumbago capensis, which took the form of 6ft. high pyramids, arranged 5ft. apart, iresine in two varieties towering up to a height of 4ft., being thinly disposed in the intervening spaces, with a splendid mass of Viola Countess of Hopetoun underneath. Campanula pyramidalis alba and Salvia virgata with long racemes of purplish-blue flowers, created a pretty effect when brought together, and no better edging can be found for such a bed than the bronzy-golden Fuchsia Meteor, which should be arranged in a wide belt. I noted a very large triangular-shaped bed in a coast garden last season which held Fuchsia Lyle's Own, in standard form, a splendid mass of Viola J. B. Riding acting as a carpet and two rows of wonderfully compact ageratum as edging. The fuchsia in question is a glorified Mrs. Marshall, and, further, is well adapted for town and city gardens.

Fuchsia fulgens over Harrison's Musk, struck a distinct note, and it was a good idea to place Chamæpeuce diacantha two feet apart between the two rows of blue lobelia. Three hundred plants of Antirrhinum Queen Victoria, of spotless purity (and incidentally this variety is possessed of a vastly more vigorous constitution than Queen of the North), with the annual Delphinium Blue Butterfly interspersed, presented a very beautiful and charming effect while a huge bed of Salvia Glory of Zurich, with Zea gracillima variegata and an edging of dark-blue violas, was a fine sight. Lantana delicatissima looms large in bedding arrangements, and small wonder seeing that the effect it creates is so soft and pleasing; Gnaphalium microphylla employed as a groundwork, seemed to be in keeping with its general character. A grand bed of celosias in Hyde Park arrested my attention, and very well did Chrysanthemum inodorum flore-pleno associate with these airy beauties. Not far distant from this bed Canna Alphonse Bouvier figured, a splendid thing in richest scarlet, which was toned down by the presence of Viola Niphetos. It was quite refreshing to note a big mass of the old and admirable, but now rarely seen, pelargonium Mrs. Pollock, and the choice of a viola to associate with it was a happy one, namely Admiration. They were thinly disposed over the whole of the bed.

Walter H. Aggett.

## KALANCHOES.

The introduction of Kalanchoe flammea from Somaliland in 1897, and the popularity which it quickly attained, served to direct attention to the ornamental qualities of other members of the genus. Though the species are fairly numerous, and hybrids have been raised, yet up to the present none of them are, from a decorative standpoint, the equal of K. flammea. This is of easy propagation and culture, and effective flowering examples may be grown in four, five, or six-inch pots. The fact that it was taken in hand by some of the foremost market growers so soon after its introduction will serve to show that it was no commonplace subject, for new plants that fulfil the market cultivators' exacting requirements are far from numerous.

The largest member of the genus, as far as I know, is Kalanchoe Dyeri; the flowers, borne in terminal heads quite early in the year, are white, and individually, somewhat suggestive of a large jasmine. This is a spare-growing plant that reaches a height of four feet or more. It is valuable for grouping purposes when tall-growing flowering plants are none too plentiful in the greenhouse. Of hybrid kinds the best known are Felthamensis, Ena, and Kewensis, this last a hybrid between the white-flowered K. Benti and K. flammea. It has pretty pink flowers. A particularly good form of K. kewensis was given an Award of Merit by the Royal Horticultural Society two years ago under the name of Excelsior.

W. T.

**Euphorbia epithymoides.**—This hardy member of the Spurge family forms a very pleasing outdoor feature in the spring, as then the terminal clusters of bright yellow bracts are at their best. The leaves on the upper portion of the stem are also tinged with the same colour. It is of free growth, and forms bold tufts, about eighteen inches in height, and is, as a rule, at its best in April and May. The form grown as E. pilosa major appears to be the same as E. epithymoides.—K.

# WORK FOR THE WEEK.

◆

### THE ORCHID HOUSES.

ONCIDIUMS.—Few oncidiums are more admired when in flower, or more useful for exhibition and decorative purposes, than those of the cyrtochilum section, which includes O. macranthum, O. superbiens, O. serratum, O. loxense, O. lamelligerum, O. corynephorum, and several others. These are of comparatively easy culture, if afforded a cool intermediate temperature, and protected from strong sunshine during the sunny months. During the winter all the light available should be admitted, as it is easily conceivable that in their native habitats the light is more penetrating than in a sombre climate like our own. The flower spikes have now developed, and as they are exceedingly large when compared with the size of the pseudo-bulbs which produce them, they necessarily exhaust the plants to a considerable extent. Therefore the plants should not be allowed to flower until they become fairly strong specimens. These oncidiums produce strong, thick roots, which should not suffer from an insufficiency of water. These species dislike disturbance at the roots, therefore repotting should only be carried out when necessary, still there is always the least of two evils, and if the compost is allowed to become sour or decayed, it is always wiser to repot. Repotting may be carried out at any time when the young growths are producing new roots. Afford ample rooting space and drainage. For the rooting medium, a compost as advised for similar plants on page 324 will answer well. When repotting, the leading growth should be brought down to the level of the compost, as owing to the climbing habit of the whole of this section, the young roots are often produced some distance above the surface of the compost. Should these roots remain exposed they are liable to injury.

PLEIONES.—Such pleiones as P. maculata, P. lagenaria, and P. birmanica, which are now suspended from the roof of the intermediate house, and P. humilis and P. Hookeriana, which occupy a similar position in the cool house, should receive sufficient water to keep them decidedly moist, as they must on no account be allowed to become dry; they may also be sprayed overhead twice a day, and three times on very hot days. Spraying or slight syringing will keep the foliage fresh and clean. When thoroughly established an occasional watering with weak liquid manure will be beneficial, and they may be exposed to more light, as the leaves will then remain green for a longer period, than if grown in a shady position. They must, however, not be exposed to strong sunshine.—J. T. Barker, The West Hill Gardens.

### STOVE PLANTS.

GLOXINIAS.—The main batch of these beautiful flowering plants will now be at their best, and means should be adopted to prolong the season of flowering for as long a time as possible. Our plants are this year carrying large numbers of flowers, and buds, in fact, too many; we shall relieve them of a few flowers for vases, and remove all ill-shaped buds. Except when seed is to be saved, all faded flowers should be promptly pinched off, thus concentrating the energies of the plant to the remainder. The best position for the plants whilst flowering is on a cool ash, or shingle-covered, stage in a low span-house. Admit a fair amount of top air by means of the ventilators throughout the day when fine, and maintain a gentle warmth in the hot-water pipes. The atmosphere should be buoyant but not too dry. Young plants raised from seed sown early in the year are now making good progress, and a batch of these may have their first flowers removed in order to ensure strong plants for later flowering.

EDGING PLANTS.—Propagate further batches of such quick-growing subjects as pileas, panicums, fittonias, and lycopodiums of sorts. Nothing adds so much to the general effect of plant houses as an edging of fresh, young plants in small pots, besides being useful for decoration in rooms. Insert several cuttings in each pot so that they will soon become useful.

GENERAL WORK.—As all plant life is now very active, it is essential to allow the plants ample room for proper development; and to rearrange them occasionally. Many plants have now been removed from the warm houses and pits to cooler quarters, thus making room for setting out those remaining farther apart. Raise the best specimens on pots, or stands specially made for the purpose, so as to allow the air to play about them. Admit air freely by the roof ventilators on fine days, but close early in the afternoon, and syringe heavily. A little air may be admitted for two or three hours early in the evening with advantage during warm weather. This will keep the atmosphere sweet without lowering the temperature. Give a light fumigation occasionally to keep down insects; but care must be taken that any delicate ferns, or other plants, are first removed for the night. —H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

PEACHES AND NECTARINES. — The fruits in the early house will be approaching the ripening stage; maintain a free circulation of air in the house night and day, and dispense with artificial heat during bright, warm, sunny days, but on sunless days and at night artificial heat must be used to maintain the proper temperature. The leaves should be turned aside from the fruits, so that the latter may be exposed to the sunlight, to ensure a fine colour and flavour; discontinue the use of the syringe as soon as the fruits begin to ripen, but at the same time plenty of clean tepid water should be given to the roots when required. It does not follow, although drier atmospheric conditions must prevail in the house during ripening, that the soil should be allowed to become dry at that period. Continue to tie in and train the young growths for next season's bearing; do not hesitate to remove any growths that are not required, as it is a common mistake to tie in a quantity of growths that will have to be cut away when the autumn pruning takes place; every endeavour should be made to retain just sufficient growths. The fruits should be carefully examined every day when they are approaching maturity, and when ripe they should be carefully gathered, exercising great care not to bruise them, or the flavour and appearance will be impaired; place them singly in shallow trays, and, if put into a cool, airy fruit room, they will keep in good condition for several days, if not required for immediate use.

PINE-APPLES.—Any plants that may require repotting should be taken in hand at once. Where successional plants have rooted well in the new soil, and also where they are swelling their fruits, abundance of heat and moisture are necessary. Thoroughly syringe the plants, and close the house early in the afternoon; carefully maintain sufficient artificial heat on dull, sunless days, and also at night, but it should be borne in mind that the pipes must not become over-heated at any time. Applications of liquid farmyard manure or some approved chemicals should be given once or twice a week. Remove suckers other than those that are required for propagation. Fruits that are ripening will require very little water. Admit air when possible, leaving a little ventilation at night when the weather permits.

FIGS.—The fruits on the earliest trees will be ripening, so admit abundance of air both at the top and side ventilators; discontinue syringing, and gradually reduce the supply of water to the roots, but in such a manner as not to allow the soil to approach dryness at any time. Remove all suckers that spring up from the roots, or otherwise the sap will flow to them rather than to the fruiting branches. Continue to stop and tie in the growths when necessary, and make every effort to keep the foliage free from red spider and other insect pests.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

THE ROCK GARDEN.—Plants like saxifragas, aubrietias, and alyssums that have finished flowering must have all dead flower stalks clipped off while any of the plants that are encroaching too much on their neighbours must be restricted. Every means should be taken to maintain the smart appearance of the rockery for as long as possible by giving it constant attention and keeping it free from weeds. Although many of the more showy plants are almost over, there are still numerous subjects to continue the display. Some of the more ornamental of these include Veronica rupestris, V. prostrata, Campanula radiana, Hypericum reptans, Gypsophila cerastioides, G. repens, Edraianthus tennifolius, Lychnis viscaria splendens fl. pl., helianthemums, and pinks in variety. Do not let any of the plants suffer for lack of water, and after bright days damp over the whole rockery in the evening. Various subjects, like arabis and aubrietia can now be rooted readily from cuttings if inserted in light sandy soil on a shady border or in a cold frame.

SEED SOWING.—The present is a suitable time to sow seeds of numerous plants for spring decoration. Amongst the various kinds that should be raised now are wallflowers, myosotis, sweet williams, polyanthuses, anchusas, and campanulas. Choose an open position for a seed-bed, and if the soil is dry, it is an advantage to water the drills before sowing. Delphiniums, aquilegias, and poppies can also be sown now.

PERPETUAL CARNATIONS.—These are ideal plants for outdoor flowering, and, if planted in a partially-shaded position at the present time, will continue to bloom until late autumn. Plants in 48-size pots in active growth, and already set with flower-buds should be employed to ensure the best results, but during the last two seasons we have utilised the old plants that have flowered during the winter with complete success. A bed of Britannia carpeted with Iresine Herbsti is a very showy object when in bloom. In addition to the above variety, Enchantress, Mrs. H. Burnett, May Day, Winsor, Rose Doré, and White Perfection are to be recommended.

PREPARATIONS FOR BEDDING.—Most spring flowers have passed early this season, and as soon as they can be dispensed with commence to prepare the beds for their summer occupants. When the beds were well manured in the autumn it will be sufficient to dig them thoroughly, and in cases where the ground is exceptionally dry it is desirable to thoroughly water the soil before planting is commenced. All bedding plants should be in cool quarters, so that they will be sufficiently hardened off by the end of the month. It is always an advantage to have as many of the plants in bloom at the time of bedding out as can well be managed, and during bright weather such subjects as fuchsias, heliotropes, streptosolens and lantanas will be greatly assisted in the matter of flower production by being kept regularly syringed over. In sheltered localities a start can be made now, commencing with the more hardy subjects first.—J. Gardner, Batsford Park Gardens.

---

**Dwarf Polyantha Roses in Pots.**—Apart from their value in the open ground, where their beauty extends over such a lengthened period, these roses are also very desirable for growing under glass, and in this way anticipating their usual season of blooming out of doors. So treated they form an exceedingly pretty feature in the greenhouse. In order to have them at their best, they must not be hard forced, but just brought on gradually. I particularly like the bright coloured variety Jessie when treated in this way.—W.

ROYAL SHOW
PRACTICE WITH SCIENCE
DONCASTER,
July 2nd to 6th, 1912.

73rd ANNUAL EXHIBITION of Horses, Cattle, Sheep, Pigs, Poultry and Farm Produce; Jumping, Sheep Dog Trials, Horse-Shoeing and Butter-Making Competitions, Agricultural Education, Forestry and Horticulture.

HORTICULTURE
ENTRIES CLOSE MAY 31st
(Live Stock entries close May 20th).

Prize-sheets and Entry Forms will be forwarded on application to
THOMAS McROW, Secretary.
Royal Agricultural Society of England,
16, Bedford Square, London, W.C.

HANLEY PARK, STAFFORDSHIRE.
JULY 3rd and 4th, 1912.
SIXTEENTH
GREAT ANNUAL FLORAL FETE.

£500 in Prizes, Silver Cups, Gold and Silver Medals, Silver Challenge Cup, value £10 10s., offered for "Trade Exhibit" (for particulars see page 7 in Schedule).
Valuable Special Prizes offered by the Principal Firms in England.
Schedules post free on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

WOLVERHAMPTON.
GREAT FLORAL FETE.
JULY 9th, 10th, 11th, 1912.
£900 IN PRIZES.
Schedules on application to the Secretary (post free),
R. F. Amphlett, 80, Darlington Street, Wolverhampton.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE: MAY 14.

Present: Mr. E. A. Bowles, M.A., F.E.S. (in the chair); Dr. A. Voelcker, Messrs. W. E. Ledger, J. T. Bennett-Poë, W. Fawcett, W. Hales, J. O'Brien, J. Fraser, C. E. Shea, R. H. Curtis, W. B. Hemsley, and F. J. Chittenden (hon. secretary).

IRISES.—It was reported that the Council had awarded a Certificate of Appreciation to Mr. R. Dykes for his work with the irises which he exhibited at the last meeting of the committee.

ARSENICAL POISONING.—Dr. Voelcker said that he had ascertained that the source of the arsenic in the water referred to at the last meeting was weed-killer.

TULIPS WITH FIMBRIATED EDGES.—Messrs. Pearson, of Lowdham, sent two tulips having their perianth pieces much cut along the edges, which had occurred among T. Gesneriana and Margaret respectively. The plants had been marked so that their behaviour next season might be ascertained. One or two other similarly cut-petalled plants had been reported this season.

HYBRID ORCHID.—Mr. J. O'Brien showed from Mr. E. F. Clark, of Evershot, Dorset, a flower of an orchid raised by crossing Lælia cinnabarina and Lælio-Cattleya × G. S. Ball. The latter is a hybrid between Lælia cinnabarina and Cattleya Schröderæ. The flower was an improved Lælia cinnabarina, large and more open in the lip, but the pollen masses were four large and four not quite so large, thus differing from both lælia and cattleya. Mr. Clark proposed the name Lælio-Cattleya × Cinnabal for it.

PRIMULAS.—Professor I. Bayley Balfour, F.R.S. showed the following primulas: P. Faurei (Franch), from mountains of Japan, a plant with rose-coloured flowers freely produced, and leaves with golden farina below. P. tibetica (Watt), a dwarf plant with rose flowers, allied to P. involucrata and native in the Tibetan highlands. P. Reedi (Duthie) ("Botanical Magazine," 6,961), a fairly well-known and beautiful pale violet species, not quite hardy, from Kumaon, introduced in 1885. P. malvacea (Franch), from Yunnan, allied to P. cortusoides, and having mauve flowers in two or three superposed umbels. P. deflexa, with bluish-lilac flowers, rather small but in dense clusters, and very sweetly scented. P. membranifolia (Franch), with violet flowers, a native of Yunnan. P. uniflora (Klatt), with very pale violet flowers (with a two-flowered scape in this instance), from the Sikkim Himalaya. P. pulchelloides (Balfour), with rather large, beautiful violet flowers, similar in appearance to P. pulchella, but nearly allied to P. nivalis, a native of China. P. Beesiana × P. Bulleyana, a beautiful hybrid with salmon-coloured flowers. Botanical certificates were recommended to the last five plants.

## National Rose Society.

MAY 20.

Taking advantage of the knowledge that a large number of foreign rosarians would be in England for the purpose of visiting the International Horticultural Exhibition, the Council of the National Rose Society arranged to hold a Rose Conference and to invite the leading rosarians of France, Germany, and America. There was an excellent response to the invitation, and the members of the society had an opportunity for seeing and hearing, many for the first time, a considerable number of the leading rosarians beyond the seas.

The conference was held at the Holborn Restaurant and proved a splendid success. Several hundred members were present, and among the foreign rosarians present were M. Pernet Ducher, of Lyons; M. Maurice de Vilmorin who has devoted much attention to species; Herr Peter Lambert, of Trier, Germany; Herr Ketten, of Luxemburg; Mr. E. G. Hill, of Richmond, Indiana, the raiser of the Richmond rose; Mr. J. L. Monk, Holland; and M. Soupert. The conference was opened by the Rev. J. H. Pemberton, president of the society, tendering to the foreign rosarians a hearty welcome, and expressing the pleasure he felt in meeting so many brother rosarians, both from at home and abroad. He then read an interesting paper on the "Modern Development of the Rose," which was followed by a brisk discussion extending over nearly two hours. We regret that space will not permit of our referring to the proceedings other than thus briefly, and we hope to be able to refer both to the paper and the discussion at some future date.

## Horticultural Club.

On Tuesday, the 14th instant, after the usual monthly dinner, at which Sir Frank Crisp presided, and which a large number of members and visitors attended, including many ladies, an extremely interesting lecture on "Trails in the Canadian Rockies" was delivered by Mrs. Henshaw, the hon. secretary of the Alpine Club of Canada. This lady, who has devoted many years to the study of both the flora and fauna of that really wonderful, yet little explored region of the British Empire, illustrated her lecture by a very large number of beautifully coloured slides depicting many of the most interesting plants she had met with, as also of the animals, plus many of the most striking views of the Alpine region of the Rockies, which is really a continuation of the mountainous range that stretches uninterruptedly from Mexico northwards to the Arctic regions. Many thousands of square miles of this domain have never yet been trodden by the foot of white men, and, despite its opening out in comparatively recent times by pioneers, followed by settlers, it presents, therefore, still, for the most part, a perfectly virgin field for the explorer, both botanically and zoologically, to say nothing of the geological and other scientific interests which it embraces apart from its future value commercially as a field of settlement for the ever-increasing population of the British Empire.

The lecturer accompanied every slide with most graphic descriptions of the circumstances attending its production and practically carried her audience with her through the vast panorama of snowy Alpine solitudes and beautiful lakes fed by glacier-born streams and clothed or surrounded by magnificent vegetation. The great glaciers themselves were traversed, and the evidence pointed out which indicated by the form of the lakes and their surroundings of the mighty work of denudation and erosion which had been effected in the past by glacial action in the great Ice Age, of which the ever-diminishing present glaciers formed a still extant remainder and reminder.

Every now and again, as a contrast to the forest scenes (one of which showed one of those raging conflagrations which every now and again occur, sometimes through lightning, but too often through the carelessness of the rare travellers in the way of neglected camp fires), her audience found themselves confronted with densely flower-clad parterres of brilliant blossom, rivalling the renowned ones of our more familiar European Alps. Here the botanical knowledge of the lecturer came in, in proper botanical names of the plants concerned, which the many peculiar semi-descriptive ones locally adopted render unrecognisable on this side. One striking slide showed a brilliant scarlet aquilegia, unnamed, which would certainly be a great acquisition if it has not already been introduced, as a valuable hybridising factor in that genus. Another slide, amongst many showing the animal life of the domain, depicted a group of the Canadian white bear, specimens of which have so far only been obtained by the native Indians, who secured a representative family group for the Victoria Museum. This animal is as purely white as the Polar bear, from which, however, it has been pronounced quite distinct, though very similar in appearance. Wolverines, porcupines, lynx, deer of many species, including wapiti, caribou, and elks, several kind of sheep and goats, as also other species of bear, including the dreaded grizzly, were also shown in their native wilds.

The lecture concluded, which was unanimously pronounced to have formed one of the most interesting in the club records, some remarks were contributed by Messrs. G. P. Baker, Reginald Farrer, C. Shea, W. Bilney, and Professor Balfour, of the Edinburgh Botanical Gardens, and a very hearty vote of thanks to Mrs. Henshaw concluded the meeting.

## FORTHCOMING ENGAGEMENTS.

MONDAY, MAY 27.—Whit-Monday. Bank Holiday.—Royal International Horticultural Exhibition opens at 9 a.m.

TUESDAY, MAY 28.—Royal International Horticultural Exhibition opens at 9 a.m.

Visit of International Jury, etc., to the Royal Gardens, Kew.

Perpetual Carnation Society's visit to Hampton Court; Mr. R. Page's Nursery, Windsor; Mr. Dutton's Nursery at Iver; and Messrs. Lowe and Shawyer's Nurseries, at Uxbridge.

Kew Guild Annual Meeting and Annual Dinner at Holborn Restaurant, 7.30 p.m. Lieut.-Col. Prain will preside.

WEDNESDAY, MAY 29.—Royal International Horticultural Exhibition opens at 9 a.m.

Perpetual Carnation Society's visit to Messrs. Stuart Low and Co.'s Nurseries at Bush Hill Park, Enfield; Mr. Alfred Smith's Nursery, Enfield Highway; and Mr. A. Stevens' and Messrs. Thomas Rochford and Sons' Nurseries at Cheshunt.

Royal Society of Arts Meeting.

THURSDAY, MAY 30.—Last day of the Royal International Horticultural Exhibition; Exhibition opens at 9 a.m.

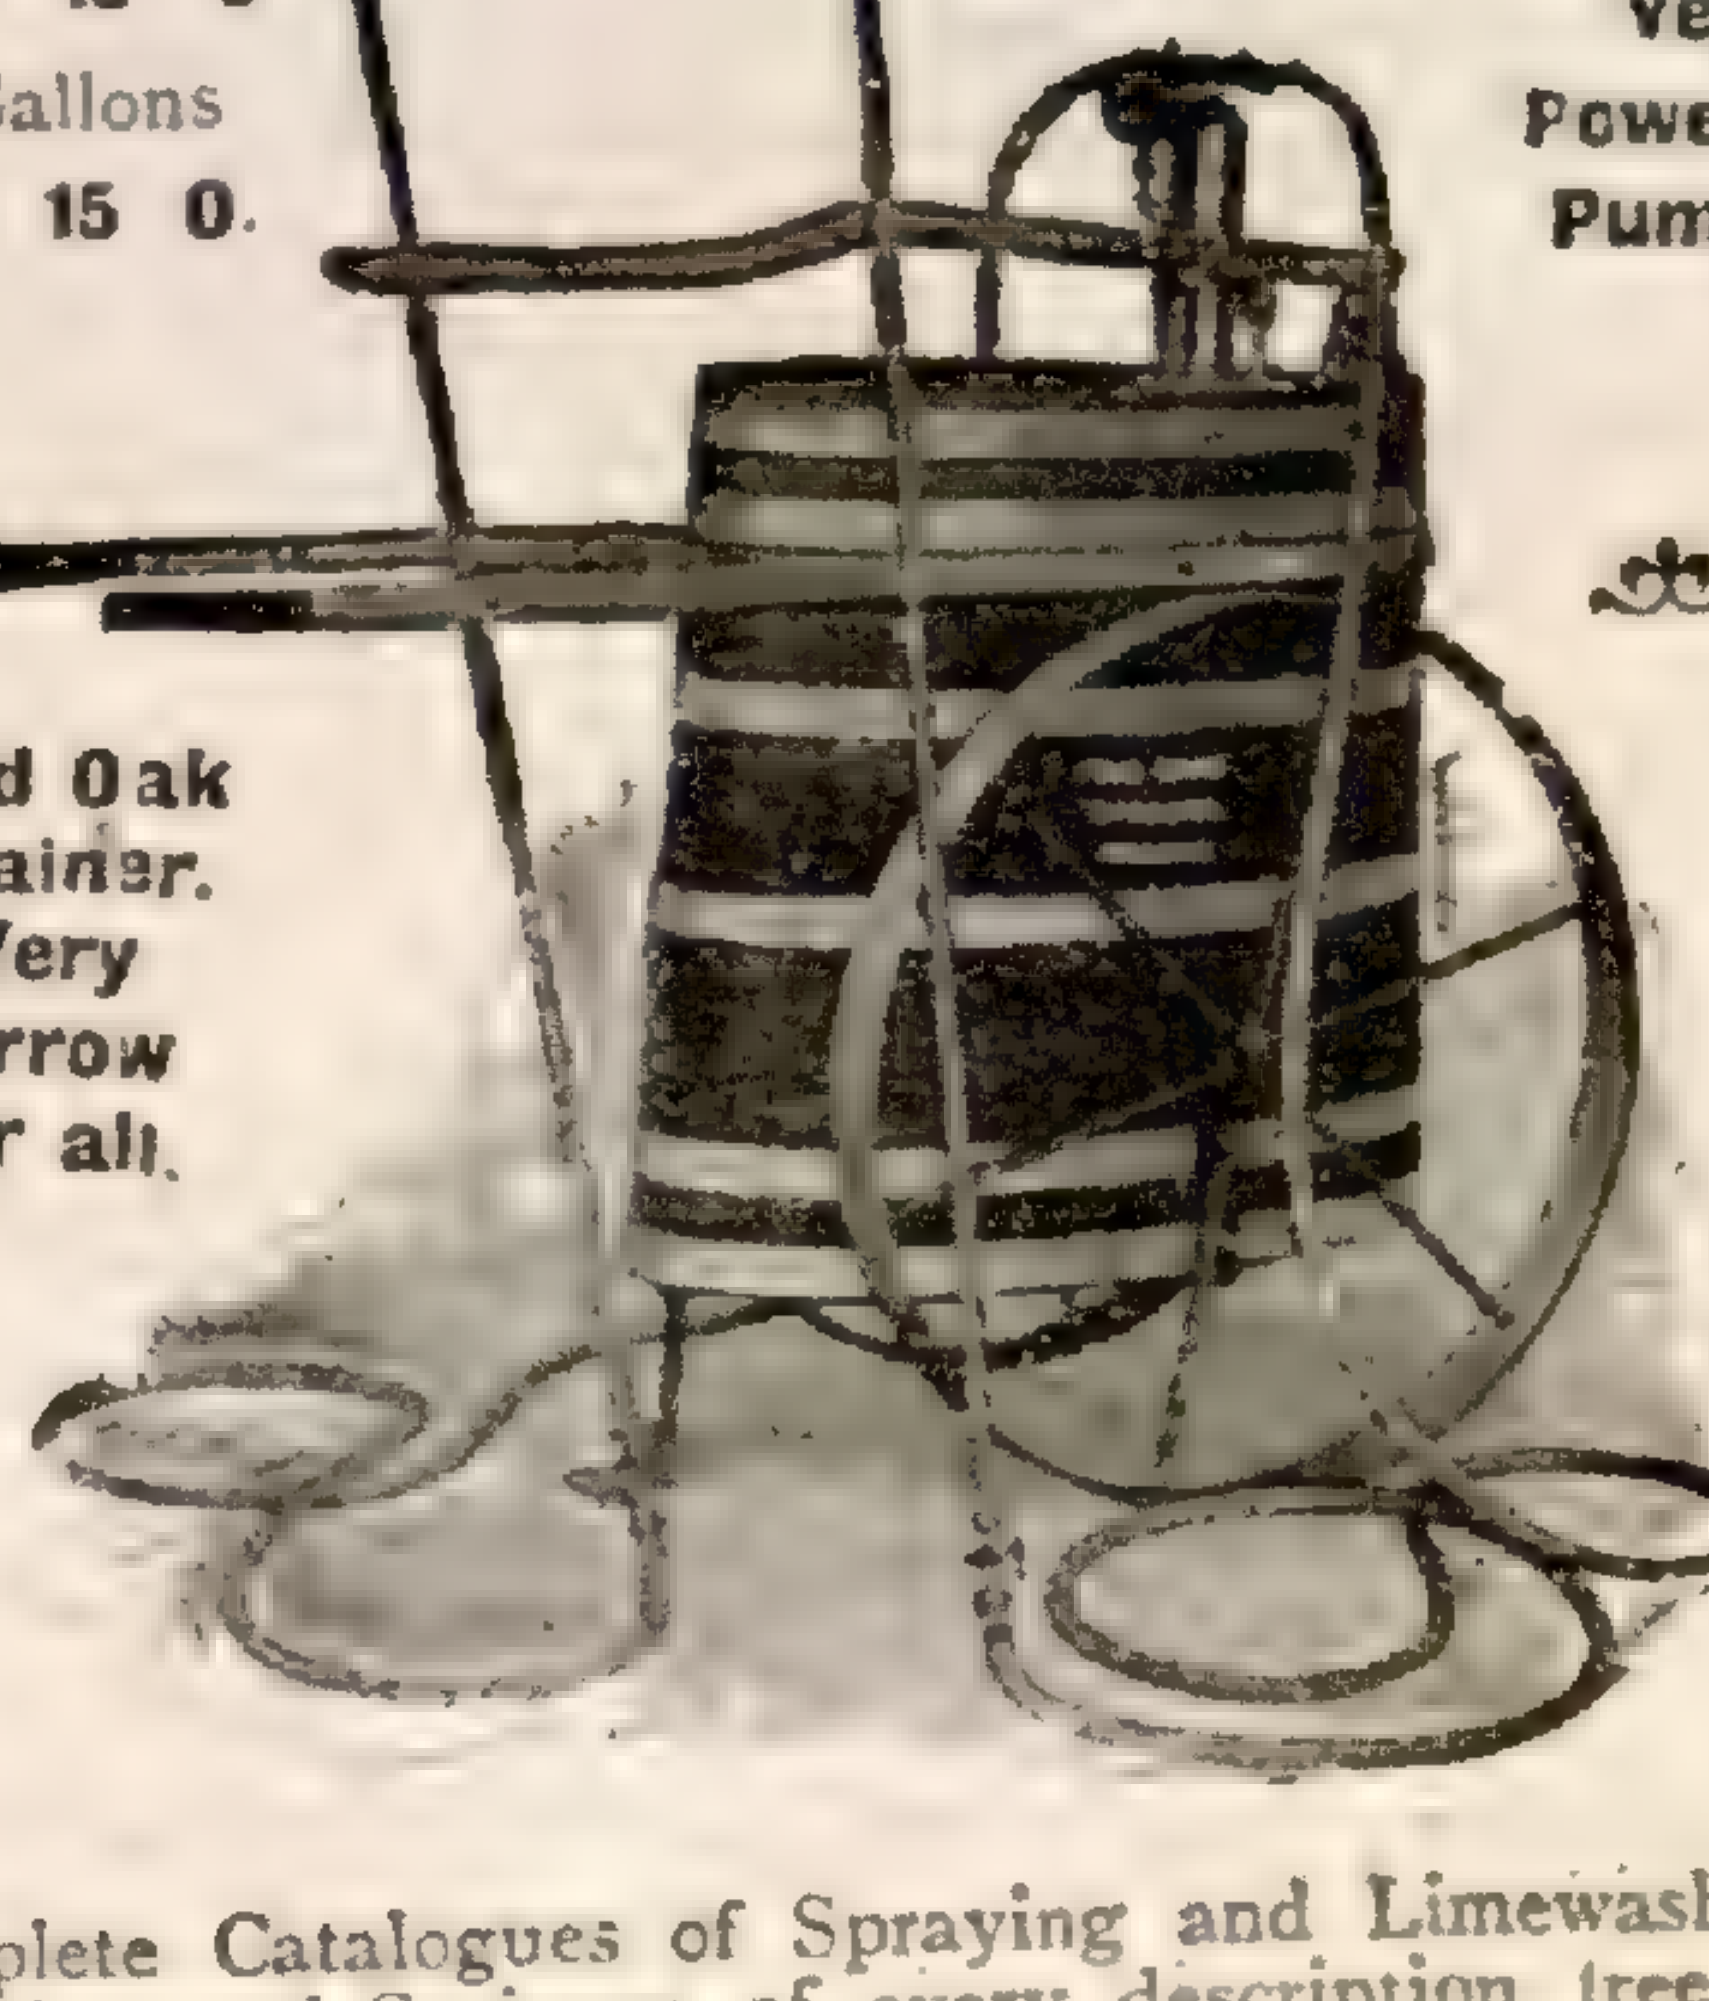
## ANSWERS TO CORRESPONDENTS.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

VIOLAS AND AUBRIETIAS. — F. M., Ewell: Kindly let me know how to propagate violas so as to produce strong, sturdy plants, like one sees in the markets during the middle and end of April, each with a flower or two, and a good ball of roots. If you will also tell me how best to propagate named varieties of aubrietias, I shall be obliged.—Taking the last question first, aubrietias have been dealt with somewhat freely in recent issues, but we may add that they may be propagated by cuttings now, these being inserted in sandy soil in a shady place, and, preferably, in a frame or under a hand-light. Violas for spring planting are raised from cuttings inserted in early autumn in frames where they are kept close up to the light, and only given sufficient shelter to keep excessive cold and wet from them. For a private garden, where spring-raised stock and autumn planting are out of the question, these autumn-struck plants should be transplanted in February or early March, into rich soil, containing a good deal of leaf-mould and grit. Here, still under cold frame shelter, and with increasing light, they grow apace. Whenever the weather is fine the lights are entirely removed, and air is always admitted, except when frost is unusually severe. Under this treatment fine plants that lift well are produced, and if planted out at the end of April or early in May they make a good display almost immediately. A good mulching of old, decayed manure should be given soon after planting, and faded flowers should be removed regularly.

DAMAGE TO BEECH BY SQUIRRELS.—D. H., Hants: We are rather bothered by squirrels in our woods, but we are not allowed to shoot the little animals because they "look so pretty." If you could state the kind of damage done by squirrels, and give suggestions for at least the reduction of that damage, it would be particularly helpful in several ways. — For sentimental reasons this destructive little animal is often



**Spraying.**

**One of England's leading Fruit Growers says:** "I consider the 'Four Oaks' Spraying Machine, **'Battle'** Pattern, to be **the only** practical machine on the market."

18 Gallons

allowed to increase in such numbers that very serious damage is done to woods, and the Board of Agriculture has recently drawn the attention of foresters to the necessity for keeping it in check. The squirrel feeds chiefly on the fruits of forest trees, such as the beech, oak, spruce, and Scots pine, and abundant signs of its activity may often be detected, for example, in a spruce wood by the piles of broken scales and stripped cones lying on the ground. In consequence, natural reproduction may be greatly reduced. The squirrel also does harm by eating buds (more particularly those of spruce and Scots pine) and biting off twigs. The destruction of the buds in snowy winters may entirely prevent seed from being produced. In plantations and thickets from 1 to 6ft. high, which are not yet provided with flowering buds, the squirrels bite off the top of the previous year's shoots and the side shoots of the last verticil, the buds of which are also eaten. Very few cones are formed on trees where squirrels have lived during the winter. In the summer also, shoots of various lengths up to 8in. are bitten off spruce trees, as at this time there are no seeds or buds to eat. The squirrel may also do great damage by peeling and girdling young trees of larch, Scots pine, silver fir, beech, hornbeam, aspen, willows, and oak. Trees from fifteen to thirty years old suffer most, but woods sixty years old are also attacked. The harm is done between May and July, and chiefly in dry years, to the stem in the crown where the squirrel sits, and is sometimes in rings or spirals, and at other times quite irregular. As it goes down to the sapwood the injured stems may die above the peeled place. Professor Fisher recommends reducing the number of squirrels by shooting, and the protection of the pine-marten (Mustela martes), which is a great enemy of the squirrel, as a natural remedy.

PEACH LEAVES FALLING. — Anxious, Potter's Bar: Could you tell me the cause of the young leaves falling from an apparently healthy peach tree in unheated house? The leaves are quite green, and at the base seem to be quite healthy, and do not appear to have been eaten by insects. This has happened for the past three years, although the tree is a very productive one. If you could kindly tell me, through your correspondence column, the cause of the leaves falling, I shall be greatly obliged.—We are always anxious to help correspondents, as far as lies in our power, but without specimens in the above case, and with such small evidence to go upon, a solution of the trouble is out of the question. If the tree continues healthy and productive, in spite of the regular annual fall of leaves at the end of April and early in May, then there must be some local cause operating, but whatever the cause, there seems little need for worry if the tree shows no signs of decline in health or fruitfulness. Troubles in connection with indoor peach culture are usually traceable to errors in watering, ventilation, and drainage.

CONSTRUCTION OF COW HOUSE. — S. C. T., Brigg: We are considering the question of erecting a new cowhouse, and I am anxious to place before my employers the best possible suggestions for such a construction before the architect is called in. I have an idea that you once referred in your "Answers" column to certain information on this matter obtainable from the Board of Agriculture; if I am right, please tell me how and where to obtain that information.—Leaflet No. 241, issued by the Board of Agriculture, contains a great deal of excellent information concerning the construction of cow houses, and also includes designs for such structures. A copy of this 16-page leaflet may be had post free on application, from the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W.

## NAMES OF PLANTS.

T. L. J., Byfleet.—1, Cattleya intermedia, C. Skinneri.

H. E., Chippenham. — 1, Polypodium lingua; 2, Hoya carnosa; 3, Gasteria verrucosa.

W. J. C., Wellington.—1, Laurus nobilis variegata; 2, Gnaphalium lanatum; 3, not recognised.

H. E. S., Marlow.—1, Anchusa italica; 2, a young growth of Physalis; 3, Polygonum Baldschuanicum; 4, Epigæa repens.

S. P. J., Barmouth.—1, Solanum Seaforthianum; 2, Costus igneus; 3, Odontoglossum polyxanthum; 4, Oncidium pulchellum; 5, a poor Lælia purpurata; 6, Swainsonia galegifolia.

## MARKETS.

Thunderstorms on the 12th and 16th.

## CATALOGUES RECEIVED.

E. J. WOOTTEN, FAIROAK, EASTLEIGH.—A special list of perpetual-flowering carnations, in which both new and old varieties have a place.

J. W. CROSS, WISBECH.—This annual spring catalogue includes hardy flowers and seed potatoes, as well as flower and vegetable seeds; it is freely illustrated.

BARR AND SONS, COVENT GARDEN, W.C.—This new catalogue of hardy perennial, alpine, aquatic, and climbing plants is remarkable for its omissions. The firm has purposely omitted a number of plants usually catalogued, but which have been superseded by improved and later introductions; consequently this descriptive and illustrated list is quite up-to-date.

J. CHEAL AND SONS, CRAWLEY.—In their work of garden designing the Messrs. Cheal have developed a special department for the design and construction of garden furniture. The catalogue before us emphasises the simplicity of the designs in seats, summer-houses, trellises, etc., and also their adaptability for certain positions.

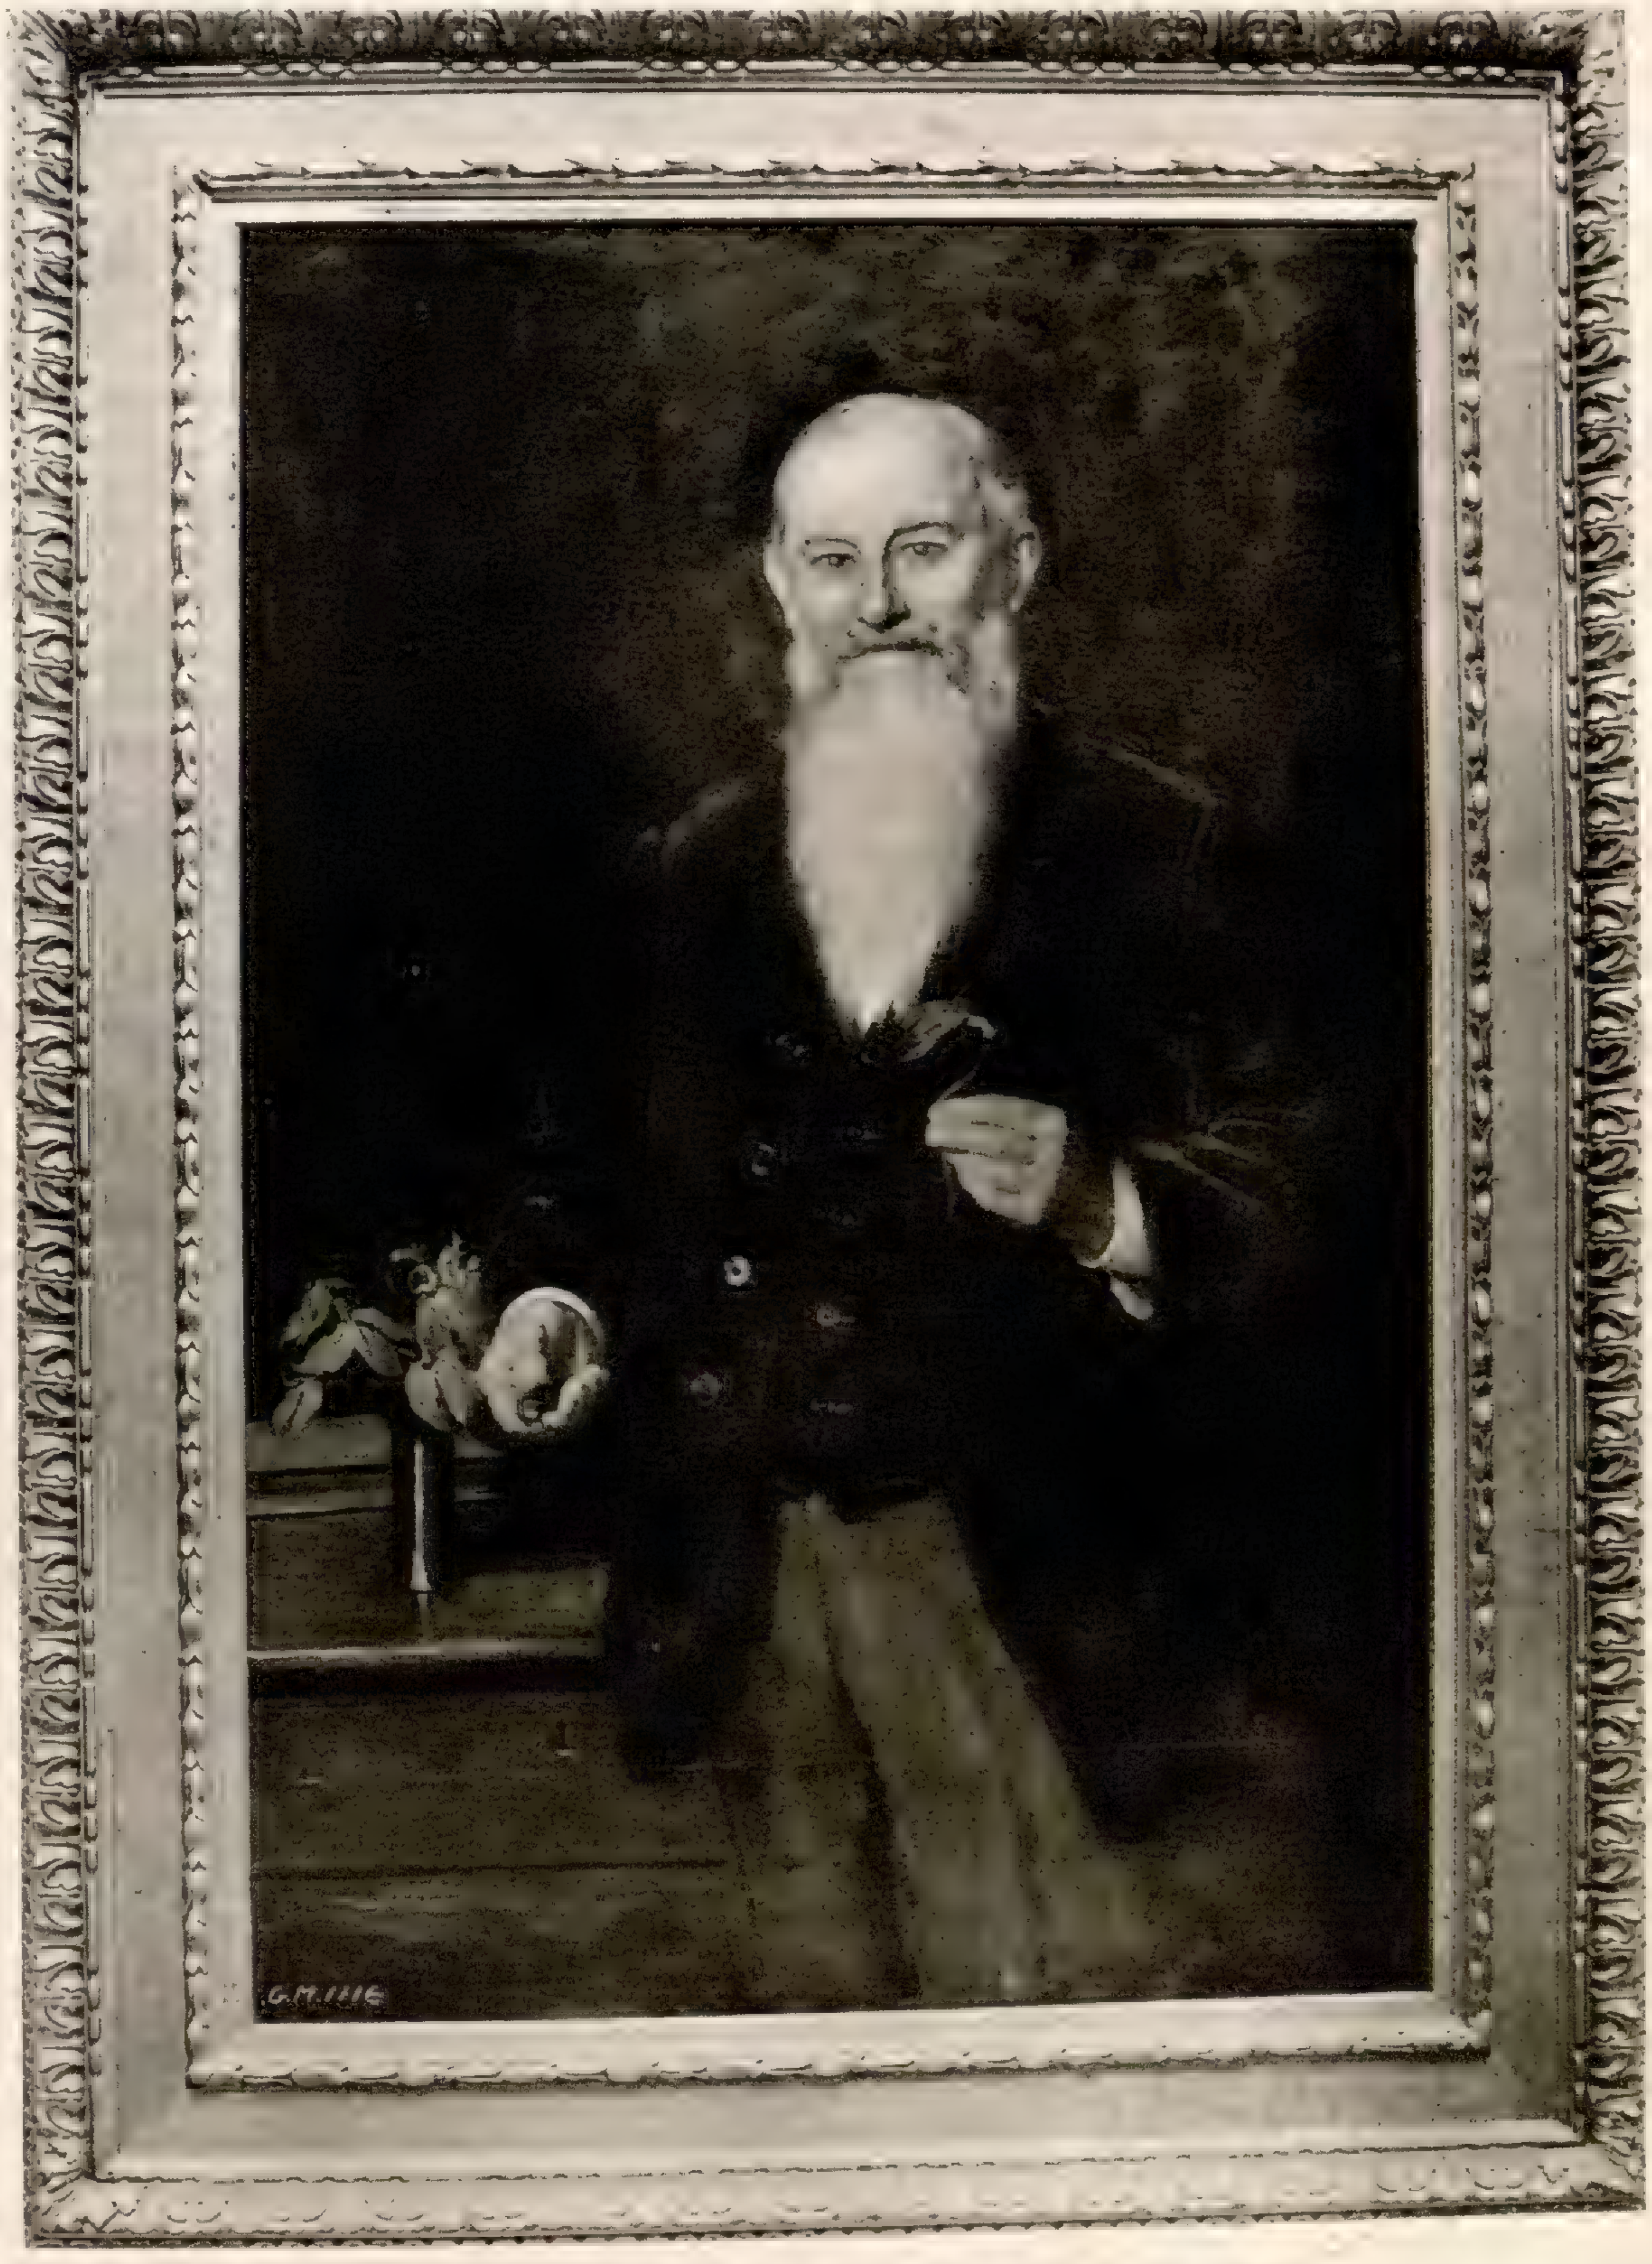
THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Legislation in Connection with Plant Diseases.

The two conferences held in connection with the Royal International Horticultural Exhibition at Chelsea were so highly successful in every way as to rank high among previous gatherings of a similar character associated with horticulture, and to reflect much credit upon the Science and Education Committee, by whom the programme was prepared and the details carried out. Both conferences dealt with matters of far-reaching importance to the horticulturists of this country, they were largely attended by those specially interested in the questions arranged for consideration, the papers were of an exceptionally high order of merit, and the discussion that followed attained to a much higher level than is customary on such occasions. As shown in our report, which appears elsewhere in the present issue, the first conference was devoted to the consideration of horticultural education and the second to legislation in connection with insect pests and fungoid diseases of plants. The two questions are of so high a degree of importance as to render it unnecessary, or indeed desirable, to attempt to differentiate between them, and if we make special reference to the second of the two, it is because the legislative enactments that have been made within recent years by Colonial and foreign countries in various parts of the world are such as to seriously interfere with the activities of nurserymen and seedsmen, whose trade extends beyond the boundaries of the United Kingdom. How great must be their interference with the trade in seeds, plants, tubers, etc., was well shown in the excellent statement which had been prepared by Mr. Arthur W. Sutton, V.M.H., F.L.S., for the information of the conference; and still more conclusive evidence upon this point is found in the comprehensive summary of regulations relating to the importation of plants, weeds, and insects from Great Britain into other countries, which has been prepared by the Board of Agriculture, and was placed at the disposal of the members of the conference. It may, as Mr. Sutton pointed out, be necessary in the interest of cultivators, and, indeed, of the community at large, to adopt some restrictive measures to prevent the export of seeds, plants, etc., from disease-infected or insect-infested areas, but the regulations that are now in force are not well devised for the exclusion of the enemies of plant life from countries that are wholly free from them. In some cases, only one of two classes of plants have to be examined at the port of arrival, and the regulations are of the simplest, while in other countries a considerable number have to be subjected to examination under regulations of the most elaborate, and it may be, vexatious, character. It was contended with some force that if the elaborate precautions that had been taken by some countries are really necessary, then the other countries have not done sufficient to protect cultivators from the various enemies of plant life from which their gardens and fields are free. Professor Ritzema Bos, who is one of the highest of the European authorities on insect pests and fungoid diseases, and read the first paper at the conference, expressed in no uncertain manner his opinion that the



SIR HARRY J. VEITCH, V.M.H., F.L.S., ETC.

examination of nursery stock, garden produce, etc., at the port of entry is not an efficient protection. His reasons are stated in the summary of the first part of his paper which is given in our report, and therefore need not be recapitulated here. He, however, did not suggest that nothing should be done with a view to the prevention of plant diseases, but, on the contrary, he strongly advocated the examination of the plants, etc., in the country of origin. In referring to the question of inspection and of granting a certificate of health before exportation, he expressed the opinion that in no other way could the importation of diseases from abroad be more effectually prevented than by efficient inspection of the stock in the country where it has grown. But this inspection can, in Professor Ritzema Bos's opinion, only give what is reasonably required of it—a guarantee for the health of the stock when a well-equipped phytopathological service exists in the country from which it comes. In Holland there is such service, and the account that was given of its method of procedure formed an important and interesting part of the paper, and we hope to have an opportunity of making some reference to it at no distant date. Much is being done in this country in the direction of facilitating commercial intercourse between this and other countries, and by means of active co-operation between nurserymen and seedsmen, and the officials of the Board of Agriculture, some at least of the difficulties that arise in connection with exports of plants, etc., might be brushed away. It was pointed out by Mr. Rogers, of the Intelligence Department of the Board of Agriculture, that the utmost the Board can do under existing conditions is to afford nurserymen facilities for complying with the regulations that require some inspection or report as regards the freedom of products from disease of that part of England in which they are grown. Arrangements have accordingly been made for such inspection, and the issue of such certificates and a memorandum setting out what the Board are prepared to undertake has been sent to all the principal nurserymen in England. This has been done in order that the Board's inspectors may be in a position to enter on premises where disease may exist, and search all places where it may be found that certain pests have been scheduled, for in some cases it is necessary to examine not only the premises or the plants in respect of which an application for a certificate has been made, but the adjoining premises also. Mr. Güssow, the botanist of the Canadian Government, who also contributed a paper to the conference, expressed the opinion that the only method by which the spread of diseases and insect pests could be prevented was by the examination of stock in the country of origin, and the issue of certificates for that found free from them. Mr. H. M. Lefroy, the Imperial entomologist for India, in dealing with insect pests of plants in the tropics, showed very clearly that there was ample room for a considerable improvement in the methods of procedure. But to effect these a much wider knowledge of the pests was necessary before it would be possible to adapt the regulations to existing conditions, and all who have paid any attention to the question will be in full agreement with this view of the case. They will also feel with us that both insect pests and diseases should be more carefully studied by all who are engaged in cultural methods, whether on the farm or in the garden.

---

**Sir Harry J. Veitch, V.M.H., F.L.S.,** has, in the course of his long and active life, rendered such splendid services in the cause of gardening and gardeners that we are fully assured the whole of our readers will join with us in tendering him our heartiest congratulations on his having had the honour of knighthood conferred upon him by the King. The pleasure that we, in common with other horticulturists, feel, is all the greater from the fact that it has long been felt by those who take an active interest in horticultural affairs that services such as those which have been rendered by Sir Harry J. Veitch during the past fifty years well merited the highest honours that could be conferred upon him by his Sovereign. Expression was given to this feeling at the dinner in his honour at the Royal Horticultural Hall on January 24, 1910, when Mrs. Veitch was presented with a duplicate of his portrait which had been painted by Mr. Hugh C. Riviere, and presented to the Royal Horticultural Society by his many friends. One of the speakers, who had taken an active part in raising the necessary funds which, by the way, was a very easy matter, said that he hoped some day the King and State might see fit to honour horticulture by honouring such a man as the guest of the evening. This expression of hope was received with acclamation, and we now rejoice in no uncertain manner in the fulfilment of this hope. It would give us pleasure to write at length on Sir Harry J. Veitch's achievements, but it would be superfluous. It is well known to all who are interested in horticulture that throughout the half-century or so that he has been associated with the firm of which he has long been the head, he has been unremitting in his endeavours to enrich British gardens with ornamental plants and useful fruits, and as exemplified by the large collection of plants that had been recently introduced from China, which formed so interesting a feature of the International Horticultural Exhibition, he is now not less keenly interested in this branch of his firm's activities than at any previous period. His work in this direction would fully justify the high honour that has now been conferred upon him, but he has done so much, both as a worker and supporter, in the cause of the charities associated with gardening as to give him a unique position among horticulturists. Moreover, as a member of the Council of the Royal Horticultural Society, since 1887, Sir Harry J. Veitch has accomplished work of such immense value, that it would be difficult to set a proper estimate upon it. It may be mentioned that he had the Victoria Medal of Honour in Horticulture conferred upon him in 1906, but he would have been included among the sixty original recipients in 1897 had not the Council then resolved that no member of the Council should receive it, and in 1908 he received from the King of the Belgians the distinction of Chevalier of the Order of Leopold. Our portrait of Sir Harry J. Veitch is reproduced from the fine presentation portrait painted by Mr. Hugh C. Riviere in 1910, which now hangs in the Council Chamber at the Royal Horticultural Hall.

**Royal International Horticultural Exhibition.**—It is with very great pleasure we are able to state that not only is the great exhibition at Chelsea Hospital Gardens a great horticultural success, as we have already shown, but it is a financial success also. So great has been the attendance, and so keen the interest created during this second week of the show that the desirability of extending the period of the exhibition until and including Saturday, June 1, was heartily suggested on all sides on Tuesday, May 28, and received the fullest consideration of the directors. Of course, the Chelsea Hospital authorities and the exhibitors are the chief persons to be considered in this connection, but at the moment of going to press, we believe there is not the slightest possibility of the extension being arranged. The attendance and takings for the several days, so far as available, were as follows: Wednesday, May 22: admission, two guineas until 5 p.m., one guinea after 5 o'clock; takings at the gates, £690. Thursday, May 23: admission, one guinea until 5 p.m., 10s. 6d. after 5 o'clock; takings, £1,932. Friday, May 24: admission 10s. 6d. until 5 p.m., 5s. after 5 o'clock; takings, £2,150. Saturday, May 25: admission 5s. until 5 p.m., 2s. 6d. after 5 o'clock; takings, £1,899. Monday, May 27 (Whit-Monday): admission, 2s. 6d. all day; visitors, 20,000; takings, £1,593. Tuesday, May 28: admission, 1s. all day; visitors, 40,000; takings, £1,720. Wednesday, May 29: admission, 1s. all day; by 12 noon, over 10,000 had passed the turnstiles, and at 3 p.m. visitors were crowding in at all the entrances.

**"Problems of Propagation"** is the title of the eighth Masters Memorial Lecture, to be delivered by Professor Isaac Bayley Balfour, at the Royal Horticultural Hall on Tuesday, June 4. Professor Balfour is director of the Royal Botanic Gardens, Edinburgh, where the most difficult plants to deal with are propagated with comparative ease. The Edinburgh exhibit in the Science Section of the Royal International Horticultural Exhibition was evidence of the skilful way in which plant propagation is conducted in the famous gardens there, and, possibly, afford some indication of the lines which Professor Balfour's lecture will follow.

**The "Gardeners' Magazine" and the Royal International Horticultural Exhibition.**—In our efforts to give our many readers the fullest possible account of the great international exhibition at Chelsea, we have spared no pains, time, or expense during the three weeks now closing, and we have devoted three special issues to this unparalleled horticultural display and its attendant conferences and functions. By means of reproductions from photographs taken on the spot, and descriptive text, we have given our readers an account that has met with unbounded success and admiration. Personal thanks and congratulations have been heaped upon our editorial and publishing staffs, and each post continues to bring us dozens of congratulatory letters. We hope and believe that this issue, the third of the exhibition numbers, will meet with the same hearty approval that the others have enjoyed. The success achieved is largely due to the fact that the whole of the reports are the work of our own regular and expert staff.

**Kew Guild.**—Seldom, if ever, in its history, has the annual gathering of past and present Kewites been so largely and representatively attended as on May 20 at the Holborn Restaurant. The business meeting, presided over by Mr. R. Hooper-Pearson, was well attended. The annual report notified a somewhat serious falling off in annual subscriptions, and a sub-committee was appointed to consider and report upon the financial situation. There appears, however to be no need for alarm as the Guild carries forward a balance of £27 4s. 6d., and has a capital account of £330 14s. 6d. The benevolent fund started last year has already been of great assistance. The business meeting was followed by the annual dinner, and Lieut.-Col. D. Prain, Director of the Royal Gardens, Kew, presided over one hundred and eighteen members gathered from all parts of the United Kingdom, the Continent, and almost all the ends of the earth. A particularly pleasant evening was spent, the only regret being the absence of Mr. W. Watson. Lieut.-Colonel Prain becomes president for the ensuing year, and Mr. A. W. Hill, Assistant Director at Kew, is elected chairman of committee for the ensuing three years. Among those present from other lands we noticed Mr. Burkill, from South Africa; Mr. W. J. Fletcher, from Hong Kong; Mr. Robson, from Montserrat; Mr. A. Hemming, from Philadelphia; Mr. Sillettoe and Mr. Patterson, from the West Indies; Mr. Harry Davis, from India; and Mr. Benbow, from La Mortola.

**Larch Saw-fly in the Lake District.**—We learn that the larch saw-fly is working havoc among the larch plantations that clothe the lower slopes of the fells in the Lake District. Great efforts have been made to stamp out the pest, but so far they do not seem to have been very effective. Tits are being encouraged, as they eat the saw-flies, and so help to keep the pest down.

**Grand Yorkshire Floral Fete and Gala.**—The dates of this great Northern flower show are June 19, 20, and 21, and, as usual, the display will take place in Bootham Park, York. A splendid schedule has been arranged, and the prizes should attract the best of exhibitors. The Archbishop of York is offering a special prize for the most meritorious and attractive exhibit in the show, and gold medals are offered respectively for the best trade displays of orchids, stove and greenhouse plants, ornamental trees and shrubs, and decorative plants and cut flowers.

**Pot Fruit Trees from Gunnersbury House.** — Few exhibits attracted more attention at the great International Horticultural Exhibition, especially from the foreign visitors, than the splendid display of forced fruits in pots staged by Mr. Jas. Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., C.V.O., Gunnersbury House, Acton. We have already referred to it, but it may be of special interest to state that the group included three varieties of grapes, twelve of cherries, three of nectarines, six of peaches, six of figs, eight of plums, four of melons, two of strawberries, two of tomatoes, the Seville orange, the loganberry, the newberry, and The Holman raspberry. We understand that all the fruits exhibited by Mr. Leopold de Rothschild have been distributed among the sick and aged pensioners at the Royal Hospital, Chelsea. The great merit of this exceptionally fine exhibit was recognised by the award of a large gold medal and the special trophy (Prix d'Honneur) offered by the National Horticultural Society of France.

**Guide to the Fruit and Vegetable Trades.**—It is only when one is conversant with the business done in the great fruit, vegetable, and flower markets of London and the large provincial cities and towns, that the immense amount of business passing through the hands of those who grow, handle, and sell the produce of the horticulturist and market gardener, becomes apparent. With almost equal force, however, is an idea of the extent of the trade emphasised in "Castle's Guide to the Fruit, Vegetable, and Allied Trades," a volume of over two hundred pages, neatly bound in blue cloth board, and containing a directory of all who come under its title in the United Kingdom. Beginning with London, the counties are then taken in alphabetical order, and in each county the names of dealers and growers are also arranged alphabetically, while the particular kind of business conducted by the person or firm is in every case indicated. Even horticultural builders and manure merchants, as well as nurserymen and seedsmen are included, so that the directory is of outstanding importance and usefulness to all who do business in the world of horticulture. It is published by Castle's Directories, Lim., Truro. The index of towns, showing their counties, is not the least valuable part of a good work.

**Protection of Rare Birds.**—Mr. Montagu Sharpe, chairman of the Royal Society for the Protection of Birds, writes: This season the Watchers' Committee of the Royal Society for the Protection of Birds is employing and paying 22 watchers in various parts of the country to safeguard the rare birds which are in danger on account of the greed of collectors and from other causes. It is a curious fact that, although many people are aware of the life-long pleasure and enjoyment which they derive from the existence of birds, it is only a few whose appreciation and gratitude takes the form of adequate contributions to the society without whose strenuous efforts during 20 years many species of birds would in all probability have been utterly destroyed. This inadequate support is probably due to the fact that bird protection is not sufficiently sensational to appeal powerfully to the ordinary person's pocket. We therefore appeal to all those who are able to realise the importance of the preservation of what is beautiful and useful in nature, and venture to express a hope through your columns that some will come forward to help by joining the Royal Society for the Protection of Birds as a fellow or member, or by sending a subscription to one or other of its special funds, of which full particulars can be obtained of the secretary, 23, Queen Anne's Gate, London, W.

**New Open Space for Bacup.**—The trustees of the late Edward Hoyle have presented to Bacup the "Moorlands" Estate for use as a public park, and a site for a new school. The estate is worth upwards of £10,000, and includes a fine mansion, which is vacant, and is situated in a healthy part of the town.

**The National Hardy Plant Society** has received some additions to its schedule of prizes for Wednesday, June 19. Two extra classes are announced, one for six bunches of pink, and one for six bunches of scarlet Sweet Williams, and in each class Messrs. Sutton and Sons are providing cash prizes of 21s., 10s., and 5s. respectively for first, second, and third prizes. Mr. A. J. Macself, 52, Beechwood Road, Finsbury Park, N., will supply schedules and particulars to intending competitors.

**Rose Killarney Brilliant.**—Under this name Messrs. Alex. Dickson and Sons, of Newtownards, have registered in America a new sport of Killarney which originated in this country. The blooms of the variety are described as being more double than Double Pink Killarney, and the colour brighter than the original Pink Killarney. The form of the flower and the habit of growth are like the original Killarney.

## NOTES FROM SCOTLAND.

◆

### The Season and the Crops.

Not for many years past has such a favourable spring-time as that now ending been experienced in the South-west of Scotland, a fact generally confirmed by all classes depending upon the produce gained from the soil for a livelihood.

Frosts, since the early part of April, have been less frequent than usual, and but little damage has accrued thereby to crops; while the amount of bright sunshine by day, and generally mild conditions by night, have assisted forward vegetation, so that at present—May 15—the crops are quite a fortnight earlier than usual, and the promise for the future all that could be wished for. The total amount of rainfall for April just exceeded one inch, thus providing the happy medium between the drought in the South of England and the excess in the northern parts of Scotland.

### The Fruit Crops.

With the exception of strawberries and raspberries, which are now in full bloom, a plentiful set of most kinds of fruits seems now assured, plums and pears being in this respect particularly good, and as the embryo fruits are now so well protected by the foliage, but little damage from inclement weather, should it come, is now feared. The earlier kinds of apples have mostly shed their bloom-petals, while those somewhat later, and orchard standards are pictures of beauty, and form striking objects wherever they may be placed. Bush fruits in general are heavily cropped, gooseberries and red currants being especially so, while black currants, though scarcely so profusely laden, will likely provide an ample supply. Owing to the absence of any very inclement weather, more particularly cold winds, the foliage of all fruit trees is remarkably fresh, and free from insect pests; and so far the gooseberry caterpillar, which is often the scourge of the season, has not made an appearance.

### Vegetables.

The genial atmospheric conditions have also had a most beneficent effect upon all green crops, which of their respective kinds were ready for use from ten days to a fortnight earlier than is usual. Asparagus, which, as a rule, thrives well here, being near the sea, has quite surpassed all previous records, both for size and quality. Cabbages were more prone to running to seed than one cares to contemplate, but later plantings are almost free from this defect, and fine succulent hearts have been for a long time available. The various summer crops, as peas, cauliflowers, and potatoes, promise well, and should the weather during the immediately succeeding weeks prove favourable to growth, bountiful crops of nearly all kinds may reasonably be expected.

### Early Potato Crops in Scotland.

The genial weather of late has proved of immense benefit to the early potatoes so extensively cultivated along the south-western coasts of Scotland. Following upon a long period of almost incessant rainfall, some difficulty was experienced in getting the tubers committed to the ground at the usual time; but as the sprouting process was well advanced, and the atmospheric conditions in general quite favourable to growth, the effects of the delay were not long noticeable. With one exception, frosts of any degree of intensity have been conspicuously absent, so that in most cases a remarkably fresh, healthy appearance is now presented. The dry weather which prevailed throughout April enabled the necessary weeding and general cultivation, by way of horse and machine labour, to be proceeded with under excellent conditions, and at present (May 10) large areas have received the final touches by way of moulding the drills.

Of course, it is impossible to foretell what the weather may be during the remainder of the month, but should it continue favourable—and the time when frost of much severity in this locality and in positions assigned to the crops is rapidly passing away—long and well-experienced cultivators predict a season of unusual earliness and weight of produce. The third week in June may be regarded as the average date for the sales of the crops, privately or by auction, and raising commences immediately thereafter, but with a continuance of the moist, warm breezes now prevailing, this period may be accelerated by at least ten days, thus, over an extensive tract of country, constituting a record for earliness.

Epicure has now largely displaced the one-time favourite Puritan, chiefly, no doubt, owing to its earliness and free cropping qualities, as also to the very uniform size of the tubers when raised, there being, as a rule, comparatively few unsaleable.

Early potato culture has of late years become a very important industry in the West of Scotland, not only to the owners themselves, but equally so to large numbers of the wage-earning class, who invade the district, and find pleasant and remunerative employment, and the start of the season of open-air labour.

JAMES DAY.

Galloway House, Wigtownshire.

## RHODODENDRON DILATATUM.

This species belongs to the azalea group of the genus, and is one of the forerunners of the numerous kinds which bloom between April and July. Normally the flowers open about mid-April, but, with many other shrubs, the flowering time is advanced by quite three weeks this year. Of Japanese origin, it is a less common plant in British gardens than its ornamental qualities warrant, for it grows into a good-sized upright bush, and produces its rosy-purple blossoms with the same freedom as the later-flowering kinds. The flowers are borne in small, loose clusters, each blossom being about 1½in. across. As is the case with other species from Japan, they lack the fragrance which is such an attraction in the North American sorts.

Fortunately it is a species which may easily be propagated from cuttings, if short pieces, 3in. to 4in. long, of semi-ripe shoots are taken in July and inserted in pots of sandy peat in a close propagating case. These root in a few weeks' time, and the best plants are formed when the rooted cuttings are planted in peaty soil in a cold frame for a year before placing them in the open. When selecting a position for this species it is advisable to choose one which is shaded from the east, so that the sun does not shine on the flowers very early in the morning after a frosty night.

W. D.

**Gesnera cardinalis.**—Known also as Gesnera macrantha, this is a very pretty plant for the warm greenhouse. It is one of those gesneras that produces a solid tuber, from which is pushed up a stout stem to a height of a foot or so. This stem is clothed with bright green heart-shaped leaves, while the curved tubular flowers, borne in terminal heads, are velvety crimson in colour.—W. T.

## JAPANESE AZALEAS.

Readers who are conversant with the glowing effects of azaleas when grouped upon the hillsides or in the gardens of Japan, must surely at times wish that these same exquisite effects might be reproduced in our English landscapes. The colourings of some of these azaleas are so attractive, so superb for distance effects, that I may be pardoned if I dilate a little upon such a subject. The use of Azalea mollis has become general, and both for garden decoration and for forcing its varieties have attained great popularity. For planting banks and slopes, this class of azaleas is very attractive, and both at the time of blossoming and in the autumn, when the leaves take on their glowing hues of scarlet and gold, they decidedly enhance the beauty and the interest of the garden.

Azaleas of the A. ledifolium and kindred types are being brought into use for wild garden effects in south country gardens, and the results have been very pleasing, the pure white variety leucanthemum being capable of fine effects.

A. amœna, or Hatsu-giri, is of distinct service for rock gardens, and when it does well, is quite attractive with its purplish blossoms. The Korean A. acuminata comes near to it in colour, though a trifle paler, but the habit of the latter is much taller and more robust. A. acuminata deserves note on account of its earliness and hardiness, as it often blooms like Rhododendron præcox, on a snow-covered landscape.

Away from all the foregoing are the azaleas from the warm mountain slopes of Japan, which are almost, if not quite, unequalled among dwarf shrubs. The usual varieties of Azalea indica do not hold the warmth of colouring and brilliancy of these new subjects, though the small glossy evergreen foliage bespeaks their near relationship to the indica type. One of the best known of this section is the glowing red A. Hinode-giri, which is capable of very fine effects, and with the following, is notable for the multitudes of blossoms which crowd the plants. Good as A. Hinode-giri is, A. Kirishima, to me, is far better. Imagine a set of dwarf shrubs clouded over with sheets of starry rosy-red flowers, a veritable blaze of rich colour, and you will have some conception of A. Kirishima. Provided that A. Kirishima proves hardy enough for the sheltered southern counties, we shall get even yet a touch of Japanese colour in our garden scenes.

Equally good is A. Yaye-giri, one of the most exquisite shades of orange-red ever noted among floral subjects. Unlike A. Kirishima, A. Yaye-giri produces duplex blossoms, but it is not the duplex flowers that one cares about, but the glowing, appealing orange-red shade which lights up the whole of its surroundings that commands attention. If one were compelled to always cultivate this azalea under glass, its beauty would more than compensate for the time and trouble expended upon it, but in the sheltered South I have hopes that it may find a permanent home on the sunny slopes of a warm rock or wild garden.

Grown as pot plants under glass the foregoing azaleas flower in March, but plants grown cool will be at their best in May. It is with the hope that these Japanese azaleas may be more widely admired and utilised that I pen these notes. They are deserving of the closest attention, and should have a good future; and apart from their usefulness for private gardens, they should be valuable to the market grower.

P. S. HAYWARD.

## CHRYSANTHEMUMS.

The plants, grown for various purposes, will now require considerable attention from the cultivator. The stock should be finally selected—for the production of exhibition blooms, cut, and on specimen plants; for conservatory decoration, the outside border, and for walls—so that ample room may be allowed for their development, as at this stage, they require much space in the frame and nursery ground.

### Plants for Large Blooms.

The experienced cultivator knows his plants well; he will not allow them to receive a check through lack of nourishment, but the new grower, who is content to wait until certain dates come before he does the necessary repotting, and carry out other details, will not have the best plants at the end of the season. If certain plants become pot-bound, they should be shifted into larger-sized pots at once, if too early for the final potting; but if intermediate repotting be out of the question, then judicious feeding must be done. Plants with hardened stems just above the soil, rarely ever recover sufficiently to yield the best blooms. Rather than starve young plants in small pots now, I would at once put two of them into an 8in. pot, and then finally transfer them to others, 12in. in diameter.

### Mixing the Compost.

The inexperienced grower should not rely too much on fancy mixtures, composts containing many kinds of ingredients, especially of chemical manures. I have seen healthy plants at this stage—the final potting—ruined by unsuitable composts, the roots perishing instead of pushing their way freely through the soil. Again, I repeat, the old hand knows what should be done. But the novice seeks for a guide. The safest course I can suggest is to use a compost consisting of fibrous loam two parts, leaf-soil one part, decayed manure and coarse sand half a part each. To six barrowloads of the above, add a 7in. potful of bone-meal, a similar quantity of soot, one peck of old mortar rubble, and a 10in. potful of wood ashes. He cannot go wrong in using such a mixture, and he can supply the plants with additional food later on.

Mix the ingredients on a level surface, and keep the heap flat; then the lumpy portion will be evenly distributed, and not roll to the sides all round; in fact, all the parts will remain where placed.

I believe Mr. Molyneux used to have his compost mixed a few weeks before it was actually required for use, and I followed his lead, and found it a good plan.

### Plants for Walls.

In some gardens there are walls and borders in front of them, which might be furnished with early summer and autumn-flowering varieties rather than leave the space bare. The general effect is really very pleasing, the plants furnish blooms for cutting in quantity, and it is a very easy matter to protect the late blooms from early frosts. My plan is to plant fairly tall and dwarf varieties alternately, and so clothe the wall all over with foliage and flowers. Three feet from the base of the wall put in a row of dwarf-growing varieties, and treat the plants as bushes. Here again, very early and late varieties may be mixed, and so prolong the show of blossom.

G. GARNER.

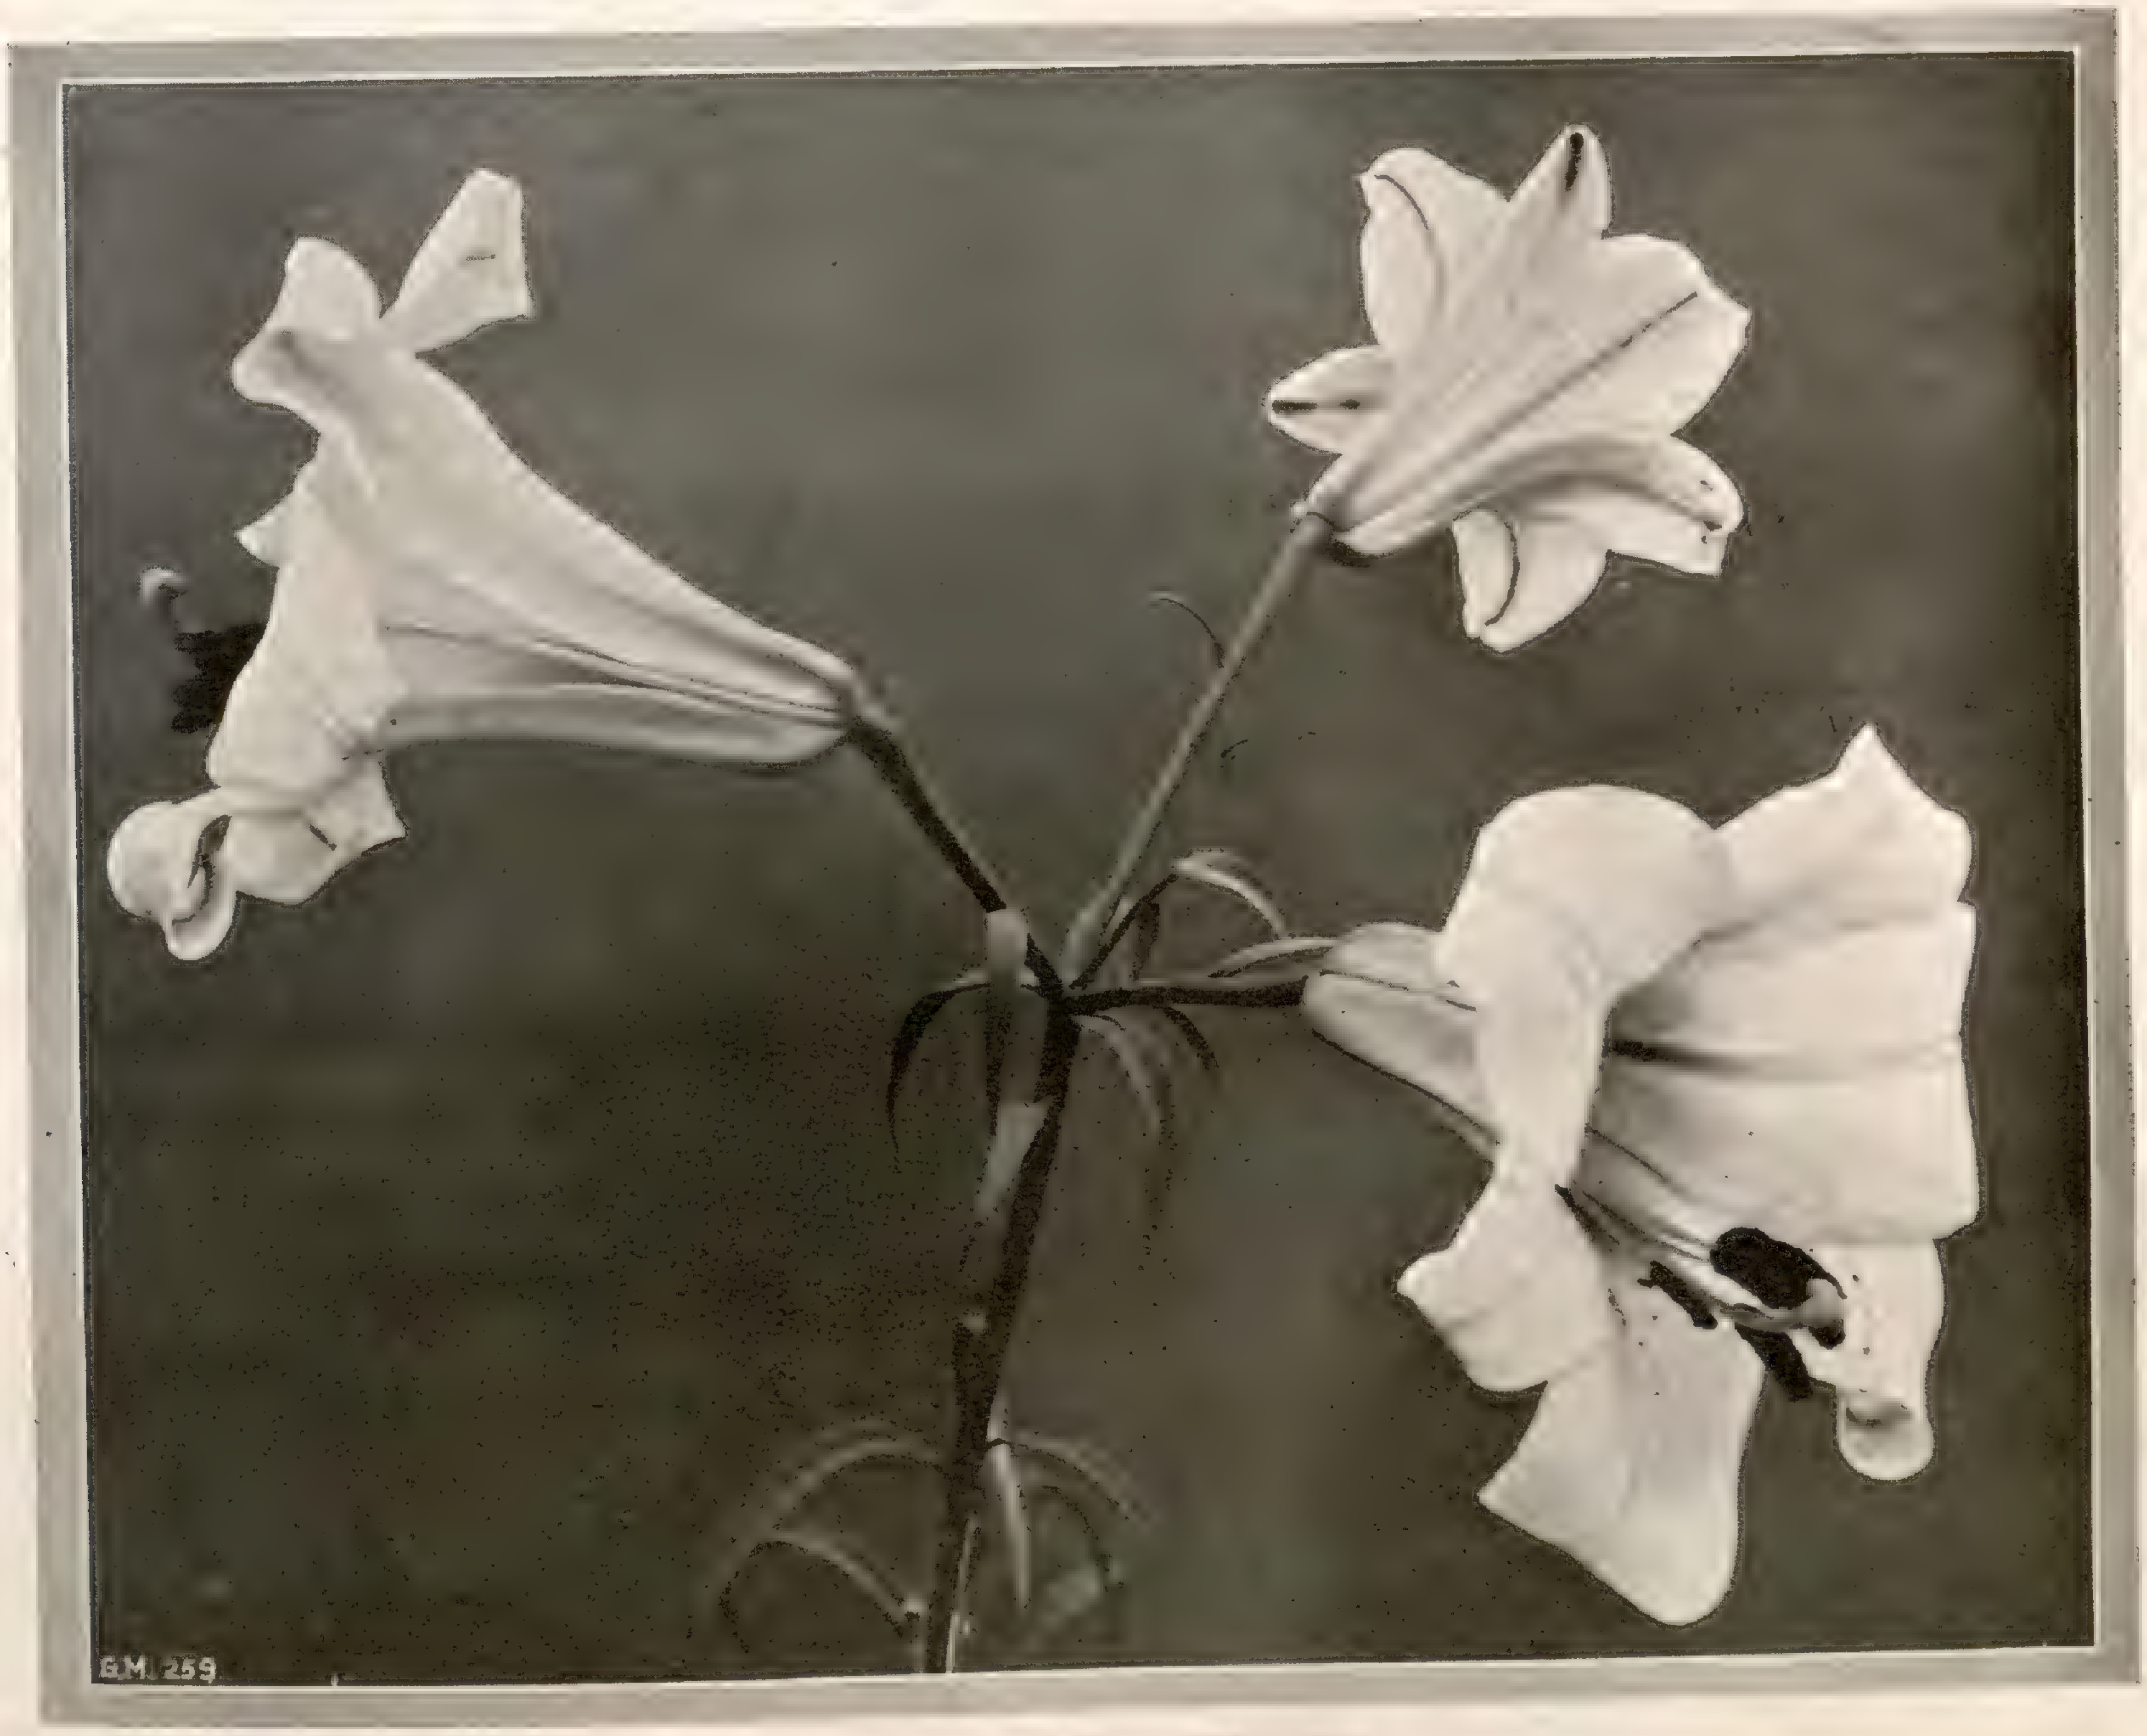
## NEW PLANTS AND FLOWERS OF EXCEPTIONAL MERIT.



LILIUM MYRIOPHYLLUM.
Flowers white, flushed with reddish-rose. A.M., R.H.S. (I.H.E.), May 22. Messrs. R. Wallace and Co., Colchester.

### LILIUM DAVURICUM LUTEUM.

A bold form of a well-known type. It has large flowers of a bright yellow shade, freely spotted with old brown. A showy garden plant. A.M., R.H.S., Int. Hort. Ex., May 22. Mr. Amos Perry, Enfield.

### LILIUM MYRIOPHYLLUM.

An exquisitely beautiful and graceful Chinese lily, with yard-high slender stems clothed with narrow dark green leaves, and crowned with (usually) three trumpet-shaped flowers. These are pure white with a soft yellow throat and golden anthers. The exterior of the flower is heavily flushed with reddish-rose. A very lovely plant. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. R. Wallace and Co., Colchester.

### ODONTOGLOSSUM HER MAJESTY.

A superb odontoglossum, with a spike of nine large and shapely flowers, very difficult to describe. The colouring is bright red-purple, with edging and veinings of blush-white. The sepals, as well as the lip, are charmingly fringed, and the latter organ has a big central area of vivid red-brown, with an edging of white and purple. The parentage is not known, but O. Wilckeanum and O. eximium are probably the parents. F.C.C., R.H.S., Int. Hort. Ex., May 22. Messrs. Charlesworth and Co., Haywards Heath.

### ODONTOGLOSSUM EXIMIUM KING GEORGE V.

A striking variety of a very showy hybrid. It had a spike of seven shapely and fair-sized flowers of good form. The chief colouring is rich old purple, but at the bases and margins of the segments a rich rosy-blush colour showed through with some purple markings. The lip is of rich purple with a white fringed apex, and a small yellow crest. F.C.C., R.H.S., Int. Hort. Ex., May 22. Messrs. Sander and Sons, St. Albans.

### ODONTOGLOSSUM MAJESTICUM VAR. JAMES WHITTON.

A striking form of a hybrid derived from O. eximium and O. percultum. It has especially large flowers, about four inches across, white, heavily blotched with bright red-purple, and also spotted and streaked with this rich colouring. On the large crispum-like lip were spots of bright colour, and a very marked yellow crest. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Sander and Sons, St. Albans.

ODONTOGLOSSUM EXIMIUM KING GEORGE.
Flowers rich rose-purple. F.C.C., R.H.S. (I.H.E.), May 22. Messrs. Sander and Sons, St. Albans.

### ODONTOGLOSSUM CRISPUM JAMES McNAB.

A very handsome, large-flowered variety of brilliant colouring and good form. On a white or blush ground the rich red-brown colouring was placed in big blotches and large spots over the whole of the segments. The large lip is white, rich red-brown and yellow at the base and crest. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Sander and Sons, St. Albans.

### ODONTOGLOSSUM AMABILE DUKE OF PORTLAND.

An especially beautiful odontoglossum of wonderfully fine size and lovely form. It has a rosy groundwork, marvellously and richly marked with glowing red-purple, through which the rose colour shows in little marks and veins. On the lip are the same bright colouring, but the basal colour and the tip is white. A fine hybrid. F.C.C, R.H.S., Int. Hort. Ex., May 22. Messrs. Sander and Sons, St. Albans.

### ODONTOGLOSSUM AMABILE PRINCESS MARY.

A beautiful form with especially large and shapely flowers that are white with a few large irregular markings of intense crimson-purple grouped from the base along about two-thirds of the length of the segments. The broad lip has a few central spots, and some side lines of colour, and a yellow crest on the white ground. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Sander and Sons, St. Albans.

### ODONTIODA QUEEN MARY.

This superb odontioda we figured in our issue of May 25. It carried a spike of eleven blooms, and several buds, and the flowers were 2½ inches across. The colour is deepest scarlet-red, while just inside the margin of each segment ran a narrow, irregular line of blush. On the lip is a rich yellow crest and a whitish apex. One of the grandest new orchids in the show. The parents of this are Odontioda Vuylstekeæ and Odontoglossum eximium. F.C.C., R.H.S., Int. Hort. Ex., May 22. Messrs. Charlesworth and Co., Haywards Heath.

### ODONTIODA BRADSHAWIÆ VIVID.

A lovely form with medium sized blooms of a bright orange-tinted scarlet shade all over, save for the deep yellow crest and a yellowish shade on the apex of the lip. The plant carried three spikes, one of them bearing about forty flowers. The rich self colouring of this variety received general approbation. A.M., R.H.S., Int. Hort. Ex., May 22. Sir Jeremiah Colman, Bart. (gardener, Mr. J. Collier), Gatton Park, Reigate.

### ODONTIODA BRADSHAWIÆ VOGELZANG.

A superb orchid, with quite large flowers of a creamy-blush ground colour, over which are clear spottings and blotches of vivid scarlet-crimson, while on the lip the bright clear golden crest stands out conspicuously. A.M., R.H.S., Int. Hort. Ex., May 22. Mons. Firmin Lambeau.

### LÆLIO-CATTLEYA LUSTRE BUDDHA.

A very beautiful hybrid carrying an immense flower, with a spread of about nine inches. The sepals are soft mauve, but the ample petals are bright but soft purplish-rose, slightly paler along the centre. The huge lip is intense purple, while in the white throat are a number of lines of rich purple. A.M., R.H.S., Int. Hort. Ex., May 22. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury.

### LÆLIO-CATTLEYA GLADIATOR.

A wonderfully fine and handsome hybrid that carried three glorious flowers. The sepals and petals are of the loveliest mauve-purple colour, and the frilled open lip is vivid crimson-purple with a rosy edge and a rich orange-shaded throat. A very attractive orchid that was very greatly admired. A.M., R.H.S., Int. Hort. Ex., May 22. Lieut.-Colonel Sir George Holford.

### LÆLIO-CATTLEYA ULYSSES.

A lovely orchid with large, shapely flowers of the purest and deepest white, save for two patches of purple veining towards the apex of the wide-fringed lip, and a deep orange-yellow throat. A charming hybrid, derived from L.-c. Fascinator (white form) and Cattleya Mossiæ Reineckiana. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Charlesworth and Co., Haywards Heath.

### LÆLIO-CATTLEYA ULYSSES ALBA.

A chastely beautiful counterpart of L.-c. Ulysses already described. The flowers are of moderate size, and purest whiteness, save for a little pale lemon-yellow in the throat. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Charlesworth and Co., Haywards Heath.

### BRASSO-CATTLEYA THE KING.

A noble and altogether splendid hybrid that carried two enormous flowers of fine rich colouring and grand form. It has purplish-rose colouring with orange, and intense bright purple markings on the wide, fringed lip. By many this was regarded as the

finest orchid in the show. F.C.C., R.H.S., Int. Hort. Ex., May 22. Lieut.-Colonel Sir George Holford.

### CATTLEYA MENDELI QUEEN MARY.

A very lovely variety of an old favourite. It is one of the very finest as regards size and shape we have seen. The sepals and petals are pure white, the lip of a delicate rosy-blush tint, with a yellow throat. The plant carried four fine blooms, and was a feature of the exhibit. F.C.C., R.H.S., Int. Hort. Ex., May 22. Lieut.-Colonel Sir George Holford.

### CATTLEYA DIRCE MAGNIFICA.

A dwarf hybrid that carries very large and fleshy flowers with rich rosy purple sepals and petals, and a very large lip with a broad, spreading apex of a rich deep royal purple hue margined with a narrow edge of rose. The throat is shaded with orange. F.C.C., R.H.S., Int. Hort. Ex., May 22. Lieut.-Colonel Sir George Holford.

### DENDROBIUM DALHOUSIEANUM LUTEUM.

A splendid and striking dendrobium that grows in similar fashion to the type, bearing its large flowers in pendulous racemes. The sepals and petals and lip are soft fawny-yellow, while on the lip are two large and handsome purple blotches. F.C.C., R.H.S., Int. Hort. Ex., May 22. Lieut.-Colonel Sir George Holford.

### MILTONIA JULES HYE DE CROM.

This striking miltonia was raised by crossing M. Hyeana with M. vexillaria. A quite small plant, carrying four beautiful flowers, was shown. The small sepals and petals are white with a mauvy flush at the base, while the broad lip is white with a crimson velvety butterfly-like marking at the base. F.C.C., R.H.S., Int. Hort. Ex., May 22. M. Jules Hye de Crom, Ghent, Belgium.

### LEPTOSPERMUM SCOPARIUM NICHOLI.

A most graceful shrub, with linear leaves half an inch long, on slender branching growths. These slender branchlets are studded from the base almost to the tip with flowers that are deep carmine-red, and range from one-half to three-quarters of an inch across. F.C.C., R.H.S., and the "Gardeners' Chronicle" cup, for the most noteworthy new plant exhibited, Int. Hort. Ex., May 22. Rev. A. T. Boscawen, Ludgvan, Cornwall.

### BEGONIA PRINCESS VICTORIA LOUISE.

A glorious double tuberous begonia with large, finely formed flowers of large size. The colouring is an exquisite shade of golden-pink. The plant exhibited carried half a dozen or more wonderful flowers. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Blackmore and Langdon, Twerton, Bath.

### CALCEOLARIA VEITCHI.

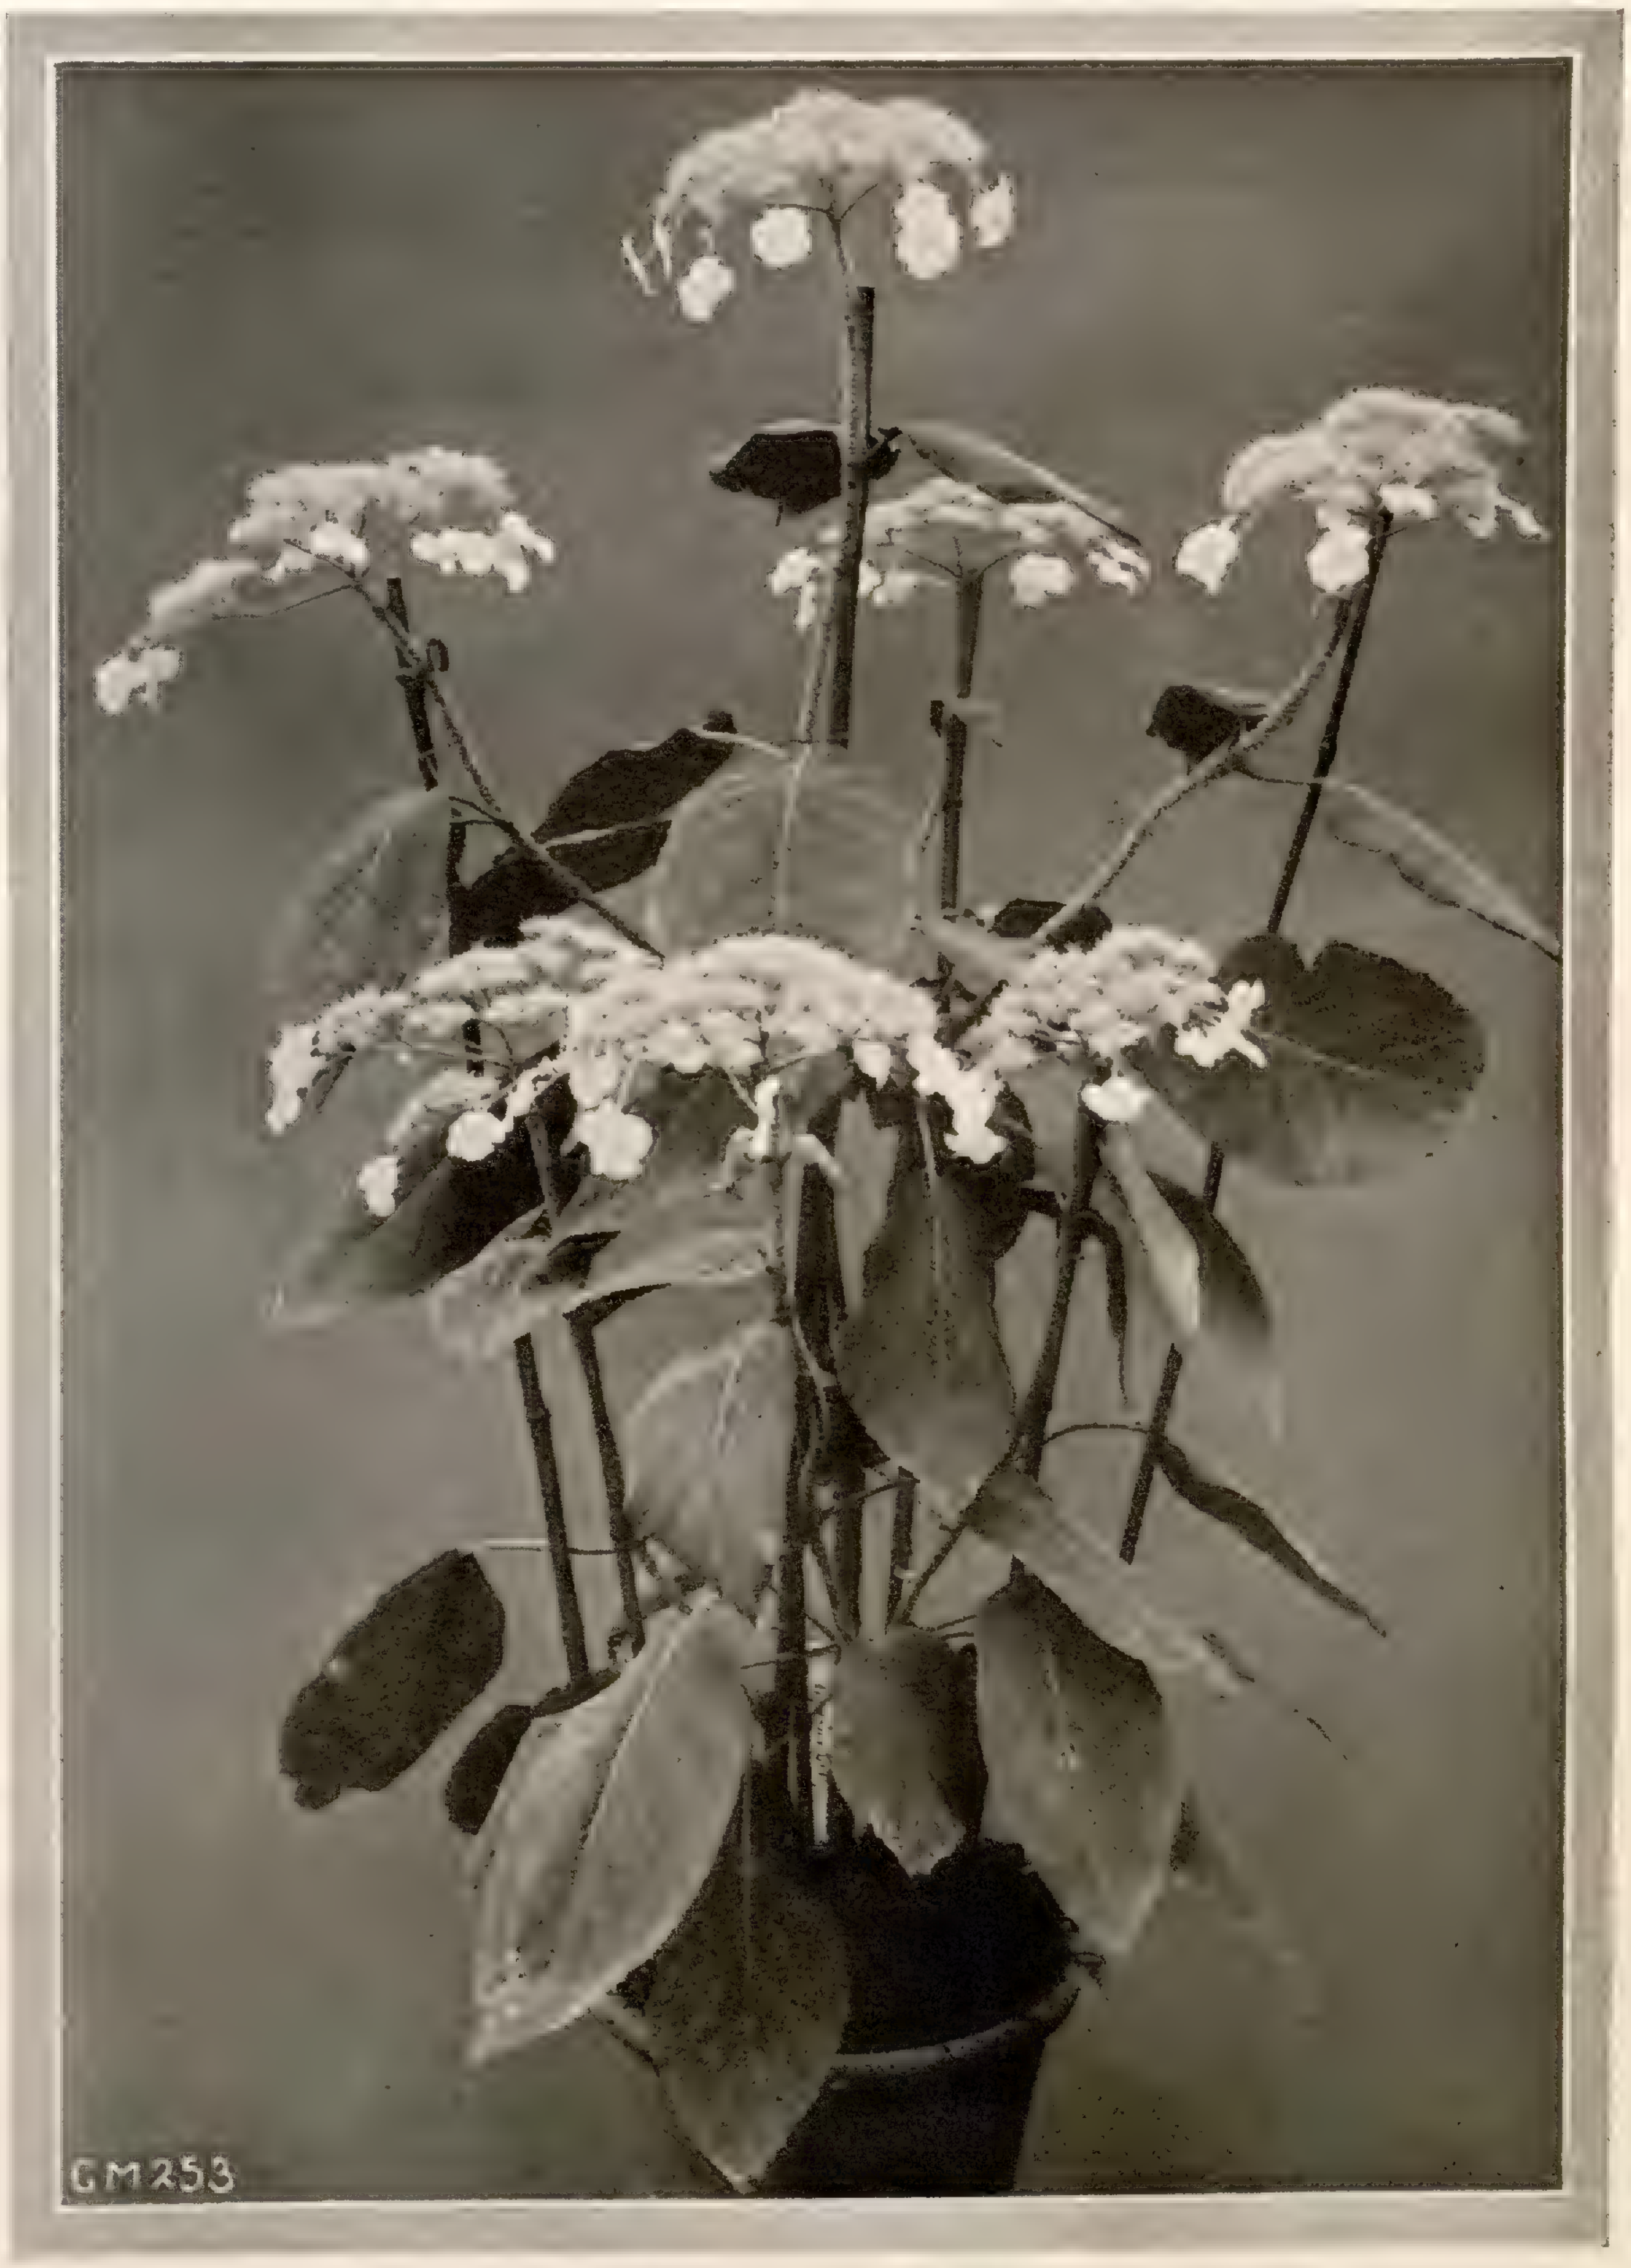
A very graceful plant, growing about five feet high, and bearing loosely elegant branching spikes of cream-white flowers at the tops of the growths. It is the result of a cross between C. alba and an unnamed seedling, and is a beautiful subject. The narrow leaves have curiously serrated margins. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Robert Veitch and Son, Exeter.

### CALCEOLARIA BRONZE AGE.

This is a dwarfer plant than C. Veitchi, but of somewhat similar charcter, and it would form a fine border for the last-named. The flowers are of a deep rich crimson-bronze hue, much brighter than the name suggests. It was well shown by Messrs. R. Veitch and Sons, Exeter, but it was somewhat overpowered by the huge specimens of C. Veitchi shown with it.

### HYDRANGEA SARGENTI.

A distinct shrubby plant that will probably prove hardy, at least in the southern counties. It has leaves nine or ten inches long and six inches broad, oval, and set on rough bright green petioles, the stem being also peculiarly rough. The inflorescence is a broad flattish head, with clusters of rosy-purple and individually small fertile flowers, with one showy large-bracted flower extending from each outer cluster. These are white or blush, and they make the inflorescence very effective. A.M., R.H.S., Int. Hort. Ex., May 22. Hon. Vicary Gibbs, Elstree; and Messrs. James Veitch and Sons, Chelsea.



HYDRANGEA SARGENTI.

Flowers rose-purple and blush. A.M., R.H.S. (I.H.E.), May 22. Hon. Vicary Gibbs, Aldenham House; and Messrs. J. Veitch and Sons, Chelsea.

### LASTREA PATENS MAYI.

A large-growing and particularly graceful fern that is a very finely divided form of the old L. patens, indeed so much sub-divided as to be practically plumose. The fronds are about two feet long, and would be about a foot across at the base if spread out, but the pinnæ rise somewhat on either side instead of spreading out flatly. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. H. B. May and Sons, Edmonton.

### POLYPODIUM VIDGENI.

A splendid fern from Queensland, and one that is capable of cultivation into a large specimen. It has two forms of fronds; one set short and simply divided, and from among these rise the tall, graceful, 2ft.-3ft. long fronds, with the pinnæ very gracefully and deeply cut, and of a bright pleasing green colour. The specimen shown was about a yard high, and four or five feet through. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. H. B. May and Sons, Edmonton.

### CELMISIA SPECTABILIS ARGENTEA.

Not long since we figured a group of celmisias, and gave an account of their introduction and cultivation. Several flowering plants were to be found in the great exhibition, and the above-named had a cluster of lanceolate leaves, each about eight inches long, green, silky-haired above, and downy white underneath. The flowers are three inches across the ray florets, white, and the disk yellow, A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Bees, Lim., Liverpool.

### POPPIES.

Edna Perry.—A delightful oriental poppy with bright salmon-pink petals, fringed at the edges. Each petal has a large blackish blotch. A.M., R.H.S., Int. Hort. Ex., May 22. Mr. Amos Perry, Enfield.

Perry's White.—Another fine and very distinct poppy, the large blooms being silvery or satiny white, with a purplish-crimson centre, and black base. A.M., R.H.S., Int. Hort. Ex., May 22. Mr. Amos Perry.

### IRISES.

I. variegata Ossian.—A fine variety, with deep purplish rose falls and golden-yellow standards. The falls are veined and crested with yellow. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Barr and Sons, Covent Garden.

I. squalens Nibelungen.—This has beautiful rosy-purple falls, charmingly veined with white, and the standards are soft yellow. The flowers are large, and most effective. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. Barr and Sons.

### EREMURUS TUBERGENI.

A fine form, probably derived from E. Bungei. It grows 4ft. high, and has dense spikes of soft sulphur-yellow flowers. A fine garden plant. A.M., R.H.S., Int. Hort. Ex., May 22. Messrs. R. Wallace and Co., Colchester.

### OXALIS ENNEAPHYLLA ROSEA.

A neat little rock garden plant that is native of the Falkland Islands, is the white O. enneaphylla, and it is already a favourite. The newcomer is exactly like it save that it has flowers of a soft rosy shade. A.M., R.H.S., Int. Hort. Ex., May 22. Mr. Clarence Elliott, Stevenage.

A MAGNIFICENT GROUP OF PLANTS, CHIEFLY WITH FINE FOLIAGE.

Exhibited by Messrs. J. Veitch and Sons, Lim., Chelsea, who were awarded the Duke of Portland's Cup for the most meritorious exhibit, exclusive of orchids.

## THE CONFERENCES.

Amongst the various functions, social and otherwise, associated with the International Horticultural Exhibition, the conferences arranged for the occasion were by no means the least important. The first, on horticultural education, took place on Thursday, May 23, and a large gathering of educationists who had been invited, assembled in the Great Hall at the Royal Hospital, Chelsea, to hear and discuss the papers. We venture to say that never before has the gentle art of gardening been discussed in that famous hall, round the walls of which hang tattered flags captured in many campaigns, and the portraits of Britain's military heroes, who fought, yea, and in many cases, died, in defence of the Union Jack. Perhaps they were not gardeners, but nevertheless they, and the red-coated old veteran pensioners who moved in and out, have done their share in making our country a place in which the peaceful art can be followed undisturbed.

The Right Hon. A. H. Dyke-Acland took the chair, and amongst those who filled the Great Hall were the staff members of most of the educational establishments in the country at which gardening is taught, and a number of county horticultural instructors who are doing so much to carry, by itinerant and other methods, gardening knowledge into the remotest parts of rural Britain. In his opening remarks the Chairman, who is also the chairman of the Science and Education Committee, said that he was much gratified to see so large and influential a gathering of those who were specially interested in horticultural education, and he had no doubt that their deliberations would be of much assistance in the solution of the various problems associated with horticultural education. The Chairman further observed that in other countries the State had done much more for horticultural education than was the case at home, and he welcomed the declaration made the day before by Mr. Runciman that the Board of Agriculture had at last decided to set up a special branch devoted to horticulture. Further, Mr. Runciman had alluded to the question of giving a diploma for gardeners, and the matter was receiving attention.

### Horticultural Education in America.

The company present were each presented with printed copies of the papers, and the one by Professor L. H. Bailey, of Cornell University, Ithaca, U.S.A., on "Public Horticultural Education in the United States" was, in the absence of the Professor, read by Mr. F. J. Chittenden. The paper took the form of a general summary of what is done on behalf of horticultural education in the United States, and gave a good deal of information as to the courses of instruction given at the establishment mentioned above. One pointed remark in the paper was that in the colleges in the States horticulture is regarded as a phase of agriculture, but, in our opinion, it should not be a phase of anything, but the actual thing itself, and because it is looked upon as a phase of the sister art educational facilities in horticulture are not what they ought to be.

### Horticultural Education in Germany.

The writer of this paper, Herr K. Weinhausen, of the Imperial School of Horticulture at Dahlem, was present, but as he was suffering from some throat affection, it was read by the Chairman. As this paper contains matter of very general interest to our readers, we have pleasure in printing the text of it below:—

German horticulture is exceedingly old. History shows us that as far back as the year 380 A.D. the Huns laid out many gardens and orchards in Germany. Special interest was taken in fruit culture, which soon received energetic support from the German nobles. In the year 800 A.D. the Emperor Charlemagne gave directions that all kinds of fruit should be planted in his domains, and at the same time he established the first nursery garden. Interrupted during times of war, but all the more energetically promoted during times of peace, horticulture in Germany advanced to a state of great excellence. In proportion to the growing importance of horticulture, did the necessity for the systematic theoretical training of gardeners increase. In the year 1842 the first German institution for the theoretical training of gardeners—the present Royal Horticultural College at Dahlem, near Berlin—was established by the Royal General Garden Director, T. F. Lenné, and this is therefore the oldest horticultural training school in Germany. At that time landscape gardening was of greater importance than general gardening, which fact was taken into account when the school was established. Horticulture received a great impetus after the year 1870. People recognised the great national politico-economic, hygienic and social importance of fruit culture, and for this reason endeavoured to promote the training of fruit-growers as much as possible. At the present day we have in Germany a large number of horticultural schools differing widely from one another, and these I may divide into four groups.

To the first group belong the Royal Horticultural Institutions of Dahlem, of Geisenheim, of Proskau, and of Dresden, which may be regarded as the most advanced class of horticultural colleges. The aim of these institutions is the same, inasmuch as they all endeavour to teach their students all branches of horticulture. Owing partly to tradition and partly to their locality, the institutions at Dahlem and Geisenheim have acquired special reputation in special branches of horticulture. Thus, Dahlem is

## King George V. (H.T.)

Strong, vigorous, free branching growth; large, handsome, and very persistent foliage, which is retained long after most other roses have shed their leaves. The flower is very large and very full, opening freely, beautifully shaped, much resembling "Mad. Jules Grayereaux" in build of flower and petal; the petals are very abundant, nicely arranged, and beautifully smooth. The colour is quite unique amongst Hybrid Teas, being rich blackish crimson, with deep velvety violet flush, a striking and brilliant colour, not burning in the sun, nor turning blue, as so many of our very dark roses do. It is very free flowering and perpetual, and delights in a warm summer like the past. The perfume is strong and very pleasing. This is one of the finest novelties which we have sent out, and has elicited universal admiration wherever shown. Awarded the Gold Medal of The Festival of Empire, Crystal Palace, London, June 29, 1911.

## Mrs. Sam. Ross (H.T.)

Strong, vigorous, upright growth; foliage distinct verdant green. Very large, full flowers, petals large, smooth, shell-shaped and slightly cupped, beautifully reflexed at the edges. A flower of the largest size and great refinement. A novel and uncommon shade of colour, at once distinct and pleasing, but difficult to describe. It may be said to shade from pale straw colour to light chamois yellow, with a distinct flush of buff on the reverse of the petals. Very sweetly scented. The handsome flowers are carried on stiff, erect footstalks, showing well above the foliage, and last a very long time in good condition. Very freely and continuously produced, and, in our opinion, one of the finest roses which we have raised. Awarded the Gold Medal of the National Rose Society, Regent's Park, London, July 7, 1911.

## Mrs. Richard Draper (H.T.)

Very free, vigorous, and branching growth, of excellent habit; flowers very large, full, and perfectly formed, with high-pointed centre, petals large, deep, and abundant, beautifully arranged and very smooth. Colour, bright rosy satin pink on the outside of the petals, inside of petals very pale silvery flesh, which shows a delightful contrast as the flowers expand; strong and very sweet perfume. This is a magnificent Exhibition Rose of great lasting qualities, and one of the most perpetual and abundant blooming of garden roses, where it is bound to become a popular favourite. Awarded the Gold Medal of the National Rose Society, Regent's Park, London, July 7, 1911.

## Mrs. David Baillie (H.T.)

Strong, free branching growth, growing to a uniform height of about two feet, making an ideal plant for massing in beds, for which it is exceptionally well adapted. The flowers are medium to large, of beautiful camellia form, with petals nicely and evenly reflexed, and high-pointed centre. Opening freely and continuously on strong, upright growths, which show the flowers to great advantage. The colour is very pleasing and novel, being bright madder carmine, with the delicate veinings of the petals pencilled with a deeper shade; very sweetly perfumed. A decided acquisition amongst bedding roses; occasionally large enough for Exhibition. Awarded the National Rose Society's Silver Gilt Medal, Ulverston, July 19, 1911.

CATALOGUE AND PRICES ON APPLICATION.

**HUGH DICKSON, LTD.,**
*Royal Nurseries,* BELFAST.

regarded as an exceptionally good training school for the art of garden-making, because of the stimulating influence caused by its close connection with the celebrated Royal Gardens at Potsdam. Owing to fruit culture having grown so important in Germany, this branch has become highly valued, and, when nine years ago the schools were reorganised, equal consideration was given to each branch of horticulture. Geisenheim is situated amongst the vineyards which are encircled by Germany's most beautiful river, the Rhine, and it is therefore natural that viticulture and fruit culture should receive special attention at this school.

In the second group I include the higher private horticultural training schools, of which I may name the Pomologisches Institut at Reutlingen as the oldest. The provincial horticultural training schools, of which there are six in Prussia and Saxony, also belong to this group.

A special position is occupied by the third group comprising the private horticultural schools for women, of which I am acquainted with four in Germany, not counting the agricultural schools with special courses for gardening.

In the fourth group I may include all the many smaller horticultural training schools, which are partly independent, but which, more frequently, are connected with agricultural continuation schools. In many of these schools, instruction is confined to the winter months. In many towns in Germany there are horticultural supplementary schools where instruction is given only in the evenings and on Sundays, so that the apprentices and young assistants from nurseries are able to attend.

Between the first and fourth groups there is a wide margin which is clearly shown in the scholastic attainments of the students as well as in the ends to be attained. The different groups, however, are not sharply defined, but there are transitions from the lowest to the highest institutions. In fact, in many schools there is a higher and a lower division to which the students are admitted according to their general education. The preparatory training in the lower horticultural training schools consists of attendance at a public elementary school until they reach fourteen years of age. This is generally followed by a three-years' practical apprenticeship, where the young gardeners acquire practical experience in digging, watering, planting, sowing, etc. The course of training at the lower horticultural schools generally lasts one year. According to the preparatory training of the young men the instruction in these schools is mainly practical. At the same time the most necessary theoretical explanation as well as instruction in knowledge of species, elementary drawing and botany are given. In addition to this instruction, the ordinary school subjects, particularly German composition and mathematics, are taught. Young men who have passed through such institutions work just as do other gardeners who have not attended such horticultural schools. As journeymen gardeners, however, if they are otherwise capable, they are more intellectual and are therefore preferred for better-class work. From this class many are selected to be foremen as well as head-gardeners to the nobility and gentry and to market gardeners. This is a short sketch of the training of gardeners in the lower horticultural schools.

The greater the requirements in theoretical and practical preparation the better is the material the teachers have to work upon, and, of course, the better the teachers are, the better are the average successes. The school cannot, of course, make the man's career, it can only give him the foundations on which each must work out his own position. It may, therefore, happen that a scholar from a lower horticultural school, or even a self-taught man, gets on better in life than one who has gone through the curriculum at one of the higher training establishments. These are, however, exceptions. The rule is that the students who have gone through the course at our higher gardening colleges are generally selected for leading positions.

Now before I pass on to discuss more fully the course of instruction in the higher institutions, I should like to point out the difference existing at the present day between the training of lady gardeners and that of men gardeners. Whereas the male gardener serves a practical apprenticeship before attending the horticultural training school, most ladies, who are desirous of taking up this profession, attend such schools for women without having obtained any previous knowledge whatever, and hope to be both practically and theoretically trained in two years. As long as the ladies do not have the same training as their male comrades, it is not possible for them to do the same work.

BEGONIA PRINCESS VICTORIA LOUISE.

Flowers soft salmon. A.M., R.H.S. (I.H.E.), May 22. Messrs. Blackmore and Langdon, Twerton Nursery, Bath.

Moreover, for about five years outsiders have been admitted to the horticultural colleges, and ladies, with the same preparatory training as men, can enter as full-course students at Dahlem.

I have brought you the prospectuses of the higher horticultural training colleges. On comparing them you will find that Dahlem differs from the rest in the following particulars. Dahlem makes the greatest demands with regard both to general education and to practical knowledge. Whereas the other training colleges require that students should have passed through only four classes at a "Gymnasium," Dahlem is the only horticultural training school in Germany that requires six classes to have been passed through, the student thereby is required to give only one year's military service. Dahlem thus requires the same as the agricultural and technical colleges. Instead of a two-years' practical training, Dahlem requires one of four years. Owing to this, Dahlem is enabled entirely to omit practical work during the two years of study whereby a great deal of time is, of course, gained for the theoretical and technical education. Just as in the lower gardening schools, the Royal Horticultural Colleges, with the exception of Dahlem, unite theory with practice, regular working hours being adhered to. In my opinion, students who have had only two years' previous practical work cannot omit the practical work while at the training school. Those who are acquainted with the practical work in such schools cannot fail to be convinced that this practical work at school is incapable of taking the place of the real workmanlike practice in a nursery garden. The very fact that a large number of young people must be employed in a comparatively small concern is detrimental to success. Another still more important fact is that the students lack that feeling of responsibility which sharpens the young assistants who are doing practical work. At the Dahlem horticultural institution theoretical instruction is supported by practical demonstration, and it moreover requires that the young people come with a four-years' practical training. In the following I will give you a short account of the course of training of young gardeners at Dahlem.

The Royal Horticultural College at Dahlem, near Berlin, is under the joint supervision of the Board of Agriculture, and an associated body of Governors, with Mr. T. H. Echtermeyer as Director.

It prepares its students in science, technical knowledge, and art of all branches of horticulture, as well as of colonial horticulture. A not unimportant task of the institution is to interest agriculturists in the development of fruit culture in the mother country, as well as to cater for the wishes of amateur gardeners.

The full course lasts two years; date of admission, October 1.

In order to be admitted, applicants must show that they have gained the certificate for the one-year's voluntary military service, or that they have had the full preparation in science necessary for obtaining the above-mentioned certificate. Also, the students must prove that he has had four years' practical horticultural experience. It is desirable that of these four years at least one has been spent at a nursery or market gardening.

Dahlem has four courses of one year each.

BRASSO-CATTLEYA THE KING.

Flowers purple-rose and orange. F.C.C., R.H.S. (I.H.E.), May 22. Lieut.-Col. Sir George Holford, Westonbirt.

The first, being a general course, is obligatory for students attending the college. At the conclusion of this course there is an examination which must be passed before one can attend the other three courses. Applicants who wish to be admitted at once to Courses 2, 3, or 4 (Course 2 being for the art of garden making, Course 3 being for fruit culture, Course 4 being for floriculture) must prove that they possess the knowledge comprised in Course 1, either by suitable certificates from other horticultural training schools or by passing the above-mentioned examination. The Courses 2, 3, and 4 are optional. Applicants who do not wish to devote themselves exclusively to the one or to the other course are allowed to attend lectures on different subjects in the three courses. Every six months, however, they are obliged to submit to the Board of Directors a list of the classes they wish to attend. At the end of each of the above courses there is an examination, for which a certificate is given. The students are at liberty to extend their studies still further, and to attend lectures at the Agricultural College and the University as non-matriculated students if they satisfy the conditions of these institutions.

Further, short courses for ladies and gentlemen are arranged as required, e.g., in the spring, a course for amateur gardeners; in late summer, a course on fruit and vegetable preserving, etc. In addition to its museum collection and material for scientific instruction, the college has a department for the utilisation of fruit, an experimental department for plant physiology, with a house for observing the growth of roots, four large hothouses, three vineries, one peach-house, one mushroom-house, a "talut" or shelter-wall for peaches, ten large walls for better-class or dessert fruit, and grounds partly laid out in ornmental beds and partly devoted to flower, fruit, and vegetable culture, which altogether, and with the demonstration fields, is nearly nineteen acres in area.

In addition to the seven lecture halls the College has two large rooms for drawing, which are daily at the disposal of the students till 9 p.m.

Royal favour has graciously placed the Royal Gardens at Potsdam at the disposal of the College for educational purposes, while the neighbouring institution of the Royal Botanical Gardens and museums of Berlin University, and the Biological Institution and the experimental fields of the Agricultural College afford ample opportunity for instruction and demonstration.

I have emphasised the points in which the Dahlem Horticultural College differs from the other Royal Horticultural Colleges in Germany, so I need only briefly describe the remaining institutions.

The Royal Horticultural College at Geisenheim in the Rheingau opened in the autumn of 1872; managing director, Geh. Reg. Rat Prof. Dr. Wortmann.

This college combines the following departments for instruction:—

(*a*) One year's lower course for students for viticulture and wine-making, fruit culture, and landscape gardening. It is necessary to have attended an elementary school in order to be admitted; further, a two years' practical apprenticeship is necessary.

(*b*) A two years' higher course for students in the same subjects. In order to attend this course it is necessary to have reached the standard of the fourth class of a Secondary School for Classics Gymnasium, or of a Realgymnasium or Oberrealschule, or the Secunda of a Progymnasium, or of a Realschule.

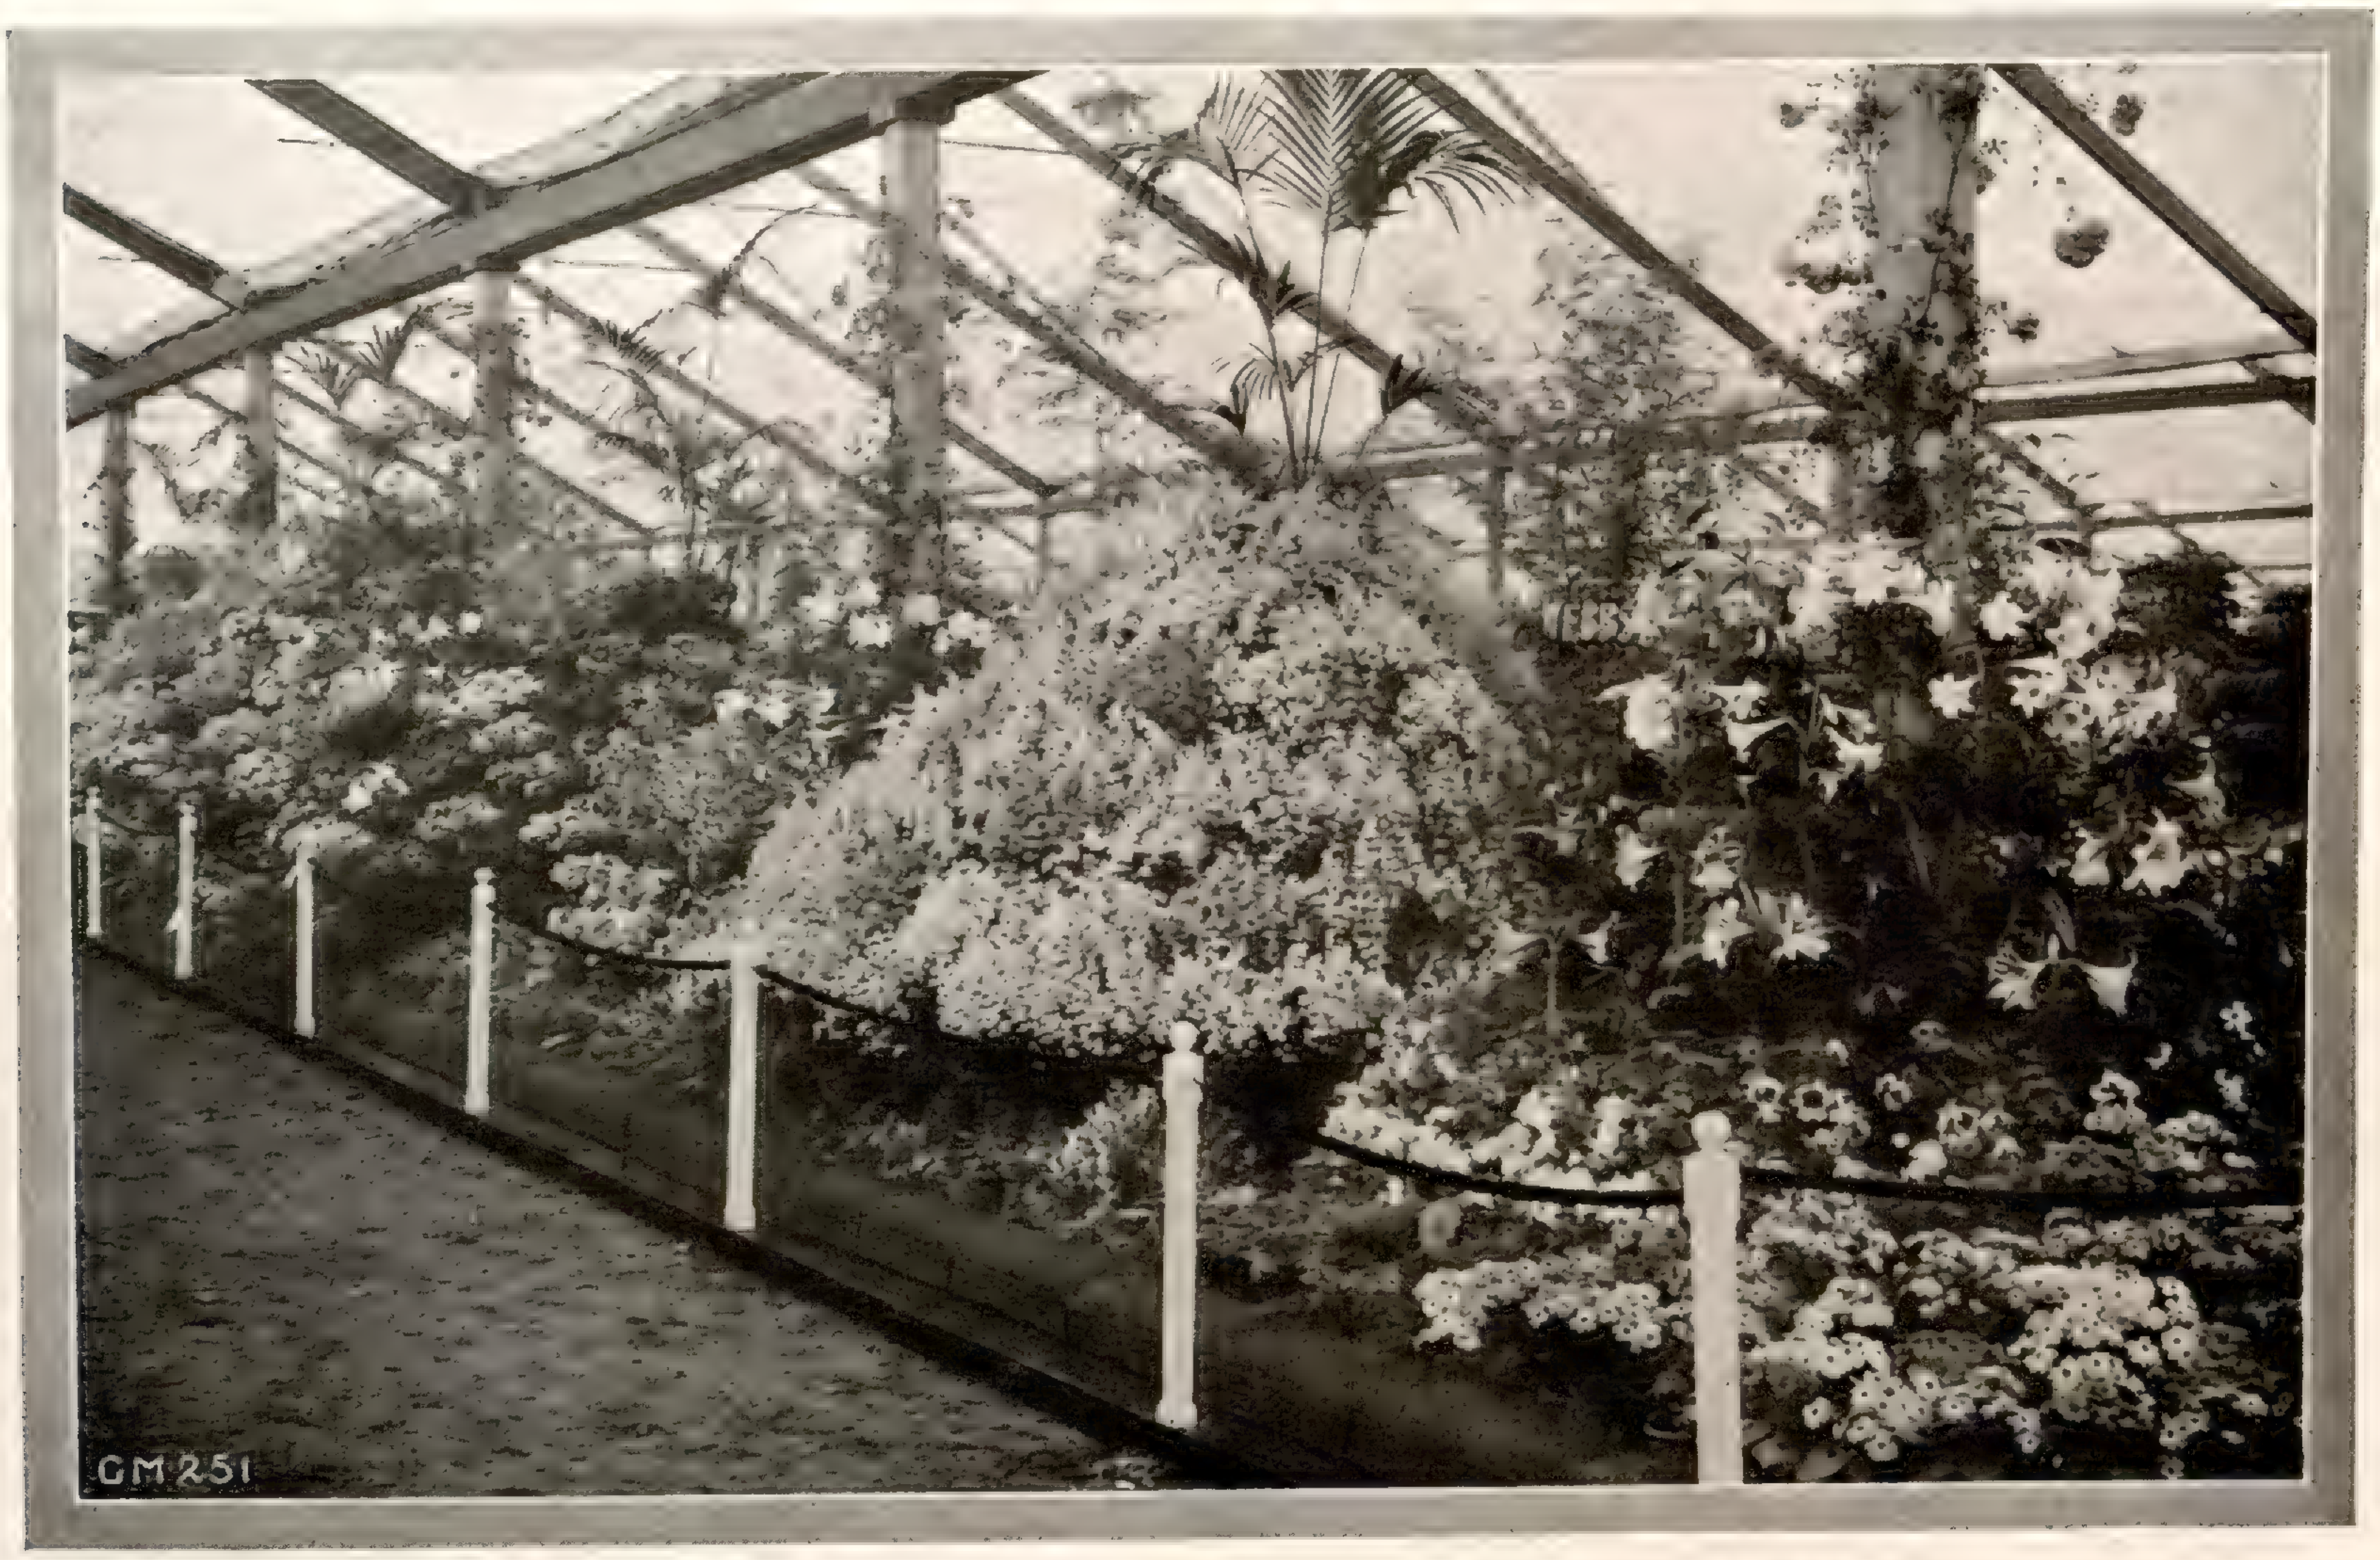
(*c*) A periodic course. This course affords opportunity to the proprietors of vineyards and orchards to perfect themselves in the growing of vine and fruit, as well as in wine-making.

The third Royal Horticultural College at Proskau is under the management of Director Schindler.

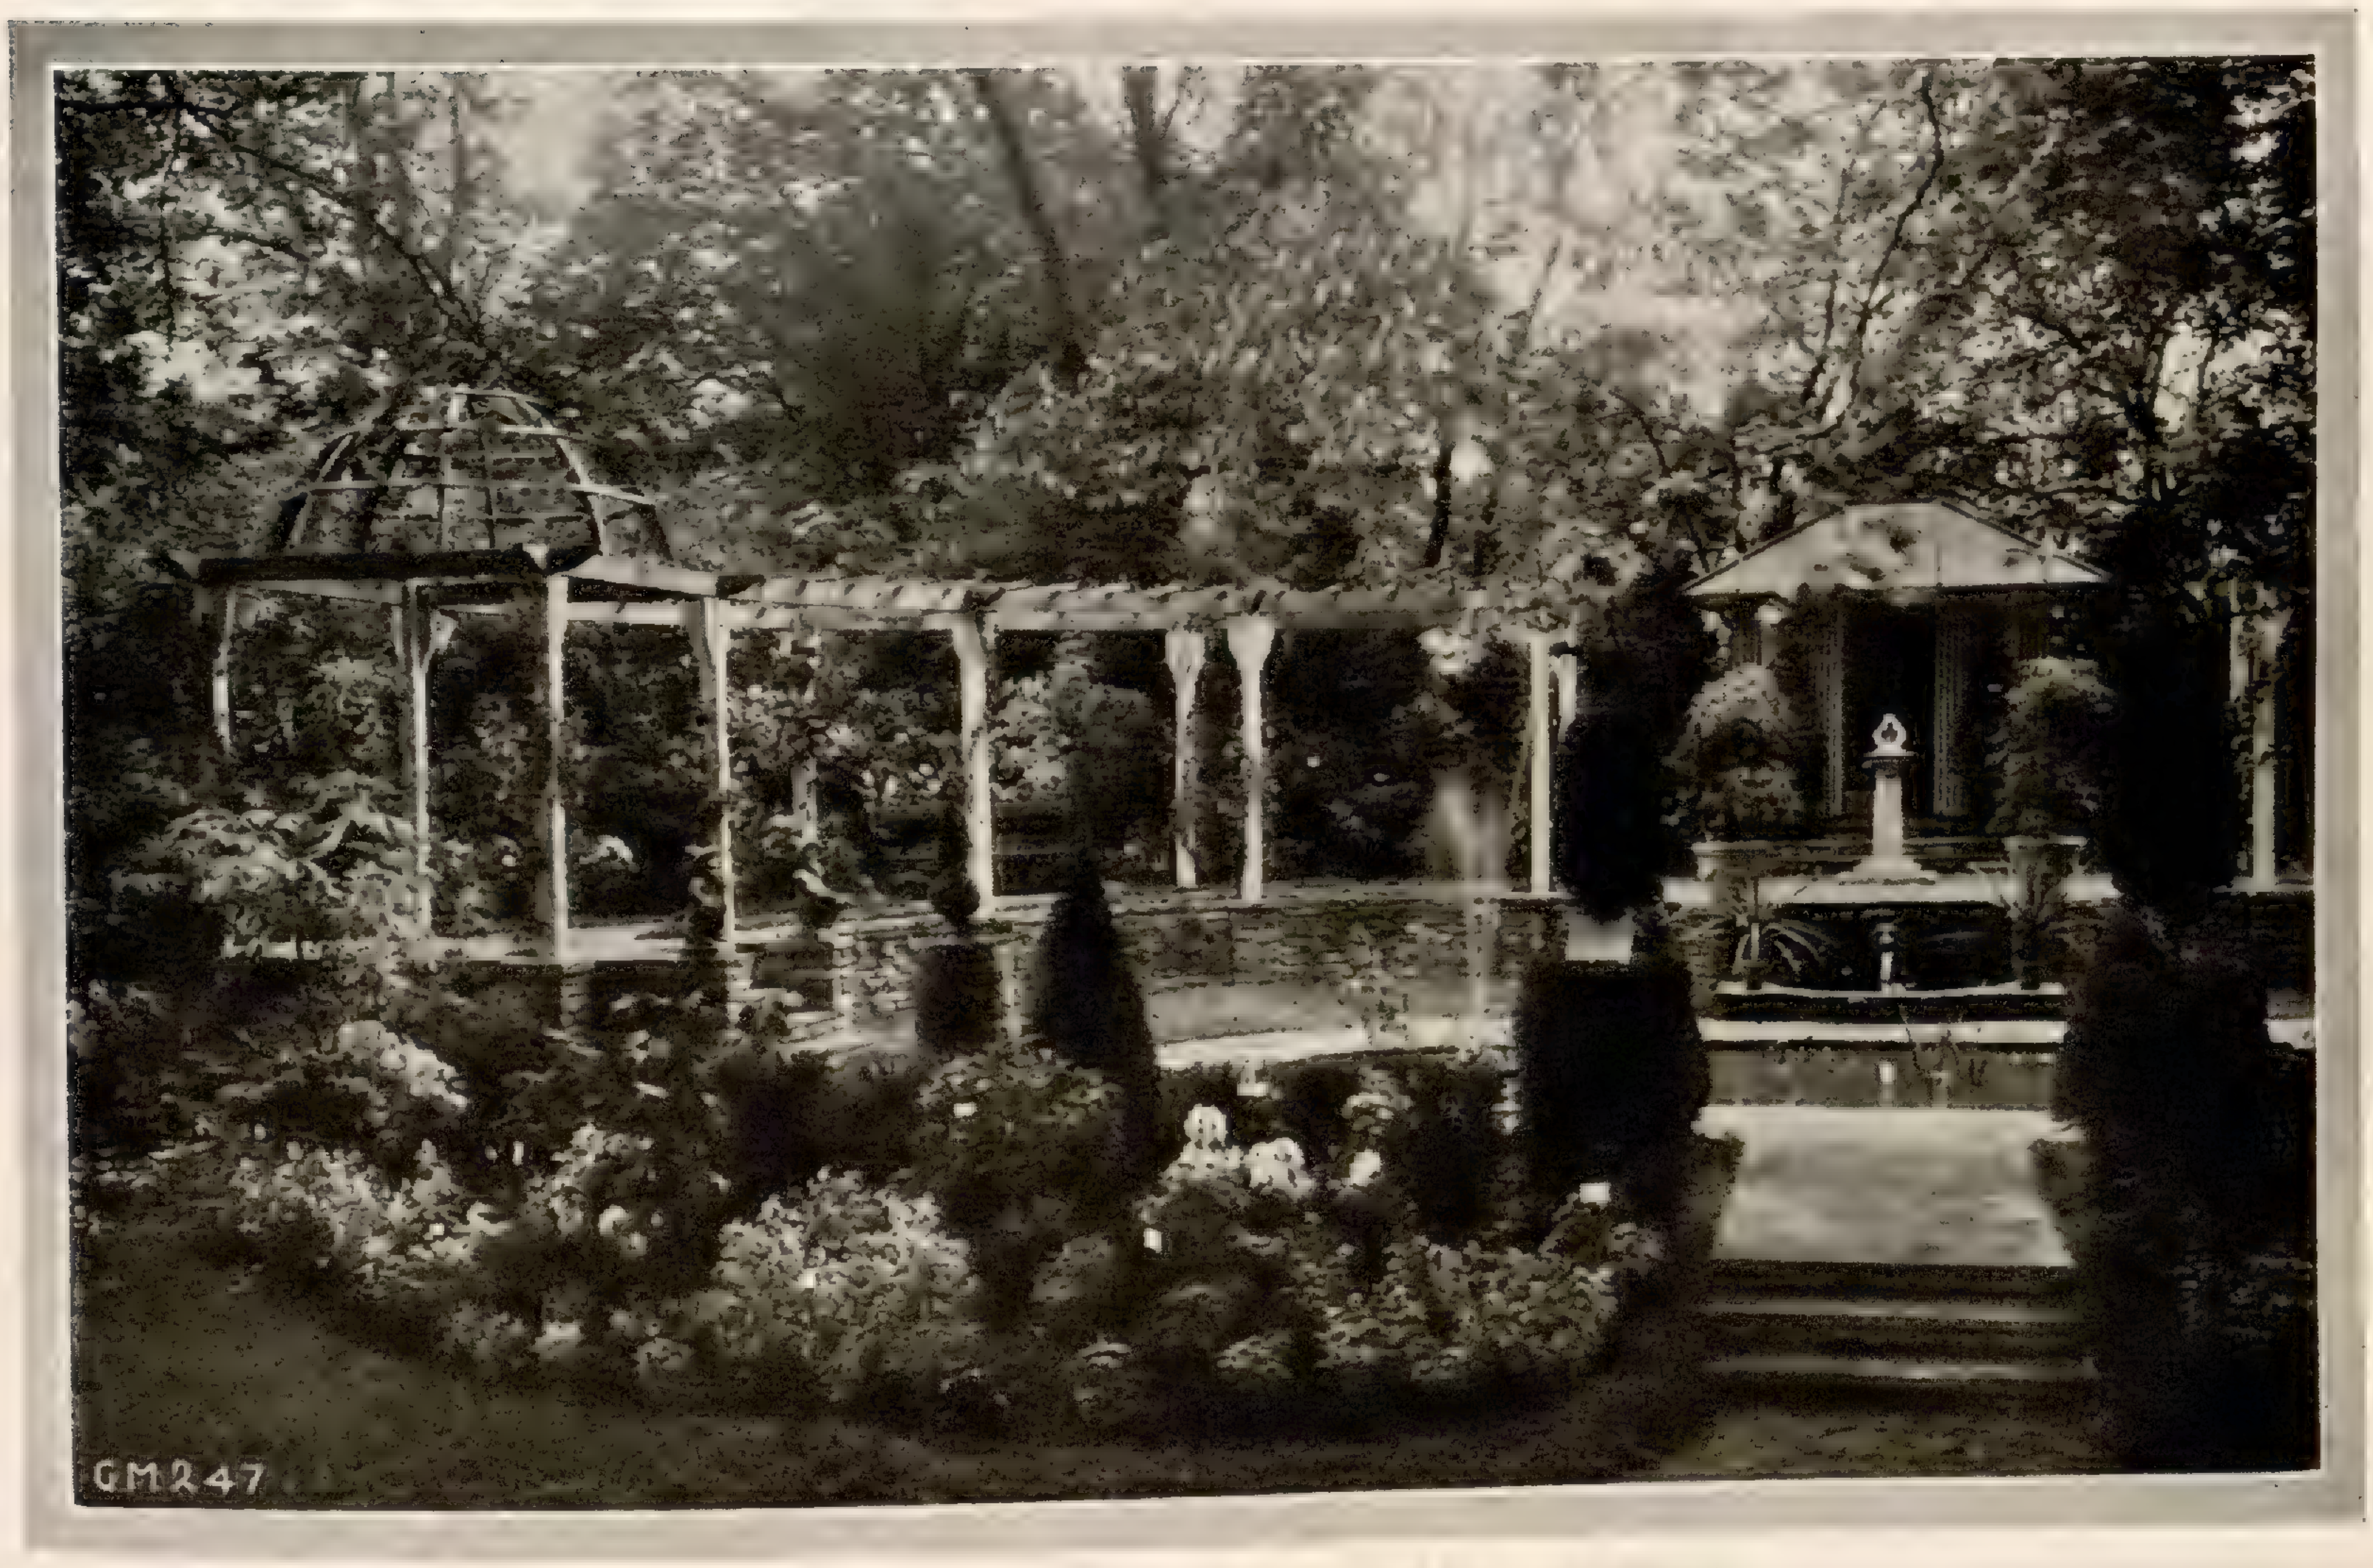
The object of this college is to promote horticulture, especially vegetable and fruit culture, both by theory and by practice. For this purpose the college includes the following courses:—

Two years' course. The pupils must be seventeen years of age, and have reached the standard of the Obertertia or fourth class of a Gymnasium or of an Oberrealschule, or else have passed an examination in which sufficient knowledge of mathematics and German composition is shown to assume the lectures being understood.

Besides the above-mentioned courses a short course for teachers in public schools is held annually in the spring and autumn, and lasts fourteen days. The same is the case with a course for the men in charge of orchards and roadside-grown fruit trees. A pruning course for amateur orchardists last six days. The course for amateur gardeners is held only once a year, either in June or July, and



A REMARKABLY FINE EXHIBIT OF CINERARIAS, GLOXINIAS, ETC.
Shown by Messrs. E. Webb and Sons, Worsley.



A TASTEFULLY DESIGNED TUDOR GARDEN.
Constructed by Messrs. J. Cheal and Sons, Crawley.

lasts three to six days. The ladies' course for the preservation of fruit lasts three to six days.

In spite of the specialisation of the Dahlem course, the training of our young gardeners is very many-sided. This is necessary, because the nursery-gardens in Germany are far more complicated and varied than, for example, those in Belgium and Holland. Formerly, the German gardener went much abroad, and even now we like to see foreign cultivation and to become acquainted with the methods of our neighbours; but practical work in other countries has now lost its importance in the training of gardeners. For a horticultural profession it is necessary to have both practical experience and theoretical knowledge. Excess of the one is detrimental only when the other is lacking, and so horticultural colleges must set themselves the task of combining both in the right way.

### The Education of a Gardener.

There was a very practical strain running through the paper on this important topic by Mr. W. Hales, A.L.S., Curator, Physic Garden, Chelsea, but for the purposes of the conference, and considering that each member of the conference had a copy, it might well have been summarised, for though the paper was exceedingly good, it was rather long, and Mr. Hales, who read it, failed to make himself heard at the back of the hall. After admitting that in the methods for the education of the gardener in this country there was a good deal of "drift," Mr. Hales went on to point out ways to better things, explaining how, in his opinion, gardeners should be trained, and finished up by paying a complimentary tribute to the value of exhibitions, and also the gardening Press, as well as mutual improvement societies, in helping forward the educational work of the gardener.

### Horticultural Education in Belgium.

An item not on the programme was the reading of an extra paper by Professor A. Buyssens, of Vilvorde, on the above topic, and his remarks, rendered in very good English, are mostly embodied in the report on horticultural education prepared by the committee for the conference, and dealt largely with the methods employed at the various educational centres in Belgium.

#### DISCUSSION.

There was an expression of relief on most of the faces of the persons present when the reading of the papers came to a finish, and the members of the audience who desired to take part in the discussion handed in their names. Five minutes was allowed to each by the chairman, and the Rev. Bernard Hall, who set the ball rolling, began by exceeding the limit, in a vigorous yet pleasant speech, in which he criticised some of the methods now in use, and substituted ideas of training gardeners which, in his opinion, were better. Professor Bretland Farmer, of the Royal College of Science, who followed, paid gardeners the compliment of having grit, but said that the young men, in matters of education, should not have things made too easy for them. He upheld the desirability of a thoroughly practical training, which at the same time advanced the interests of science.

Mr. Macoun, horticulturist of the Government of Canada, described the work of the horticultural sections of the Educational Department in that Colony; and, while he deplored the fact that they had no means of training gardeners, he observed that the British gardeners who came to Canada soon adapted themselves to the conditions and proved their ability.

In a lucid speech, Professor Ainsworth Davis, of the Royal Agricultural College, Cirencester, spoke of a scheme he had in hand by which it was hoped to make the work of Mutual Improvement Societies more educational, and he also emphasised the necessity of more being done in the way of continuing education after the young gardeners' schools days are over.

A lady member of the Swanley College staff devoted her five minutes to an account of the methods employed at that establishment.

Professor Bayley Balfour, Edinburgh, advanced the claims of book-keeping and mensuration in the education of a gardener, and in further thoughtful remarks, said that in teaching the rising generation, we should draw more on the experience of the old gardeners who had done such splendid work. We should, he said, work up from the practical, not the other way; and made the remark that most of the gardeners trained at Edinburgh emigrated to America.

Mr. Frogbrook, of Leyton Parks, Essex, supported the apprenticeship system as a means of training gardeners, and the County Instructor from Hertford also spoke on this point.

The discussion was brought to a conclusion by Mr. J. C. Newsham, manager of the Hampshire Farm School at Basing, who made reference to the low salaries that horticultural instructors could command after going through all the training that some of the speakers thought was necessary. Mr. Newsham also had a good word to say for the Horticultural Instructors' Association, which, very strange to say, was the first time this body was mentioned at all in the conference, which seems to suggest that it is either too modest, too unenterprising, or it has failed up to now to attract the notice of the authorities that it deserves. In describing what the association had done, the speaker pointed out what a lot more it might do, and concluded by saying that he should like to see young horticulturists as keen on working up for diplomas as young agriculturists are.

The proceedings closed with the usual votes of thanks.

---

## Legislation in Connection with Plant Diseases.

The second of the two conferences arranged in connection with the International Horticultural Exhibition was held on Friday, May 24, and was not less successful than the gathering on the previous day. The Right Hon. A. H. Dyke-Acland again presided, and there was a large attendance, the members of the conference including the leading scientists both at home and abroad who devote special attention to insect pests and fungi injurious to plant life, some of the leading members of the nursery and seed trades, and a few gardeners. The subject for consideration was "Legislation in connection with Plant Diseases," and the great interest taken in the papers that were read and the subsequent discussion was evidenced by the fact that, although the proceedings commenced at the early hour of 9.30 a.m., for the purpose of enabling the members of the conference to join the party visiting the Royal Gardens at Windsor, the sitting continued until about one and a-half hours after the special train had left Paddington without any appreciable diminution in the numbers present. It was evident that the importance of a full discussion on the legislation in relation to plant diseases and plant pests was so fully appreciated by those present, that the great attractions of the Royal Gardens was not sufficient to divert any considerable number from taking advantage of the opportunity of becoming fully acquainted with what has been done in the framing of legislative measures with a view to the prevention of the conveyance of insects or fungi of an injurious character from one country to the other.

In opening the proceedings the Chairman said that the Science and Education Committee, which had been sitting nearly two years, had wisely selected the subject that would be discussed, and hoped those present would give all the help they could in the elucidation of the various points. He heartily welcomed the many scientific and practical men from abroad, and their presence was a sufficient proof that the subject was one that concerned other countries as well as our own. The Chairman then called upon Professor J. Ritzema Bos, chief of the Phytopathological Service of Holland, to head his paper on

### The Value of Importation Regulations.

It is a natural consequence of world traffic, said Professor Ritzema Bos, that animal and fungous enemies of agriculture and horticulture are sometimes transported with the plants on which they live from one country to another. So two very dangerous enemies of the vine, the Downy-mildew (Peronospora viticola) and the only too well-known Phylloxera vastatrix have been successively transported from America to nearly all vine-growing countries of the Old World. So in recent times the serious American Gooseberry mildew has come from America to Europe, where it has spread over several countries in a short time. So the not less grave San José Scale has been carried from one State of the American Union to nearly all others, and the authorities in several European countries, too, fear its introduction. So the Gipsy Moth and the Brown-tail Moth were transported from Europe to America; and last, but not least, the potato "Blackscab" is spreading in every country where the diseased tubers are brought by trade and heedlessly planted for seed.

Now the question, he said, suggests itself: In what way has a country to guard against the invasion of injurious animals and plants diseases from abroad?

The answer seems to be simple. When some very injurious organism feeds on a certain plant in a certain country, take care not to import from that country specimens of this plant or parts of it. In former days this, indeed, was the opinion of the public, the authorities, and the Governments, and this point of view is still held by some people. When about 1877 and 1878 the Colorado-beetle spread in America, some European States closed their boundaries for the import of potatoes from the New World, though neither the beetle nor its grub live in the tubers; they only feed on the foliage. When the San José Scale made a great stir in the Eastern States of America about 1898, most of the European countries closed their boundaries to the importation of American nursery stock, and some of them did so, too, for the importation of American fruit. And since the American Gooseberry mildew causes a great deal of damage in some European countries, nearly every State has ordered prohibitive measures concerning the importation of goosberry, currant, and raspberry bushes.

While not absolutely dissenting from the idea of prohibitive regulations, Professor Ritzema Bos drew attention to some difficulties connected with those measures, and then proceeded to show that in most cases they only represent a misuse of both labour and money. To-day one pest, to-morrow another, menaces a country from abroad. Again and again, new prohibitive orders will be necessary in every country. At last several States will be almost entirely isolated, much to the cost of their trade, their culture, in short, of their whole population.

Often the insistence of prohibitive measures is not free from protectionistic inclinations. Interested persons are anxious to find out pests or blights on the stock of competing countries in order to have a pretext for requesting the Government for a prohibitive order.

With regard to the results of the importation regulations, the question may be asked: Are they proportional to the expectations they raise? The answer of the Professor was: No, indeed!

In the first place, they are nearly always issued too late. Not until a certain pest seriously damages our cultures, and not until the newspapers interfere with it, as a rule, are the Governments reminded that something should be done. But between the intention and the issue of a Governmental order, time passes, and when busy commercial relations exist between the country where the pest is feared, and the country where it has got a firm footing, no doubt it will have stolen across the boundaries long before the order has come into force. That the San José Scale hitherto never gained footing in Europe is, in the opinion of the Professor, not because of the prohibitive measures enacted in several European countries concerning the importation of American stock. The difference in climate, in soil, in cultivation, furnish reasons why it cannot thrive in these regions.

In the second place, attention has to be paid to the fact that sometimes a disease or insect pest is not nearly so destructive in the country of its origin as in the country where it is introduced.

The vine Phylloxera is a striking instance; it is not at all such a bad pest in America, its native country, as in Europe. On the other hand, the Gipsy Moth and the Brown-tail Moth are not among the prominent injurious insects in Europe, while in some of the United States of America, where they are introduced from the Old World, they play havoc with all plantations and parks.

AN ATTRACTIVE ARRANGEMENT OF NEW HOLLAND AND OTHER PLANTS.
Exhibited by Messrs. Stuart Low and Co., Bush Hill Park, N.

How often, on the other hand, a pest which one would like to keep outside the frontiers proves, after being introduced, not to be so destructive as it was expected to be. In 1877 and 1878 Europe stood in awe of the Colorado beetle, the introduction of which was expected to be the ruin of the cultivation of the most indispensable article of food. But afterwards, when the public attention had been turned away from it, the Colorado beetle was unquestionably present for at least three years—from 1884 to 1887—in the potato fields at Torgau (Germany) without developing to a destructive pest.

To avoid being misunderstood, the Professor distinctly stated that he was not an absolute opponent to prohibitive orders as a method of checking pests. Especially when it concerns the prevention of the re-introduction of a pest which is about to be exterminated. He then gave an instance from his own experience. Four years ago the American Gooseberry mildew was observed for the first time in Holland; two years ago it spread over a great deal of the country, and it appeared to be a grave menace to gooseberry cultivation in some districts. The Dutch Phytopathological Service has done its utmost to control this pest. In some districts the efforts to exterminate it were crowned with success, in other parts they had not yet been successful. In the meanwhile, a rather rigorous law was passed enacting measures to prevent the inland spread of the disease. The burgomaster of each community where the disease prevails is authorised by it to order the means of exterminating which are considered necessary and useful by the chief of the Phytopathological Service. So the cutting off and burning of the diseased parts of the shrubs can be ordered. If need be, the uprooting and burning of entire shrubs is ordered, and, anyhow, the transport of infected shrubs, cuttings, or fruits, and even of sound shrubs, from infected grounds or premises, is forbidden.

Having thus taken all possible pains to exterminate the disease, it would, in his opinion, be a great mistake to run the venture of re-infection from abroad. In the present circumstances he considered it quite reasonable, for the Dutch Government has completed the measures by forbidding the importation into Holland of gooseberry, currant, and raspberry bushes. Indeed, this prohibitive measure should have been taken before the disease passed over the frontiers, for this alarming pest already having spread to a great extent in several countries of Europe, which in soil, climate, and culture are not considerably different from those of Holland, it was probable that it would come.

But, however unavoidable, in some cases prohibitive measures may be, yet authorities are cautioned once more not to take refuge in them heedlessly, because of the great obstacles they offer to trade, and the uncertainty of their effect.

In dealing with the question: Can inspection at the port of landing be relied upon as a method of preventing the introduction of plant diseases from abroad? The answer, said the Professor, was, No.

As a rule, the great quantity of imported stock and the solidness of its packing will make it impossible to inspect thoroughly. Let it be granted for a moment that the potatoes imported from abroad must be inspected at the port of entrance for the presence of black scab, which dangerous pest in its first stage only is perceptible at the eyes of the tubers by careful examination. The inspector would be obliged to look attentively at nearly every potato in every imported case; for even when only one in a thousand of the potatoes destined for seed is attacked, the disease can make its introduction.

Taking into consideration the enormous quantity in which cases full of conifers, evergreens, shrubs, and plants are shipped in the export season from Holland to other countries, we must be convinced that it is impossible for the experts at the port of landing to inspect these quantities as carefully as to be secured against the introduction of nests of Brown-tail Moth, egg-clusters of Gipsy Moth, woolly aphis, scales, nectria, monilia, American Gooseberry mildew, and so on.

It was not denied that the use which in some cases may be derived from inspection at the port of landing, for when fungus or insect pests are found on the imported stock, and when this stock is burnt or returned at the consigner's charge, he gets the worst of it. Experience keeps a dear school for him, and he may serve as an example for his fellow-nurserymen.

Professor Ritzema Bos then proceeded to deal at some length with the question of inspection of stock, and the granting of certificates, and expressed the opinion that in no other way could the importation of diseases from abroad be more effectually prevented than by efficient inspection of the stock imported in the country in which it is grown.

This paper, which obtained for its author the heartiest applause, was followed by one not less interesting or important, from the pen of Mr. G. L. Rogers, of the Intelligence Division of the Board of Trade on

### The Aim of English Legislation.

In his opening remarks Mr. Rogers pointed out that although the importance of exterpating contagious diseases of cattle had long been recognised in England, and the State had taken an active part in preserving the health of English cattle for many years past, legislation on the subject of diseases of plants was of quite recent date. Many other countries had been earlier in the field, and have advanced further than it had been found possible to do in this country. Greater powers have been given to the Government, the service of inspectors is larger, and the regulations more drastic and sweeping. But this, he considered, need cause no surprise, nor lead anyone to suppose that the interests of horticulture in this country had been overlooked or neglected.

A SKILFULLY CONSTRUCTED PERGOLA WITH GRAPE VINES, ETC.
Exhibited by Mr. J. Hudson, V.M.H., Gunnersbury House Gardens.

Those countries, it was pointed out, which had led the way in legislating on the subject of insect pests and diseases of plants, had, generally speaking, public attention roused to the necessity of taking action by some sudden, and almost dramatic, disaster. Some new pest, whose life history had been unknown, had appeared in their midst, and swept, like an epidemic, across the country, destroying the crops and ruining the cultivators of the soil. In England, with one notable exception, we had been spared that experience.

The freedom from serious pests that we have so long enjoyed in this country was, Mr. Rogers stated, due, not to any accidental good fortune, but, in a great measure, to the geographical position and climatic conditions of the British Isles. The destructive pests which have spread across Europe, without regard to national boundaries, have been checked by the sea from invading England. Some foreign pests may be, and indeed are, imported every year with fruit and agricultural produce, but most of them are parasites on tropical or semi-tropical plants, which can with difficulty survive a year in this country. In giving expression to these views, Mr. Rogers was careful to point out that there is a danger of the introduction of some new pest that may prove destructive, more especially in fruit plantations, and, therefore, it was essential that a constant watch should be kept, not only in English gardens and fields, but also through foreign publications.

Mr. Rogers dealt at some length with the Destructive Insect and Pests Acts of 1877 and 1907, and their administration, and to this part we purpose making a fuller reference than is now possible in an early issue.

The next paper was by Mr. H. M. Lefroy, M.A., F.Z.S., Imperial Entomologist for India, on

### Legislation in Connection with Insect Pests in the Tropics.

This paper was on the same high level as the two which had preceded it, and proved of much interest. Mr. Lefroy, in the course of his paper, dealt with the many pests of plants that cultivators in India and other tropical countries, have to contend with. He strongly urged the importance of all concerned carefully studying the various insect pests that have become established, and for scientists to study the insect pests of other countries, and to give publicity to the information they may obtain, both for the purpose of educating public opinion and putting cultivators on their guard. The greatest safeguard would be knowledge, that legislation might be effectual, and yet free from useless and vexatious restrictions. We should, he said, be awake to the danger, and be in a position to meet it. It was deplorable to see countries fencing themselves blindly with indiscriminate prohibitions, fumigations, quarantine, and inspections. What, in Mr. Lefroy's opinion, was necessary was to move towards a common basis of legislative action upon which to build a measure adapted to the needs of each area, a necessary preliminary to that being a far wider knowledge of the dangers that exist, so that legislation may be framed against them.

### Legislation in Connection with Fungus Diseases.

This was the title of a paper contributed by Mr. H. J. Güssow, botanist to the Canadian Government. Unfortunately, Mr. Güssow was unable to be present, and the paper was read by the Chairman. In the course of his paper, Mr. Güssow pointed out that legislation in connection with fungoid diseases showed that there had been great ignorance on the part of those responsible for the measures that had become law, and that they had proved of little value. In his opinion, it was impossible to satisfactorily determine whether some plants were diseased or not without their being subjected to a microscopical examination by experts, and as that entails much time inspection is more or less inefficient. The only means, in his opinion, by which a solution of the question relating to prevention of the spread of the diseases of plant life was international co-operation in formulating a scheme for the inspection of plants, trees, fruits, etc., in the countries from which they are exported, instead of the countries into which they are imported.

### DISCUSSION.

The discussion was opened by Mr. A. W. Sutton, V.M.H., who had contributed to the report presented to the conference a valuable statement embodying the information acquired by his firm in the course of their export trade relating to the regulations affecting the importation of seeds and nursery stock that are imposed in various parts of the world. Mr. Sutton said he considered that some restrictions on imports are required, but he felt that, in many cases, they are imposed far beyond what was necessary or desirable. The great diversity in the restrictive measures rendered it extremely difficult for those who were not in a position to obtain the fullest information to become acquainted with them. In many cases, the restrictions were probably for the purpose of protecting the growers from competition rather than their crops from insect enemies or disease. In New Zealand nothing was required beyond a certificate from the country of export. He considered it, however, a serious matter that when a consignment of potatoes, for example, was certificated after careful examination free from disease, that it should not be allowed to land because some portion thereof was found to be infected owing to the development of the disease during the voyage.

Sir F. Moore said there had been much difference of opinion with regard to the value of certificates, and it was contended by some that many were worthless. He was gratified to find that there was some change of opinion on the question, and was also glad to find that growers were beginning to recognise the fact that it was to their interest to stamp out disease.

Mr. W. J. Lobjoit, Professor Potter, Professor E. G. Salmon, and Mr. C. E. Pearson, also spoke, and at the close of the discussion Professor Keeble proposed a resolution to the effect that the Science and Education Committee be requested to remain in being, and to confer with the Board of Agriculture with a view to officially summoning an international conference to consider the means of simplifying and consolidating legislative enactments bearing on plant diseases. The motion was seconded by Sir Daniel Morris, and carried unanimously.

The Chairman proposed votes of thanks to the Chelsea pensioners for vacating their Recreation Hall for the two days over which the conferences had extended, to the readers of papers, and to Mr. J. F. Chittenden for the splendid work he had accomplished as hon. secretary of the Science and Education Committee. These, on being put to the meeting, were passed with acclamation. On the motion of Professor I. Bayley Balfour, a hearty vote of thanks was accorded the Chairman.

## SCIENCE AND EDUCATIONAL EXHIBITS.

An interesting exhibit from the Horticultural Department, Reading University College (Mr. Drew), showed suitable stocks for various fruit trees; best methods of training; the difference between disbudded and undisbudded peaches, etc.; inarching and other methods of vine propagation, etc. Mr. George Massee's paintings of various fungus diseases proved most interesting and instructive, while the series of dried plant specimens showing fungus infestations, from M. H. Eicke, Frankfort, would have raised the hair of a plant diseases inspector. An ingenious set of instruments for recording the rate of plant growth, the amount of water lost by a plant by evaporation, etc., was vastly interesting.

Mr. T. Cheesman, the butler at East Burnham Park, showed a quaint exhibit of a vast range of seedlings, largely of trees, grown in water in receptacles of all kinds and sizes; besides these there were carrot, beet, and parsnip tops in water, and even potatoes in water, all giving suggestions that school teachers might well take up in connection with nature study.

Mr. A. S. Horne, Wisley Laboratory, demonstrated, by specimens and a large number of drawings, the appearance of a number of obscure diseases of potatoes. Messrs. Jas. Veitch and Sons, Chelsea, showed how fairly wide is the effective range of stocks upon which scions may be grafted; photinia on cotoneaster, lycopsis on hamamelis, arthrotaxis on cryptomeria, pyrus on cotoneaster, cratægus on cotoneaster, and hippophæ on eleagnus, were a few very interesting and successful graft experiments.

From the Royal Botanic Gardens, Edinburgh, came a wonderful series of unusual examples of successful plant propagation; the formation of bulbils in bulbs, rooted sterculia cuttings, acanthus leaf cuttings, stem cuttings in endless variety, runners, etc., etc. Dr. Winifred Brenchley, of Rothamstead, showed water cultures; and experiments representing the results of sterilisation of sick soils, also came from Rothamstead, and created a great deal of interest. Numerous exhibits from Reading and elsewhere showed the progress of silver leaf disease, but, so far as we could gather, little progress in the prevention of the disease has yet been made.

The Board of Agriculture sent maps and charts showing the different parts of the country where certain special crops of fruit and vegetables are grown, and also others denoting the distribution of plant diseases. From the Agricultural College, Wye, came a most instructive exhibit of insect and allied pests, of fruit trees and bushes; and Mr. F. Enock and Prof. Newstead showed series of insects that prey on injurious insects, and tropical scale insects respectively. A set of the "Reichenbachia" exhibited by Mr. F. Sander, St. Albans, together with some of the late Mr. H. G. Moon's original paintings of orchids figured in that wonderful work, made book-lovers envious and covetous.

A series of berberis seedlings, showing the effects of careful working on Mendelian lines, came from Major Hurst, Burbage Experimental Station. An exhibit of both old and new types of vegetables, staged by Messrs. Sutton and Sons, Reading, gave ocular demonstrations of the advances made during recent years. The wild cabbage, old long-necked cucumbers, corrugated red tomatoes, and a wild edible pea from Palestine, were contrasted with the most modern

AN EFFECTIVE ROCK GARDEN.
Designed and formed by Messrs. Pulham and Son.

varieties in each case, and, the intervening improvements being left out, the contrast was very wonderful.

A demonstration of Mendelian inheritance in tropæolums was given by the John Innes Horticultural Institution, and the various combinations of characters in the specimens were little short of wonderful, and indicated the possibilities that lie before raisers who tackle their work in scientific fashion. From Reading College came a large series of primulas, showing the results of crossing certain varieties, the re-combination of Mendelian characters, and the loss of Mendelian character. One cross, betwen a palm leaf and a fern leaf primula, gave all palm leaf in the first generation, and three palm leaves to one fern leaf in F. 2; in this case the growing plants were on view to show the results indicated.

A series of drawings in colour from Mr. W. Cuthbertson, Edinburgh, showed the parentage of some of the best known modern sweet peas. These proved that the Spencer form is always recessive in the first generation when crossed with the old type, but it appears in F. 2. Purple dominates all other colours, i.e., when a red, pink, cream, or white sweet pea is crossed with the pollen from a purple flower all the flowers in the first generation are purple. In the second generation (F. 2) the other colours appear. Red dominates pink, cream, and white; white dominates cream. Messrs. H. B. May and Sons showed the gradual evolution of the plumosa nephrolepis from the old type.

A series of specimens from the Woburn Experimental Fruit Farm demonstrated in practically every case, and did so effectively, that fruit and other trees grown during their earlier years with grass over their roots right up to the stems, suffer very materially; while in the absence of grass trees of similar character do well under the same kind of soil and conditions.

CALCEOLARIA BRONZE AGE.

An elegant variety, bearing a profusion of rich crimson flowers. Raised and exhibited (I.H.E.), by Messrs. R. Veitch and Son, Exeter.

---

## SOCIAL FUNCTIONS.

On Tuesday, May 21, the President and directors lunched together at the Grosvenor Hotel, and in the evening, the President—the Duke of Portland—held a reception to which most of the foreign visitors were invited.

On Wednesday, the whole of the Jury were entertained at lunch on the Terrace in the Chelsea Hospital grounds, and to this function we have already referred.

Thursday evening, May 23, Leopold de Rothschild, Esq., entertained a large party to dinner at Gunnersbury Park, Acton. Before dinner the guests inspected the beautiful grounds of Gunnersbury Park and Gunnersbury House, where Mr. Reynolds and Mr. James Hudson are respectively the clever gardeners. Great admiration was expressed for all that was seen. At the dinner Mr. Leopold de Rothschild presided in one salon and Mr. Lionel de Rothschild in another. Among the guests were the Comte de Germiny, Comte de Hemptinne, Sir G. Holford, Sir J. Colman, Bart., Sir F. Moore, M. Maurice de Vilmorin, M. Philippe de Vilmorin, Professor Valvassori, Herr Siebert, Herr Bonfledt, Dr. Schrenchner, Mr. Harry J. Veitch, Mr. A. W. Sutton, M. Martinet, M. Gentil, M. Correvon, M. Delmard, Mr. E. H. Krelage, Herr Kuhns, M. de Smet, Mr. J. Farquhar, Hon. Vicary Gibbs, and Mr. N. N. Sherwood.

The loyal toasts were duly honoured, and then Mr. L. de Rothschild welcomed the guests in English, French, and German, and said how delighted everyone was to have the opportunity of meeting so many distinguished foreigners from other lands. He made kindly reference to the exhibits at Chelsea from France, Holland, Belgium, Japan, Italy, Germany, Canada, and Australia, and spoke of the friendly spirit of emulation, rivalry, and admiration existing in the realm of horticulture among the nations represented, a spirit that made for the peace of the world. The Comte de Germiny, Mr. E. H. Krelage, M. Brodersen, Dr. Schrenchner, and the Comte de Hemptinne all responded, and each echoed the sentiments expressed by their host, and spoke in high terms of admiration of the great show that had brought all together.

M. Philippe de Vilmorin proposed the health of the host, and referred to the love of gardening that permeated all classes in the British Isles, and how great was the influence exerted in horticulture by the wealthy gentlemen, who, like their host, were such generous patrons of the gentle art. Mr. Leopold de Rothschild suitably responded, and said that when he was a boy there were only two flower shops in London. He made kind reference to Mrs. Lawrence's garden in the old days at Ealing Park, and of Sir George Holford's father's love of orchids. He wished great success to the show, and Sir Jeremiah Colman, Bart., replied on behalf of the directors. Mr. Farquhar, of Boston, U.S.A., an old Chiswick student, and M. Valvassori, of Florence, each spoke, and Sir George Holford responded for "The Prize Winners."

## Royal Horticultural Society's Banquet.

Some four hundred guests accepted the invitation of the President and Council of the Royal Horticultural Society to dinner at the Hall, Vincent Square, Westminster, on the evening of Friday, May 24. Sir Trevor Lawrence presided, and was supported on the dais by Prince A. Mestschersky, the Lord Mayor of London, Major-Gen. C. Crutchley, Mons. M. de Vilmorin, Lieut.-Col. Prain, Lord Desborough, Sir G. Holford, Sir J. Colman, Bart., Senhor T. Gomes, Comte de Germiny, Baron B. Schroder, Comte de Hemptinne, Dr. C. Mitchell, Professor Waldhein, Dr. Toozanowsky, etc., etc. No fewer than forty-one tables were set out in the hall, and the guests included practically all the best-known men in European, and not a few in American horticulture, Messrs. Farquhar, H. Bunyard, C. Barron, and C. H. Trotby representing the United States.

The Hall was finely decorated, the roof being hung with flags of all nations, while fine palms and other plants filled the corners. Mr. Alfred de Rothschild kindly lent his private band, which discoursed sweet music during the dinner, and to the great enjoyment of the guests, Mons. Tivadar Nachez gave several splendid violin solos during the evening.

It was practically impossible save for the few close to the dais, to hear the speeches, but we may say that great cordiality prevailed, every possible kind attention was paid to the foreign guests, and they in return paid British horticulture the highest possible compliments, and all joined in praise of the immense show and thanks for the hospitality extended to them during their stay.

The loyal toasts were enthusiastically honoured, and Baron von Ernsthausen gave "The Royal International Horticultural Exhibition of 1912," and to this Mr. Harry J. Veitch responded on behalf of the directors. Sir Trevor Lawrence proposed "Our Guests from Abroad," and Mons. A. Truffaut, president of the National Horticultural Society of France, responded in an eloquent and excellent speech.

"The Horticultural Society" was very ably proposed by Mr. Ernst Krelage, of Haarlem, and responded to by Sir Jeremiah Colman, Bart. In conclusion, Sir Trevor's health was proposed in fine fashion by Mons. Maurice de Vilmorin, and accorded an enthusiastic reception and musical honours.

West of Scotland Cup.—To Messrs. J. Waterer and Son, Woking, for conifers and specimen trees.

Somersetshire Cup.—To Sir Eric Hambro, Hayes, for alpines and hardy flowers.

South Wales Rose Bowl.—To Messrs. Jas. Veitch and Sons, Chelsea.

Suffolk Cup.—To Messrs. Fisher, Son, and Sibray, Handsworth, for hardy, evergreen, and deciduous shrubs.

Warwickshire, Cup.—To Messrs. Bakers Wolverhampton, for rock garden.

Wiltshire Rose Bowls.—To Messrs. Sander and Sons, St. Albans, for orchids; and to Messrs. W. Cutbush and Son, Highgate, for rock garden.

Worcestershire Cup.—To Mr. C. Engelmann, Saffron Walden, for carnations.

Yorkshire East Riding Cup.—To Lt.-Col. Sir George Holford, Westonbirt, for orchids and amaryllis.

Irish Cup.—To Mr. J. Wood, Boston Spa, for rock garden.

French Horticultural Society's Statuette.—To Leopold de Rothschild, Esq., Gunnersbury, for fruit trees and pelargoniums.

Jules Hye de Crom's Cup.—To Lieut.-Col. Sir George Holford, for orchids.

Sir George Holford's Cup.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Special Silver Cup.—To Messrs. Sander and Sons, St. Albans, for orchids.

Special Silver Cup.—To Sir Everard Hambro (gardener, Mr. Grandfield), Hayes, for alpines.

Silver Cup.—To Messrs. Laxton Bros., Bedford, for fruit trees.

Silver Cup.—To Messrs. Storrie and Storrie, Glencarse, for fruit trees.

Large Silver Cup.—To Messrs. Benjamin Cant and Sons, Colchester, for roses.

A SHADY POOL.
Exhibited by Mr. Amos Perry, Enfield.

# THE AWARDS.

## COUNTY CUPS.

Bedfordshire Cup.—To Messrs. Laxton Brothers, Bedford, for strawberries and fruit trees.

Derbyshire Cup.—To Messrs. J. Backhouse and Son, York, for rock garden.

Dorsetshire Cup.—To Mr. L. R. Russell, Richmond, for trees and shrubs.

Gloucestershire Cup.—To Messrs. J. Cypher and Sons, for plants and orchids.

Hertfordshire Cup.—To J. Gurney Fowler, Esq., South Woodford, for orchids, etc.

Isle of Wight Cup.—To Mr. Leopold de Rothschild, Gunnersbury, for orchids and fruit trees.

Lancashire Cup.—To Messrs. H. B. May and Sons, Edmonton, for ferns.

Leicestershire Cup.—To Messrs. Jackman and Son, Woking, for conifers.

Norfolk Cup.—To the Netherlands Horticultural Federation, for vegetables.

Shropshire Cup.—To Messrs. G. Bunyard and Co., Maidstone, for fruit trees.

## OTHER CUPS AND SPECIAL MEDALS.

Queen Alexandra's Cup.—To Messrs. R. Wallace and Co., Colchester, for rock and water garden.

Clay and Son's Rose Bowl.—To Messrs. G. Mount and Sons, Canterbury, for roses.

The Veitchian Memorial Medals.—To Mons. Truffaut, Versailles, and to Professor Keeble, of Reading University College.

Veitchian Cup.—To the Hon. Vicary Gibbs, Elstree, for choice trees and shrubs.

"The Gardeners' Chronicle" Cup.—To Rev. A. T. Boscawen, for Leptospermum scoparium Nicholi, as the best new plant not previously exhibited.

Horticultural Club Cup.—To Messrs. James Carter and Co., for Japanese garden.

Ernst Benary Memorial Medal.—To Messrs. Sutton and Sons, Reading, for plants raised from seeds.

Glasgow Cup.—To Mr. A. C. Jackman, for trees and shrubs suitable for smoky towns.

Messrs. J. Walker and Tolhurst's Cup.—To Messrs. Jas. Veitch and Sons, Chelsea.

Special Silver Cup.—To Messrs. G. Bunyard and Co., Maidstone, for apples and pears.

Silver Cup.—To Messrs. Hobbies, Lim., Dereham, for roses.

Silver Cup.—To Messrs. D. Prior and Sons, Colchester, for roses.

Large Silver Cup.—To Mr. Chas. Deitrich, Belgium, for orchids.

Silver Cup.—To Mr. F. H. Davidson, for orchids.

Silver Cup.—To Messrs. Stuart Low and Co., Enfield, for orchids.

Large Silver Cup.—To Messrs. Peeters and Son, Brussels, for orchids.

Silver Cup.—To Mr. H. A. Tracy, Twickenham, for orchids.

Silver Cup.—To Mr. Chas. Blick, Hayes, for carnations.

Small Silver Cup.—To Mr. James Douglas, Bookham, for carnations.

Silver Cup.—To Mr. C. Lange, Hampton, for pinks.

Silver Cup.—To Messrs. Stuart Low and Co., Enfield, for pinks, etc.

Silver Cup.—To Leopold de Rothschild, Esq., Gunnersbury, for carnations.

Silver Cup.—To Mr. L. R. Russell, Richmond, for carnations.

Special Silver Cup.—To Messrs. Young and Co., Hatherley, for carnations.

Silver Cup.—To Mr. W. E. Alsen, Waterlooville, for sweet peas.

Silver Cup.—To Messrs. Reamsbottom and Co., Geashill, King's County, for anemones.

Large Silver Cup.—To Messrs. Barr and Sons, Covent Garden, for hardy flowers.

Large Silver Cup.—To Messrs. G. Bunyard and Co., Maidstone, for hardy flowers.

Silver Cup.—To Messrs. J. Cocker and Sons, Aberdeen, for trolliuses.

Silver Cup.—To Messrs. Dobbie and Co., Edinburgh, for hardy flowers.

Silver Cup.—To Messrs. Gunn and Sons, Olton, for phloxes, etc.

Silver Cup.—To Messrs. Jarman and Co., Chard, for hardy flowers.

Silver Cup.—To Messrs. G. W. Miller, Wisbech, for pyrethrums.

Silver Cup.—To Messrs. F. Smith and Co., Woodbridge, for hardy flowers.

Silver Cup.—To Messrs. Barr and Sons, Covent Garden, for pigmy trees.

Large Silver Cup.—To Messrs. William Cutbush and Son, Highgate, for climbers.

Special Cup.—To Messrs. G. Jackson and Son, Woking, for conifers.

Special Cup.—To Mr. L. R. Russell, Richmond, for ornamental trees.

Silver Cup.—To the Aalsmeer Florists' Association for cut flowers.

Silver Cup.—To Mr. H. N. Ellison, West Bromwich, for cacti.

Special Cup.—To Mr. J. Macdonald, Harpenden, for grasses.

Special Cup.—To Messrs. H. B. May and Sons, for ferns.

Silver Cup.—To the Yokohama Nursery Company, for dwarf trees.

Silver Cup.—To Messrs. Wm. Cutbush and Son, Highgate, for clipped trees.

Special Cup.—To Messrs. James Veitch and Sons, Chelsea, for lilacs and azaleas.

Silver Cup.—To Miss Wilmott, V.M.H., Great Warley, for Chinese plants.

Special Cup.—To Messrs. Backhouse and Son, York, for rock and water garden.

Special Cup.—To Messrs. Bakers, Lim., Wolverhampton, for rock and water garden.

Special Cup.—To Messrs. Wm. Cutbush and Son, Highgate, for rock and water garden.

Silver Cup.—To Messrs. Kent and Brydon, Darlington, for rock and water garden.

Special Cup.—To Mr. Maurice Prichard, Christchurch, for rock and water garden.

Silver Cup.—To Messrs. T. S. Ware, Lim., Feltham, for rock and water garden.

Silver Cup.—To Messrs. Carlton-White, Bond Street, for clipped trees.

Silver Cup.—To Messrs. G. Bunyard and Co., Maidstone, for rock and water garden.

Silver Cup.—To M. Bonfigioli, for anthuriums.

Special Cup.—To Messrs. R. Veitch and Son, Exeter, for calceolarias, etc.

Small Cup.—To Colonel Mark Lockwood, for acalyphyas.

Silver Cup.—To the Pomological and Horticultural School of Florence, for anthuriums.

Special Cup.—To Leopold de Rothschild, Esq., Gunnersbury House, for pelargoniums.

Silver Cup.—To Mr. Dorrien-Smith, Tresco, Scilly, for puya.

Silver Cup.—To Messrs. J. Cheal and Sons, Crawley, for garden designs.

Silver Cup.—To J. Gurney Fowler, Esq., Glebelands, South Woodford, for orchids and selaginellas.

Special Cup.—To Mr. C. Engelmann, Saffron Walden, for carnations.

### LARGE GOLD MEDALS.

To the Australian Government, for fruits, etc.; to the Canadian Government, for fruit, etc.; to Leopold de Rothschild, Esq. (gardener, Mr. J. Hudson, V.M.H.), for fruiting trees in pots; to Messrs. Searle and Sons, Australia, for packed fruit; to Messrs. Jas. Veitch and Sons, Chelsea, for trained fruit trees; to Messrs. George Mount and Sons, Canterbury, for roses; to Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Mr. Amos Perry, Enfield, for rock and water gardens; to Messrs. H. B. May and Sons, Edmonton, for ferns; to the Yokohama Nursery Company, for Japanese trees, etc.; to Messrs. Wm. Cutbush and Sons, Highgate, for roses and carnations; to Messrs. Fisher, Son, and Sibray, Handsworth, for trees and shrubs; to the Hon. Vicary Gibbs, Elstree, for Chinese shrubs; to Messrs. Jas. Veitch and Sons, Chelsea, for Chinese shrubs; to Captain Dorrien-Smith, for olearias; to Messrs. Jas. Veitch and Sons, Chelsea, for bay trees; to Messrs. J. Waterer and Sons, Bagshot, for trees and shrubs; to Messrs. R. Wallace and Co., Colchester, for rock garden; to Messrs. Jas. Carter and Co., Raynes Park, for greenhouse flowering plants; to Messrs. E. Webb and Sons, Stourbridge, for greenhouse plants; to Messrs. Jas. Carter and Co., Raynes Park, for Japanese garden; to Messrs. Sutton and Sons, Reading, for greenhouse plants; to Messrs. Jas. Veitch and Sons, Chelsea, for stove plants.

### GOLD MEDALS.

To J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford, for orchids; to Leopold de Rothschild, Esq. (gardener, Mr. G. Reynolds), Gunnersbury Park, Acton, for vandas; to Mr. H. Burnett, Guernsey, for carnations; to Mr. C. Engelmann, Saffron Walden, for carnations; to Messrs. Dobbie and Co., Edinburgh, for sweet peas; to Messrs. Watkins and Simpson, Covent Garden, for annuals; to the Rev. A. T. Boscawen, Ludgvan, Cornwall, for leptospermums, etc.; to Mr. J. Macdonald, Harpenden, for grasses; to Mr. I. Neale, for insectivorous plants; to Mr. W. Iceton, Putney Park Lane, for lily of the valley; to Messrs. R. P. Ker and Sons, Liverpool, for amaryllis; to Mr. L. R. Russell, Richmond, for stove plants; to Mr. R. C. Notcutt, Woodbridge, for an English garden; to Mr. R. C. Pulham, Newman Street, W., for rock garden.

### SMALL GOLD MEDAL.

To Messrs. H. Cannell and Sons, Swanley, for cannas, etc.

### LARGE SILVER-GILT MEDALS.

To Mr. T. H. Mawson, Windermere, for lead statuary; to Messrs. Carter Page and Co., London Wall, for dahlias, etc.

### SILVER-GILT MEDALS.

To Mons. H. Graire, Amiens, for orchids; to Mons. Chas. Vuylsteke, Loochristy, for orchids; to Sir G. Faudel-Phillips, for carnations; to Mr. C. W. Breadmore, Winchester, for sweet peas; to Messrs. R. H. Bath, Lim., Wisbech, for hardy flowers; to Messrs. Hogg and Robertson, Dublin, for tulips, etc.; to Messrs. J. Kelway and Sons, Langport, for hardy flowers; to the Japanese Horticultural Society, Japan, for pigmy trees, etc.; to Mr. J. Friedlander, for schizanthuses; to Mr. W. Proffitlich, Twickenham, for lily of the valley; to Messrs. Cunningham, Fraser, and Co., Edinburgh, for alpines; to Mr. C. Elliott, Stevenage, for alpines and rock garden; to the Lissadel Floral Farms, Sligo, for hardy flowers.

### LARGE SILVER MEDALS.

To Mr. R. J. Barnes, for roses; to Messrs. Dicksons, Chester, for roses; to Messrs. R. Harkness and Co., Hitchin, for roses; to Mr. C. H. Herbert, for pinks; to Lord Burnham, Hall Barn, Beaconsfield, for carnations; to Mr. H. S. Brassey, for carnations; to Mr. F. Lilly, Guernsey, for gladiolus, etc.; to Messrs. Jas. Forbes, Hawick, for hardy flowers; to the Locksheath Nursery Company, Southampton, for hardy flowers; to Messrs. Carlton-White, for clipped trees; to Mr. S. Mortimer, Farnham, for stocks; to Messrs. Robt. Sydenham, Lim., Birmingham, for sweet peas; to Mr. W. Sydenham, Tamworth, for violas.

### SILVER MEDALS.

To Messrs. Seabrook and Sons, Chelmsford, for apples and pears; to Messrs. Munch and Haufe, for roses; to Mr. J. Mattock, Headington, for roses; to Mr. C. Birchenhall, for orchids; to Mr. R. C. Felton, Hanover Square, for carnations; to Mr. E. W. King and Co., Colchester, for sweet peas; to Mr. J. Stevenson, Poole, for sweet peas; to Mr. A. L. Gwillim, Eltham, for begonias; to Mr. H. J. Harris, for anemones; to Messrs. Hubert and Co., Guernsey, for cut flowers; to the Pyrenees Horticultural Society, for hardy flowers; to Messrs. Walter T. Ware, Lim., Inglescombe, for tulips; to Messrs. Bees, Lim., Liverpool, for alpines; to Mons. H. Correvon, Geneva, for alpines; to Mrs. Edwards, for saxifragas; to Dr. Mcwatt, Duns., for primulas; to Messrs. W. and J. Brown, Stamford, for hardy flowers; to Messrs. Dicksons, Chester, for trees and shrubs; to Mr. Prime, gardener to the Marquis of Salisbury, Hatfield, for stove plants; to Mr. Mercatelli, for mamantas; to Messrs. H. B. May and Sons, Edmonton, for flowering plants; to Mr. G. Reuthe, Keston, for alpines, rhododendrons, etc.; to Messrs. Thompson and Charman, for alpine garden; to Mr. G. Reuthe, Keston, for rock garden; to the Dutch Winter School, Boskoop, for azaleas; to Mr. H. N. Ellison, West Bromwich, for ferns; to Mr. A. A. Fabius, for Adiantum Glory of Moordrecht; to Mr. P. Ladds, Swanley, for pelargoniums; to the Hon. Mrs. Grosvenor, for parterre garden; to Mr. H. Hemsley, Crawley, for formal garden.

### AWARDS IN SCIENCE SECTION.

Veitch Memorial Cups.—To M. Truffaut for collection of insects, and to Professor Keeble for exhibit of primulas.

Gold Medal.—To Professor Winkler for graft hybrids; to Professor Bateson for plant-breeding exhibit; to Professor Theobald for collection of injurious insects; and to Mr. F. I. Brooks for exhibit of silver-leaf and plum rust.

Silver-gilt Medal.—To Professor Newstead for collection of scale insects; to Mr. Pickering for injurious insects; and to Dr. Pethybridge for potato diseases.

Silver Medal.—To Dr. Russell for soil sterilisation experiments; to Miss Brenchley for water cultures; to Mr. H. J. Veitch for bigeneric grafts; to Professor Armstrong for exhibit of chemical differences between allied plants; to Mr. F. G. Drew for the educational value of exhibit showing the training and growth of fruit trees; to Mr. H. B. May for exhibit showing origin of fern varieties; to Mr. A. W. Sutton for exhibit showing comparison between old and new types of vegetables; to Mr. A. W. Sutton for species of solanum; to Mr. W. Cuthbertson for pictures showing origin of sweet pea varieties; to Mr. Malthouse for exhibit of black scab in potatoes; to Dr. Berger for exhibit of scale insects attacked by fungi; and to Mr. Hugh Barton for British mosses.

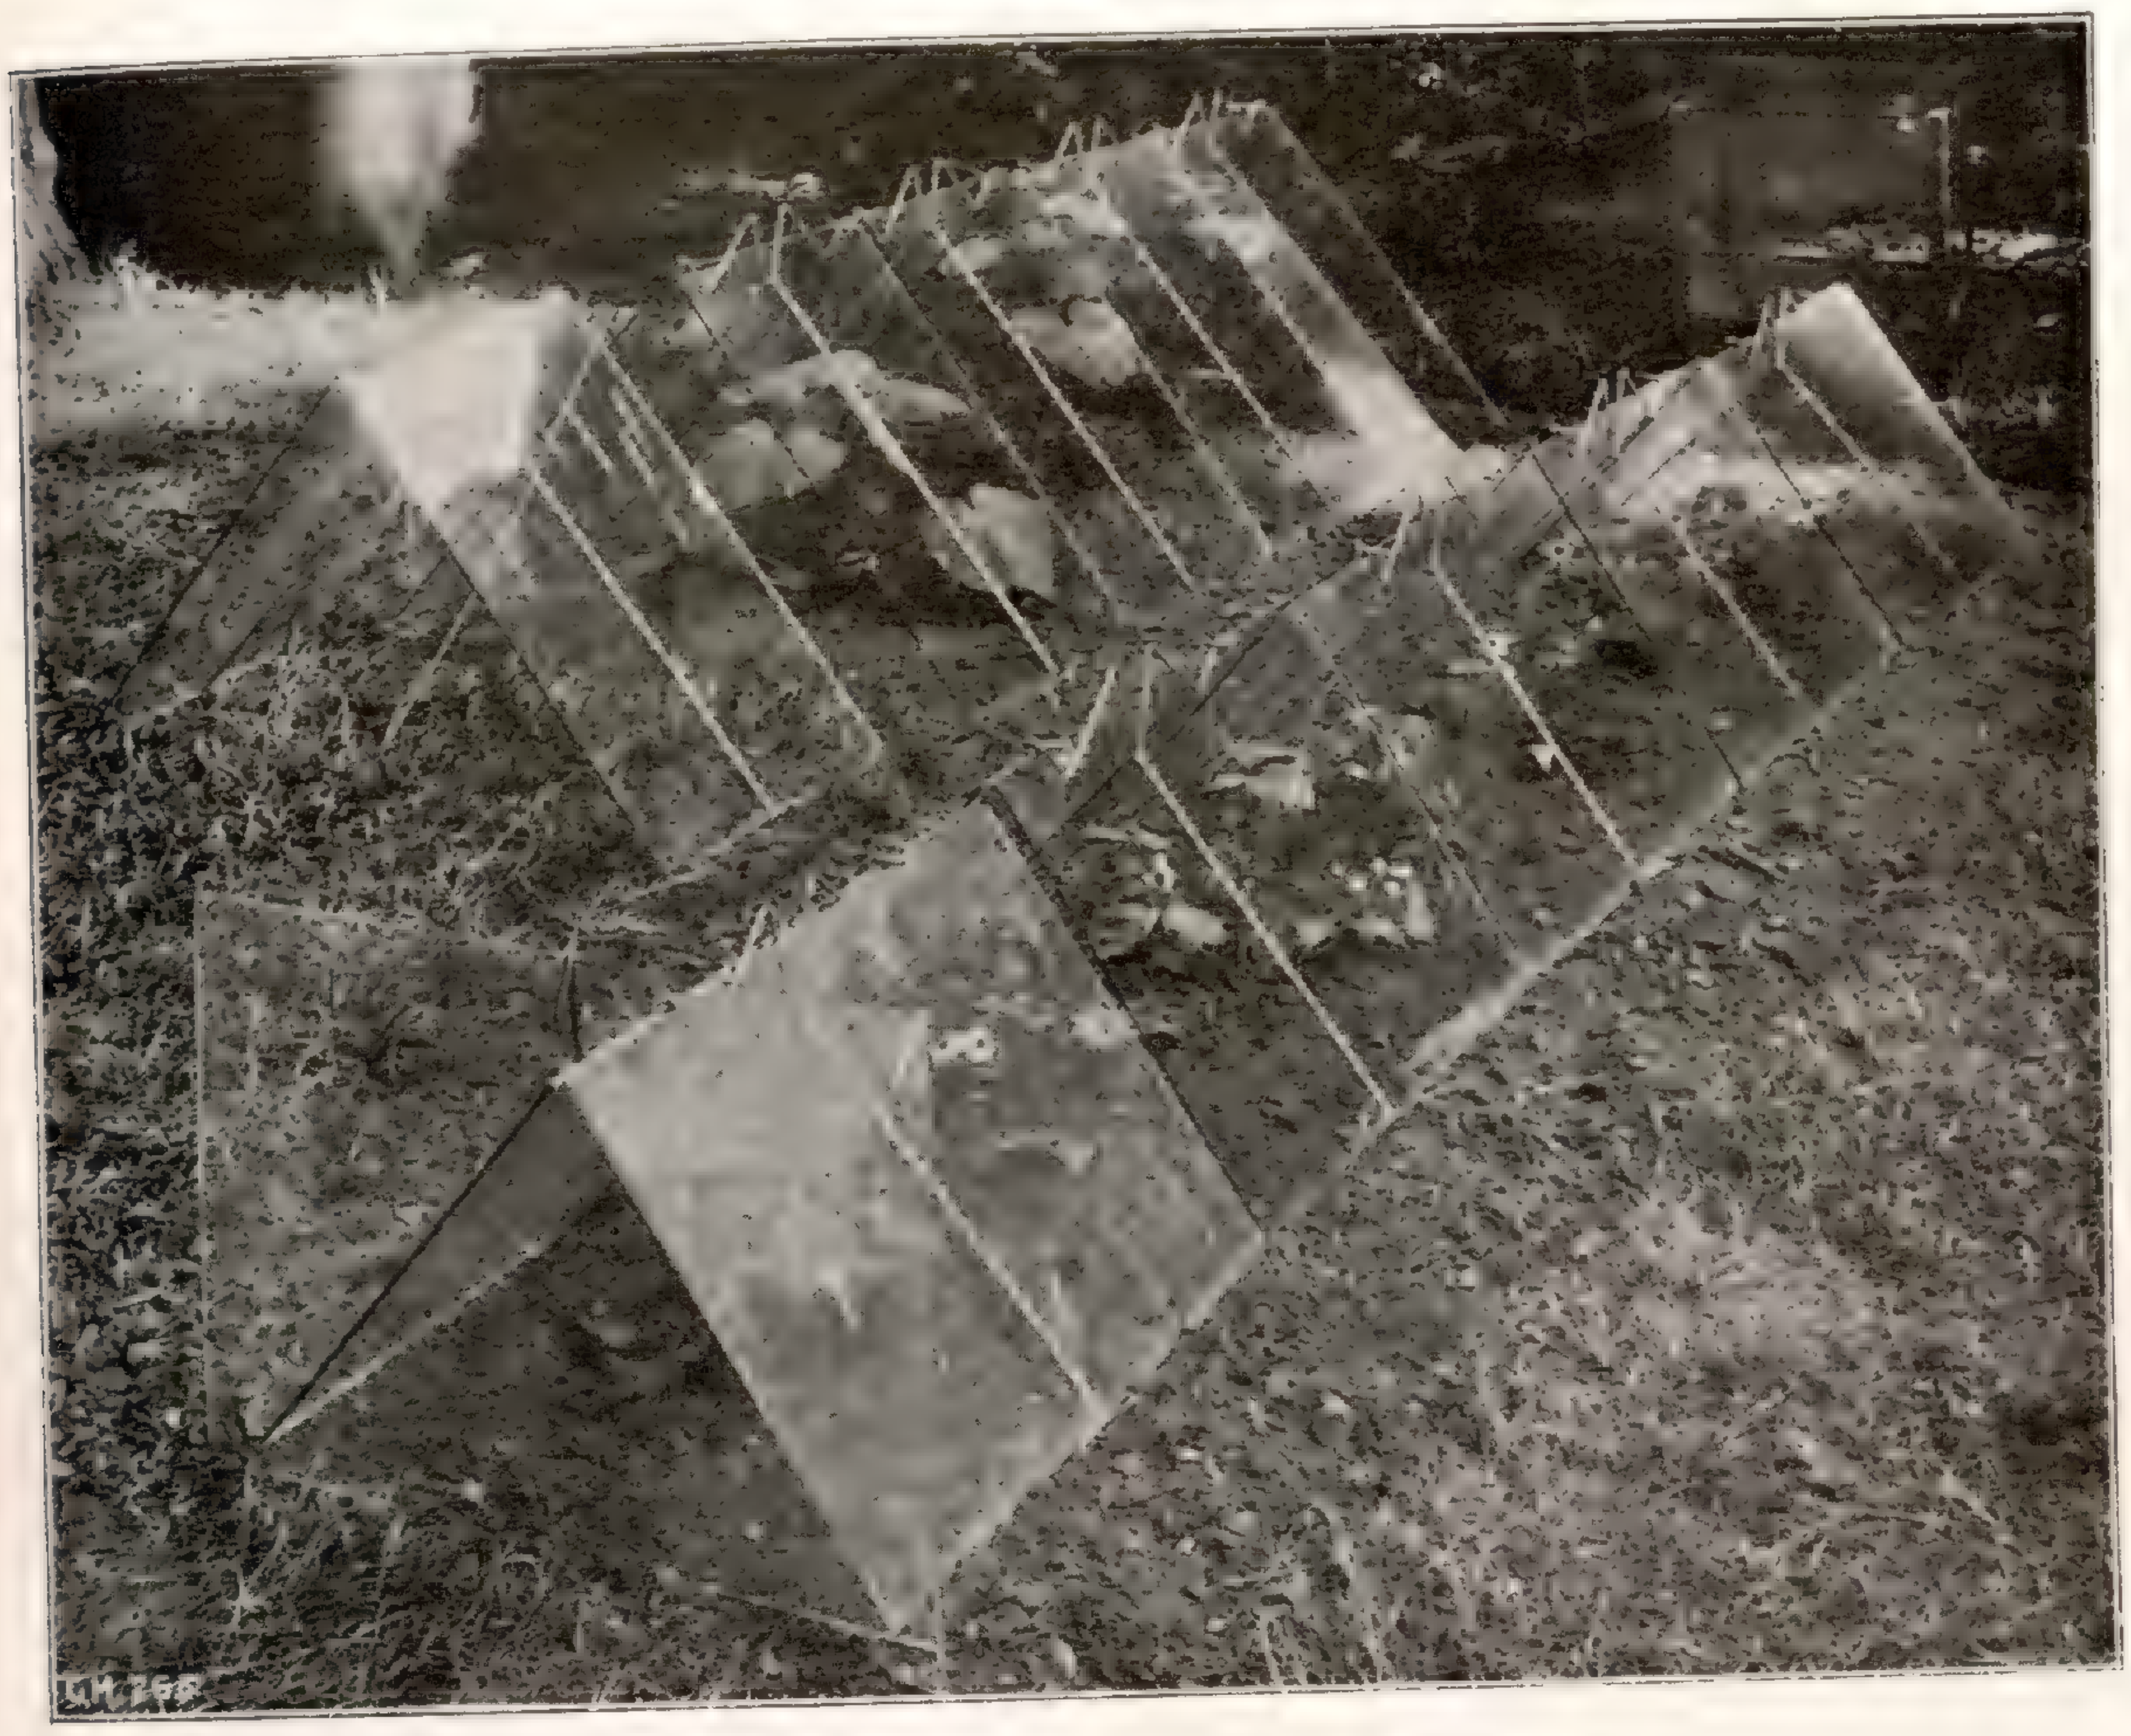
Bronze Medal.—To Mr. T. Cheesman for tree seedlings in water.

Diploma.—To Mons. Daniel for pictures of grafts, illustrative of effect of stock on scion; to Professor Blackman for physiological experiments; to Major Hurst for breeding experiments with berberis; to Mr. Enock for insect parasites of injurious pests; to Dr. McDougall for illustrations of injurious insects; to Mr. E. S. Salmon for fungus diseases of fruit trees; to Professor Percival for exhibit of silver leaf in plum; to Mr. G. Massee for paintings of plant diseases; to Herr Eicke for specimens of diseased plants; and to the Board of Agriculture for maps showing distribution of plant diseases.

### AWARDS TO FOREIGN SECTION.

M. Goosens, Silver Medal; M. Regner, Silver Medal; M. Maquet, Bronze Medal; M. Compoint, Silver Medal; M. Libraire Agricole de la Maison, Large Silver Medal; M. Edouard Debrie, Silver Cup (a); M. Cauchaume, Gold Medal; M. George Truffaut, Gold Medal; M. Vilmorin, Silver Cup (a); MM. Fortin and Laumonmiere, Silver Cup (a); M. Henrie Vacherot, Large Silver Cup; M. Henri Guichard, Silver-gilt Medal;

MM. Rivoire et Fils, Gold Medal; Libraire et Impoimene Horticoles, Silver Medal; M. E. Draps, Large Silver Cup; The Belgian Committee for the Progress of Horticulture, Gold Medal; Dr. D. Baardse, Silver-gilt Medal; MM. Strensina Bros., Silver Cup; Messrs. von. Waveren and Kruyff, Large Silver Cup; Messrs. E. H. Krelage and Son, Gold Medal; The Aalsmeer Florists, Association, Special Cup and Gold Medal; M. Meonder Plasache, Silver Cup; Messrs. T. Smith and Co., Bronze Medal; M. Moos, Gold Medal; M. J. Berger, Bronze Medal; the Syndicat Agricole, Silver-gilt Medal; De Cairllon Producterus, Gold Medal; MM. Robert et Vidal, Gold Medal; M. Roumat, Bronze Medal; M. Chauvin, Silver Medal; M. Victor Platt, Bronze Medal; M. Franciosa, Bronze Medal; M. Carmel Jovine, Bronze Medal; M. Dehaye, Bronze Medal; M. Ekienne Rocca, Silver Medal; M. Francois Ouillet, Silver Medal.



THE CHASE CONTINUOUS CLOCHE.
Exhibited by the Three C.'s Company, Dale Street, Liverpool.

### AWARDS TO SUNDRIES EXHIBITS.

Cups and Gold Medals.—Messrs. Houtsch and Co., Gold Medal; Thames Bank Iron Company, Gold Medal; Four Oaks Spraying Company, Silver Cup; Messrs. T. Crowther and Sons, Silver Cup; Messrs. Drew, Clarke, and Co., Silver Cup; Mr. H. C. Slingsby, Silver Cup.

Bronze and Silver Medals.—Messrs. Abbot Bros., Large Silver-gilt Medal; Messrs. Barr and Sons, Bronze Medal; Messrs. J. Bentley, Lim., Large Silver Medal; Messrs. Berger Lewis and Son, Lim., Large Silver Medal; Messrs. Blake and Mackenzie, Lim., Small Silver Medal; the Bon Arbor Chemical Company, Small Silver Medal; the Boundary Chemical Company, Small Silver Medal; Messrs. Bull and Sons, Bronze Medal; Messrs. Jas. Carter and Co., Large Silver Medal; Messrs. Thos. Christy and Co., Bronze Medal; Miss Colt, Bronze Medal; Messrs. Cooper and Nephews, Large Silver-gilt Medal; Messrs. Corry and Co., Lim., Large Silver-gilt Medal; Messrs. A. Cross and Son, Large Silver Medal; Danysz Virus, Lim., Bronze Medal; Mr. F. C. Edwards, Small Silver Medal; the Elsenham Jam Company, Bronze Medal, The French Cloche Company, Small Silver Medal; Mr. J. George, Small Silver Medal; Messrs. C. H. Glover and Co., Bronze Medal; Messrs. J. Green and Nephew, Large Silver-gilt Medal; Mr. John Groom, Small Silver Medal; Halliford French Gardens, Large Silver Medal, Mr. J. Hansen, Bronze Medal; Mr. A. Harris, Small Silver Medal; Mr. J. Haws, Large Silver Medal; Messrs. Headley Bros., Small Silver Medal; Mr. G. Henniger, Large Silver-gilt Medal; Messrs. Leslie and Greening, Large Silver-gilt Medal; Messrs. Geo. Jackman and Sons, Large Silver-gilt Medal; Mr. H. Jackson, Bronze Medal; Jeyes Sanitary Compound Company, Large Silver Medal; Mrs. F. A. Jonas, Large Silver Medal; Messrs. Kinnell and Co., Silver-gilt Medal; Mr. A. C. Laws, Bronze Medal; Laws Chemical Manure Company, Small Silver-gilt Medal; Mr. F. F. Lemon, Bronze Medal; Messrs. R. A. Lister and Co., Large Silver Medal; Patent Ladder Company, Silver-gilt Medal; Messrs. H. Pattison and Co., Small Silver Medal; Messrs. Pilkington Bros., Small Silver Medal; Messrs. J. Pither, Lim., Bronze Medal; Plant Plantoids, Lim., Bronze Medal; The Potash Syndicate, Bronze Medal; Price's Patent Candle Company, Lim., Large Silver Medal; Messrs. Michael Rains, Lim., Bronze Medal; Mr. G. H. Richards, Large Silver Medal; Messrs. Robinson Bros., Large Silver-gilt Medal; The Sanitas Company, Small Silver Medal; Messrs. R. Sydenham, Lim., Small Silver Medal; Messrs. W. Voss and Co., Lim., Large Silver-gilt Medal; Messrs. Wakeley Bros. and Co., Lim., Bronze Medal; Mr. Wilfred Mark Webb, Bronze Medal; Messrs. E. A. White, Lim., Large Silver-gilt Medal; Preserved Flowers Company, Large Silver Medal; Mr. H. C. Burton, Bronze Medal; Mr. J. A. Evans, Small Silver Medal; Mr. E. D. Greening, Large Silver Medal; International Supply Association, Bronze Medal; Messrs. W. Poupart, Lim., Small Gold Medal; Pwllbach Colliery Company, Bronze Medal; Messrs. Elliott Bros. and Co., Bronze Medal; Mr. Ambrose Palmer, Large Silver Medal; the Army and Navy Co-operative Supply, Silver-gilt Medal; Messrs. Braggins and Co., Silver-gilt Medal; Messrs. Coldrum, Silver-gilt Medal; Mr. W. H. Cook, Silver-gilt Medal; Messrs. Drake and Fletcher, Silver-gilt Medal; Fernden Fencing Company, Silver-gilt Medal; Folding Span-light Company, Silver-gilt Medal; Messrs. Lloyd Lawrence and Co., Silver-gilt Medal; Leyton Timber Company, Silver-gilt Medal; Messrs. Liberty and Co., Silver-gilt Medal; Mr. H. Peach, Silver-gilt Medal; Messrs. Skinner, Board, and Co., Silver-gilt Medal; Twelve-Hours Stove Syndicate, Silver-gilt Medal; Mrs. M. Watts, Silver-gilt Medal.

THE "GARDENERS' MAGAZINE" KIOSK IN THE LIME AVENUE.

## MEMBERS OF JURY.

COMPETITIVE CLASSES.

Concluded from last week's supplement, p. 28.

Smith, W. H., Mr., West Dean Park Gardens, Chichester.
Smith, W., Mr., Lambton Castle Gardens, Fence Houses, Durham.
Soupert, Monsieur, Rose Grower, Luxemburg.
Speed, W., Mr., Penrhyn Castle Gardens, Bangor.
Stanton, G., Mr., Park Place, Henley.
Summers, G., Mr., Sandbeck Park Gardens, Rotherham, Yorkshire.
Thatcher, Mr., Arnold Arboretum, Harvard University, Jamaica Plain (Mass), U.S.A.
Thomson, D., Mr., 113, George Street, Edinburgh.

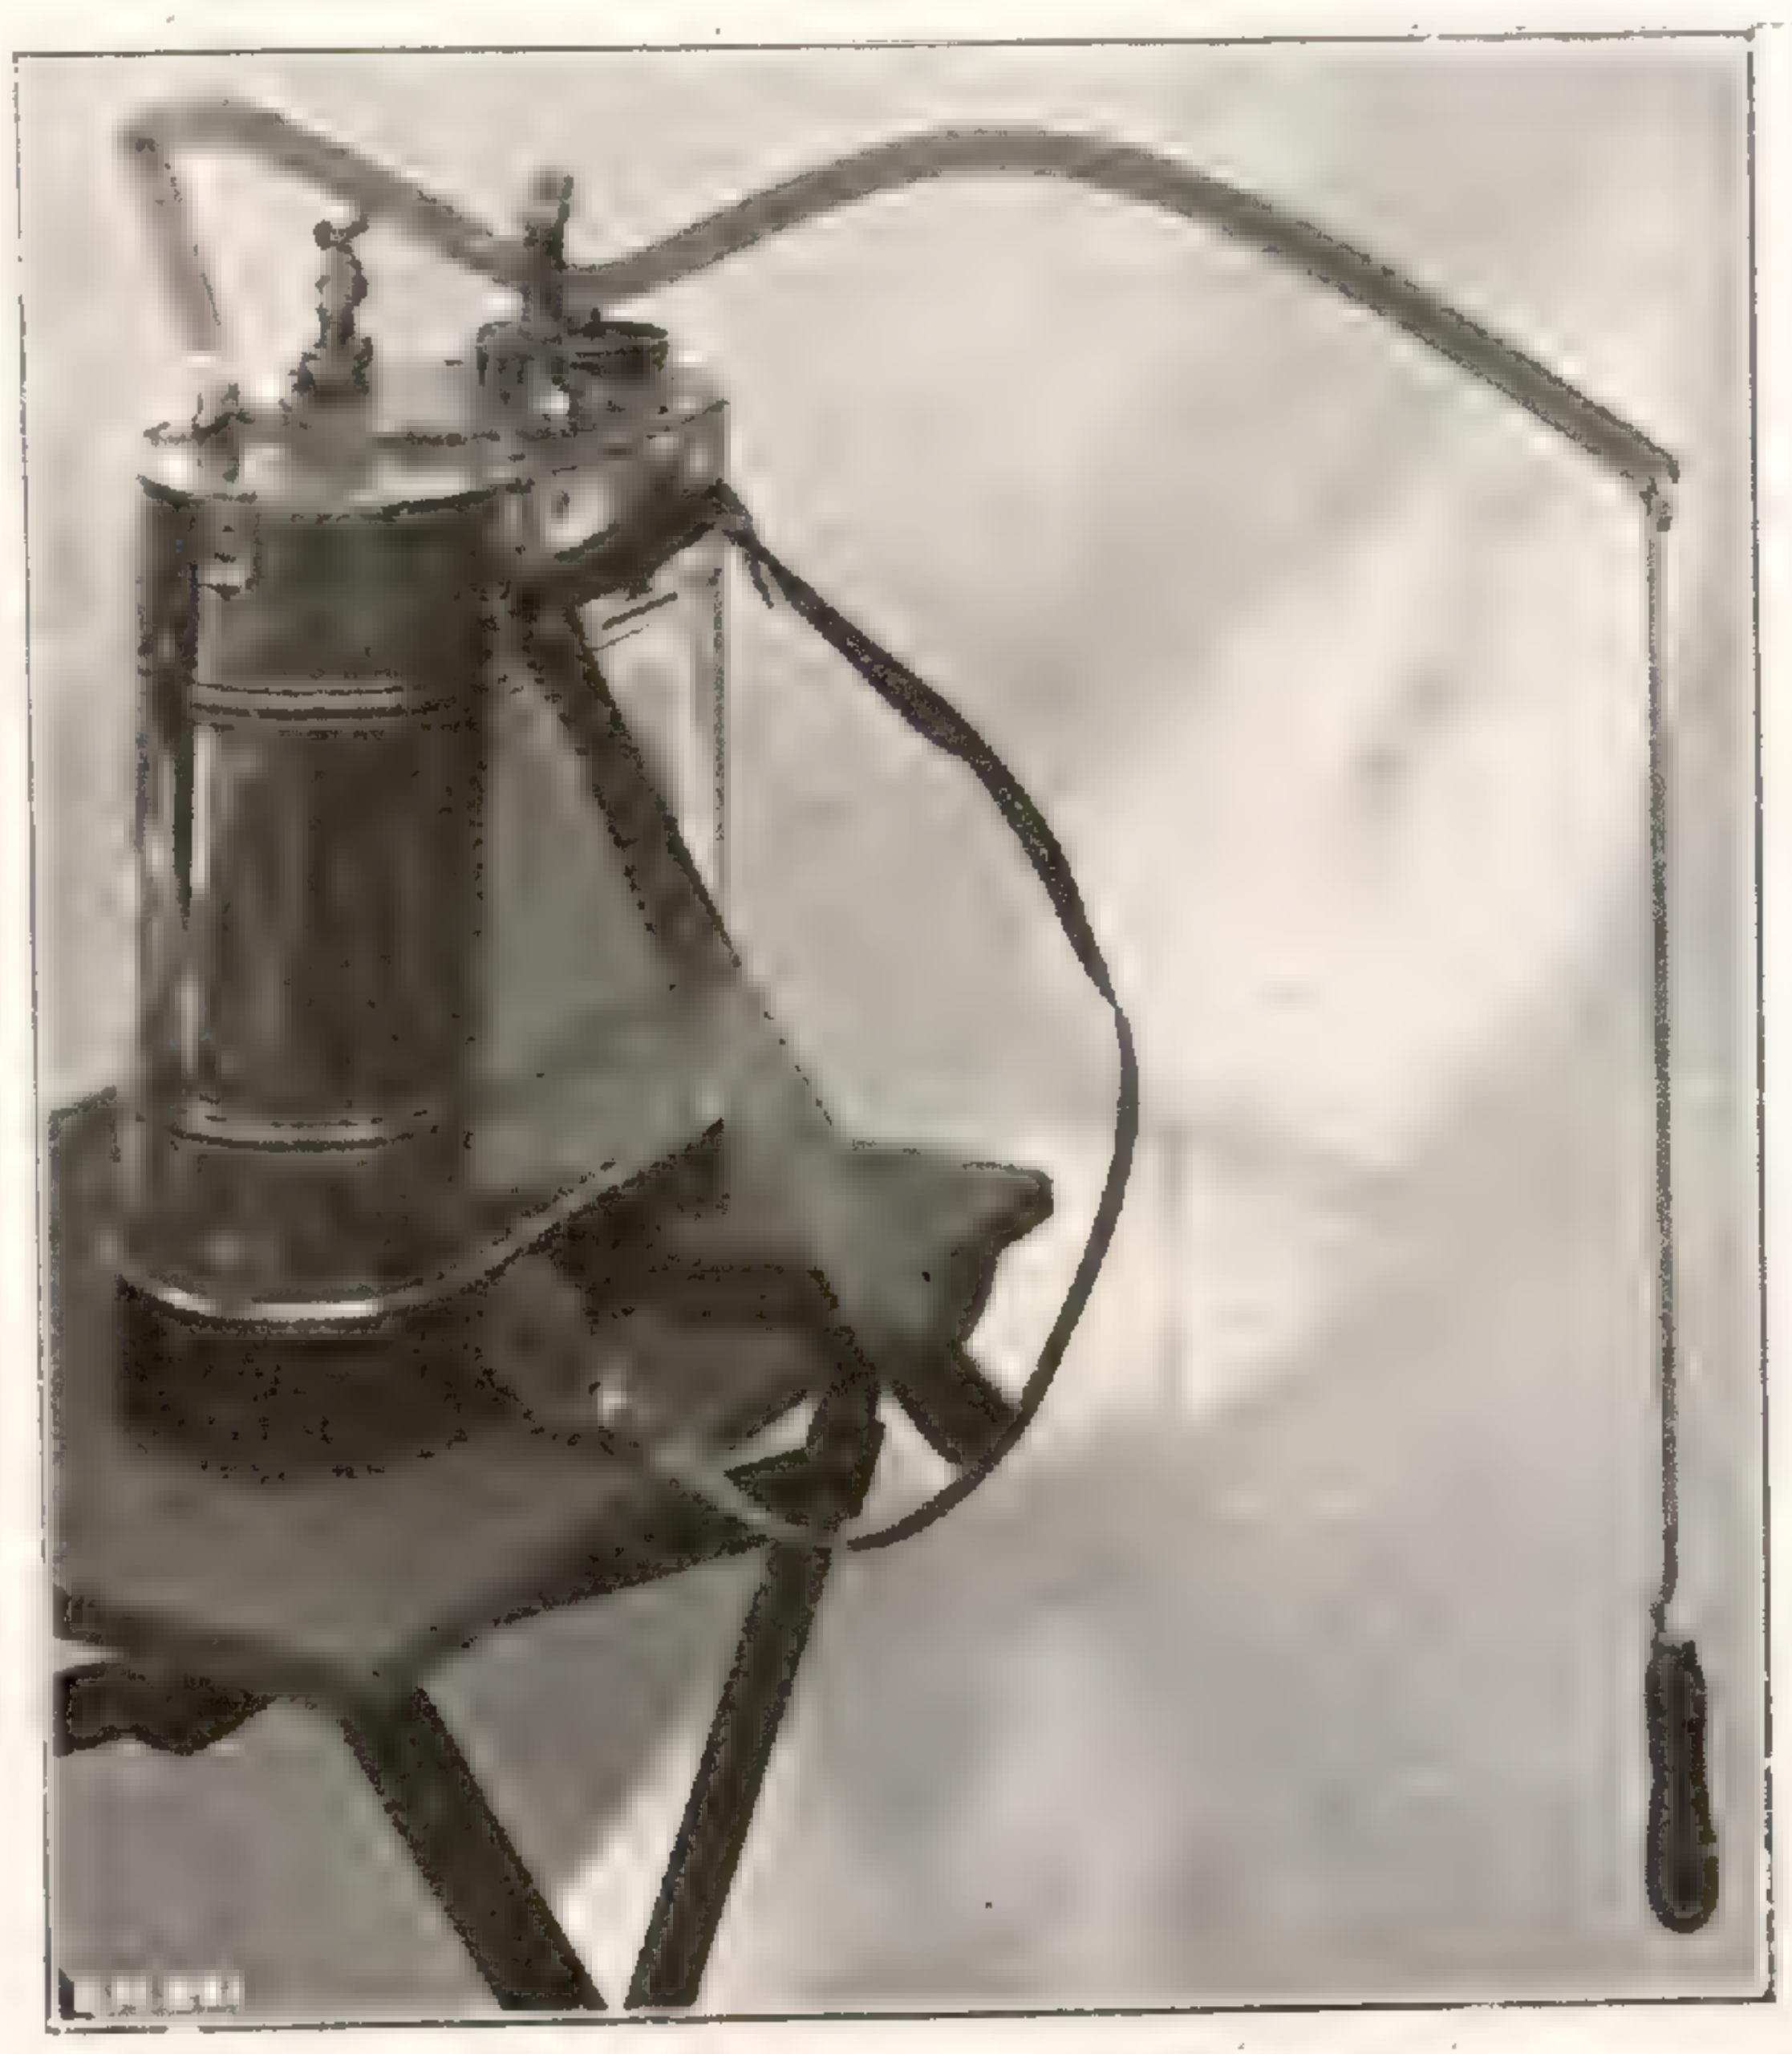
Thomson, J., Mr., Knighton Frith, Leicester.
Thomson, W., Mr., Walton Grange, Stone, Staffs.
Thwaites, R., Mr., 23, Christchurch Road, Streatham.
Troyanowsky, J., Dr., Maison Loukine, No. 11. Skatertny p. Powarskaia, Moscow, Russia.
Truffaut, A., Monsieur, 42, Rue des Chantiers, Versailles, France.
Turner, A., Mr., Royal Nurseries, Slough.
Upjohn, W., Mr., Worsley Gardens, Worsley.
Valvassori, Monsieur, Director, School of Horticulture, Florence, Italy.
Van Waveren, G. H., Herr, Leeuwenstein Nurseries, Hillegom, Holland.
Veitch, P. C. M., Mr., Royal Nurseries, Exeter.
Vilmorin, Philippe de, Monsieur, 66, Rue Boissiere, Paris, France.
Von Solemacher, Herr Baron, President, Pomological Society, Bohn, Germany.
Vuylsteke, C., Monsieur, Loochristi, Ghent, Belgium.
Wallace, R. W., Mr., Kilnfield Nurseries, Colchester.
Wallace, W. E., Mr., Eaton Bray, Dunstable.
Wartel, Monsieur, Société Anonyme Horticole Gantoise, Ghent, Belgium.
Waterman, R. G., Mr., Woolton, Liverpool.
Webster, A. D., Mr., Park Superintendent, Regent's Park, N.W.
Webster, C., Mr., Gordon Castle Gardens, Fochabers, N.B.
Wellesley, F. A., Mr., Westfield, Woking.
Weston, J. G., Mr., Eastwell Park Gardens, Ashford.
White, W. H., Mr., Burford Lodge Gardens, Dorking.
Whitton, J., Mr., Parks Department, Glasgow.
Whytock, J., Mr., The Palace Gardens, Dalkeith, N.B.
Wilke, J. T., Herr, Curator of Botanic Gardens, Rotterdam, Holland.
Williams, J. C., Mr., Caerhays Castle, St. Austell.
Wilson, Gurney, Mr., Glenthorne, Haywards Heath.
Woodward, G., Mr., Barham Court Gardens, Maidstone.
Worsley, A., Mr., Mandeville House, Isleworth.
Wright, H. J., Mr., 32, Dault Road, Wandsworth.
Wythes, George, Mr., Maryville, Chart Road, Folkestone.

### NON-COMPETITIVE SECTION.

(Under canvas.)

Ames, Oakes, Mr., 96, Ames Buildings, Boston, U.S.A.
Bartholomew, A. C., Mr., Parkhouse, Reading.
Beckett, E., Mr., Aldenham House Gardens, Elstree.
Bennett, W., Mr., Rangemore Gardens, Burton-on-Trent.
Beranek, C., Monsieur, Horticulteur, 8, Rue de l'Hermitage, Versailles, France.
Black, A., Mr., Carton Park Gardens, Maynooth, Ireland.
Blair, P., Mr., Trentham Gardens, Staffs.
Brown, J., Mr., Knockbrex, Kirkcudbright, N.B.
Candler, T. H., Mr., Wittington Hall Gardens, Marlow.
Challis, T., Mr., Wilton House Gardens, Salisbury.
Chapman, A., Mr., Westonbirt Gardens, Tetbury, Glos.
Clutton-Brock, A., Mr., Farncombe, Godalming.
Cooke, W. H., Mr., Kingston Hall Gardens, Derby.
Cox, J., Mr., Havering Park Gardens, Romford.
Cranfield, W. B., Mr., East Lodge, Enfield Chase, Enfield.
Cutbush, H. J., Mr., Highgate Nurseries, London, N.
Cuthbert, G. H., Mr., Southgate.
Cypher, J. J., Mr., Queen's Road Nursery, Cheltenham.
Davidson, G. D., Mr., Westwich Gardens, Norwich.
Debrie, Monsieur, Fleuriste, 10, Rue Royale, Paris.
Detriche, C., Monsieur, Route des Ponts de Cé, Angers, France.
Farrer, R., Mr., Ingleborough, Lancaster.
Gentil, Louis, Monsieur, Secretaire, Société Royal de Flore, Botanic Gardens, Brussels.
Gilson, M., Monsieur, 8, Parvis Notre Dame, Laeken, Belgium.
Graaf, Jan De, Herr, Nurseryman, Leiden, Holland.
Gravereau, A., Monsieur, Neauphle-le-Chateau (Seine et Oise), France.
Hales, W., Mr., Curator, Chelsea Botanic Gardens.
Hoog, J. M. C., Herr, care of C. G. van Tubergen, jun., Haarlem, Holland.
Howe, W., Mr., Park Hill Gardens, Streatham.
Jackman, A. G., Mr., The Nurseries, Woking.
Kempshall, H., Mr., Abbotsbury Castle Gardens, Dorchester.
Kuniz, Karl, Herr, Garteninspector, de Baron a Von Rothschildien, Hohe Warte, Vienna XXX, Austria.
Lee, W. R., Mr., Plumpton Hall, Heywood, Lancashire
MacLaren, H. D., The Hon., Bodnant, Talycafn, R.S.O.
Malcolm, A., Mr., South View, Duns, N.B.
Marlow, W. J., Mr., Garden Superintendent, Hampton Court Palace Middlesex.
Mattock, J. R., Mr., The Nursery, New Headington, Oxford.
Moorman, J. W., Mr., 33, Wetherell Road, South Hackney, N.E.
Mottet, S., Monsieur, 7, Rue de Paris, Verrières le Buisson (Seine et Oise), France.
Neubert, W., Herr, Wandsbek, Hamburg, Germany.
Nix, C. G. A., Mr, Tilgate, Crawley.
Nomblot-Bruneau, Monsier, Bour la Reine (Seine), France.
O'Brien, J., Mr., Marian, Harrow-on-the-Hill.
Odell, J. W., Mr., Grove Farm, Stanmore, Middlesex.
Opoix, Pierre, O., Monsieur, Chef des Jardins du Luxembourg, 64, Boulevard St. Michel, Paris.
Pearson, C. E., Mr., Hillcrest, Lowdham, Notts.
Peters, Major, Westwick, Norwich.
Pinguet-Guindon, Monsieur, 21, Avenue du Mans, La Tranchée, Tours, France.
Prior, W. D., Mr., The Nurseries, Colchester.
Reuthe, G., Mr., Sunnycroft, Crown Lane, Bromley, Kent.
Rivers, H. Somers, Mr., Sawbridgeworth.
Smet, Arthur de, Monsieur, Horticulteur a Ledeberg, Ghent.
Stevenson, T., Mr., Woburn Place Gardens, Addlestone.
Turton, T., Mr., The Castle Gardens, Sherborne, Dorset.

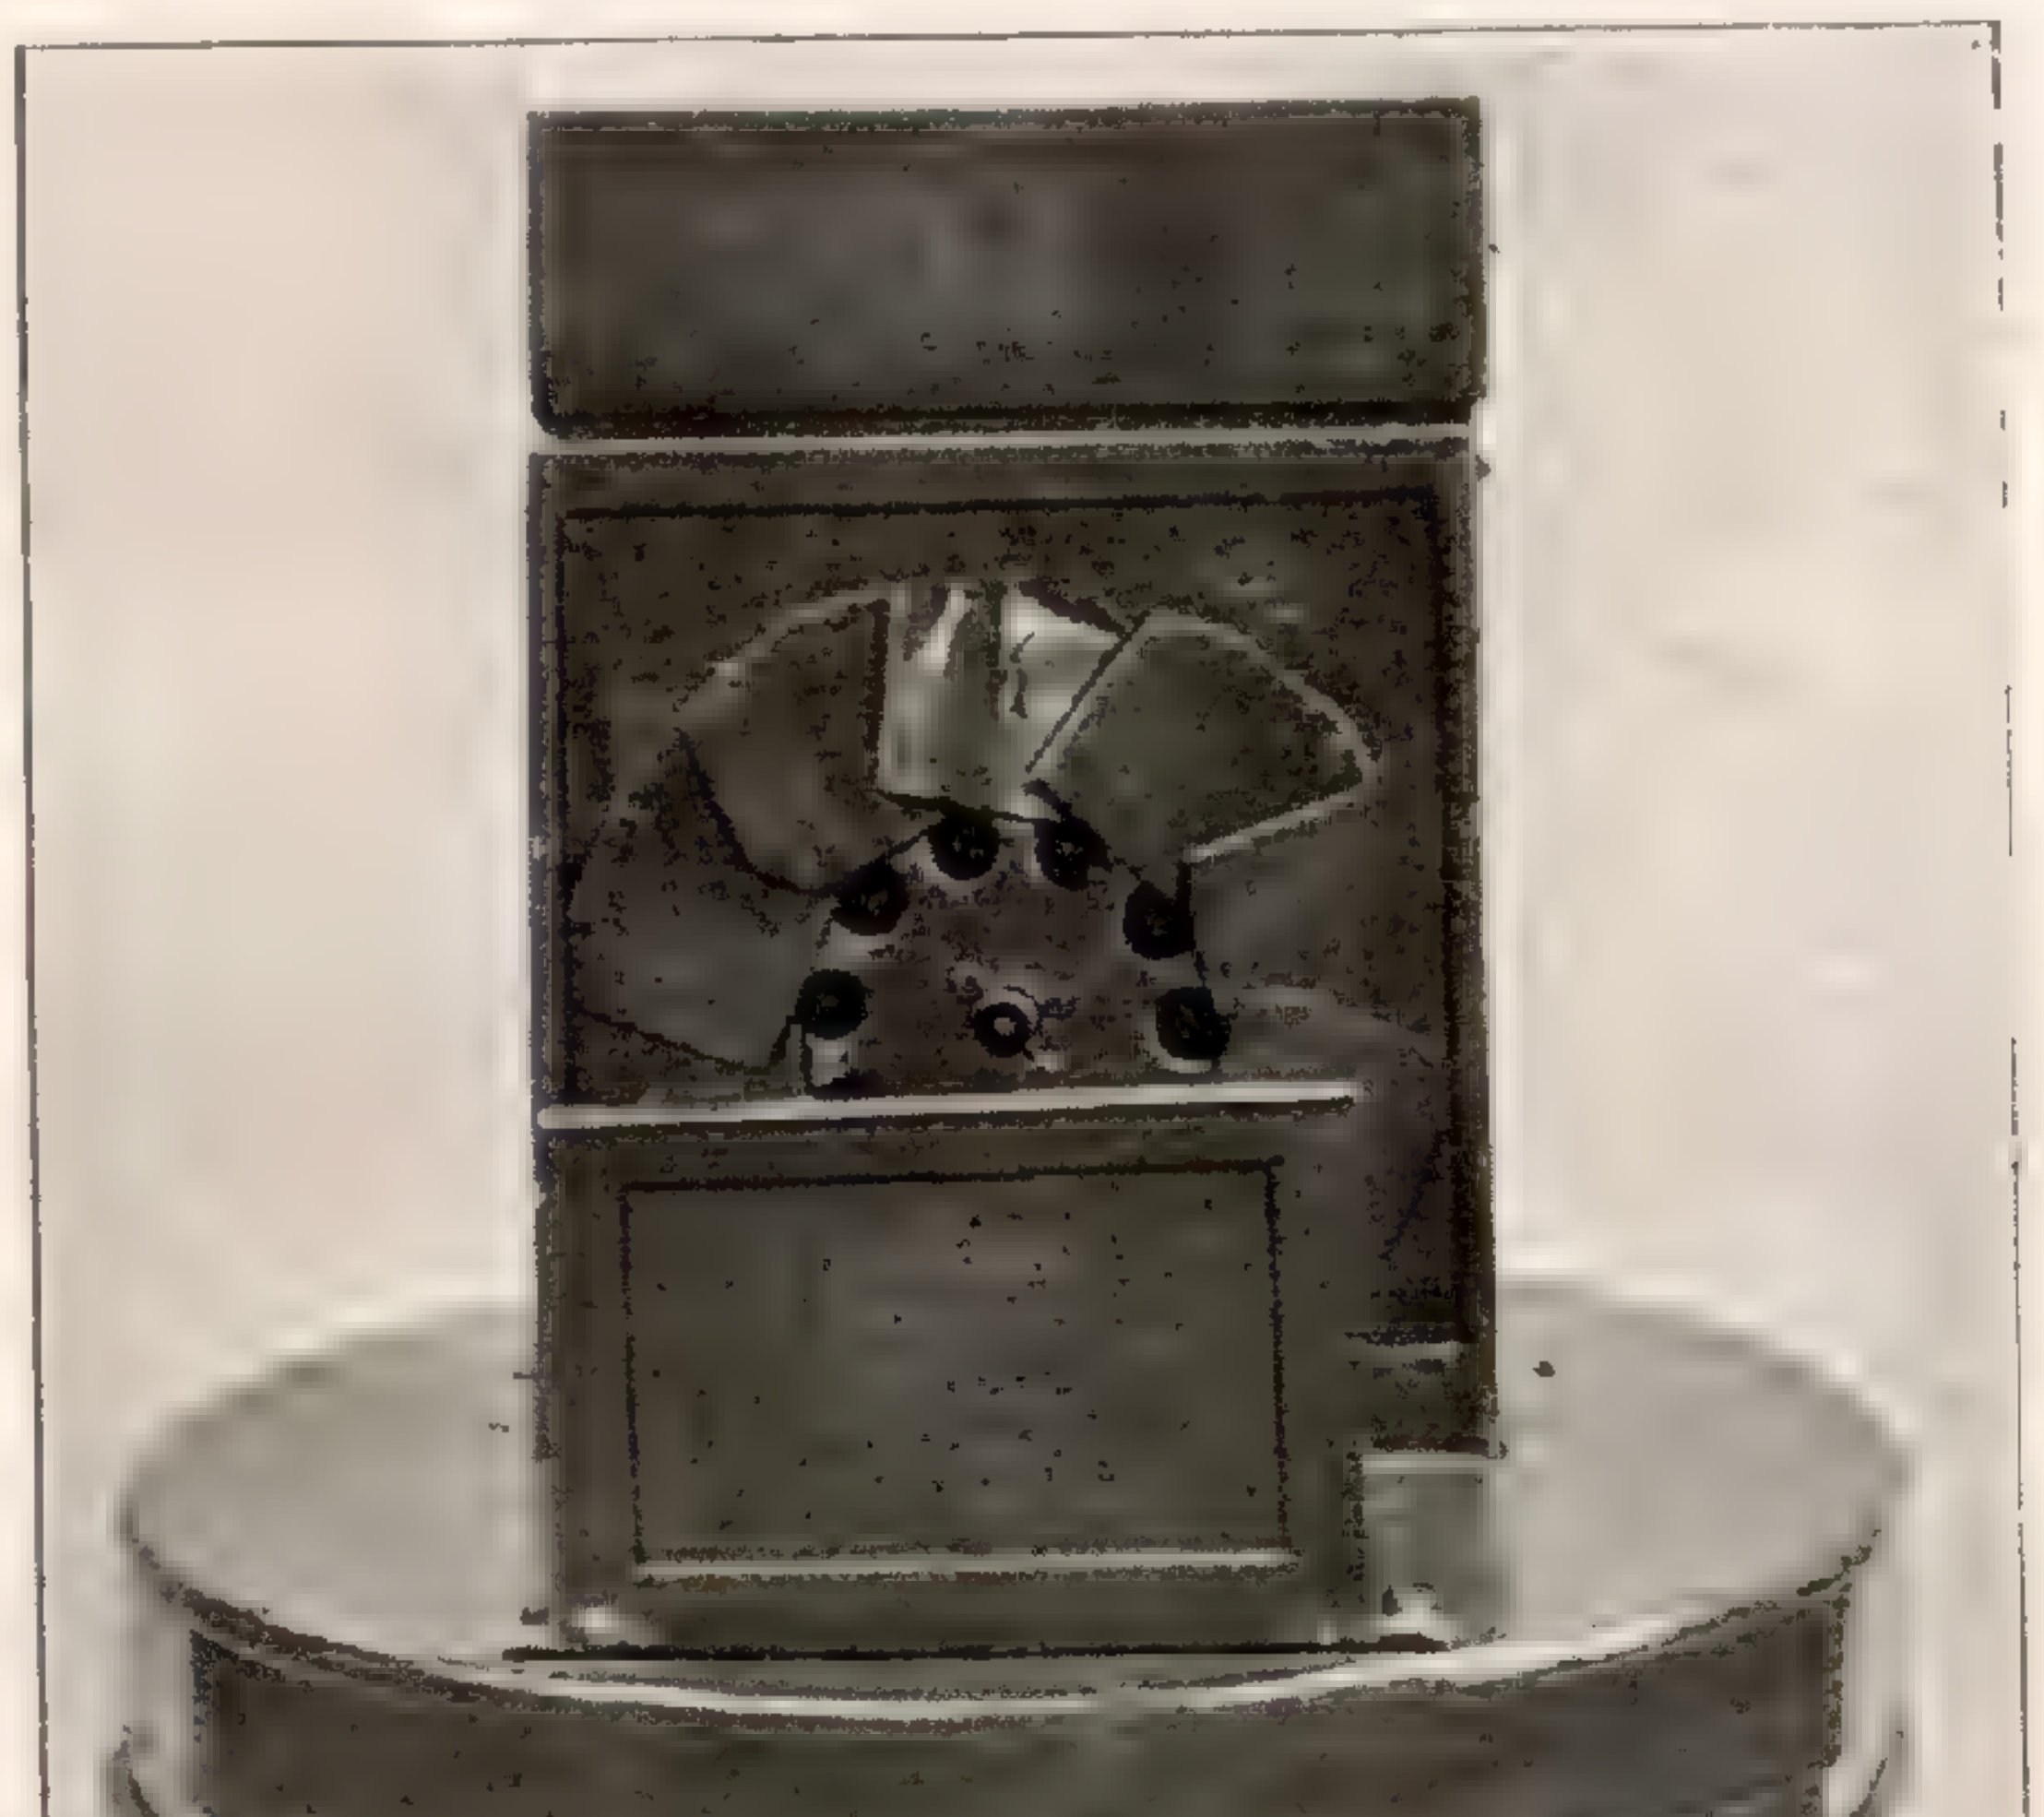
Vert, James, Mr., Audley End Gardens, Saffron Walden.
Ward, H. W., Mr., Nurseries, Rayleigh, Essex.
Ware, W. T., Mr., Inglescombe Nurseries, Bath.
Watkins A., Mr., 12, Tavistock Street, Covent Garden.
Watson, W., Mr., Royal Gardens, Kew.
Witte, E. T., Herr, Curator, Botanic Garden, Leiden, Holland.
Wright, W. P., Mr., The Grey House, Lyminge, Kent.
Young, A., Mr., Witley Court Gardens, Worcester.



NEW DOUBLE-CYLINDER KNAPSACK SPRAYING PUMP.
Exhibited by the Four Oaks Spraying Machine Company, Sutton Coldfield.

### OUTDOOR GROUPS AND SUNDRIES.

Allsop, A. J., Mr., Superintendent of Parks, Leeds.
Backhouse, J., Mr., Holgate, York.
Basham, J., Mr., Fairoak, Bassaleg, Newport, Mon.
Blake, H. W., Mr., Clandon Park Gardens, Guildford.
Clayton, H. J., Mr., Wharfe Bank, Ulleskelf, York.
Cook, W. A., Mr., Leonardslee Gardens, Horsham.
Cornford, J., Mr., Quex Park Gardens, Birchington, Kent.
Elwes, H. J., Mr., Colesborne, Cheltenham.
Goaring, W., Mr., Elmdene Gardens, Lewes.



NEW CYANIDING MACHINE.
Exhibited by Mr. C. F. Edwards, Leeds.

Humphreys, T., Mr., Botanic Gardens, Birmingham.
Iceton, W., Mr., Granard Gardens, Putney Park Lane.
Keeble, F., Professor, University College, Reading.
Llewelyn, J. T. D., Sir, Bart., Penllergaer, Swansea.
Lucas, C. J., Mr., Warnham Court, Horsham.
Naylor Mr. H., The Gardens, The Pleasaunce, Cromer.
Negus, R., Mr., The Lawn, Rydens Avenue, Walton-on-Thames.

Notcutt, R. C., Mr., The Nursery, Woodbridge, Suff
Perkins, F., Mr., Handsworth, Queen's Park Para Northampton.
Pettigrew, H. A., Mr., St. Fagan's Castle Gar Cardiff.
Rochford, Joseph, Mr., The Nursery, Turnford, Broxbourne.
Rogers, J., Mr., The Lodge, Battersea Park, S.W.
Ruys, B., Herr, Moerheim Nurseries, Dedemsvaar Holland.
Sanders, R. C., Mr., Halton Gardens, Tring.
Smith, T., Mr., Dicksons, Lim., Chester.
Spath, Helmut L., Herr Dr., Baumschulenweg, Berl
Stevenson, J. B., Mr., The Parks and Gardens superintendent, Bournemouth.
Tissot, J. C., Monsieur, 7, Rue de Louvre, Paris.
Truffaut, G., Monsieur, 90 bis, Avenue de Paris, Versailles, France.
Turner, T. W., Mr., Royal Hospital Gardens, Chelsea.
Vacherot, J., Monsieur, 12, Rue Carnot, Billancourt (Seine), France.
Warren, W. H., Mr., Aston Clinton Gardens, Tring, Herts.
Waterer, F. G., Mr., American Nursery, Bagshot.
Wheeler, A., Mr., Apley Park Gardens, Bridgenorth.
Williams, P. D., Mr., Lanarth House, St. Keverne R.S.O., Cornwall.

### SCIENTIFIC AND EDUCATIONAL SECTION.

Buyssens, A., Monsieur, 20, Rue des Theresienne, Vilvorde, Belgium.
Cogniaux, Monsieur, Genappe, Brabant, Belgium.
Henry, L., Monsieur, 57, Rue Cuvier, Paris, France.
Lauche, W., Herr Dr. Mahrisch, Eisgrub, Mahren, Germany.
Ritzema Bos, Professor, Wageningen, Holland.
Wittmack, Professor, 42, Invalidenstrasse, Berlin.
And other English jurors.
Du Pré, Mons., Brussels.
Duquesnoy, Mons., Ghent.
Gutteridge, Jas., Mr., Parks, Liverpool.
Hudson, J. F., Mr., Huddersfield.
Iggulden, W., Mr., Frome.
Stansfield, Dr., Reading.
And other English jurors.

---

## HORTICULTURAL SUNDRIES.

The section of the exhibition designated by the above somewhat vague term, was indeed an exhibition in itself of no mean order. A tent of large dimensions housed the smaller and more or less perishable articles, but in the open there were a vast array of all kinds of implements, machines, ornaments, and furniture necessary or attractive in gardens.

### IN THE TENT.

Messrs. Robinson Bros., Lim., West Bromwich, who occupied the elaborate stand on the right of the entrance to the tent, had a very attractive array of their many useful "Gardenalities." Carmona fertilizers, specially compounded for various classes of plants, pine spray fluid, and the adjustable syringe for applying the same, and Clift's manurial and liquid soil germicides, were prominent; and the now well-known Alpha spraying machines were shown in various patterns and sizes.

Messrs. Corry and Co., Lim., Finsbury Street, London, were other exhibitors of the very necessary preparations to aid the gardener in fighting the enemies of plant life, and in enriching the soil or counteracting its defects. The Abol specialities from Messrs. A. E. White, Lim., Paddock Wood, including their well-made and popular syringes, were admirably staged, and continuously demonstrated by the firm's able representatives. The Abol superior insecticid was shown in canisters of various sizes.

Mr. G. H. Richards, the well-known sundriesman, of Borough High Street, brought a large glazed cabinet, in which samples of chemicals were displayed. The XL. All fumigants, in liquid and tabloid form, also came in for attention, as well as compound fertilizers and patent washes. Mushroom spawn and growing mushrooms were shown by Messrs. J. Pithey, Lim., Uxbridge. Danysz Virus was smartly advertised by means of clockwork models of cats feeding the last rat left as a result of a "Virus" campaign upon the rodents. The Selborne nesting boxes for birds, shown by the Brent Valley Bird Sanctuary Committee, were cleverly made, and of quite natural appearance.

A collection of antique well heads of real artistic merit was grouped in a recess among the trees in a manner that made their worth apparent to all. It was an exhibit of beautiful objects, set out in an ideal spot. The exhibitors were Messrs. G. Trollope and Sons, West Halkin Street, Belgrave Square, S.W.

## Horticultural Sundries.

(Continued from Supplement, page 20.)

The Climax specialities of the Boundary Chemical Company, Liverpool, were supplemented by the newly-introduced Simplicitas netting and pea supports. This netting, fixed upon suitable framework, has already proved to be an excellent substitute for pea sticks. Messrs. Bentley's insecticides and manures were brought in sample tins, and, of course, their weed killers were given a prominent position on the stand. Messrs. Walter Voss and Co., Lim., Millwall, London, East, had the largest stand in the tent, which was of excellent design, and was replete with chemicals of many uses. The Woburn Bordeaux paste, Voss's winter wash, and banding grease, and the Carlton fertilisers made quite an imposing show.

Lawn boots were, of course, the principal feature of Messrs. H. Pattison and Co.'s stand, who, however, also showed the well-designed and constructed "Max" lawn sprinkler, and a number of other useful implements. Messrs. Robert Sydenham, Lim., Tenby Street, Birmingham, made their stand of rustic floral decorations very attractive by the use of sweet peas, carnations, and other light and elegant flowers.

Messrs. James Carter and Co.'s exhibit took the form of a cleverly constructed model of their Raynes' Park premises, and also of their modern seed-testing apparatus, which were recently described in the GARDENERS' MAGAZINE. An ingenious one-man spray pump on wheels came from Berger's, Homerton, N.E., who also showed their various fluids and preparations for wood preserving. Evans' Challenge ventilating apparatus, from the Quaker City Machine Company, Richmond, U.S.A., is a clevely-designed arrangement for the adjustment of ventilators in glasshouses by simply turning a wheel.

Wakeley's Hop Manure was shown in loose samples, and in bags by Messrs. Wakeley Bros., Lim., Bankside, London. This hop manure, which undergoes special treatment by which it is impregnated with essential plant foods is especially valuable where soils are deficient in humus. Another good fertiliser on view was Barr's Phytobroma in two distinct forms, the one for general use and the other specially adapted as a lawn-grass manure. Messrs. Barr and Sons also brought from their Covent Garden warehouse a comprehensive display of tools and appliances. Plants Plantoids, the new tabloid fertiliser put up in tins like biscuits or tea, brought forth a good many amusing remarks, some critics considering the idea simply fanciful, while other apparently considered that for plants in rooms and conservatories the tabloid food would be useful and convenient.

Messrs. Alex. Cross and Sons, Lim., Glasgow, had sundries of all descriptions. Whether one required fertilizers, insecticides, shears, knives, labels, and plant supports, or baskets, boxes, and packing material, this firm can evidently supply the need. Mr. J. Haws, Clapton, N.E., showed the water-cans that have been for many years associated with his name. They are now made in a more extensive range of sizes and patterns than ever. The "Little Gripper" fruit gatherer, was shown by Mr. A. C. Harris, Howard Road, Leicester. By the aid of this handy little device, an apple, pear, or other fruit can be detached from a tree, and brought to hand with ease and without fear of damaging the fruit.

Mr. C. F. Edwards, Leeds, has for several years made and vended a very good cyaniding machine, but he had on view for the first time a greatly improved machine fitted with a clock-work fan, by which the gas is both cooled and evenly distributed. This machine is an important development in the direction of safety and efficiency in the hitherto somewhat risky operation of cyaniding plant houses, and was, in our opinion, one of the most serviceable novelties in the show.

Disinfectants, germicides, and up-to-date insecticides were exhibited by the Sanitas Company, Lim., Bactox liquid soap, Okol germicide, and Sanitas powder for slugs being worth notice. Jeyes' horticultural washes were also well shown, both winter and summer washes prepared by this well-known firm being well to the fore. Messrs. W. Bull and Sons, the Chelsea nurserymen, had a stand to show their tobacco extract for fumigating. This is put up in bottles and canisters of various sizes.

Other exhibits in the tent were folding garden tables from Messrs. Abbott Bros., Southall, French gardening requisites from the Halliford French Garden, Shepperton, and the French Cloche Company, Caxton House, Westminster. Horticol, the preparation for preserving seeds from the depredations of birds, and the various preparations for horticultural use made by Messrs. W. Cooper and Nephews, Berkhampstead.

Mr. Leslie T. Greening, 6, Park Hill, Richmond, exhibited plans for the modelling of gardens and laying-out of estates, most of them being actual plans of work carried out by the exhibitor.

Other plans of an elaborate character were shown by Messrs. G. Jackman and Sons, Woking, and Mr. C. Engelmann, Saffron Walden, who has added a landscape department to his already large business in carnations. Excellent little glass plant protectors and hand-lights were shown by Mr. A. Overend, High Road, Streatham, S.W. The movable panes of glass were simply held in position by grooved triangles of wood at the corners.

The Potash Syndicate, 117, Victoria Street, Westminster, had in the tent a most interesting stand upon which examples of fruits, flowering, and foliage plants were shown, which had been fed scientifically with potash. Useful pamphlets dealing with scientific feeding were available on the stand.

In the open the Syndicate had another highly instructive exhibit, which practically demonstrated the importance of potash as a manurial agent. Forest as well as fruit trees showed in no uncertain manner that their progress is far away more satisfactory when scientifically fed on manures containing a proper proportion of potash.

Messrs. W. Duncan Tucker and Sons, Lim., 27, Cannon Street, London, E.C., brought a large show of horticultural buildings, comprising an ornamental conservatory, well-built orchid houses, a good plant house, a small suburban house of good construction, and some capital span-roof pits and frames. The Tottenham sectional boiler was exhibited, and such things as tree tubs, dovecotes, and summer houses made up a praiseworthy exhibit. Glasshouses of roomy design and substantial build came from Messrs. J. Crispin and Sons, Nelson Street, Bristol, and also from Messrs. Skinner, Board, and Co., of the same city. Messrs. J. Weeks and Co., Chelsea, showed small models, as well as actual houses and boilers, their designs being excellent, both from an artistic and practical point of view.

The well-known firm of C. P. Kinnell and Co., Southwark Street, London, had their Anglian and Horse Shoe boilers on view, which appeared to attract a good deal of attention from the nurserymen present. A big exhibit of boilers and heating apparatus came from the Thames Bank Iron Company, Lim., Upper Ground Street, S.E., the Crown sectional boiler being a powerful-looking apparatus, capable of doing good work. The Economic and the Waltham are other boilers for large houses.

The Chase Continuous Cloche, exhibited by the Three C's Company, Dale Street, Liverpool, is an ingenious device. As herewith illustrated, it is the simplest and best we have seen for the protection of tender seedlings or the cultivation of small crops on French gardening lines. The panes of glass are held in position by wires twisted and interlaced in a manner that makes a rigid framework without obstruction of light.

George Blay, fencing contractor, New Malden, had gates of both substantial and ornamental character. Extremely beautiful were some of the stone ornaments, well heads, and vases put up by the firm of T. Crowther and Sons, North End Road, Fulham. Every piece was a work of art, fit for the grounds of any mansion. Messrs. Drew, Clark, and Co., Leyton, had their Diamond step ladders and extension ladders on view. The Folding Spanlight Company, Slough, brought their convenient little lights and frames, which are very suitable for French gardening and the protection of small plants. Another exhibit of ladders and steps came from the Acme Patent Ladder Company, Earlsfield, S.W., and still another from Mr. H. C. Slingsby, of Manchester and Liverpool.

The Four Oaks Spraying Machine Company, Sutton Coldfield, had sprayers of many sizes and styles also the undentable syringes and the Dreadnought digging tools, which are useful for hard or harsh soils. A good knapsack sprayer had a pump fixed that could be worked over the shoulder, making the task much easier than with the former side pump. Messrs. Drake and Fletcher, Maidstone, had a large space on either side the approach to the Japanese section, in which they showed various styles of pumps and sprayers, and a very smartly constructed fruit cleaning and grading machine that should appeal strongly to all commercial fruit growers.

Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, had Acme labels in great variety, and also rose shades, flower supports, etc., but a new machine for packing roses, trees, and shrubs was the novelty of the exhibit, and greatly interested the nurserymen. Messrs. S. and E. Collier, Lim., Reading, were exhibitors of garden pottery, and Messrs. Walters and Co., Croydon, brought artistic trellis work and garden furniture. The Hardy Patent Pick Company, of Sheffield, had their excellent spades, forks, and other garden tools on view.

One of the largest exhibits in the open was that of Messrs. Watkins and Simpson, the wholesale seed merchants. Architecturally, their pavilion, which was erected by Messrs. Duncan Tucker, was of imposing aspect, but from a purely horticultural point of view the great interest centred in the wonderful display of annuals, which we might almost describe as the richest in variety of form and colour we have ever seen. Almost every species of annuals worth growing were represented by the grand varieties which this well-known firm supply to the trade throughout the kingdom.

## In the Lime Avenue.

The spaces on either side of the historic avenue were filled with miscellaneous groups, mostly conifers. Near to the upper end of the avenue, Messrs. John Waterer and Sons, Lim., Bagshot, exhibited a group of ornamental hollies, in which numerous fine forms were represented. Near at hand, the same firm had a collection of conifers, amongst which Abies Nordmanniana, Abies concolor, and Sciadopitys verticillata were conspicuous. On the opposite side, this firm had a group of ornamental evergreens, and in this Cupressus obtusa Crippsi was very fine. An interesting little collection of conifers in pots was shown by H. S. Elwes, Esq., of Colesborne. The tall pyramid and mop-headed bay trees exhibited in the avenue attracted much attention, and here were some splendid specimens exhibited by Messrs. F. Sander and Co., St. Albans. A big display of Japanese garden furniture and the inevitable pigmy trees was made by Messrs. Liberty and Co., London. Conspicuous amongst the most effective of the groups of conifers was the one exhibited by Messrs. J. Jefferies and Son, Cirencester. It was evident from the healthy look of the plants that they had flourished well in the elevated nursery on the Cotswold Hills, where they were grown, and amongst the choicest of those shown were Abies Kosteriana pendula, Cedrus atlantica glauca, Cupressus Lawsoniana Stuarti, Cedrus deodora aurea, but underneath the trees the light was not as good as it might have been for showing off the colour. Very large mop-headed bay trees were exhibited in quantity by Messrs. Jas. Veitch and Son.

Messrs. Fromow and Sons, Chiswick, adorned the way into the tents with a large collection of their well-known hardy plants, in which acers figured quite conspicuously.

Messrs. Dicksons, Chester, set up a fine group of hardy shrubs, in which rhododendrons and azaleas were pleasingly interspersed with acers and other variegated foliage plants.

Messrs. Ladhams, Lim., Southampton, showed a group of hardy flowers, in which Muscaria plumosa major was conspicuous. Messrs. Cutbush and Son, Highgate, showed a fine lot of pyramid ivies and varied forms of vitis.

Under a very elegant structure outside the tents, Messrs. Watkins and Simpson, Covent Garden, set up a delightful exhibit of flowers. These were arranged in a bank-like form, but with no solidity of outline, and we noticed, amongst other things, some very fine linarias, Nemesia compacta Blue Gem, Clarkia elegans Vesuvius, hybrid schizanthuses, Lobelia tenuior, and Yellow Prince mignonette.

It is not usual for horticultural journals to have stands at flower shows, but this, of course, was a special occasion, and most of the leading papers having to do with horticulture and rural life were represented. The GARDENERS' MAGAZINE was at home in a rustic summer-house under the lime trees, and it can be congratulated on having quite a garden appearance, as the pillars of our little arbour were covered with Dorothy Perkins rose, the railings in front were entwined with ivy, the miniature garden was embellished with salmon zonal pelargoniums and white marguerites, and the grass verges and gravelled path gave our temporary home, from which literature was distributed, quite a finished appearance.

The Leyton Timber Company, Lim., New Cross, S.E., exhibited rustic summer-houses, both tiled and thatched, as well as arches and flower stands. A revolving tea house was another item of the exhibit. Stearn's lawn mowers, fitted with ball bearings were shown, the Leyton Timber Company being European agents for these machines. The exhibit of the Army and Navy Stores was elaborate and varied. All sorts of garden furniture, tools, and sundries were housed in a pavilion constructed of trellis-work. A big motor mower and horse rollers contrasted in bulk and size with many small but useful garden requisites.

Artistic seats and shelters in both teak and painted white wood were shown by Messrs. Vipan and Headly, Church Street, Leicester; another exhibit of furniture, but of totally different style being the Dryad cane furniture from Mr. Peach, Leicester. Small heating apparatus were shown by the Twelve-Hours Stove Syndicate, Lim., Vauxhall Bridge Road, Westminster, who also had on view an excellent large sectional boiler, suitable for large erections.

Gates, fencing, and hurdles were brought by the Fernden Fencing Company, Haslemere. The Patent Safety Ladder Company, Peterborough, had their excellent and very convenient adjustable ladders. The advantage of these over ordinary ladders is very great, especially for tree pruning, fruit gathering, etc. Messrs. G. F. Braggins and Co., Banbury, brought entrance gates in oak, and they also had a most ingenious little truck called the Scout's Kit Cart. Its detachable sides can be converted into a ladder, its body into a table, and its shafts into scout poles. Its uses would be many in a garden or on an estate.

**Streptosolen Jamesoni.**—It is somewhat strange that this beautiful flowering greenhouse plant should have been completely lost to cultivation for so many years. It was introduced in 1850, but would seem to have soon disappeared till re-introduced about 30 years ago. It is, however, not likely to again disappear, for it has now become a general favourite, not only for growing in bush form, but also for clothing the supporting pillars in the greenhouse or conservatory. Beside this it is often used as large specimens for summer bedding. In addition to the generic name of streptosolen it is also known by that of Browallia.—W. T.

## WORK FOR THE WEEK.

◆

### CONSERVATORY AND GREENHOUSE.

NERIUMS OR OLEANDERS. — These beautiful greenhouse shrubs are now fast developing their flowers, and where room can be given them to grow freely, they are desirable. They are easily cultivated, and can be grown in any greenhouse, but they are seen at their best when planted in the border in the conservatory and trained on the back walls. Nerines appreciate good culture, and a suitable compost is one consisting of fibrous loam two parts, peat or leaf-soil one part, with coarse sand, mortar rubble, and wood ashes added. During the winter the plants will stand a low temperature, and flower best after having had a good rest. They cannot be so easily propagated as some conservatory shrubs, but cuttings can be rooted quite easily if the following method of procedure is adopted. Select medium-sized shoots, and take them off with a heel, and an ordinary wide-mouthed bottle filled with soft water. Add some pieces of charcoal to keep the water sweet, place the shoots in the water, and stand the bottle on a shelf in a plant stove. The cuttings will soon emit roots, when they may be put into pots in the usual way. The best varieties are Nerium album plenum, N. Madonna grandiflora, and N. roseum plenum.

MARGUERITES. — These are old favourites, and are used extensively for bedding and window-boxes; they are also very useful for the greenhouse. The new variety, Mrs. F. Sander, has, however, eclipsed them all. Queen Alexandra was considered a great improvement on the double form, but, except on very few occasions, it showed a yellow hard centre, which disfigured it very much. When first I saw the first-named at the Temple Show it appealed to me as being a fine acquisition, and my opinion of it has since been fully justified. The blooms are pure white, the centre opening perfectly; it reminds one of a finely-formed pyrethrum. The constitution, however, is not all one could desire; the plants must be rooted from cuttings annually, and the soil should be rich but porous. This variety does not root so freely as some of the marguerites, and if the soil becomes sour the plants often die suddenly. If some plants are bedded out the cuttings from them will be much stronger when required in the autumn for stock.

KALOSANTHUS AND KALANCHOE FLAMMEA.—These may be grown together, the bright colours of their flower spikes making them most conspicuous when arranged in groups. Both are very easily grown to a high degree of perfection. The plants are best grown on a shelf near the glass, and watered only when dry. If the soil becomes in the least degree water-logged or sour, rust sets in on the leaves, and disfigures them very much. The present is the best time to root cuttings. The young growths that are not flowering make the best cuttings, and they will be found to root readily if inserted in 3in. pots, three in each, filled with sandy loam. The plants are best shifted on without being separated, as they then make fine plants.—LEWIS SMITH, Shotesham Park Gardens.

### THE ORCHID HOUSES.

CATTLEYA HOUSE.—Since my previous notes on these lovely plants great advances will have been made, both in the growth of the plants and in the flowers. Amongst those in flower at the present time are C. Mendelli, C. Mossiæ, and innumerable hybrids, which make an imposing display. C. Trianæ and C. Schroderæ, as they commence to make new roots, should have new rooting material afforded them, should the compost in which they are growing show signs of exhaustion. To my mind, these plants are as easily grown as any others, provided a few simple details are followed. The first is simply to keep them in a sweet and healthy rooting medium, and always to repot them when they will receive the least check, and whenever the compost show signs of exhaustion. The second is the application of water to the roots, and in the atmosphere. The compost in which the plant is growing must be taken into account when watering, and a compost which will retain water, much in the same way as a sponge will, must have a much less quantity applied to it, than one through which the water passes readily. During the growing season, providing the compost is in good condition, and the plant well rooted, not much harm will accrue from an over-abundant supply either at the roots or in the atmosphere if the proper temperatures of the house and water are maintained. I am firmly convinced that many growers give their cattleyas much too little water when in full growth, and a great deal too much when at rest.

PLANTS OF C. WARSCEWICZI (GIGAS), which are now making strong growths, and are about showing their flower sheaths, may be kept fairly moist at the roots to assist the plants in developing their flower spikes, and they should be placed well up to the roof glass, where they will receive an abundance of light, but must be shaded from the direct rays of the sun. The plants which fail to produce sheaths must also receive generous treatment, or they will not develop strong pseudo-bulbs. When the growths are fully completed, and the flower spikes removed, gradually expose the plants to more air and sunshine by removing them to another house, where a slightly lower temperature is maintained. The better the pseudo-bulbs are ripened, the better the plants will bloom next year. When the bulbs are completed, only sufficient water should be given to keep them plump and healthy, but on no account should they be put in an out-of-the-way place to take care of themselves.

C. DOWIANA and its variety aurea, having now started into growth, may be placed at the warmer end of the house, and should be carefully watered until the flowers open, and when these fade, the plants should be treated, as advised for C. Warscewiczi. C. Luedemanniana (speciosissima) another species which delights in the temperature of the warm cattleya house, may be repotted in the same way, within a few weeks after the plants have flowered, and then be kept in a cooler and drier atmosphere whilst at rest.

HYBRIDS. — At this season there are numerous hybrid cattleyas and lælio-cattleyas which have passed out of flower, and that need a short period of rest, therefore let them be treated in the same way by placing them in a cooler and more airy position, and no efforts should be made to induce them to start into growth. The same treatment is also applicable to Lælia purpurata and numerous other species and hybrids, which are apt to start into growth immediately after they have flowered.—J. T. BARKER, The West Hill Gardens.

### HARDY FRUITS.

MORELLO CHERRIES.—The training of the Morello cherry is usually followed out on similar lines as the peach and nectarine, and now the fruit is set and growth is making good progress, disbudding may have attention. Pinch back to two or three leaves all foreright shoots, if it be thought advisable to let spurs form, removing those at the back or badly placed. Lay in young extension shoots, and those intended to take the place of present bearing growths. Avoid overcrowding, as each shoot should be allowed sufficient space to properly mature. With us the crop is heavy and the fruits are swelling fast, and it will be necessary to lighten the crop on young trees, and also on some of the old and well-established ones, otherwise growth will be more or less checked and starved. Many young trees are absolutely ruined at the outset by allowing them to carry heavy crops the first year or two after planting. The borders should be mulched with good manure, and water freely applied. Aphis are a source of trouble, and should be kept under by spraying with quassia extract, or a similar preparation; an occasional good wash with the hose or garden engine will materially benefit the trees and ward off attacks of insect pests.

FIGS.—The hot, dry season of last year had a beneficial effect on fig trees, and the crop is most promising. In spite of cold winds the fruits are swelling satisfactorily. The young growths now growing freely should be thinned out, leaving no more than are required for filling blank spaces on the walls and to replace the bearing wood of the current season; strong and vigorous growths should be pinched at the seventh or eighth leaf. It is seldom necessary to apply water to a fig border, unless severe root-pruning has recently taken place, or the roots are strictly confined to a limited area. Where these conditions occur it may be necessary to afford a good soaking of water, and apply a mulch. Trees making a vigorous growth and failing to bear fruit, should be subjected to starving treatment; if this treatment fails to induce shorter and more fruitful growths, root-pruning must be carried out next autumn. The greatest enemy to outdoor figs on walls is red spider. This pest may be kept in check by forcibly syringing the foliage at frequent intervals; cold spring water is most distasteful to red spider, especially when forcibly applied. Young suckers springing up at the base of the tree should be removed unless required for filling up gaps or replacing worn-out growths.

CURRANTS.—The cold winds have caused a considerable amount of leaf-curl, and the aphis has made a home in the leaves. Pinching out the affected tips is practised, but I prefer to spray with quassia extract, and continue so doing until the bushes are quite free of the pest. If aphis are allowed to multiply unchecked the trees suffer, and the fruits are often unusable unless heavy rains wash them prior to the ripening period. Side growths should receive attention, thinning out where there is an excess, and pinching back to four or five leaves on the spur growths, leaving intact such growths as may be required to fill up blank spaces. Black currants require different treatment to the red and white varieties; growths arising from the base should be allowed to grow away, to eventually become bearing wood; old exhausted growths are cut out at pruning time, to make way for young and vigorous growths.

## THE KITCHEN GARDEN.

BEETROOT will require very careful thinning now; leave ample for a time, as birds are often troublesome, till the plants reach a good size, after this the final thinning should take place. Ply the hoe regularly, and give a scattering of soot around the plants previous to this procedure. The latter acts as a fertiliser, and a deterrent to the slugs, which have a strong liking for beetroot when quite small.

CUCUMBERS.—Ridge cucumbers can now be planted out in safety. Use a trench as for celery, filling in with old marrow bed soil, and a plentiful supply of pig dung. In the case of frame cucumbers, continue to plant and sow as may be necessary to meet the requirements of the establishment. Do not overcrop, and cut the fruits so soon as ready and stand in jars where a-half inch of water is kept. Placed in a cool place they will last many days.

PEAS.—Pay special attention to this crop from this date. Special trenches must be provided to maintain a full supply of nice young pods, water regularly, and munch; sow every ten days varieties that are best adapted to the locality.

CELERY for the main crop is now large enough for the final planting. A slight dressing of soot should have been occasionally strewn over the foliage, particularly when the celery fly is plentiful. If this is carried out on the young plants that are pricked off in skeleton frames earlier in the year, and followed up throughout the season, very little would be heard of the celery grub. If fungus is troublesome on the foliage at a later date, use equal parts lime and sulphur, dusting over the foliage similar to the soot. When planting, lift with good balls of soil, plant quickly after taking them up, and make them very firm, then well soak in with water. Perhaps the two best maincrop varieties are Lulham Prize and Standard Bearer, the latter being the best late variety grown in most districts. Its keeping qualities being without reproach.

ENDIVE.—Make a small sowing in drills one inch deep, thin out to nine inches apart, for an early supply.

LETTUCE.—Make frequent sowings up to the middle of July, after which fewer sowings will be sufficient, the later sowings not running to seed so quickly as the autumn advances.

GENERAL REMARKS.—Frequently hoe, water, and mulch all crops as required, and proceed with planting out such things as cauliflower, savoy, French beans, and turnips to maintain a constant supply of young succulent vegetables.—George Ellwood, Swanmore Park Gardens.

## METEOROLOGICAL OBSERVATIONS.

Bracken shoots blackened by frost on Saturday morning.

## FORTHCOMING ENGAGEMENTS.

SATURDAY, June 1.—French Horticultural Society of London.

TUESDAY, June 4.—Royal Horticultural Society; Committees meet at 12 o'clock; Masters' Lecture at 3 p.m. on "Problems of Propagation," by Professor I. Bayley Balfour; Scientific Committee at 4 o'clock.

Scottish Horticultural Association.

THURSDAY, June 6.—Linnean Society.

MONDAY, June 10.—United Horticultural Benefit and Provident Society.

TUESDAY, June 11.—Royal Counties' Agricultural Society: Flower Show; three days.

WEDNESDAY, June 12.—East Anglian Horticultural Club.

Royal Society of Arts.

Royal Cornwall Agricultural Society; two days.

TUESDAY, June 18.—Royal Horticultural Society: Committees meet at 12 o'clock; lecture at 3 p.m., by Prof. E. Henslow, on "Prof. J. S. Henslow as an Ecologist." Scientific Committee at 4 o'clock.

Gladiolus Show at Royal Horticultural Hall.

ROYAL BOTANICAL AND HORTICULTURAL SOCIETY OF MANCHESTER AND THE NORTHERN COUNTIES.

GRAND ROSE SHOW
and
SUMMER SHOW,
At the White City and Botanical Gardens,
Manchester,
On JULY 12th and 13th. 1912.
(Please note alteration of dates.)

PRIZES. £200 PRIZES.
FOR ROSES, GROUPS, SWEET PEAS, AND HERBACEOUS FLOWERS.

Schedules and all Particulars from P. Weathers, Secretary, Botanical Gardens, Manchester.

THE NATIONAL HARDY PLANT SOCIETY'S FIRST SHOW
will be held in the R.H.S. Hall, Vincent Square,
on WEDNESDAY, June 19th,
1 p.m. to 6 p.m.
Admission One Shilling.

Since publication of the Schedule two Classes have been added. One for Six Bunches Sutton's Pink Sweet William, and one for Six Bunches Scarlet ditto. Messrs. Sutton and Sons offer prizes, 21s., 10s., and 5s. in each class.

Entries close June 8th.

Schedules and particulars from A. J. MACSELF, 52, Beechfield Road, Finsbury Park, N.

GRAND YORKSHIRE FLOWER SHOW AND GALA.
June 19th, 20th, and 21st, 1912. £800 offered in prizes. £275 for Orchids, Stove and Greenhouse Plants. £175 for Pelargoniums, Carnations, Begonias, etc. £225 for Roses, Cut Flowers, etc. £125 for Fruit and Vegetables. Four Gold Medals and Premier Prize for Trade Exhibits. Entries close June 12th.
For Schedules apply to FRED AREY, Secretary, Davyhall Chambers, York.

NEXT TO THE INTERNATIONAL SHOW, THE SHOW OF THE YEAR WILL BE
THE FIRST GREAT BIRMINGHAM
FLORAL AND FRUIT EXHIBITION
(Formerly Handsworth Flower Show).
Space should be booked without delay at this great
SHOW OF THE MIDLANDS.
Schedules and all information from
WILLIAM G. CARRADINE,
Hamstead Road, Birmingham.

ROYAL SHOW, DONCASTER.
HORTICULTURAL EXHIBITION.
JULY 2nd to 6th.
Intending exhibitors are requested to send in their Entries at once to THOS. McROW, Royal Agricultural Society of England, 16, Bedford Square, London, W.C.

WOLVERHAMPTON.
GREAT FLORAL FETE.
JULY 9th, 10th, 11th, 1912.
£900 IN PRIZES.
Schedules on application to the Secretary (post free), R. F. Amphlett, 80, Darlington Street, Wolverhampton.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

## EXHIBITIONS AND MEETINGS.

◆

### National Gladiolus Society.

A very successful meeting of the National Gladiolus Society was held on the opening day of the International Horticultural Exhibition at the Royal Horticultural Hall at 5.30 p.m.

The proceedings lasted two hours, and the meeting was very well attended, many of the foreign growers being present. The hon. secretary presented the accounts for the past year, which were passed as being highly satisfactory, the society having money on deposit at its bank, and a balance in the current account.

Many new members have joined since 1911 and the numbers are steadily increasing.

The schedule for the autumn show, to be held on August 13 at the Royal Horticultural Hall, on the occasion of one of the fortnightly meetings, was then drawn up, and it is hoped that the classes will attract a number of exhibitors. A very fine collective exhibit from the growers in Holland will be a feature of this show, and the competitive classes offer scope for all.

Mr. Lionel Perkin kindly offered a silver medal for competition at this show, which was gratefully accepted, and Mr. Warnaar, of Warnaar and Co., Sassenheim, Holland, said he wished to offer a silver cup. Mr. Hopman also expressed his wish to offer a prize and as Messrs. Kelway and Son, and one or two other members have already recorded their wish to give prizes, the list will be attractive and interesting to competitors.

The schedule being completed, the question of awarding certificates to new varieties then came up for discussion, and it was finally decided that two forms of certificate should be in future awarded: 1, To good market varieties; 2, to good exhibition varieties. This received unanimous approval, as it is well known that many of the fine exhibition varieties are useless for market purposes.

The committee then awarded a certificate to Gladiolus Pink Beauty as a good market variety. This was raised, and on this occasion shown, by Firma P. Vos Mz. Sassenheim, Holland. This gladious is a most valuable variety, on account of its early flowering. It can be bloomed outside in June and early in July, when its deep pink colour and fine markings are a most attractive feature in the garden, and for cut flower trade it is supremely useful.

It was then decided that the Council should sit to consider new varieties for certificates on July 30, August 13, and August 27, all of which dates are occasions of the Royal Horticultural Society's meetings. The time and place of meeting will be announced later, and the Council will also sit on June 18 for the same purpose, and on this date the show for early-flowering varieties will be held in Vincent Square.

The annual general meeting of the society will be held on August 13 at the Royal Horticultural Hall.

It was resolved that, in submitting new varieties for certificates, trade growers are required to show six spikes, and must be prepared to put the variety on the market; it is felt that no good purpose is served by awarding certificates to new varieties of which there is no stock and cannot therefore be bought and sold. Amateurs submitting new varieties are required to show three spikes only, and will receive a different form of certificate. Mr. Lionel Perkin, of Berrylands Road, Surbiton, was enrolled a member of the Council, and the proceedings then terminated. All applications for membership should be sent to the Honorary Secretary, The Flagstaff, Locksheath, near Southampton.

## Perpetual Flowering Carnation Society.

Not one of the many functions held in association with the Royal International Horticultural Exhibition was more homely and characteristically British than the dinner at the Holborn Restaurant on May 23, which was given by that young but extremely enterprising Perpetual Flowering Carnation Society, for the purpose of extending a hand of welcome to the florists from the Continent and America, who were over for the big show. France, Belgium, Italy, and the land of the Stars and Stripes were represented amongst the guests, who helped to make up a large company, and seated at the table we observed Mr. Richard Vincent, jun., the President of the Society of American Florists; Mr. W. A. Manda, of New Jersey, who brought over Polypodium Mandaianum to the show; Mr. E. G. Hill; M. Maumené, Editor of "La Vie á la Campagne"; the Brothers Dailledouze, cut-flower growers, of Brookland; C. H. Trotby, of Madison; Joll Evans, Richmond, Indiana; Louis Doupez, White Stone; Harry Bunyard, of the States, and many others.

Mr. J. S. Brunton, who made an admirable chairman, welcomed the foreigners to our land, and spoke of the perpetual flowering carnation as being a flower not of one nation, but of many nations; for, while France was responsible for introducing the perpetual carnation, America had given us good things, and England had improved on what the Americans had done.

Mr. Richard Vincent, jun., the genial President of the Society of American Florists, who replied to the toast of "Our Guests," had very little to say about carnations, but he was feelingly sentimental in respect of the good fellowship existing between the nations that grow the flower, and, Yankee though he is to his finger-ends, it was obvious that he has a warm corner in his heart for the old country.

Mr. E. G. Hill gave the "Perpetual Flowering Carnation Society," and observed that at one time it was thought that the flower could not be successfully grown in this country. Great progress, however, had been made by English growers; but Mr. W. H. Page, who replied, paid Americans the compliment of being the pioneers in perpetual carnation culture.

Other speakers were Mr. H. T. Mason, the Rev. J. Jacob, Mr. H. A. Bunyard, Mr. E. F. Hawes (hon. secretary of the society), and Mr. W. A. Sherwood; and the intervals between the speeches were occupied by songs and music. Everybody was in the best of good humour; an air of jollity prevailed, jokes were cracked, amusing stories were told, and but for the latter some of the rather long speeches would have been a trifle wearying. The presence of many ladies added brightness to the proceedings. It may be observed in passing that, in addition to the banquet, excursions were arranged to different places of interest on four days, all for the benefit of foreign visitors, and it may be fairly said in compliment that the Perpetual Flowering Carnation Society did its share in entertaining our friends from across the seas. Doubtless they will carry back with them happy impressions of the genuine nature of British hospitality.

## British Gardeners' Association.

A large number of members from all parts of the country attended the eighth annual meeting of this association, which was held at Carr's Restaurant on Saturday, May 25, and a more representative meeting of the association has not been held. The members were well satisfied with the balance-sheet and report, the few criticisms made being satisfactorily answered. By a unanimous vote it was decided to hold the next annual meeting in Birmingham. The question of the association's journal cropped up. Many excellent suggestions were made, and eventually the matter was left in the hands of the Executive. Altogether the meeting was a very hopeful sign of the future. The new members of the Executive Council are: Messrs. J. D. Jones, J. Lodge, W. B. Child, and E. Smallman, Birmingham; Bertram Tindall and G. W. Butcher, Kew; T. G. Friend and I. E. Little, London; W. H. Paine, Kildare; E. H. Chitty, Highgate; and T. Aley, East Finchley. Mr. T. Winter again accepted the position of treasurer; and Messrs. J. Weathers and Parrott are the new auditors. Mr. T. Roberts, of Sandy, retired from the Executive, to make room for Mr. Winter. The usual votes of thanks concluded a successful meeting, which was presided over by Mr. J. Collier, of Gatton Park Gardens.

## GARDENING ENGAGEMENT.

Mr. W. J. Middlebrooke, who for the past eight years has been fruit expert to the King's Acre Nurseries, Lim., and who was previously with Messrs. J. Veitch and Sons, has been appointed horticultural adviser and fruit expert to the Locksheath Nurseries, Lim., whose nurseries are situated at Locksheath, near Southampton.

## ANSWERS TO CORRESPONDENTS.

SCABIOUS.—S. L., Yalding: Two amateur friends were discussing plants the other day, and one asserted that all scabious were annuals; the other being equally emphatic that they were perennials. I pointed out that the genus included both annual and perennial species, but, as we were all readers of the "G.M.," we decided to refer the matter to you, so that an authoritative answer could be given.—The very popular Pincushion Flower of gardens is an annual, and the species from which the fine flowers and varied colours we now possess have been evolved is Scabiosa atropurpurea, an annual species that has the curious popular name of Mournful Widow. One of the commonest of perennial border plants is Scabiosa caucasica, and though it is thoroughly perennial in many parts of the country, it is a quite common practice to grow it as a biennial. There are many other species, both perennial and annual, but not a large number are in general cultivation.

PELARGONIUMS PAUL CRAMPEL AND PAUL CRAMPTON.—J. W., Lincs.: Can you tell me the difference between Paul Crampel and Paul Crampton pelargoniums? I fancy the former is a double, and the latter a single; our stock is mixed.—We do not know Pelargonium Paul Crampton, and have vainly searched through a long list to find such a name. Paul Crampel is a fine rich scarlet variety, with large trusses of bold rich scarlet flowers, and it is at present one of the most popular of bedding pelargoniums.

EREMURUS.—A. W. B., Hounslow: I am very unsuccessful with my eremuruses, so that I should be very glad indeed if you would kindly give me a few hints as to the proper cultivation of these plants. For two years in succession fine healthy shoots have pushed up through the ground, and have been protected by litter from frost. Generally, when the flower shoots are just visible (about April), the leaves turn brown at the tips, and ultimately die away about May. The tubers seem still unhurt. They are planted in a border facing south west, in light and fairly rich soil, and they are protected from the north east. E. robustus suffers much more than E. himalaicus, for the latter, although its flower spike dies, retains its leaves through the summer.—Eremuri need light, well-drained, and quite rich soil, but there seems to be very little wrong with the soil or aspect in your case. The great difficulty lies in keeping the ground free from frost just when the growth starts,

RAFFIATAPE.—To pass off green corrugated tape (that rots and fades) for this is to sell old seed as new. Raffiatape is bound with strong unfadeable cotton, which gives it great strength, durability, and, being two colours, it is never unsightly. Plants are as quickly tied as parcels, as it expands with growth. 1d. coils (ties up 150 plants); 6d., 1s., and 1s. 6d. reels. Samples and catalogue of all garden sundries.—C. E. WEST, Higham Hill, London, N.E. Please ask your seedsman for West's Patent Garden Sundries.

**PROTECT YOUR GARDENS**—I DO NOT REQUIRE PAYMENT UNTIL YOU HAVE SEEN AND APPROVED OF THE NETTING.—Netting, good strong, stout, small mesh, will not rot, THE VERY BEST, as supplied to the ROYAL GARDENS by ME, 25yds. by 1yd., 1s.; by 2yds., 2s.; by 3yds., 3s., and so on; any length or width supplied. Orders over 5s. car. paid. List and samples free. Commoner and tender netting, as sold by others, 60 sq. yds. for 1s. — H. J. GASSON, Net Works, Rye. Est. 126 years.

and, as this occurs quite early, it is always a good plan to cover the ground occupied by eremuri with heather, or bracken, all the winter. If a careful watch is kept and a hand-light is placed over the young growth directly it pierces the soil, then little harm will result from frost or cold rains and snow. Such protection is especially necessary in the Thames Valley, where spring frosts are often so sudden and severe.

IRONWEED.—H. S. T., Bournemouth: I have a strong-growing perennial plant that bears purplish flower heads late in the autumn. It grows about 6ft. high, and has an abundance of rough green leaves. The name given me with the plant is evidently a popular one, and is Ironweed. I believe seeds were brought from the United States.—Ironweed is a title given to a large genus of composites, chiefly natives of North America. Very few of the several hundred known species are of any value for garden decoration, although two of them have some merit in the semi-wild garden. The botanical name of the genus is Vernonia, and the species referred to are V. prælta and V. novæboracensis. Your plant is most probably the latter.

DECORATIVE ALLIUMS.—G. C. M., Faversham: Although the genus Allium is chiefly notable for its economic value and the inclusion of the onion, shallot, leek, and garlic, I believe I saw some quite decorative species when in Italy a few years ago. Perhaps you will tell me if I am right; and, if so, give the names of those kinds that would be useful in a warm garden.—There are several species of alliums of considerable decorative value, but they are not commonly cultivated because of the onion-like odour emitted by the crushed or cut stems and leaves. The best are: A. neapolitanum, white; A. Moly, bright yellow, capital for the rock garden; A. cæruleum, blue, flowers in dense heads; A. nigrum, violet; and the newer A. Schuberti, lilac.

A FAILING DIPLADENIA.—J. B., Forfar: A gardener friend of mine is much grieved over the imminent loss of a fine Dipladenia Brearleyana, which has for many years covered the roof of a large stove, and won the admiration of all who have seen it in flower. At present it is almost destitute of leaves, and it is a very difficult matter to suggest a cause for the trouble. There are no insect pests present, but I send a few leaves and portions of stem for your inspection. The dipladenia is planted out, and over it is a stage for ordinary pot stove plants.—The leaves and stems sent show no signs whatever of insect attack, nor is there anything to suggest the careless use of strong insecticides. We believe the last sentence of your letter points to the source of trouble, and that the condition of the soil and roots is answerable for the collapse. It may be possible to save the plant by lifting and replanting or potting it (if our presumption is found correct), and pruning it moderately hard.

## Situations Wanted.

E. DEAN, Esq., highly recommends GARDENER (Head or Single-handed); 5½ years with him; 29 years' experience Inside and Out; age 43. Apply WELSTEAD, Woodvale, Woodvale Avenue, South Norwood.

FOREMAN (Inside), or good Second; 11 years good experience; 3 as Foreman; all Fruit, Plant, and Carnation Houses, also Begonias, Chrysanthemums, and Decorating; excellent references; age 25; married when suited. J. M., Penzance Lodge, Arthur's Hill, Shanklin.

FOREMAN (Working), life experience; Chrysanthemums, Tomatoes, Ferns from spore, Forcing, Bedding, and general Nursery stuff; age 35; good references. HUGGETT, Cleadon, near Sunderland.

GARDENER (Head, or Single-handed), Caretaker, or any place of trust; life experience in Fruit, Flowers, and Vegetables; Indoors and Out; middle age; married, no family; 5½ years in last place, where I can have excellent character from. J. P., 8, Cateshall Road, Farncombe, Surrey.

GARDENER or MARRIED FOREMAN.—Mr. GILES, Head Gardener to F. D. Godman, Esq., South Lodge, Horsham, will be pleased to recommend Young Man as above; age 29; life experience all branches; first-class gardens, including Tring Park; thoroughly recommended. Apply, BOVINGTON, as above.

GARDENER (Head Working, or good Sinhanded, with help); life experience in all branches; good references from present and previous employers; one daughter, who could act as dressmaker or sewing maid; age 45. Address, GARDENER, 28, Martell Road, West Dulwich, S.E.

GARDENER (Head Working, where two or more are kept); life experience Inside and Out; Fruit, Flowers, Vegetables, Vines, etc.; married, no family. BLAGBURN, Sherwood Farm, Mitcham.

GARDENER (Head Working), where several are kept; life experience in all branches; well recommended by present and previous employers; age 31. Address H. EMMERSON, The Gardens, Falkland Park, South Norwood Hill. No circulars.

GARDENER. — MR. HIGGIE, Stanwick Park, Darlington, highly recommends E. SMITH, who has been General Foreman 9 years, to any Lady or Gentleman requiring Head; experienced in all branches, Inside and Out; age 33. Address, Stanwick Park, Darlington.

GARDENER seeks SITUATION, single-handed or help given; understands Grapes, Tomatoes, etc., Flower and Kitchen Gardening; married; abstainer; Vicar's and other references; age 50. SUTTON, Upchurch, Sittingbourne, Kent.

GRANVILLE FARQUHAR, Esq., Batsford Park, highly recommends his Foreman as Gardener (Head Working, where three or more are kept); experienced in all branches; excellent references; age 30; married when suited. H. CRISP, Batsford Park Gardens, Moreton-in-Marsh.

**Read what an Advertiser writes re "Gardeners' Magazine."**

**March 31, 1912.**

**Dear Sirs,—**

**Will you kindly discontinue my advt. in your "G. M.," as I am suited. I obtained more answers through the medium of your paper than through any other source, and have obtained this position through same. Thank you very much.**

**Yours, etc.,**

**E. D.**

**The "GARDENERS' MAGAZINE" is the gardener's friend. Read it and recommend it to your friends.**

GARDENER (Head Working); thoroughly experienced in all branches (Inside and Out); highly recommended; married, no family. T. ELLIS, Tinnivelli, Caterham Valley, Surrey.

GARDENER (Single-handed or with help), good experience in large gardens; age 25; single; good references. W. COWARD, The Gardens, Lexham Hall, Swaffham, Norfolk.

GARDENER (Head Working); experienced in all branches, Inside and Out, Vines, Peaches, Melons, Begonias, Chrysanthemums; Flowers, Fruit, and Vegetables for succession; good references; age 25. T. REED, Stonor, Henley-on-Thames.

GARDENER seeks SITUATION as Head; life experience (Inside and Out); Vines, Peaches, Melons, Cucumbers, Stove, Greenhouse Plants, House and Table Decorations; age 33; excellent references. W. HUGHES, The Gardens, Landguard Manor, Shanklin, Isle of Wight.

GARDENER seeks SITUATION as Single-handed, or with help; 15 years' experience (Inside and Out); good reference; 10 years' previous place; 5 years present; age 32; married when suited. J. MONCK, 84, Crown Street, New England, Peterborough.

GARDENER (Single-handed, or where help is given); experienced in all branches; abstainer; married, no family; age 37 years; good reference. C. G., Office of this Paper.

GARDENER (Single-handed or with help), 11 years' experience (Inside and Out); 2½ years at last place; good reference; age 25; single. WALTON, Finchfield Hill, Compton, Wolverhampton.

MR. J. SHELTON wishes to recommend E. Roose as FOREMAN (Inside or General); 14 years' experience in first-class places; age 28; 3½ years as Foreman. ROOSE, Beeley, Rowsley, Derbyshire.

THE RIGHT HON. LADY BROUGHAM and VAUX and her Head Gardener, Mr. AUTON, can with confidence recommend their Foreman, F. MUTIMER, to any lady or gentleman wanting a thoroughly competent man as GARDENER (Head Working); 14 years' experience gained in good places; 2½ years here where Orchids and Malmaisons are specialities; age 28; married when suited. MUTIMER, Brougham Gardens, Penrith.

YOUNG MAN, 26, seeks SITUATION, 7 years in nursery; Inside and Out; knowledge of private work; good references; abstainer. Apply, C. NICHOLLS, 32, Orme Road, Worthing.

**THIS COUPON**, duly filled up, should be forwarded not later than Tuesday for the next issue.

HOT WATER PIPES.—Bowling boiler; 8-tube radiator, 736ft. run 3in. pipes, 375ft. 2in. do., bends, stands, taps, etc. Also a smaller boiler. Lately used for heating factory. Will accept low price to get material out of way. Suitable for greenhouse.—DENNISON WATCH CASE COMPANY, Villa Road, Handsworth, Birmingham.

ROCKERY STONE.—Fine old weathered material, in very pretty shapes, also Spar Gravel for garden paths, etc. BECK and CO., Stone Merchants, Matlock.

STRAWBERRY NETS, best, stout, small mesh, will not rot. Can be sent on approval. As supplied by me to the Royal Gardens. 25 yds. by 2 yds., 2s.; by 3 yds., 3s.; by 4 yds., 4s.; any length or width supplied. Orders over 5s. carr. paid. Lists and samples free. H. J. GASSON, Net Works, Rye.

ORCHIDS FOR AMATEURS.—A practical guide to the Cultivation of Cool and Warm-house Orchids, adapted for Small Mixed Greenhouses. The author is C. Alwyn Harrison, F.R.H.S., and the book can be obtained, by post, for 2s. 10d., from Publisher, 149, Aldersgate Street, London.

MARK SMITH, Ltd.,
LOUTH, LINCS.
"PERFECT" WEED KILLER
STRONGEST, CHEAPEST & BEST.

# The . . .
# GARDENERS' MAGAZINE.

**Edited by GEORGE GORDON, V.M.H.**

THE GARDENERS' MAGAZINE was established in 1833, and is indeed an Institution of Horticulture, and in this province the oldest periodical extant. Its progress through the years is marked always by an eagerness to keep abreast of the times, and although 79 years old its pages glow with the virility and freshness of youth. Thus in 1912 it occupies a position in Horticulture second to none, and remains the ideal Journal for all those who love a Garden.

THE GARDENERS' MAGAZINE is a competent companion and instructor in matters of Practical and Thoroughly Modern Horticulture, while the Illustrations appearing as object lessons are a special feature and are maintained at the high level of excellence for which it has always been noted.

The Special Features of THE GARDENERS' MAGAZINE, week by week, comprise:—SEASONABLE GARDEN WORK detailed by a number of First-Class Cultivators. ROSES, CHRYSANTHEMUMS, CARNATIONS, SWEET PEAS, AND DAHLIAS are dealt with by the most successful Growers and Raisers. NEW PLANTS, FLOWERS AND FRUITS are critically described and beautifully illustrated. VEGETABLES receive full attention, and advice is given on the merits of varieties, with the most approved culture. TREES AND SHRUBS constantly receive attention and have their beauties pictorially emphasised. ORCHIDS meet with the recognition due to their wondrous beauty. Cultural directions are contributed by prominent Growers, and new and rare kinds are freely illustrated. THE FLOWER GARDEN is dealt with from every aspect. Hardy and Tender, Indoor and Outdoor Flowers have their cultivation carefully described. HARDY FRUITS receive special attention from the foremost Growers and Exhibitors. BEAUTIFUL GARDENS are described and illustrated. GREENHOUSE AND CONSERVATORY MANAGEMENT, as becomes its importance, occupies considerable space in the pages of THE GARDENERS' MAGAZINE. EXHIBITIONS, MEETINGS, AND CONFERENCES are fully and critically reported, and form one of its leading features. PLANT PESTS AND DISEASES are described and remedial measures suggested.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Foliage.

When we consider the uniform nature of the function which foliage performs in the vegetable kingdom, namely, that of absorption and assimulation of the carbonic acid gas in the air with the salts derived from the soil, and supplied to it by the transmitted sap, it is a very wonderful thing that in the process of evolution it should have developed on such infinitely diverse lines. At this season of the year, particularly when we behold a widespreading verdurous landscape clothed with vegetation in all its pristine freshness, although distance may preclude discrimination of detail, we can still perceive a marvellous diversity in the tints of greens, browns, and other colours, and in the characters and habits of the masses of foliage which form the chief feature, though broken up here and there by stretches of pasture or cereals, or other humbler growths, which are none the less interesting as forms of foliage on different lines. In the nearer distance we may see the rocks coated, or even only stained, by the still humbler forms of the lichens and mosses which, by their minuteness, hardly claim to be foliage proper at all, though none the less is their primary function the same. The main tint, however, is green, the colour proper of the great agent, chlorophyll, which constitutes the one and only link between organic life and the vital influence of the sun, of which we have treated in former issues. This green, however, is very often masked by other tints, and in effect is also modified by the texture of the leaves themselves, so that in many trees and shrubs, especially evergreens, like the holly, ivy, and many conifers, it is so intensely dark as to present an altogether different aspect to the pale tints of the larches and other growths, which stands out as gleams of gold and admirable counterfoils, against the backgrounds of their more sombre fellows. Even within the same genus, as particularly in the maples, we find innumerable bright tints of warm reds, which our Japanese friends have so enhanced by selection that a collection of maples may be almost as brilliant as so many floriferous shrubs, while in another direction, that of form, their diversity of cutting is extreme. A closer examination, indeed, of every species, or even variety, of plants shows such diversity to be general. Apart from the varied habits concerned, we find the foliage, the individual leaves, to be distinctly characterised, ranging from the simple undivided leaf, varied, however, considerably in outlines, from mere needle-like ones in the pines to huge ones in the banana, through serrate forms to much-divided ones, and, in short, ranging through every conceivable gradation of type from the grass blade to the lace-like frondage of the finest fern. In make and texture, too, the foliage varies immense, from the diaphanous to the tough and leathery, from the water-borne vallisneria, whose very veins are so transparent as to display the circulation of its sap, to the tough, leathery, opaque foliage of the saxifrages and sedums, portulaceas, mesembryanthemums, and the general host of xerophils or drought-loving plants, who find congenial homes in parching deserts, these culminating in the cacti and euphorbias, in which the foliar function is really delegated to the leaf stalks to ensure the greatest economy of transpiration of the scarce, but all-essential, water supply. The charm of brightly-coloured foliage, as a decorated adjunct to brilliancy of bloom, has been so highly appreciated by horticultural selective breeders, that Nature has been largely transcended, and it is among highly-cultivated plants that we find the most brilliantly-coloured foliage. Caladiums, for instance, with their large, and yet delicate, leaves of the most delicate rosy tints, veined and mottled with white or green; crotons of gleaming yellow, orange, and gold, and of the most quaint and contorted shapes to boot; while the coleus, in the hands of the selector, has developed coloured leaves often of the most beautiful patterns and designs on extremely varied and brilliant lines, no two plants being probably alike unless propagated by cuttings, to which process they lend themselves freely. Apart from all these wide variations in colour and make, each species has its characteristic form of veining, i.e., the arrangement of the delicate system of main and minor ribs, which perform the double function of supporting the cellular tissue in the leaves, and supplying the cells with material from below. No two leaves, even in the same plant, will be found identical in this respect, although in monocotyledonous plants they run on much simpler and parallel lines, instead of being netted, as in the case of those of dicotyledonous plants.

PROFESSOR FREDERICK KEEBLE, Sc.D.

**Professor F. Keeble, Sc.D.,** Dean of the Faculty of Science of University College, Reading, has, by virtue of his commanding ability and his combining a thorough acquaintance with the practical aspects of every-day life with scientific attainments of a high order, contributed in no small degree to the remarkable success achieved by the college in making Reading famous as an important educational centre. We have on more than one occasion referred to the remarkable results that have been obtained in the teaching of practical and scientific horticulture in the fine garden attached to the University College; but that, it need hardly be said, is only one branch of its activities. It is, however, of special interest as evidence of the completeness of equipment, and the thoroughness of the work that is accomplished in all the departments, and to Professor Keeble belongs much of the honour that is reflected by the high position that this comparatively young college occupies as a centre of university education. We have pleasure in giving Professor Keeble's portrait and making brief reference to his position as a scientist, because of the great value of the work he accomplished as a member of the Science and Education Committee of the Royal International Horticultural Exhibition during the somewhat long period over which the activities of that body extended. Professor Keeble not only devoted a full share of attention to the arrangements that were made for holding conferences and demonstrating some of the scientific aspects of horticulture, but he exhibited a series of primulas which must have been of much interest to gardeners and horticulturists generally who are devoting attention to Mendelism in connection with plant improvement. This contribution of primulas certainly appealed to the section of the jury who were entrusted with making the awards in the scientific part of the exhibition, for they awarded Professor Keeble one of the two Veitch Memorial Cups that were placed at their disposal.

**The Kew Palace Linden.**—A link with the past, when Kew was a Royal domain, disappears by the removal of the Kew Palace linden. Growing on a mound to the left of the entrance gates to Kew Palace from the riverside, the tree was described when in its prime, as a good specimen of singular beauty and great height. The girth of the trunk at 4ft. from the ground was 18ft. 7in. The tree is said to have been a favourite haunt with the children of George III. when "pursuing their youthful studies." It is, perhaps, for this reason that in some books the tree is referred to as the "King's Lime." During a heavy storm on January 27, 1901, the tree suffered severely, but being of historic interest, the portion remaining was made to look presentable with the aid of a few bricks and cement. As evidence of the life left in the old tree two or three vigorous young shoots developed. It was one of these growths, says the "Kew Bulletin," which, coupled with the attack of fungus and decay of the heartwood, finally broke up the trunk. A strong wind during March of this year blew off one of the strongest growths, this unfortunately taking with it at least one-third of the trunk. As the tree was thereby reduced to a complete wreck, the remains were cleared away on April 3 and burned.

**Sir Harry J. Veitch.**—With reference to the Knighthood conferred upon Sir Harry J. Veitch, Sir Trevor Lawrence writes: "I should be glad if you would allow me, as President of the Royal Horticultural Society since 1884, to offer to Sir Harry Veitch, on behalf of the garden lovers of the kingdom, our warm congratulations on the honour conferred upon him. Wherever gardens are valued—and where in Great and Greater Britain are they not?—the name of Harry Veitch stands in the very first rank of those we honour and esteem. This is so, not only on account of his never-tiring labours to promote horticulture, but in recognition of his and his firm's strict adherence to the best traditions of commercial dealing, of his personal qualities, and of his energy, enterprise, and success in every branch of horticulture and in the introduction of valuable trees, shrubs, and plants for the embellishment of woods and gardens. There is not, moreover, a poor member of the garden world who is not grateful for Sir Harry's unremitting labours on behalf of garden charities—nor is there a gardener in the Empire who will not wish him long years to enjoy an honour so worthily bestowed."

**Royal International Horticultural Exhibition.**—According to the official figures the total number of visitors to the exhibition during the nine days over which it extended was 176,889, and the attendance on the several days was as follows: Wednesday, May 22, 4,551; Thursday, May 23, 11,714; Friday, May 24, 15,485; Saturday, May 25, 18,010; Monday, May 27, 20,453; Tuesday, May 28, 39,522; Wednesday, May 29, 41,154; Thursday, May 30, 26,000. The amount taken at the turnstiles exceeded £10,000, and we learn on good authority that the profit will be about £4,000.

**High Prices for Asparagus.**—In accordance with the usual custom, an auction sale was held at the close of the annual asparagus show at Evesham, and high prices were obtained for the winning bundles. The bundle of 100 sticks, which weighed 18lb. 4oz., and obtained for the exhibitor the challenge cup, was sold for £10 10s., the purchaser being Mr. Barnett Emanuel, of Covent Garden, who bought the champion bundle last year for £10. Mr. Emanuel was also the buyer of the heaviest bundle in the show, which weighed 21lb. 4oz., and realised £6.

**Use of Electricity in Plant Culture.**—Professor J. H. Priestley, of the Leeds University, has during the past few years devoted much attention to the investigation of the potential uses and value of electricity in the cultivation of ornamental plants and useful crops, and his lecture the other day at Leeds was of much interest. In his opening remarks, Professor Priestley said the knowledge of the subject was not far enough advanced for electrical energy to be practically applied either in horticulture or agriculture. It is, however, he affirmed, a subject that seems to offer opportunities to the experimenter of ultimately arriving at new methods and new ideas in cultivation. He explained by the aid of diagrams the system of overhead electrical discharge, by which it is believed possible to supplement to useful purpose the natural supply of energy which plants and crops derive from the sunlight. Very little current was needed, but the enormous pressure of 100,000 volts was required. At Evesham experiements had been conducted over some 20 acres of ground bearing crops of wheat, strawberries, mangolds, and potatoes. The results obtained were, on the whole, decidedly satisfactory. The wheat, measured at so many bushels to the acre, showed an increased yield of 29 per cent. in favour of the electrified crop, as against the non-electrified, while the increased yield in mangolds was 18 per cent. The experiment with strawberries was even more striking. The area electrified was only half as big as that which was not, and yet, in the first stages of the experiment, the smaller electrified area yielded 56lb. of fruit, as compared with only 33lb. from the larger one. This increase was unfortunately not maintained, and the final aggregate increased yield was only one of 25 per cent. The experiments made with plants growing under glass had not been so successful, owing to the current being obstructed or diverted by the hot-water pipes and the glass. Several years' work would be needed to demonstrate the practicability or otherwise of the method in this direction.

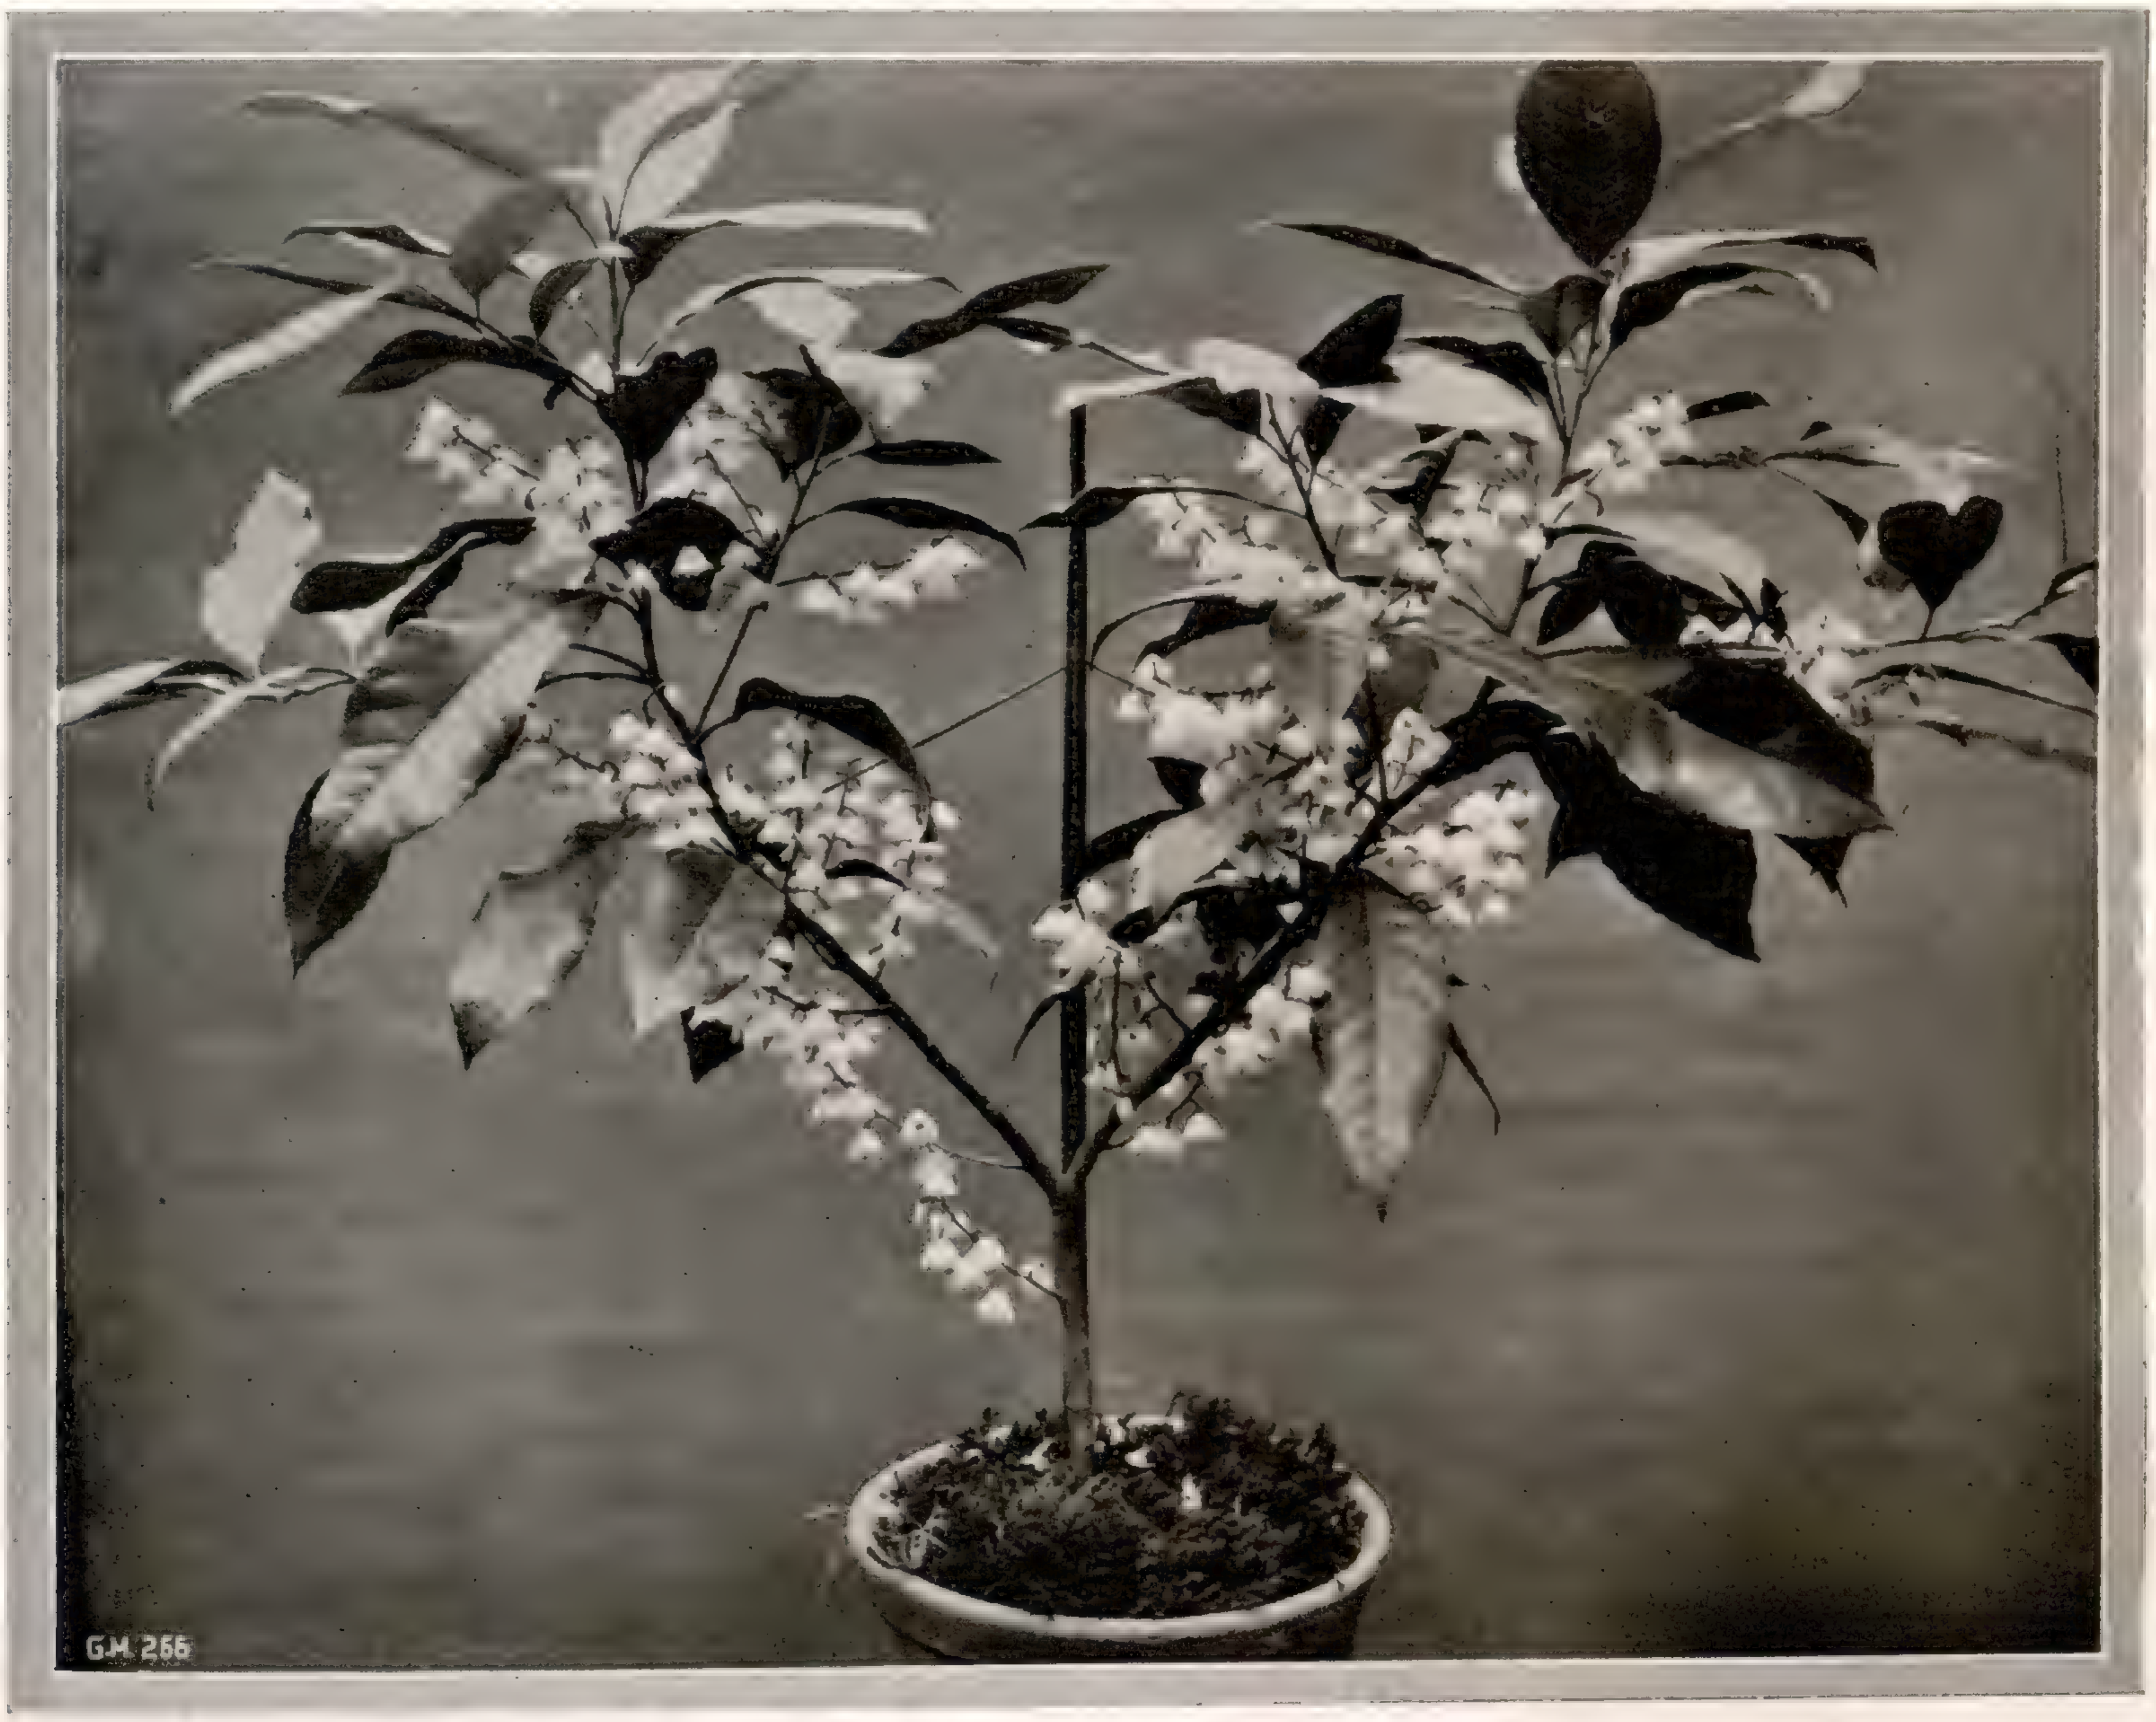
**Portrait of the Late Sir Joseph D. Hooker for Kew.**—To Mr. C. P. Hooker, Dollarward House, Cirencester, Kew is deeply indebted for the gift of a photogravure reproduction of a portrait of his father, the late Sir J. D. Hooker, as a young man. The original, a crayon drawing by the late G. Richmond, R.A., was executed in November, 1855, and is a companion picture to a similar portrait of the late Dr. T. Thomson, the companion of Sir Joseph during the later portion of the travels described in the famous "Himalayan Journals." The two friends returned to England in 1851, and during the next three years were conjointly engaged in the preparation of their "Flora Indica," the first and only volume of which was issued in 1855. The portraits mark the close of this period of companionship and collaboration. That of Thomson was presented to Kew by Sir Joseph many years ago, and it is pleasant to reflect not only that Kew now possesses a vivid likeness of the brilliant author of the "Himalayan Journals," but that portraits of the joint authors of the "Flora Indica" hang side by side in the building in which their work was done.

**Fruiterers' Cup for Messrs. Thos. Rivers and Son.**—In addition to winning a Large Gold Medal for their fruit trees in pots, a Gold Medal for citrus trees, and several Silver-gilt Medals in competition, Messrs. Thomas Rivers and Son, Sawbridgeworth, were awarded a fine cup, offered at the Royal International Horticultural Exhibition by the Worshipful Company of Fruiterers, for their excellent display of pot fruit trees.

**Exhibition of Rhododendrons at Regent's Park.**—The exhibition of rhododendrons now being held by Messrs. John Waterer and Sons in the gardens of the Royal Botanic Society, Regent's Park, is extensive, and of great merit, and while affording a rich feast of flowers, fully maintains the traditions of the firm.

**The Large Larch - Sawfly** (Nematus Ericksoni) was the subject of an interesting paper contributed by Dr. R. Stewart MacDougall to a recent meeting of the Royal Society of Edinburgh. The larvæ of this sawfly, which was first noticed in numbers some years ago in the Lake district, have also been found at work in Wales, and more recently in Perthshire and Forfarshire. Dr. MacDougall stated that in breeding out adults from cocoons collected in spring, he obtained 165 females to one male. Hewitt had previously recorded two males to 298 females. To test this suggested parthenogenesis, seven newly-issued virgin females were placed, on May 26, 1910, on a young larch, which was potted and so confined that no other insect had access to it. By June 12 three were dead, and in a few days the remaining four had died. Although there was no reasonable doubt as to the sex, the dead insects were dissected, and proved all to be females. Eggs had been freely laid, and through June the caterpillars which hatched from them fed greedily. Examination on July 3 showed two caterpillars on the soil of the pot, and these had spun their cocoons by July 7. On July 17, the soil was sifted from the pot, and altogether 47 cocoons and five dead caterpillars were found. The cocoons were kept over the winter in suitable conditions indoors. On April 21 three females issued, and by May 8 fourteen other adults—all female. In five other similar experiments with virgin females, eggs were freely laid and caterpillars hatched.

**Presentation to a Dumfriesshire Gardener.**—Mr. John Johnstone, gardener to Mrs. Hunter Arundel, at the fine old mansion of Barjarg Tower, Dumfriesshire, being about to retire after the long service of forty-three years with the family; was presented with a testimonial the other day as a token of the respect and esteem in which he is held by his friends and neighbours. Mr. J. M'Kie occupied the chair, and Mr. R. Clark, forester on Barjarg Estate, made the presentation in highly appropriate terms, in which he eulogised Mr. Johnstone's character and abilities as a gardener. He handed over the presents, which consisted of a substantial sum of money for Mr. Johnstone, and a handsome silver teapot for his wife. Mr. Johnstone made a suitable reply in acknowledgement, and referred to the kindness and consideration always shown by his employers and his friends.



ELÆOCARPUS CYANEUS.

A beautiful Australian shrub easily grown in a warm greenhouse. It was introduced in 1803, and has neat, lanceolate, reticulately veined leaves. The drooping, graceful, white flowers, each with a little cluster of yellow stamens, are carried on racemes produced from the axils of the leaves. The species was figured in the "Bot. Mag." t.1737, in June, 1815. The white flowers are followed by blue olive-like fruits. Under the name of E. reticulatus (a synonym), this gained an F.C.C., R.H.S., June 4, and was shown by Messrs. Jas. Veitch and Sons, Chelsea.

**R.I.H.E. Awards.**—In the list of special awards published in our issue of June 1, Messrs. C. P. Kinnell and Co., Lim., are credited with having been awarded a silver-gilt medal for their exhibit at the Royal International Horticultural Exhibition. We are glad to learn that they received the more appropriate award of a gold medal. Messrs. R. H. Bath, Lim., were awarded the Van Waveran silver cup for their fine collection of British-grown tulips. The Potash Syndicate were awarded a silver medal for their exhibit. Our list was compiled from information supplied officially.

**American Gooseberry Mildew.**—On the 25th ult. a local fruiterer was summoned at Malton for a contravention of an Order of the Board of Agriculture in failing to observe the conditions of a licence for the removal of fifty currant bushes from Wisbech. As the garden from which they were obtained had been scheduled, the bushes should have been grown for a year in the buyer's garden, whereas some were sold. A technical case was admitted, and fine of 10s. was imposed.

**Fareham Sweet Pea Society** is the most recent addition to the list of organisations formed in the interest of sweet peas. At a meeting held a few evenings since, it was decided to form a sweet pea society for Fareham, and Colonel Mathews was elected president, and Mr. M. Colan, hon. secretary. The date of the show was fixed for June 4.

**Mr. W. Gelder,** who has been the hon. secretary of the Knaresborough Horticultural Society during the past six years, has found it necessary, through advancing years to retire, and the other evening the committee presented him with a silver inkstand as a mark of their appreciation of the splendid service he had rendered the society during the period of his office. Mr. A. A. Gibson, who presided, and made the presentation, testified to the admirable manner in which Mr. Gelder had performed his duties, more particularly with regard to the collection of subscriptions, and to his unvarying courtesy.

## HORTICULTURAL EDUCATION.

There is always a certain stamp of authority about anything that appears in the "Times," no matter whether that staid journal is discussing a question of Imperial importance or such a commonplace topic as the education of a gardener, and therefore the article on the latter question which recently occupied the columns of the "Times" has doubtless been read with interest by a good many members of the horticultural profession.

Reading between the lines of the article referred to one gathered the impression that it was largely based on what was said at the recent Conference on Horticultural Education, which took place in connection with the International Exhibition, and I quite agree with the "Times" that the tendency of the Conference was rather to advertise existing methods than to formulate any general policy that might be adopted in this country.

The "Times" grades gardeners into three sections: (1) the man working for an employer, (2) the fruit grower or market gardener conducting a business of his own, and (3) the horticultural expert—teacher or investigator. It is not quite clear where the nurseryman comes in, but perhaps under the second heading, since he does not answer to the description of either of the other two.

Referring to the education of the three grades referred to above, the "Times" seems to think that the most difficult is that of the working gardener, which is not an unreasonable suggestion when one considers how many different classes of working gardeners there are, ranging from the man who includes boot and knife cleaning amongst his duties to the individual who is head of a pretentious gardening establishment. After describing at some length what the education of the working gardener ought to consist of, the "Times" contends that it can best be obtained during a long apprenticeship in a garden under a gardener where up-to-date methods are employed, and where opportunity is given for a boy of improving his knowledge by study or attending classes or lectures which may be available in the district. Unless I am mistaken, the first part of the suggestion is only a case of history repeating itself, and no better gardeners were ever trained than in the old days of the apprenticeship system before the door of gardening admitted all and sundry, and before so many so-called gardeners were made by a method than can only be called drift. It is this custom of pushing every Tom, Dick, and Harry who obtains employment as a boy in a garden, to become a gardener, that is so fatal, and it only ends in a futile attempt to fit round pegs into square holes. As for scientific knowledge, no matter how desirable it may be to the working gardener, I am afraid he does not get much encouragement to acquire it; in the first place, because the possesssion of knowledge other than that which is practical does not assist the working gardener much in the matter of salary, and there are actually employers who are averse to employing what may be described as educated gardeners on the grounds that the latter are too good for their rquirements. Until employers give distinct preference to men who have those extra qualifications which the "Times" suggests, there will be little encouragement for young gardeners to acquire them. I might add that there is another important essential to the making of a successful gardener that is not altogether a matter of education. The world calls it force of character, or the capacity to get on, and it has been the means of carrying men who have never had any facilities for education from the lowest rung of the ladder right to the very top. There are men who will get on under any circumstances, though they may not be endowed with the heaven-sent gift which men call genius, and these are the individuals who will benefit most by any improved methods of education or training. Any improved methods then, will be welcomed, even if they are only a means of assisting those who possess the capacity for getting on.

For the young market gardener, the "Times" suggests that he should begin at a horticultural college, and then go for at least two years to a thoroughly successful grower, and in his training he should get hold of as much science as will enable him to grapple with problems of manuring, insect or fungus attacks, and so forth, but the article adds this scientific knowledge is no use unless it is read into commercial and business methods. I agree with this, and take no exception to the suggestion as a whole, but I should put the training in a commercial establishment first, and if the college training is desirable, it had better come after, when the young man would be at an age when he would be more likely to appreciate the advantages it had to offer him.

In the matter of teachers, the "Times" deplores the absence of really well-trained efficient horticultural experts. The article enlarges on the shortcomings of the men who were made teachers and lecturers by County Councils some years ago, but without giving these very men credit for having done more to advance rural horticultural education than anybody else, simply because they were practical and experienced, and by these qualities did more to win the confidence of the people whom they were sent out to teach than any college graduates could ever hope to do. Perhaps these early pioneers in horticultural education lacked polish, and were not so grammatical as they might have been, but they possessed common sense, they understood the people they were teaching, they have obtained results, and I question if there is any class of rural teacher who has more to show for his work than the horticultural instructor. All honour, then, to the men who were first in the field in the matter of horticultural teaching. They had the spade work to do, it was for them to break down the local prejudices which they would never have done if they had not been practical, and they have paved the way for the type of lecturer that the "Times" suggests.

According to that authority, he will certainly want a good deal of training. He must first be an efficient practical horticulturist, with experience and knowledge gained under the best and widely different conditions. Added to this he should graduate in science, and his knowledge of chemistry, botany, and zoology should be acquired by systematic work in lecture-room and laboratory. Thirdly, he should be trained in public speaking or lecturing, and I would add, what is as equally important as anything else, he should have a knowledge of human nature.

The "Times" thinks that the demand for men trained on the above lines should be considerable, and their influence on the progress of the horticultural industry would be most valuable. Just so, but I am reminded here of a story I heard from the lips of a well-known old Yorkshire gardener. The authorities of a certain borough were contemplating the appointment of a superintendent for their parks and public gardens, and one of the members of the Corporation, a tradesman, by the way, was favouring the old gardener with his opinion as to the qualifications the man appointed must possess. He went on to great lengths, and in reply the old gardener said: "Yes; it would be a good thing to get a man with all those qualifications; I hope you'll be successful, and when you've got him, I should advise you to have him 'stuffed,' because I'm quite sure you'll never see another like him." If there is any parallel between this story and the ideal horticultural instructor of the "Times," perhaps the reader will see it, but it is not the easiest matter in the world to get or train men whose work and recommendations, to quote the "Times," must satisfy both the scientific and the practical man, and his qualifications and experience must enable him to speak with authority to both, apart from being trained in public speaking. When men possessed of all these qualifications have been trained and are forthcoming, it is to be hoped that the salaries will be better than the miserable £120 a year that some education authorities offer when advertising for a horticultural lecturer, minus, of course, house rent and other perquisites that the majority of head gardeners enjoy.

H.

---

**Hydrangea Mdlle. E. Mouilliere.**—This is a white-flowered form of the common hydrangea, being of equally free growth, and bearing large massive heads of flowers. First shown in 1910, it is now extensively grown. Well over thirty years ago the variety Thomas Hogg made its appearance, and is still much grown, though its position is now assailed among varieties of this tint by the newer form.—S. W.

---

## AMONG THE ALPINE FLOWERS.

> "Never, ah, never,
> Since Eastward in Eden God planted a garden,
> Was ever a garden that blossom'd like ours,
> With dreams from the shadows
> Of wind-winnowed meadows
> Haunting the alleys, and sun on the flowers."
> —Laurie Magnus.

Few words better express the thoughts in the mind of the lover of the alpine flowers in a season such as this, when, probably the rock garden is more full of beauty than at any other time. Yet it is hard to draw a comparison beween the seasons of the alpine flowers as we know them, for they keep coming and going, one succeeding another, in loveliness of flower or in charm of leafage, until we feel that we echo and re-echo the words of the poet each season of the year. With the writer it is a bountiful year of flowers, and never before has he seen his alpine plants more beautiful than now. Even after the rich feast of beauty shown at the great Chelsea Show one feels glad indeed of one's own flowers, with all their glowing of chaste beauty in the beginning of the "merry month of June." From among the array of beauties let us seek to choose a few for notice, not as being the best, but as giving points of beauty worth recalling and recording.

### Ramondia pyrenaica alba.

Not new, by any means, but still scarce is the real white variety of the Pyrenean Rosette Mullein, Ramondia pyrenaica alba. Very beautiful is it now, with its pure white flowers on the deep green wrinkled leaves, which look so well in a crevice of the rock garden. The true white variety is more beautiful than some of he plants sold as "white," and my plants have more than a passing interest to me, seeing that they serve as a reminder of that true lover of flowers, the late Max Leichtlin, who sent me this ramondia some years ago. For this and other rosette mulleins there seems no better place than the north side of the rock garden or a wall with plenty of soil behind it and with a similar exposure. It is a lesson in cultivation to see how quickly these ramondias will shrivel up in continued dry weather, and with even a moderate exposure to the sun. Coming, as they do, from the crevices of cliffs shaded from the sun, these flowers hate the full sunlight and the heat it generates on the stones. Lovely as are the newer ramondias, there is nothing more beautiful than the virgin beauty of this white variety of R. pyrenaica.

### Oxalis enneaphylla rosea.

Of all the wood sorrels for the rock garden Oxalis enneaphylla is the most beautiful. The type, with its charming silvery leaves and satin-like white flowers, with just a tinge of blush about them, is a diamond of the first water. It is a flower which has been in my garden for years, and now it must have a companion in the exquisite variety rosea, which received an Award of Merit at the International Horticultural Exhibition. The type and this variety form a duet of true harmony indeed, and we cannot but rejoice in their loveliness. It is a true rose, this variety, and is one of the most charming of all the wonderful race of flowers we call the oxalises, lovely indeed as most of them are, though some are not free from a somewhat aggressive magenta tone. O. enneaphylla rosea is absolutely devoid of this, and is a flower to be coveted and grown in any good place in the rock garden, though it apparently prefers some shade with us.

S. Arnott.

## NEW PLANTS.

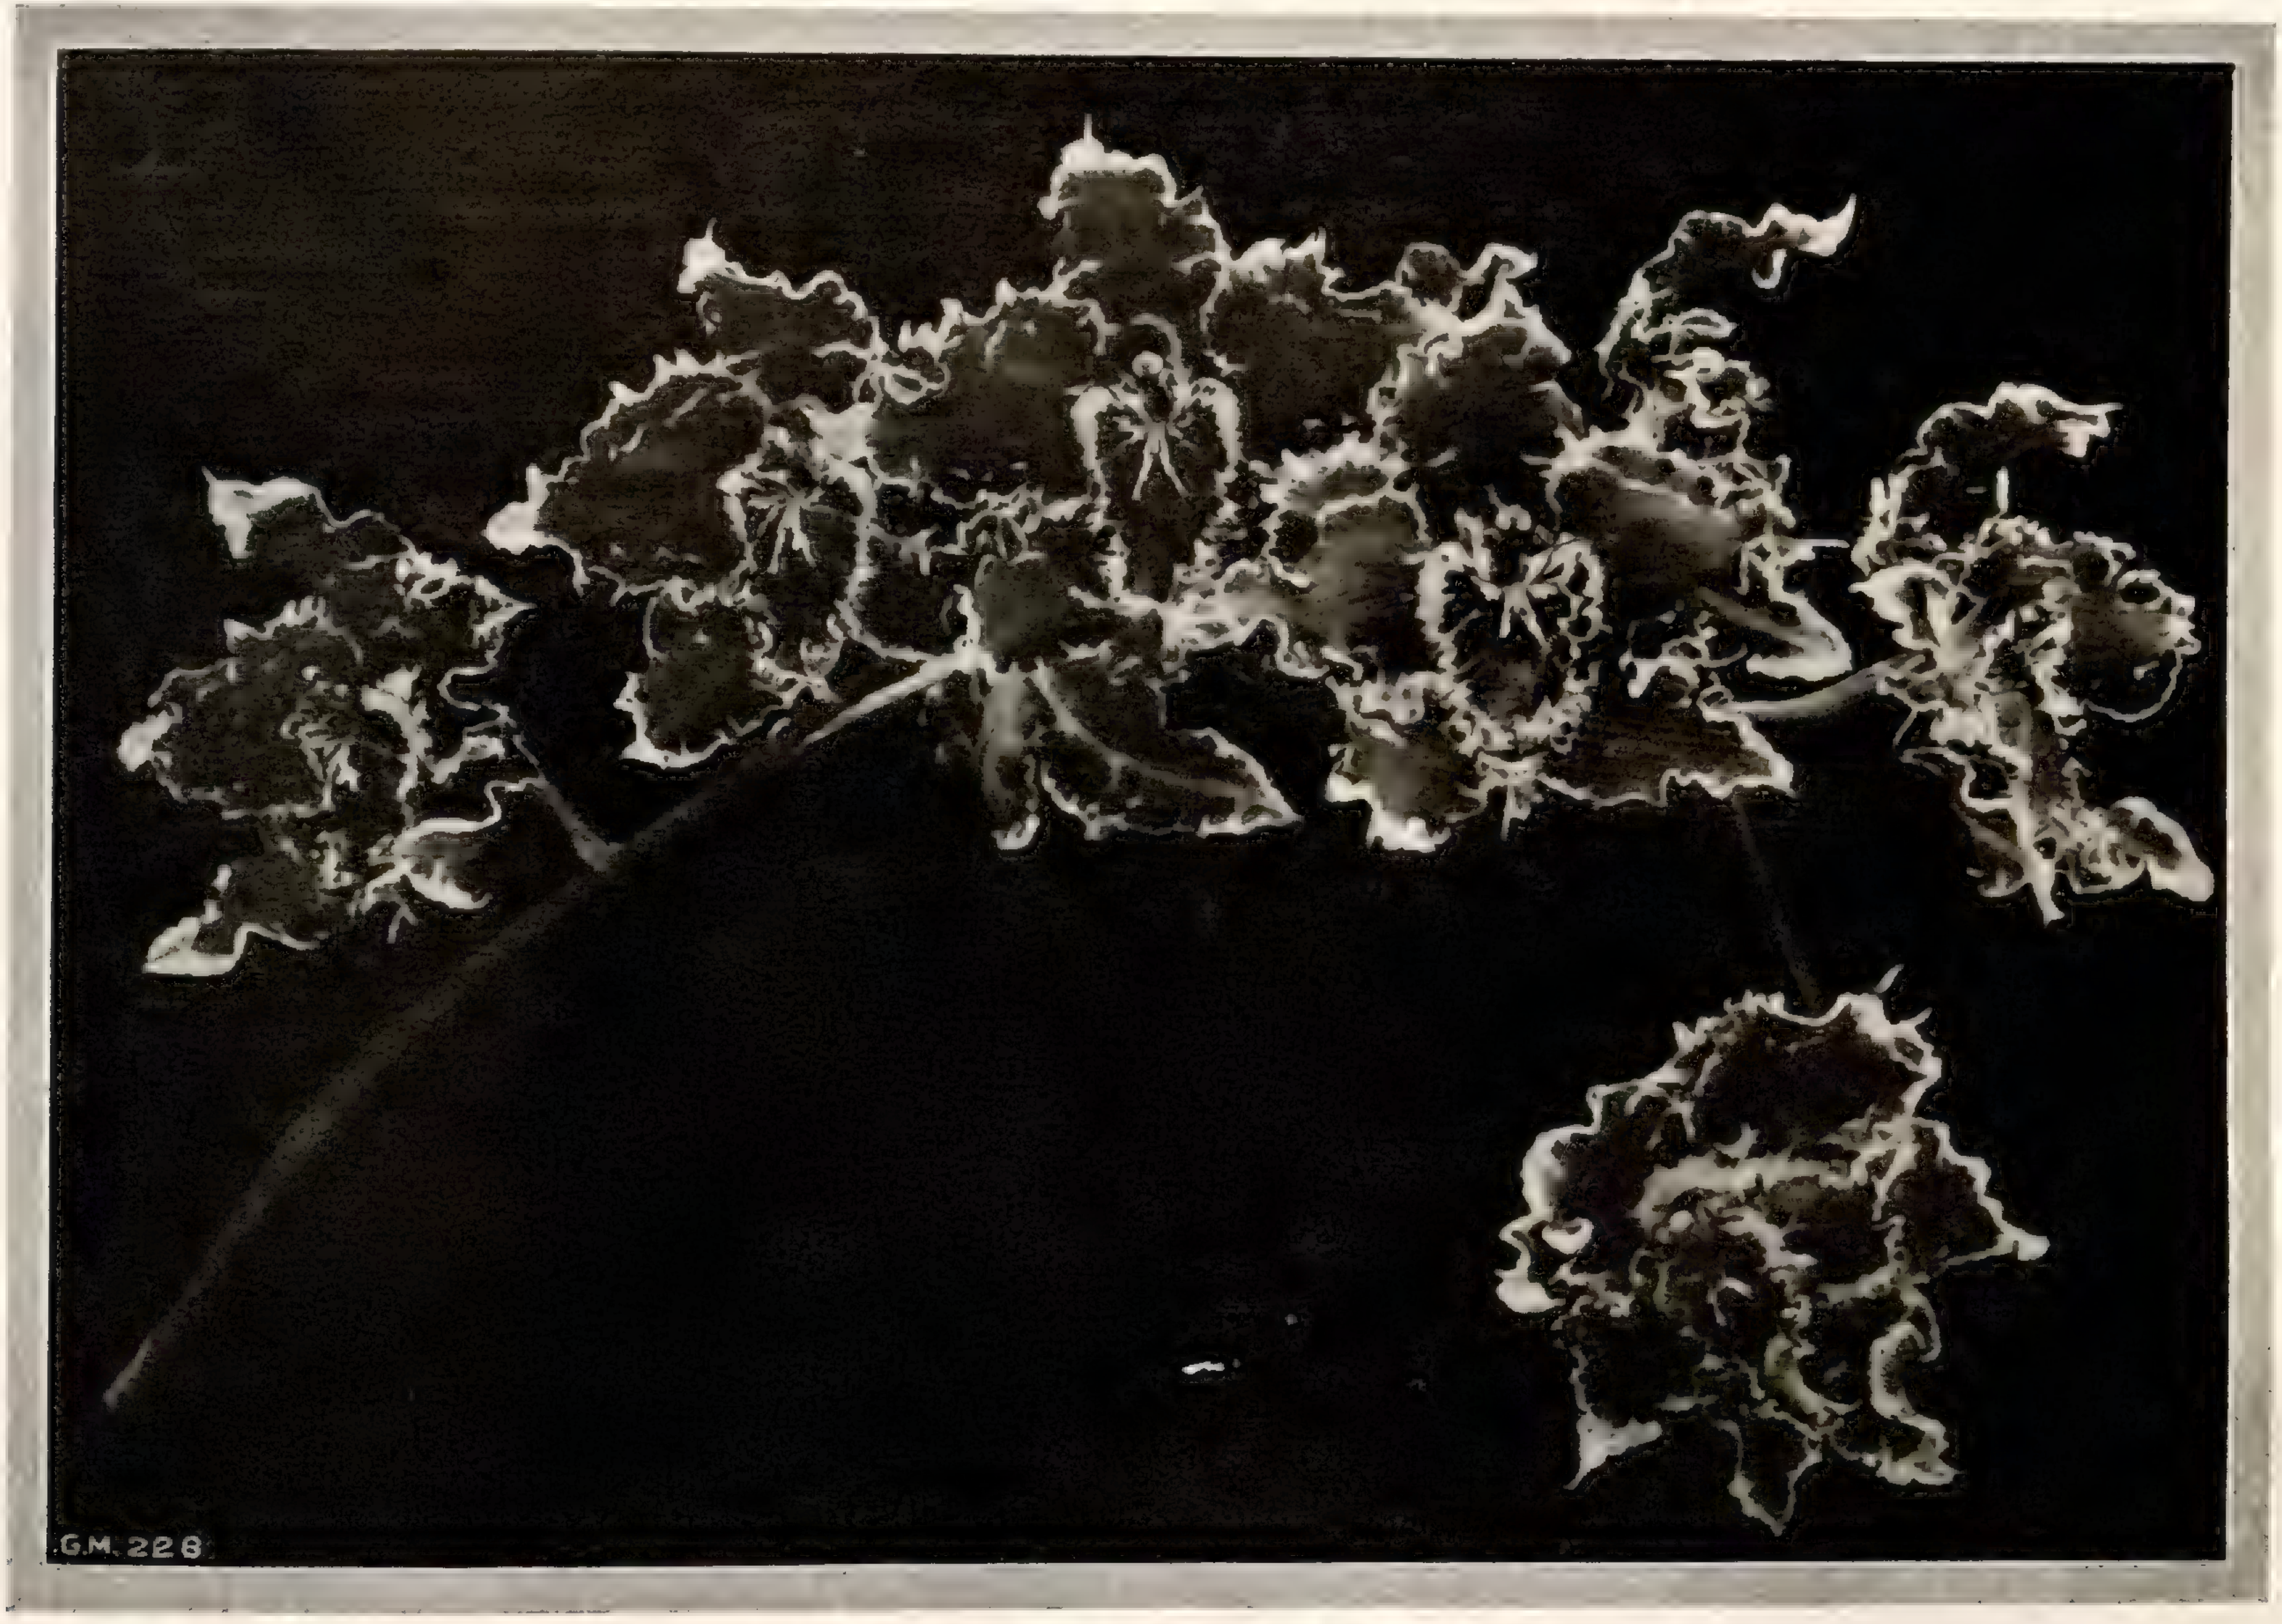
◆

### CYMBIDIUM WOODHAMSIANUM FOWLER'S VAR.

A very fine cymbidium, derived from C. eburneo-Lowianum crossed with C. Lowianum. It has large flowers and a drooping spike. Sepals and petals are of a bright greenish or fawny-yellow tint, almost an apricot-yellow shade. The bold lip has a white base, some red spots at the side, and the characteristic semi-circular red-brown mark on the apical lobe. This orchid was figured in our issue of May 18, p. 391. F.C.C., R.H.S., May 14. J. Gurney Fowler, Esq. (gardener, Mr. Davis), Glebelands, South Woodford.

### LÆLIO-CATTLEYA APOLLO.

The parents of this bright hybrid are Cattleya Schroderæ and L.-c. Warnhamensis.



ODONTOGLOSSUM HER MAJESTY.
Flowers large, deep red-purple on a pale rose ground. F.C.C., R.H.S., Int. Hort. Ex., May 22. Messrs. Charlesworth and Co., Haywards Heath.

The flowers are of fair size with soft nankeen yellow sepals and petals, and a rosy lip that has an orange-yellow disk and throat of deep rose-purple veinings. A.M., R.H.S., May 14. C. J. Lucas, Esq. (gardener, Mr. Duncan), Warnham Court, Horsham.

### LÆLIO-CATTLEYA LUSTRE VAR. LAVINGO.

A large-flowered and very beautiful hybrid that attracted a great deal of attention. It has amber sepals and petals, and an intensely rich crimson-purple lip. F.C.C., R.H.S., Int. Hort. Ex., May 22. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

### LÆLIO-CATTLEYA BEDOUIN.

This splendid hybrid from Lælio purpurata and L.-c. Hyeana, has been shown previously, but never has such a splendid specimen been seen as the one carrying twenty-three flowers, exhibited by Lieut.-Colonel Sir G. Holford in his superb group of orchids at the International Horticultural Exhibition at Chelsea.

### TROPÆOLUM ALBIFLORUM.

A slender South American climber with an abundance of tiny five-lobed leaves of a light grey-green colour. It flowers freely, as shown, and the blooms are pinkish-white with a pale yellow base. A.M., R.H.S., May 14. Miss Willmott, V.M.H. (gardener, Mr. C. Fielder, V.M.H.), Warley Place, Great Warley.

### PETUNIA BROWN'S PURPLE.

This very fine single variety has unusually large blooms, and these are of very rich and vivid purple colour. A.M., R.H.S., May 14. Messrs. W. and J. Brown, Peterborough.

### PHYLLOCACTUS COOPERMANNI.

A beautiful hybrid between P. Ackermanni and P. Cooperi. The large flowers are vivid scarlet with purplish flushings, and as they measure about eight inches across, and have an effective central group of creamy stamens, they are most effective. A.M., R.H.S., May 14. A. Worsley, Esq., Mandeville House, Isleworth.

### ODONTIODA MRS. F. M. OGILVIE.

This showy orchid is the result of crossing Odontoglossum amabile Royal George with Odontioda Vuylstekæ. The rounded blooms are of fair size, reddish, with deep rose markings, and veins and margins of white. The white-tipped lip has a golden crest and base. F.C.C., R.H.S., Int. Hort. Ex., May 22. F. Mentieth Ogilvie, Esq. (gardener, Mr. Balmforth), The Shrubbery, Oxford.

### ODONTIODA BRADSHAWIÆ VOGELZANG.

A bright and beautiful orchid with large rounded flowers, the colour being rich red on a soft rose ground. A.M., R.H.S., Int. Hort. Ex., May 22. Mons. F. Lambeau, Brussels.

### ODONTOGLOSSUM HER MAJESTY.

A description of this wonderful odontoglossum appeared in our issue of June 1. The brilliant and deep red-purple colouring of the flowers attracted a large amount of attention. An illustration appears in the present issue. F.C.C., R.H.S., Int. Hort. Ex., May 22. Messrs. Charlesworth and Co., Haywards Heath.

### CEREUS AMECAENSIS.

Another beautiful succulent plant, and one that appeared not unworthy of a First Class Certificate. We believe it was found near Ameca in the Mexican province of Jalisco. It has tall, slender growths, somewhat like those of some of the species of phyllocacti. The flowers are exquisitely beautiful, large, and pure white. A.M., R.H.S., May 14. A. Worsley, Esq., Mandeville House, Isleworth.

### MILTONIA HYEANA VOGELZANG.

This handsome variety has ivory-white flowers, the big spreading lip having a distinct yellow base or disk.

### PYRETHRUM QUEEN MARY.

We have previously described this long-stemmed double pink perennial pyrethrum, and now give an illustration of this splendid variety. A.M., R.H.S., Int. Hort. Ex., May 22. Mr. G. W. Miller, Wisbech.

### CARNATION WODENETHE.

This fine pure white perpetual carnation gains in popularity. Its large, substantial, fragrant, and fringed flowers are of great beauty and usefulness. A.M., R.H.S., April 16. Messrs. W. Wells and Co., Merstham.

## VIVIPAROUS FERNS.

In a general way, most of the plants of higher organisation are viviparous in the sense that the buds seated in the axils of the leaves are really individuals, capable of self-development if removed from their place of origin and installed under conditions enabling them to form roots, or, as in grafting, to obtain nourishment otherwise. The term, however, is usually applied to cases where young plants appear as outgrowths on sites not usually occupied by buds, as in the case of Asplenium bulbiferum, the fronds of which develop a profusion of youngsters which break out from the actual surfaces of the subdivisions, and often attain a size while still attached, which permits them to bear a second generation. This is an extreme case, and as a familiar illustration can hardly be excelled. Many of its nearly related species do the same thing, and it has been remarked that, being this endowed with extra reproductive power in this direction, the spores, though abundantly produced, rarely yield plants.

This viviparous character in its latent form is much more common among ferns than flowering plants, but in the latter we have it, nevertheless, in various types, the strawberry, for instance, and any similar stoloniferous grower, is practically viviparous in so far that it bears well-defined youngsters at the nodes of its stolons prior to their rooting, and in such cases as Sedum soboliferum, we see a quite different type, its little globular offspring being furnished with a root or two, and then sent rolling in all directions to establish themselves on their own account.

Returning to ferns, which, as we have said, present this phenomenon more frequently than other plants, we find many examples of viviparousness pure and simple, some specific and some varietal. Thus among the Woodwardias, W. radicans bears one or more young plants near the end of each frond, and these grow and develop actual roots until their weight brings them in contact with the soil, and enables them to root therein and take a start for fresh strides, a gigantic imitation of the tiny so-called Walking Fern (Camptosorus rhizophyllus), which acts precisely similar. Woodwardia orientalis, however, has its fronds in favourable situations literally covered with little plants produced from surface buds, and so lightly attached as to be easily rubbed off, when they fall parachute fashion to the ground, and so obtain their chance of an independent career.

Many of the Shield ferns (polystichum) bear plantlets in more or less profusion in the axils of their sub-divisions, these under natural conditions being borne to the ground when the frond has run its seasonal course, and decays at the base. A considerable number of varieties of this family, not reputedly viviparous, yet bear one or more such bulbils in the axils of the two lowermost pinnæ. Several forms of Lastrea montana do the like, L. m. Barnesi and L. m. folifera, to wit, two rare forms. An elongated type of Asplenium fontanum known as Asplenium f. refractum bears similar bulbils. Cystopteris bulbifera has a fashion of its own of producing fat, fleshy, bi-lobed bodies, as big as peas in the axils of its fronds, and these when shed, give rise to strong plants wherever they fall, rendering the fern a veritable weed.

In all these cases and many analogous ones which could be cited, the bulbils spring either from the axils of the frond divisions, in which case they are practically identical with ordinary buds of the phanerogams, or from the upper surfaces as viviparous outgrowths proper, but, in rarer cases, as in Lastrea vivipara, we find these bulbil plants originating on the under surfaces of the fronds in conjunction with the spore heaps presumably from modified sporangia. This description of bulbil is also found on several of our plumose varieties of Athyrum felix fœmina, on forms of Adiantum capillus veneris, A. c. v. daphnites, and imbricatum, and in Polypodium vulgare var. elegantissimum. In all these cases, the bulbils spring from the sites of the sori, and are frequently associated with perfect sporangia and spores. In the primary phase of fern life, the prothallus stage, we find also a type of viviparousness, or rather two, since the prothallus fern formed from the spore very frequently buds out at the edges, or even from the surface, into other prothalli, and where apogamy occurs, it is the prothallus which buds out into a fern proper by means of a simple asexual bulbil precisely akin to those formed upon the fronds, and finally we get the converse form of viviparousness when the fronds in the aposporous ferns develop prothalli from these tips.

These various forms of viviparousness are, in most cases, immense aids to the cultivator, since under proper treatment the plants so produced root readily, and form specimens far more quickly than if raised from spores, months being saved in the operation. Furthermore in valuable plants, i.e., whose spores are apt to yield varied progeny, the bulbils may be fairly relied upon to reproduce truly. We say fairly, because instances have certainly occurred where bulbil plants have developed into very different types. This, as bud sports are not uncommon, is only to be expected, seeing that if a tendency to vary is in the blood, so to speak, we may as reasonably expect it to evidence itself in the mother-cell of a bud as in that of a sporangium or single spore. Nevertheless, it may be taken as a fact that selective culture, with a view to improvement of type is far less likely to reap results if bulbils be employed than if spores be sown, the sexual interaction on resulting prothalli undoubtedly being a factor in variations.

Thus, to revert to our illustration of viviparousness in Asplenium bulbiferum, this fern must have been raised by millions by trade hands on account of its facile culture and marketability, but generation after generation originating from bulbils only, not a single variety worthy of the name has made its appearance, while we do not think that any fern raised on a like scale from its spores, can be quoted as equally constant.

Ordinary bulbil growths are, as we have said, easy to raise, but the extraordinary ones associated with the spore heaps are, with the exception of Lastrea vivipara, by no means easy to establish. For one reason, they only make their appearance right at the fag-end of the growing season as a sort of final effort at growth, and hence have a great tendency to perish with the fronds. We have succeeded several times in pulling a smaller percentage through by severing the small pieces of frond on which they are situated, and inserting these in sterilised soil, so that the bulbils just touch the soil, by keeping them close and giving them a little warmth, the strongest manage to retain vitality through the winter, and to form roots the following spring, when, of, course, they are safe. The smaller the portion of attached frond the better, and this is sure to decay and in so doing will too frequently infect its tiny offspring with fatal germs.

Chas. T. Druery, V.M.H., F.L.S.

## FOUR NEW RHODODENDRONS.

During the present century a large number of new rhododendrons have been introduced to European gardens from various parts of China, and some of these are now sufficiently well established to blossom freely enough for us to form an idea of their value as garden plants. The four species to which allusion is made were all introduced by Messrs. J. Veitch and Sons, Chelsea, though the medium of their collector, Mr. E. H. Wilson. All are of comparatively dwarf habit, comparing in height with the two Chinese species, R. yunnanense and R. rubiginosum, which were brought to public notice about twenty years ago. All appear to be as hardy as those two species, which stand the winter well, but sometimes have their flowers or young shoots cut by a late and rather severe spring frost.

R. ambignum forms a bush two feet or more high, with ovate leaves, the larger ones being two to two and a-half inches long. The upper surface is green, the under glaucous, spotted with small brown scales. From four to six flowers, each about one and a-half inches across, are borne in clusters from the points of the branches. The colour is yellow, but the upper petal is heavily spotted with green. Evergreen rhododendrons with yellow flowers are not very common, therefore this is of special interest.

R. augustini is conspicuous by reason of the large size of its flowers, for they bear comparison with those of large-growing garden hybrids. Plants a couple of feet high may be seen growing in companionship with the previously-mentioned species in the vicinity of King William's Temple at Kew. The bushes in question are about two feet high, and bear lanceolate or oblong leaves up to two and a-half inches long, and one inch wide. The stalks are about a quarter of an inch long, and together with the mid-ribs and bark of the younger branches, intensely hairy. From four to six lilac, orange-spotted flowers are borne together in fairly compact heads, each flower being two inches across. This species was described in 1890 in Vol. XXVI. of the "Journal of the Linnean Society," from specimens collected by Mr. A. Henry in the Patung District of Hupeh.

R. concinnum differs from the others by having bright, reddish-purple flowers, each one to one and a-half inch across, in small clusters, the upper petal being marked with reddish-brown spots. The ovate leaves are one and a-half to two inches long, the larger ones being about three-quarters of an inch wide, green above and glaucous beneath, both surfaces being covered with small brown scales.

R. siderophyllum bears a resemblance to R. yunnanense, especially when in flower, for the blooms are of a similar size and shape, but flesh-coloured and spotted with yellowish-brown. The leaves are narrow, one to two inches long, and up to three-quarters of an inch wide. Of loose habit, this species has a less inviting appearance than the others, though it will probably become more vigorous as its requirements become better known.

These and the numerous other new rhododendrons from the same country are well worth the attention of garden lovers, although with a genus which contains such a large number of good garden shrubs as rhododendron, they will have an uphill fight if they are to oust the more beautiful of the older kinds from the foremost places they now occupy.

W. Dallimore.

## SILVERY SAXIFRAGES.

With the star of the alpines still in the ascendant, and the ever-increasing love of rock gardening and its associations, among the garden-making section of the community, a more vivid light is thrown upon the various groups of the alpine flora. Plants that were but little esteemed a few years back are rapidly winning their way into public favour, and novelties are so frequent nowadays that one ofttimes feels the difficulty of keeping in close touch with both new and old.

The glorious range of beauty which the alpine flowers afford, and the haunting interest that enshrouds them, reaches a culminating point in the silvery saxifrages. Here both the amateur and professional gardener can find a field for enthusiastic study. The exquisite beauty, the varying forms, and the deep enthusing interest, stands up as a vision that will remain ever dominant in one's mind. Silvery saxifrages, with the hoary colouring of the frost aglint on the rosettes of foliage, a study in quiet beauty, from the tiny miniatures which barely rise above the surface of the soil to the magnificent pyramids and clouds of blossom produced by the grander species.

Easy of cultivation, revelling in a fairly sunny position, and a soil that is open and gritty (with a distinct preference for lime rubble), the silver-leaved saxifrages are invaluable in the rock garden. Adaptable to many positions, you will find the "frosty" rosettes peeping from rifts and fissures, or creeping like an ever-spreading carpet in the breaks between, and over the face of the boulders, out on the sun-lit ledges, or in the nooks below, while often in half-shady places you will meet with good specimens. But it is in the exposed sunny positions that you will obtain the deep silvery hues to perfection, and there you will note the ripening of growth which makes for a superb blossoming.

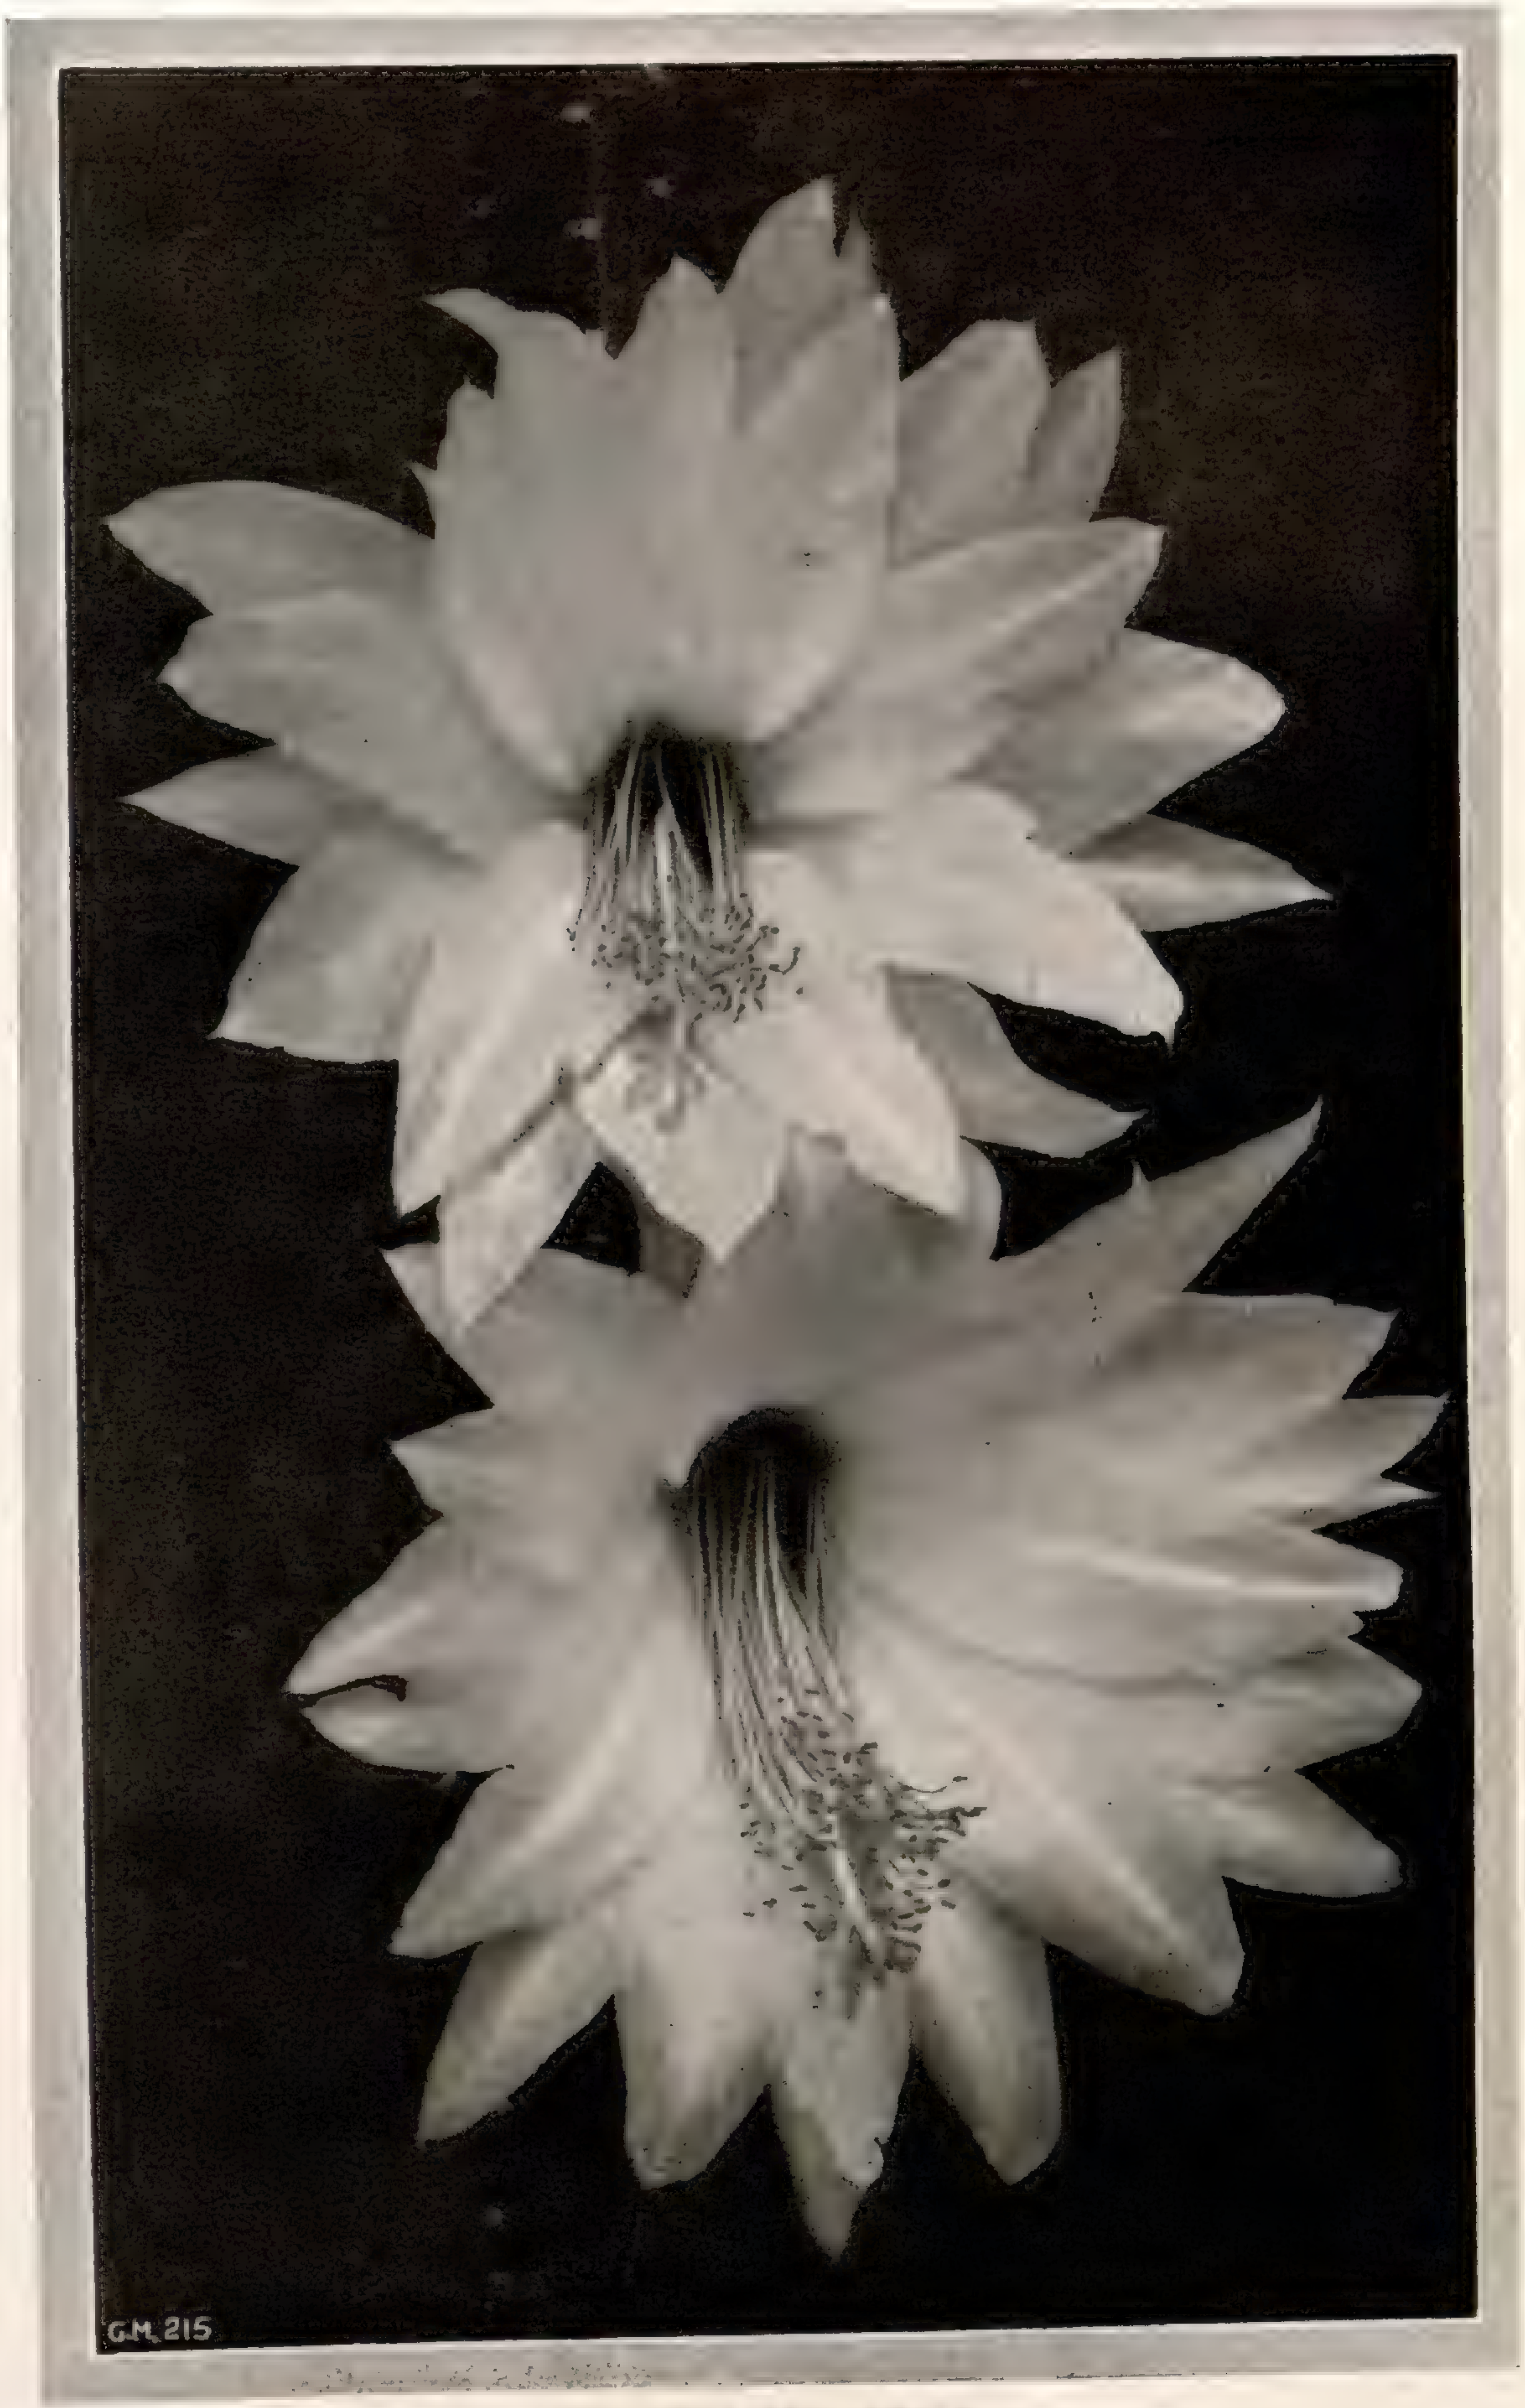
The potential wealth of varieties which S. aizoon affords us is certainly worthy of note, and probably no group of saxifrages has given the same confusion in nomenclature as these. But the whole group is gradually emerging from this cloud of confusion, and many forms now stand out in their distinctive characteristics. Especially interesting are balcana, a fine, bright variety, with good-sized white blossoms, heavily spotted with pink; carinthiaca, a dainty white, with heavily-silvered foliage; flavescens, a lovely rarity from the Southern Alps, with pure lemon-coloured blossoms; lutea, another rare and beautiful yellow, rather deeper in hue; and rosea, a very pretty novelty with bright pink flowers upon purple stems. Paradoxa is charming, its heavy silvery margins contrasting with the deep green of the rest of the foliage; atropurpurea is very rare, but is worthy of acquisition, if only for its bright rosy blossoms; La Graveana is distinctly pleasing, with its coral-red stems, carrying profuse sprays of white flowers, and Malyi is a very compact form with greenish rosettes and close spikes of white flowers.

The two forms of S. cæsia are quaintly pretty. The minute form, which may be regarded as the true species, is noteworthy by reason of the tiny rosettes spotted with silver, and the little wiry stems which support the solitary, or nearly so, flowers. The larger form, known sometimes by the varietal name of major, is useful with a marked habit of creeping over the rocks. A sterling rarity is represented by S. calyciflora, a species revelling in a limestone formation, its spikes of crimson flowers are very pleasing; S. cartilageana is a favourite form, producing spreading masses of narrow-leaved rosettes, surmounted by slender arching panicles of white flowers; S. catalaunica is somewhat rarer, dwarfer in growth than the preceding, very free, and effective.

A very useful group is formed by S. cochlearis and its varieties. The type is noteworthy by reason of its dense hillocks of tiny glaucous rosettes, and its graceful panicles of white flowers, produced upon rosy-purple stems. The principal varieties are major and minor, the former a fine vigorous gem, and the latter a miniature in all but blossom.

That general favourite, S. cotyledon, is seldom omitted from any collection, its free, unrestrained vigour, its massive panicles of blossom, and the handsome rosettes, combine to make it of great value. First-class varieties are represented by pyramidalis, well-known to all rock planters; Icelandica, the giant of the section, and compacta, a dwarf, floriferous form rarely exceeding a foot in height. S. crustata is a plant one can recommend, its pleasing wealth of silvery rosettes and erect panicles of snowy blossoms will ensure it a place for many years. The hybrid form raised as the result of crossing S. crustata with S. Hosti is equally pretty. S. Engleri is a free grower, with narrow silver-margined leaves, and arching sprays of white blossoms carried on red stems. It needs a warm situation to flower well.

It is a question as to which of the two saxifrages that are known as S. Forsteri is correct, but the natural Tyrolese hybrid between S. cæsia and S. mutata, is undoubtedly the better of the two, and worthy of acquisition. Of S. Griesebachi one has nothing but praise; it is a sterling novelty, with handsome glaucous leaves margined with silver. It is early to blossom, and its



CEREUS AMECAENSIS.

Flowers of large size, and pure white. A.M., R.H.S., May 14. A. Worsley, Esq., Mandeville House, Isleworth.

drooping crimson bells are borne upon dark reddish stems.

There is a good hybrid (S. Hausmanni) derived from a cross between S. aizoides and S. mutata. It retains something of the silvered leafage of mutata, and carries rich yellow flowers. A place should be found for this interesting saxifrage, where it can have plenty of moisture. S. Hosti, with its masses of elegant rosettes, and its graceful clouds of white blossoms, tipped with purple, and its pleasing variety altissima with its recurving foliage, are both worthy of note.

P. S. Hayward.

## SOME GOOD HERON'S BILLS.

Many pretty and valuable rock garden or border plants are comprised in the Erodiums, or Heron's Bills, and the attention of the lovers of hardy flowers is called to the beauty and serviceableness of some of these charming subjects, most of which have graceful foliage and distinctly pretty blooms. Their number is too great for full consideration; but among those here mentioned there will be found a sufficient number of good plants to serve for most gardens, however large.

These Erodiums are invaluable for the rockery and rock garden, the smaller species being excellent for the small rockery, and also for the choice border, while the bigger ones are good border flowers, and also look remarkably well when planted in the large rock garden in places where they will not make their smaller neighbours look insignificant. They generally like sun, but can do with a moderate amount of shade. A dryish soil is what they prefer.

For the border the best are the larger ones, such as Erodium chelidonifolium, with rosy-purple flowers with crimson stripes and pretty foliage. It makes a nice bush about a foot high, and is a capital border plant in a dry soil. Even finer for the border is E. Manescavi, which affords us a long succession of good, large, rosy-purple flowers on a bush of neatly-divided foliage. It, also, likes a dry border, and there it will give its bright flowers for a long season.

For the front of the border or the rockery, most of these are lovely and valuable little flowers, and among them we have none nicer than E. guttatum, which has white blooms with a deep, almost black, blotch at the base of each petal. The contrast is very fine. The leaves are very pretty, and the whole plant is only about four inches high. E. hymenodes is not quite so hardy, and has pale purple flowers with a dark blotch, on a plant about nine inches high. It likes a dry and sunny place on the rock work. In E. Reichardi, also called chamædryoides, we find a little plant rising only an inch or two above the soil, and affording us lovely small white flowers on a plant with heart-shaped leaves, the little blooms being adorned with pink veining. I find that this sometimes dies out in northern gardens, so that it is prudent to keep a plant or two in a frame in winter to replace any which may be lost in cold winters.

The charming little E. Sibthorpianum, which has white and crimson-purple flowers on a plant with exquisitely cut foliage, is one of the prettiest. It is only about six inches high, and its habit and general beauty necessitate its inclusion among the best of the smaller Heron's Bills.

These flowers can be purchased and planted in spring, and some of them may be raised from seeds, sown at the same time, and the seeds treated as with other smaller hardy flowers.

S. Arnott.

## TRIFLES ABOUT TREES.

There are two proverbs which describe the life of trees. One says, "Acorns make forests," the other declares, "If no leaf dropped no branch would shoot." When spring has come how joyously we read hope in the budding out of the tender green foliage, but how seldom do we realise that the preliminary growth is taking place in that "sad autumntide" which we call a melancholy season, since not a russet tint but has its usefulness.

Trees minister to our daily wants by their wood in hundreds of ways not generally reckoned or but vaguely understood. For example, when we look upon the common willow how seldom do we remember that it will come in time to be sawn and fashioned into small boats, used to line stone-carrying carts, and the smaller pieces made, probably, into pails, flour tubs, bread plattens, soap dishes, spoons, cabinet rails, bowls, and clothes pegs! The virtue of the wood is its non-liability to be split by any sudden shock. Years ago it used to be so finely sliced that chip hats were made of the younger branches. An old writer says that willows grow always in wet, marshy districts, where fevers abound, because the bark, when shredded into boiling water and allowed to stand until cool, provides a tonic drink of medicinal value approaching that of quinine, and the poorer folk could thus obtain at once a potent remedy. Probably the maladies lingering in low lands are alluded to in the lines,

> "Live near the willow, you'll not live long;
> Its roots ne'er flourish without some wrong."

To live beside an elder tree, on the contrary, is to "have a fair skin and a cheerful hearth," but the tree must have sprung up from seed, not been transplanted from elsewhere. Few people seem aware now that a delicious cooling face wash can be made by soaking the blossoms twenty-four hours in water that is kept gently boiling. Each berry contains three seeds, which gained the tree the name of Trinity bush.

Acorn bread was a general article of food among our distant ancestors, those men of whom a poet wrote,

> "Fed with the oaken mast,
> The aged trees themselves in age surpassed."

Now we forget this usefulness of our native monarch of the woods, although the word acorn is merely the Saxon version of "corn of the oak." The great diarist, Evelyn, states, too, that a pig will increase a pound a day in weight if fed every morn with a peck of acorns in a little bran. It is amusing to note the widespread employment of the word oak in naming towns and villages, for the ancient "Oc" was corrupted in innumerable fashions, giving us the Sussex Uckfield, say some authoritites, Okehampton and Ockley, as well as the more easily recognised Acton, Accrington, and Axminster.

The wood of the oaks grows slowest of all, but lasts longest, which gave rise perhaps to the common saying, about any blustering, restless person, "Oh, he will need an oak coffin." The poet Dryden was not correct in his calculation, but the verse in which he tried to state the career of a tree of this species is not without interest.

> "The monarch oak, the patriarch of trees,
> Shoots rising up, and spreads by slow degrees.
> Three centuries he grows and three he stays,
> Supreme in state, and in three more decays."

There was an oak of over eight hundred years of age at Morley, in Cheshire, according to local traditions. To dream of an oak in full foliage in winter is a sign of the coming of a gift or legacy, but if the branches should be bare then the omen was a mournful one, predicting a fall from fortune. In symbolic lore the oak means hospitality, not strength or fame, as so often declared, while the leaves alone signify bravery. The ancient Romans wished to award a chaplet of oak to Scipio Africanus, for having risked his own life to save that of his father in the battle of Trebia; the great warrior, however, refused to be thus honoured for a deed which carried with it its own reward.

A Norse theory is that man was made out of the wood of the ash tree. The Greeks possessed the same fancy, while in olden Wales no churchyard was thought complete without the "sacred" ash that is a protection against all evil spirits. Spencer alludes to

> "The ash for nothing ill."

Druidic circles in North Britain are proved to have been generally drawn around a mountain ash tree, and the wood provides handles for spades and axes, also oars.

Yews and cypresses have been classed together as solemn graveyard trees, yet the former were chiefly valued as giving stout wood for the bows of yeomen, and it was becoming rare, of costly price, when the invention of firearms relieved the situation.

> "Ye wood, speeding death home unto three kingly hearts,
> Be grown near tombs for aye."

So a poet bids. The monarchs referred to were the great Richard Cœur de Lion, William Rufus, and Harold. Cypresses were cut up into the coffins for heroes of Athens, as well as into the indestructible chests in which Egyptian mummies were always laid, and a plantation of this tree was reckoned a rich portion for a Roman daughter. Organ pipes used to be constructed of the wood, according to Evelyn, also harps and other musical instruments.

An old writer tells us that a favourite hobby of a luxurious Roman was the collecting of rarely-marked maple wood to have made into tables. For curious specimens the sums given were quite marvellous, and the wives of the connoisseurs had a habit of pointing to these articles of furniture when reproached with their lesser extravagancies, whence arose the phrase, "turning the tables."

From sycamores sugar was formerly extracted by the Scotch. Limes supply sounding-boards for pianos, panels for carriages, and other commodities that must never warp, while the famous Grinling Gibbons carved some of his finest work in St. Paul's Cathedral, Windsor Castle, and Chatsworth in the wood. Clogs and wooden soles for shoes come from the alder, guns from the walnut, the bark of old black poplar is so light that it will float like cork, so is used for supports in fishermen's nets. Birch bark yields an oil used in the preparation of Russia leather, and is responsible for its distinctive odour. The wheels of water-mills are mostly of elm.

Old sayings, of proverbial character, dealing with our subject, are the following: "No tree but has rotten wood enough to burn it." "The topmost branch o' the tree is safe but for those that can fly." "Such as the tree is, such the fruit." "An oak is not felled with one blow." "Remove a young tree and it'll soon bear, Remove an auld tree an' it's a'ready withered." "'Tis foolish to send fir to Norway."

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

## THE PERSIAN LILAC.

The popularity of the Common Lilac (Syringa vulgaris) and its numerous varieties rather overshadows the virtues of the more lowly Persian lilac; yet for small gardens, and for certain positions in large gardens also, S. persica has much to commend it. Really old bushes are rarely more than six feet high, whilst plants ten or twelve years old may not be more than a yard or four feet in height. It is easily distinguished by its thin, graceful branches, from which a profusion of fragrant blossoms appear in May. It may be depended on to bloom more freely and regularly than S. vulgaris, for it seldoms happens that a full crop of flowers is not produced. Requiring no special culture, it grows well in light, loamy soil, and may be allowed to grow year after year without attention, no pruning being absolutely necessary, and when any is done it should take the form of a little thinning rather than hard cutting back. For shrubbery planting, and also for masses in conspicuous positions, it is admirably adapted, whilst specimens grown in pots or tubs are excellent for conservatory decoration in spring. In addition to flowers of the ordinary lilac colour, a variety may be obtained which bears white blooms.

W. D.

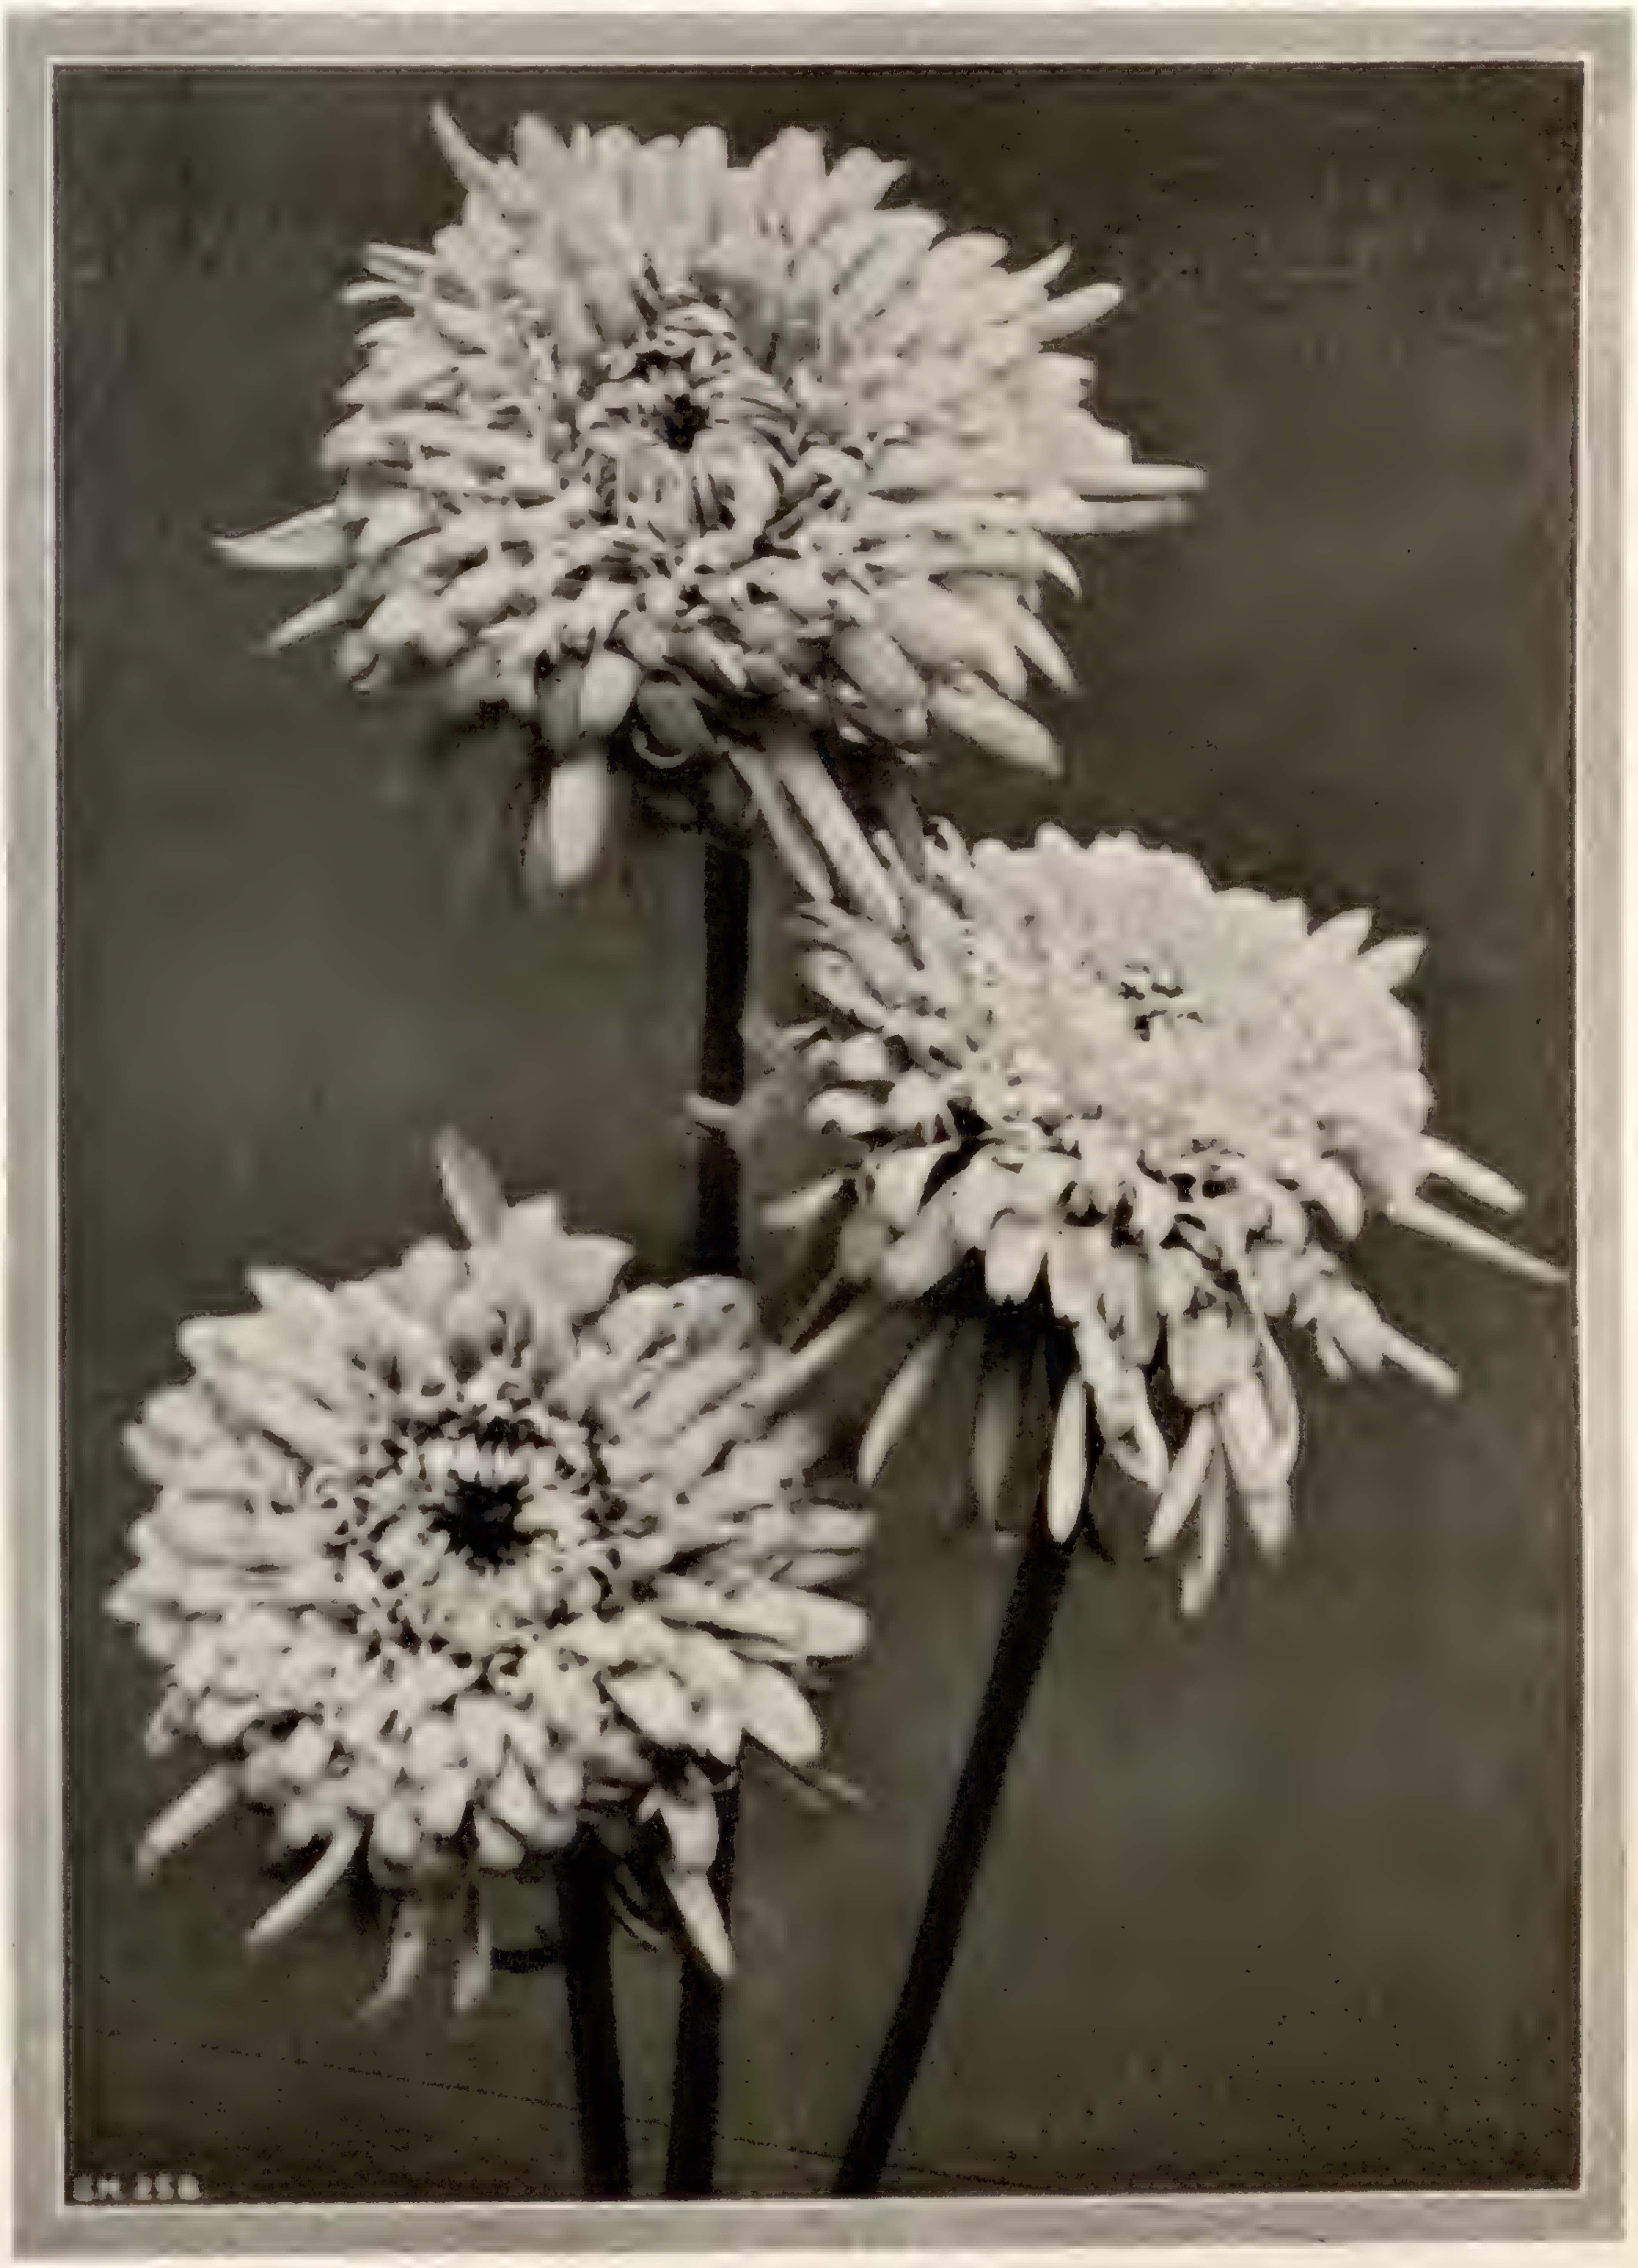
## FRAGRANT BORDERS.

A large garden should contain two borders of scented plants and flowers, one consisting of species that are fragrant all day long, the other devoted to those only possessing evening perfume. The best positions for these will be, respectively, close to the house windows, and around a summer shelter that is much used as a smoking-room. The small garden can seldom contain more than one border of sweet scent, but this can be made very delightful as well as lovely.

**Tobacco Plants and Verbenas** are richly perfumed after sundown, although they may be included as day-scented flowers also. It is noteworthy that the Nicotianas do best in this respect when in shade or semi-shade, but to give them this it is not necessary to inflict shadow upon other perfumed plants that would not do as well then. A short hedge of sweet briar put behind the tobacco plant group, with a bush of gorse and one of golden broom at each side, will make a shady nook, unless the border faces due south; if it does, the right plan is to grow a quintette of pillar roses, a foot apart, and the interlaced side branches will shade a mass of nicotianas behind.

Evening primroses can be similarly arranged for, and the ground sown lavishly with night-scented stocks. Biennial scabiouses should be largely relied upon for bright colour; the rose, terra-cotta, and cerise ones are extra beautiful, while the deep maroon has the best "muskateer" scent. Mignonette ought to be represented by many sorts kept separate, for the perfumes of the red, yellow, and cream-white are noticeably different. Pansies and violas are now recognised as scented. I have always found the named violas Goldfinch and Ardwell Gem of great value. Violets, primroses, and cowslips should have their places.

**Bold Planting in Groups,** or large stretches of "carpeting" is the right method. Individual plants dotted about should be given up in favour of concentration of perfume. Spring bulbous flowers are, of course, of noted scent, and so are wallflowers, but we may now have annual and winter-blooming wallflowers as well, so that few months see the garden devoid of these blossoms. Clove and border carnations and pinks charm most when grown together, their foliage being then so pleasing; a few clumps of sweet rocket can be added, to bloom with the pinks, earlier than carnations. Yellow tree lupins are invaluable. Phloxes are better avoided unless they are obtained as cuttings, or divided pieces, from varieties known to be really sweet, as distinct from sickly in scent. The cream-white Jacob's Ladder has a delicious honey perfume, its title being Polemonium confertum mellitum, while others are rather disagreeable. Sweet woodruff and the fragrant wood sorrel (Oxalis enneaphylla) make fair carpets.



PYRETHRUM QUEEN MARY.

A very fine double pyrethrum with large rose-pink flowers. A.M., R.H.S., May 22, Royal International Horticultural Exhibition. Mr. G. W. Miller, Wisbech.

Day lilies are useful in sun or shade, the best being Hemerocallis aurantiaca major and Hemerocallis flava. The white Goat's Rue (Galega officinalis alba), and the Plantain Lily (Funkia subcordata), the musk-scented Delphinium Brunonianum, the hay-scented, erect-growing Clematis Davidiana, Centaurea montana too, the orange Asclepias tuberosa, the rose-perfumed double Chinese pæonies, Francois Ortigat (rich purple), Madame Furtado (rose-carmine), can be cordially recommended. An unfamiliar flower, with an aromatic odour, yellow, eighteen inches tall, is Grendelia inuloides.

**Sweet Peas are Indispensable,** so, too, are sweet sultans, stocks, Schizopetalon Walkeri, almond-scented, cream, a foot tall; and sweet alyssum. Petunias and heliotropes should be plentiful, with many kinds of scented-leaved geraniums. Auriculas and coloured cowslips may be summer sown to furnish foregrounds. Shrubs that are needed will be the Daphnes Mezereum, cneorum, and Blagayana, the two last being but a foot tall; lilacs, philadelphus, and laurustinus. There must be moss roses, lilies, lavender, rosemary, southernwood, jasmines, and honeysuckles. Seats should always be accompanied by at least some groups of scented flowers.

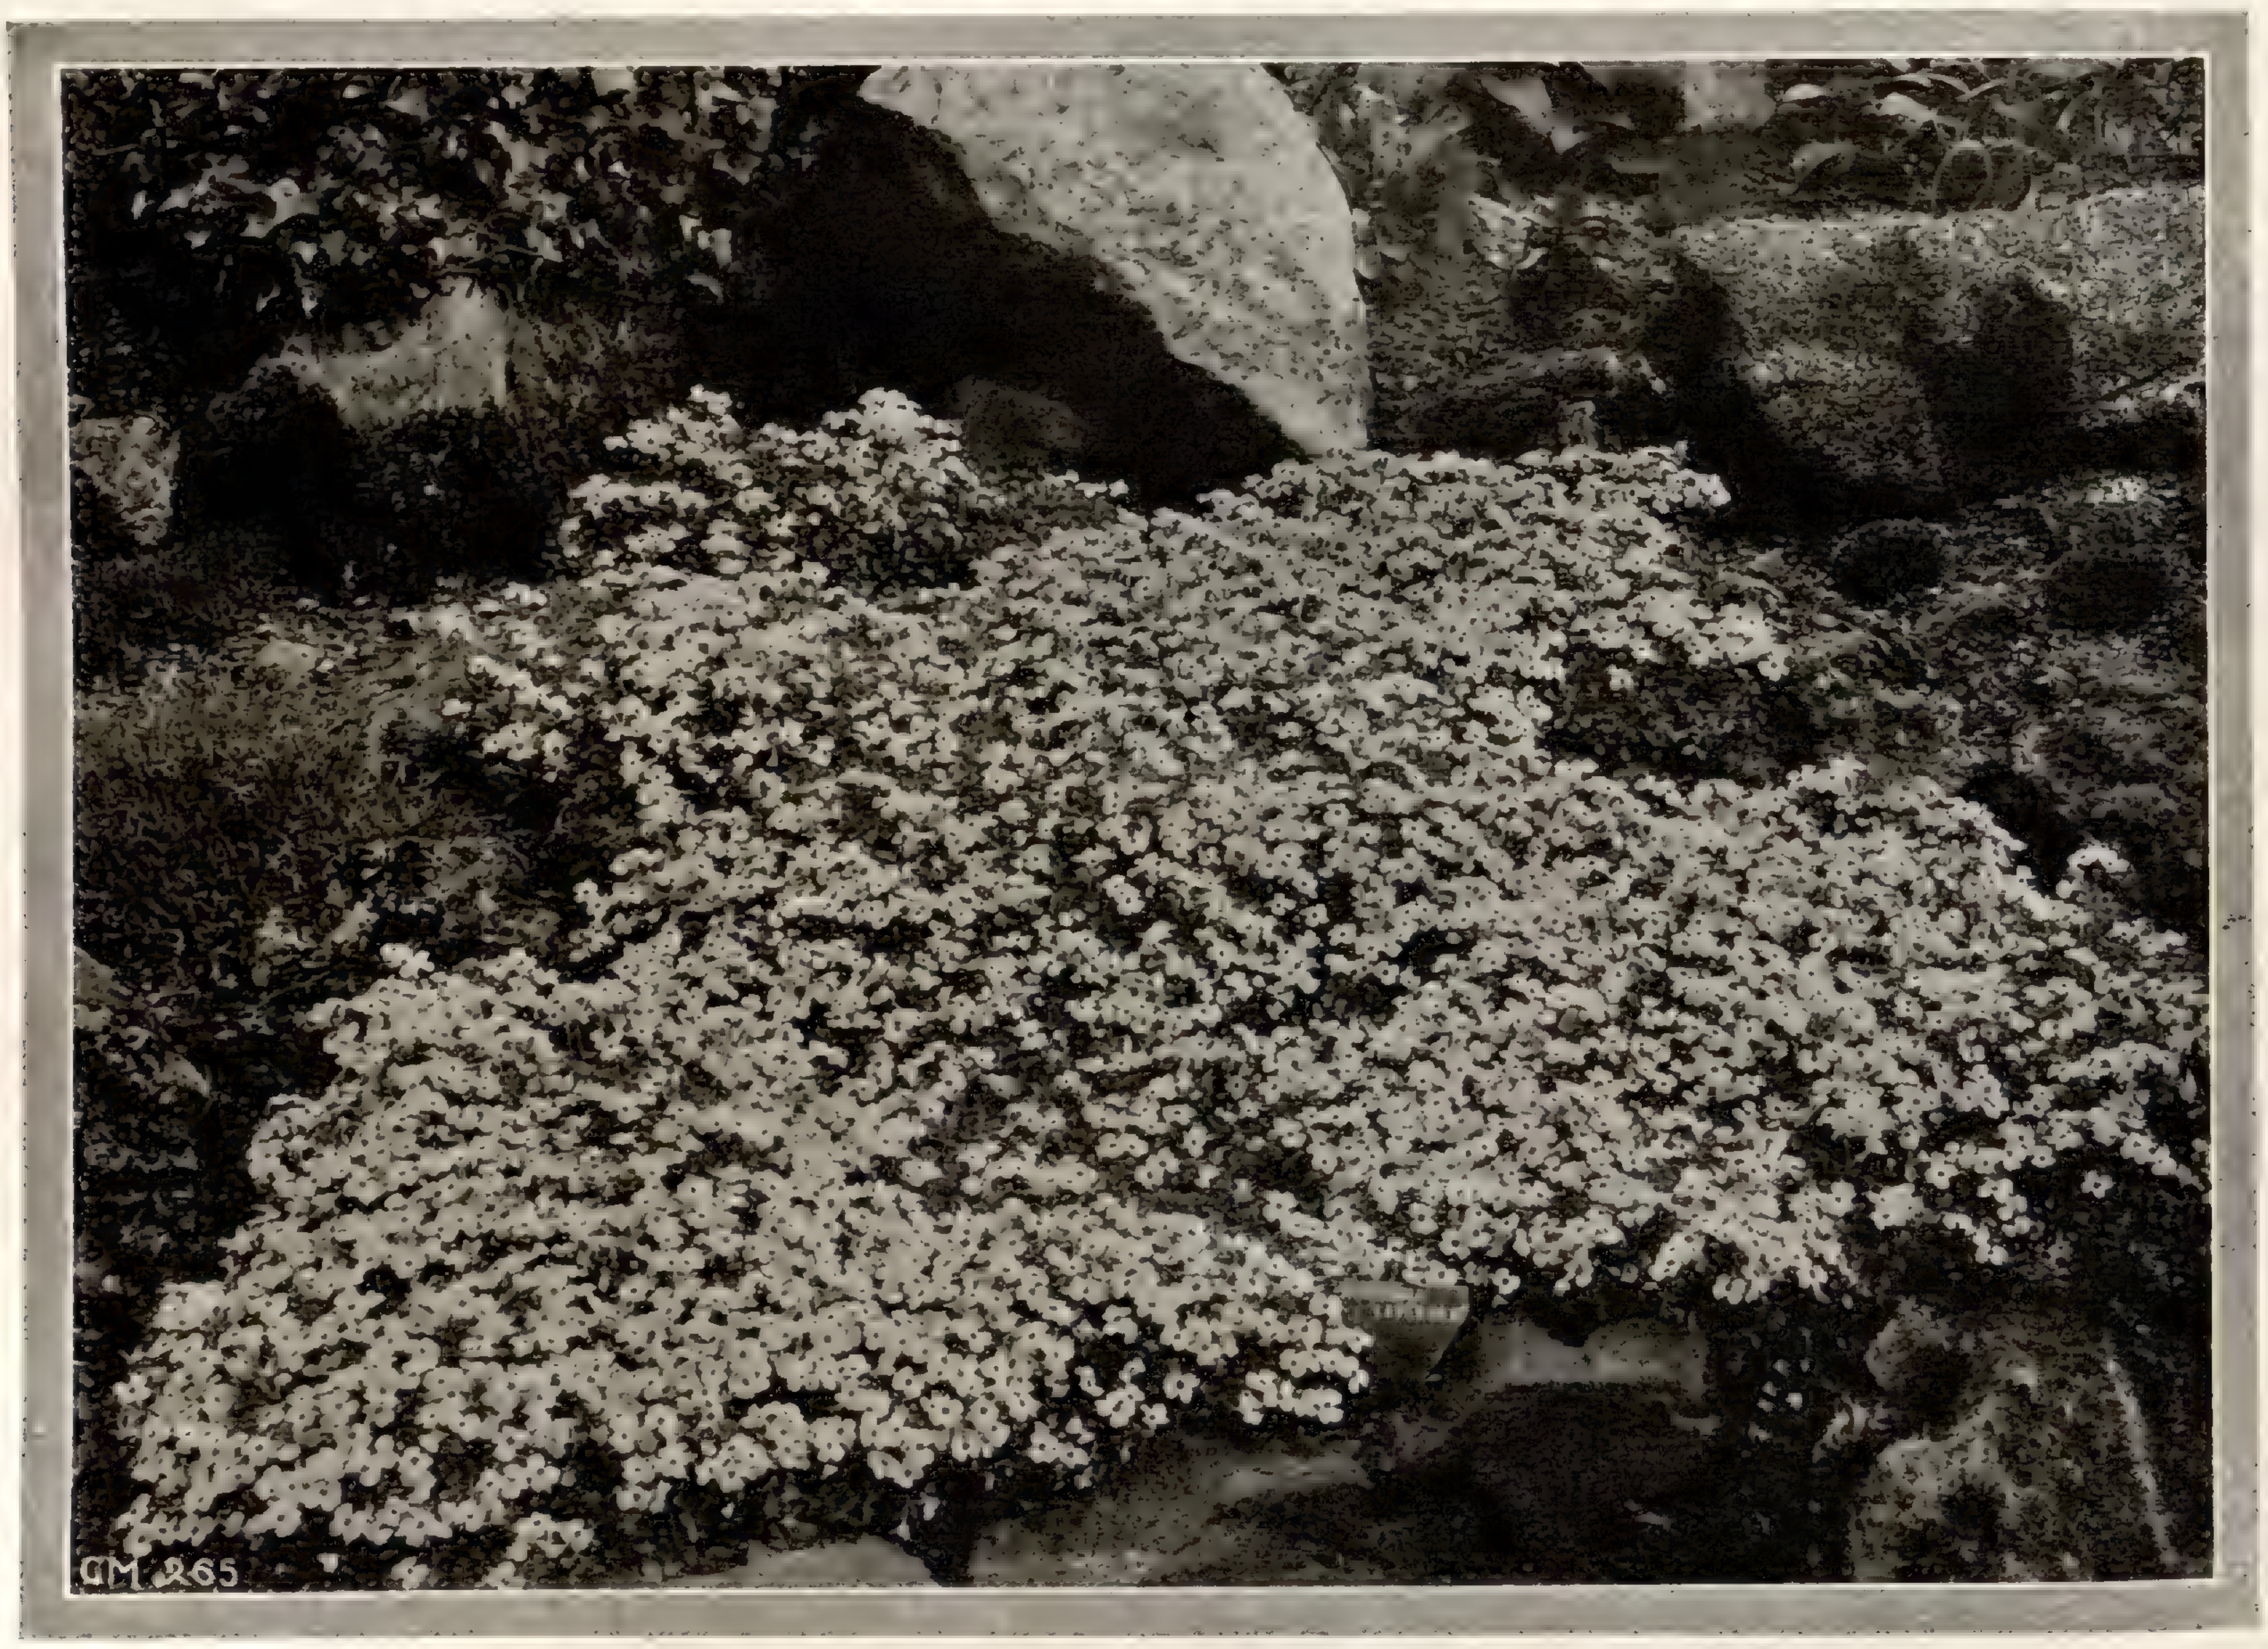
M. H.

"Carnations, Picotees, and Pinks" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## AUBRIETIAS.

Few plants possess higher qualities for rock garden adornment than aubrietias, and few, if any, produce such an effective and striking display of colour during late spring and early summer. Seen from a distance, a large drift is simply a display of colour, the flowers being produced in such abundance that the foliage is almost hidden. One great point in their favour is that they adapt themselves to the shady parts of the rock garden as well as to the sunny positions. The flowers are not so numerous when the plants are grown in the shade, but the foliage has a richer appearance than when growing in full sun.

It is always advisable to plant the variety Dr. Mules in a shady or half-shady spot, for the colour is much better in such a position than it is when exposed to the hot rays of the sun. Cultivation is very simple, for aubrietias will accommodate themselves in any ordinary garden soil of a light character. Early autumn is the most suitable time to plant aubrietias, so that they may become fully established before the winter sets in. The finest effects are obtained when the plants are grouped in masses or drifts; an irregular stream of colour commencing at the top of a mound of rockery and coming down unbroken to the base makes a pleasing picture.



AUBRIETIA DELTOIDEA LAVENDER.
A distinct and beautiful variety with lavender-coloured flowers. The fine example herewith illustrated is growing in the rock garden at Kew.

Regarding the propagation, this can be effected by sowing seeds or by cuttings. Raising plants from seeds is much the easiest method, yet when dealing with named varieties, it is necessary to propagate by cuttings to obtain a true stock. Seed saved from the choice varieties and sown immediately it is ripe produces some beautiful forms, embracing many colours.

The young soft growths, which are produced when the flowering season is over, will be found the most suitable material for cuttings. These should be about an inch or an inch and a-half long and prepared in the ordinary way. Pots or pans filled with clean sand are most convenient for rooting the cuttings in, and they should be placed in a close cold frame, which must be kept shaded until root action commences. When the cuttings have made a fair amount of roots they should be put singly into small pots, and given cold frame treatment through the first winter. During the following spring they may be put into larger pots, with the idea of growing them until good-sized examples are obtained, which, when planted in their permanent positions, will produce an effective display.

Another method of cultivation is to plant out the young stock into raised nursery beds, instead of repotting, and excellent plants are obtained in this way. The one advantage of pot-grown plants is that they may be planted at any time, whereas when they have to be lifted from the open ground it must be done in early autumn.

Apart from rock garden cultivation, the aubrietias are desirable plants for spring bedding, and may be effectively used for carpeting and edging. They also adapt themselves to wall gardening, and large patches in flower on the top of an old wall make pleasing pictures, as these pages have shown.

The two variegated forms, argentea and aurea, are highly appreciated for the colouring of the foliage, which provides colour after the flowers are past. Bridesmaid is a very fine variety of a soft blush colour; Campbelli is violet, with a compact habit of growth; Dr. Mules is still one of the best, the rich purple flowers being produced in great abundance. Fire King gives the best results when grown in a sunny position, and it is the most brilliant red of all the aubrietias; Lavender is one of the newer varieties, with pale lavender flowers, opening somewhat later than many of the older kinds; Leichtlini varies considerably in colour, but when a good form is obtained, the flowers are bright crimson; Moerheimi has beautiful rose-coloured flowers, of a large size, but, unfortunately, it is not such a fast grower as one might wish it to be; Prichard's A1 is rather late in flowering, and has large, violet flowers; Souvenir de W. Ingram has a splendid habit, and is of rapid growth, the rose-coloured flowers being very fine, with bold, rounded petals. Now that the plants are in bloom they should be studied, and notes made for future reference.

Gnaton Gardens. E. C. Pooley.

**Arum The Godfrey.**—This variety presents one of those striking anomalies that frequently occur in gardening, for, whereas the type plant Richardia æthiopica is extensively grown in practically every garden, its merits are quite second-rate to the variety under notice. In The Godfrey the spathes are much whiter and more expanded than in the type; while the plant is dwarfer, blooms earlier, and produces a greater number of spathes, quite a distinct feature being the manner in which the succession is maintained. When grown side by side in quantity, the superiority of the variety is so well defined, that once its merits is recognised, the type plant will not long be entertained in the same collection. Like the common R. æthiopica, it revels in a rich compost with an abundant supply of moisture. I find, however, that the best results follow from a restricted root run, as the spathes always come the most freely once the roots have thoroughly taken possession of the soil.—T. S.

## HARD-WOODED PLANTS.

One of the many features in which the International Horticultural Exhibition of this year differed from the preceding one is that hard-wooded plants occupied a far less prominent position than they did 46 years ago. At that time specimen plants of these subjects were met with in many gardens, and freely exhibited, whereas now their culture is followed by very few.

Not only were hard-wooded plants, then popular, but they had long been extensively grown. This was brought forcibly home to me when perusing some numbers of the "Floricultural Cabinet" for the years 1845-6 and 7. In the reports of the exhibitions then held at Chiswick and Regent's Park the size of some of the specimens was enough to take one's breath away. Thus the following, among a vast number of others were noted: Aphelexis humilis, 2ft. high and 3ft. in diameter; Boronia serrulata, 3ft. by 4ft.; Chorizemas, 5ft. by 5ft.; Chorizema Henchmanni, 2ft. by 2ft.; Daviesia saligna, 4ft. by 6ft.; Eutaxia pungens, 3ft by 4ft.; Hovea Celsi, 3ft. by 2ft.; Leschenaultia formosa, 2ft. by 3ft.; Pavetta caffra, 8ft. by 4ft.; Pimelea decussata, 4ft. by 4ft.; Polygala oppositifolia, 4ft. by 8ft.; and Phœnicoma prolifera, 2ft. by 4ft., with many others almost, if not equally, fine and Cape heaths innumerable.

When one considers the vast improvements that have taken place in horticultural structures and their heating since that period, it says much for the great care and attention that the old-time gardeners used to bestow upon their plants. Whether the vagaries of fashion will ever bring them again into popularity remains to be seen, but the fact is that the culture of hard-wooded plants as large specimens is too slow for present-day ideas, and furthermore, they are not of much use for the supply of cut flowers, which is now the standard by which so many subjects are judged.

The culture of hard-wooded plants is, however, not discontinued in this country; in fact, some of them are grown in very large quantities, but the sorts are, as a rule, decidedly limited, and, instead of huge specimens, they are now, generally speaking, confined to pots from five inches to six inches in diameter. Some cultivators grow a few kinds of heaths by thousands, a busy time being when the annual sales of these plants take place at the end of the summer or in early autumn, within the environs of London. Just at that time, on the point of opening its earliest purplish-red blossoms comes Erica gracilis, and its pretty white variety nivalis, which is in purity superior to the older variety alba. After that comes the little white, sweet-scented Erica caffra, and then follows the winter heath—Erica hyemalis, so valuable from the fact that it may be had in bloom during the month of December, and at the New Year. The little specimens of this heath that one meets with in the florists' shops of London about Christmas time are models of cultural skill. It is strange that the origin and early history of such a valuable heath as this should be unknown, but it is usually regarded as a hybrid. The white variety—Erica hyemalis alba—is also much grown. Another winter-flowering heath, whose culture has been considerably extended within recent years is Erica melanthera, that bears a profusion of very pale mauve, almost white, blossoms, against which the blackish anthers stand out in a conspicuous manner. The flowers are small, and have a slight but pleasing fragrance. With the new year, or, at all events, before it is far advanced, comes the showy reddish-pink Erica Wilmoreana, the beautiful white-flowered E. candidissima, E. persoluta alba, with tiny white bells, the bright red E. hybrida, and E. Spenceriana, whose tubular-shaped blossoms are white, tinged more or less with lilac-rose.

As spring advances the beautiful golden blooms of E. Cavendishiana are at their best, and also the charming dwarf-growing E. ventricosa, represented by several forms. Towards the latter part of the summer the scarlet-flowered E. cerinthoides coronata and E. verticillata are very showy, but at that season there is less demand for them, and consequently they are grown in more limited numbers.

Boronias are another very popular class, of which the most generally grown are Boronia megastigma, whose drooping bell-shaped blossoms, though somewhat dull in their colouring, are deliciously fragrant; B. heterophylla, with bright carmine-coloured flowers; and B. elatior, with drooping rosy-red tinted blossoms, are later in expanding than those of the others.

Epacrises are frequently grown in 6in. pots, and in this way delightful little

LÆLIO-CATTLEYA BEDOUIN.
A magnificent specimen carrying twenty-three fine white and purple flowers. Exhibited by Lieut.-Colonel Sir George Holford at the Royal International Horticultural Exhibition.

specimens are turned out in large quantities by the most successful cultivators. Among their other desirable features is the fact that they may be had in bloom in the depth of winter, while the flowers remain fresh and bright for a considerable time, and, being in many varieties borne in long sprays, they are very useful in a cut state. Of these the white and rose shades are especially pleasing.

Other hard-wooded plants that are still grown, but in limited numbers are aphelexis, Aotus gracillima, pimeleas, chorizemas, polygalas, and the scarlet Bottle Brush plant, known both as Metrosideros floribunda and Callistemon salignus.

Acacias are usually classed with hard-wooded or New Holland plants, but they are less particular in their cultural requirements than those previously mentioned. Except in the case of one or two of the more delicate growers, such as Acacia Drummondi, they require but little peat, whereas heaths, etc., need a soil consisting entirely of peat and sand.

Although botanists tell us that the so-called Indian azaleas are in reality rhododendrons, yet for garden purposes the generic name of azalea is not at all likely to be superseded. The varieties of Indian azalea are to-day as popular as ever, but instead of the huge pyramidal or standard specimens that such of us as are past middle age can well remember, we rarely see other than the neat little plants grafted on to stems about a foot in height, which are grown in a wholesale manner, chiefly in Belgium, and are sent to this country in immense numbers during the autumn months. Small standards on tall stems are now sometimes seen, while one variety in particular, namely Hexe, is grown as little bushy plants on its own roots.

Of rhododendrons proper many of the Himalayan hybrids are much appreciated, but to see them at their best they need, in most cases at least, to attain the dimensions of good-sized bushes. The hybrids in which the compact-growing Rhododendron ciliatum has played a part, bloom more readily in a small state than most of the others.

The members of the Javanese section will, however, flower freely when small, while, what is more, their period of blooming is not limited to any particular season of the year, as they flower more or less continuously from January to December. They form an exceedingly bright and cheerful feature in the warm greenhouse, for the original species, being natives of the tropics, the several varieties need more heat than the Himalayan species and the hybrids that have originated therefrom.

W.

---

**Solanum Wendlandi.**—When first introduced this solanum quickly showed its value as a vigorous growing climber for the warm greenhouse, or coolest part of the stove. After a time it was proved that by striking shoots, such as would flower if allowed to remain on the plant, neat little examples, each carrying a large head of blossoms, could be obtained. Beautiful as Solanum Wendlandi is when grown in this way, its merits as a climber must not be overlooked, for, given a good light position in a structure kept somewhat warmer than an ordinary greenhouse, it will flower well. Cuttings of the growing shoots strike root readily in spring and summer. This solanum, which is a native of Costa Rica, was first sent to England by Mr. Wendland, director of the famous Botanic Garden at Herrenhausen, in Hanover, in 1882. Unlike a plant distributed by nurserymen, who naturally push its sale as much as possible, it was a long while before it became generally distributed.—W. T.

## LILIES AT THE INTERNATIONAL EXHIBITION.

Lovers of lilies—and who does not admire these beautiful flowers?—found much of interest at the great show at Chelsea, for in some collections veritable sheaves of the finest forms were to be seen. Special interest is, of course, centred around any new variety, and for that reason a very distinct form of Lilium davuricum or dauricum, which received an Award of Merit, was much sought after. The different varieties of Lilium davuricum are, for the most part, characterised by upright heads of cup-shaped flowers of some shade of red or deep orange. In this particular form, however, which bears the name of L. davuricum luteum, the colour of the flowers is a clear bright yellow, with dark-coloured dots on the basal half of the segments. In the very middle of the flower there is a slight orange suffusion. This lily, which attains a height of 3½ to 4ft., has very narrow leaves, which are on the under sides thickly clothed with tomentum. This feature also occurs on the stems and flower-buds. It is in every way a very distinct lily, and appears to be quite as robust as the ordinary forms of L. davuricum, all of which thrive so well in the open border. It was shown in good condition by Mr. Amos Perry, of Enfield.

A second lily to obtain an Award of Merit was Lilium myriophyllum, a Chinese species, that belongs to the Browni section. Like this last-named species, the funnel-shaped flowers are ivory-white, tinged with purple on the exterior. Inside they are pure white around the edges, with a yellowish shade towards the centre. A particularly notable feature of this lily is the great profusion in which the very narrow leaves are borne, as they are closely packed together on the stem. From this feature the specific name of myriophyllum is derived. The specimens to which the award was made were shown by Messrs. R. Wallace and Co., of Colchester, who have imported this lily in quantity of late, but for its discovery and introduction we are indebted to Mr. E. H. Wilson, who found it when travelling in China some years since.

Nearly all the lilies that it is possible to have in flower at this season were represented, among the most noticeable being the Siberian Lilium tenuifolium, with its prettily reflexed deep scarlet flowers, and its comparatively new form, Golden Gleam, in which the blossoms are of an orange-apricot colour. Lilium Hansoni, too, which is one of the most dependable of the different members of the Martagon section for flowering in pots, was largely shown, while most interesting lilies were the hybrids between it and the white Martagon, known as Miss Willmott, and Marhan.

The Browni class included, beside this species, L. myriophyllum above alluded to, L. leucanthum and L. odorum, known also as L. japonicum colchesteriense. Of the upright-flowered lilies which bloom naturally at this season there was no lack, the dwarf-growing Lilium elegans being represented by many varieties, while numerous forms of L. davuricum were also noted, including the new one above-mentioned. The old Orange Lily (L. croceum) still holds its own as one of the best of these cup-shaped lilies, as in warmth of colouring it stands out alone. Numerous examples of L. Batemanniæ were also noted, a decidedly unexpected exhibit, as it naturally flowers much later in the season. Splendid examples of Lilium longiflorum, L. testaceum, L. candidum, and L. speciosum were to be met with on all hands, the last-named being the result of retarding the bulbs.

Besides these above enumerated, the following were jotted down here and there, while passing the various exhibits: L. Parryi, L. Bloomerianum, L. giganteum, L. Krameri, and the allied L. rubescens, L. auratum, L. Grayi, L. Kellogi, L. Humboldti, L. maritimum, and the distinct L. columbianum.

## GREENHOUSE CLIMBERS.

The present rage for cut flowers, especially those having long stems, has been the cause of the neglect of many choice, neat-flowering greenhouse climbers, hence the reason so many of these have gone out of cultivation. There are but few establishments where time can be afforded to pay due attention to everything, and unless climbers are regularly looked after during the time they are making their growth, the shoots soon become so entangled as to be beyond control. It is the fashion now in many places to grow only such plants as can be used for cutting and furnishing, and, as but few of the greenhouse climbers lend themselves to these purposes, they have been discarded. The roof of a greenhouse or conservatory looks bare unless plants of some kind are hanging from the rafters, and even though the flowers produced on such plants may be unsuited for indoor decorations, they are nevertheless very pleasing when hanging from the roof. Therefore a small selection of plants of scandent habit should be regarded as essential to the proper furnishing of both the greenhouse and conservatory.

Some, we know, are of little worth individually, but when growing on the plants are very interesting. Take Hibbertia dentata for an example; the flowers would not make any display whatever if gathered and arranged in a vase, but intermingled with their bronze-looking foliage, they are very interesting. Those who take a keen interest in gardening, though they may like to have the rooms in the dwelling-house nicely furnished with plants and cut flowers are also desirous of growing everything they can that is beautiful and interesting, and some of these subjects are to be found among the more hardy of our greenhouse climbers. Streptosolen Jamesoni is one of these, for when allowed room to develop, it blooms most profusely, and as the flowers are of a rich old-gold colour, they have a telling effect, either when growing near the roof, or on a pillar. The flowers, too, are most useful for table decoration, as they can be used with good effect. The streptosolen is of easy culture, and flowers quite in a small state.

Solanum jasminoides is another of these free-flowering plants, and is well worthy of attention, and though it may be hardy in some places, it does best in a greenhouse. Kennedyas, too, form a neat group of free-flowering plants that appear to have gone quite out of cultivation. Their little pea-shaped flowers hang in small racemes among the foliage. Sollya Drummondi and S. heterophylla are also interesting. So are the two varieties of lapageria. To have these climbers do well, they must be kept free from insect pests, which, now there are so many different kinds of insecticides, should not be a very difficult task, provided this is taken in hand before they become too numerous. Repressive measures should be adopted immediately they are seen.

## HARDY PEACH CULTURE.

Much may be said in favour of the cultivation of almost any kind of hardy fruit, as the work is most interesting, and the results, when skill has been employed, the needful attention bestowed, and every requirement of the subject provided for, satisfying and encouraging.

The cultivation of the peach, as a hardy out-door fruit, however, demands the greatest knowledge, keenest discrimination, closest attention, and largest amount of labour in its management, and, for this reason, may be credited with being the most fascinating kind to grow. The introduction of hot-water pipes and cheap glass probably accounts for the absence of this fine fruit on the outdoor walls of so many of the gardens in the country, or, it may be, that a diminished staff cannot afford the necessary time to bestow the attention indispensable to success in its management. Either way, there are many garden walls in England, Wales, and Ireland, which could be utilised for the production of peaches with every success if care was taken in the preparation of the soil, and cultural requirements were attended to.

The peach luxuriates in a well-drained, stiff loam containing a high percentage of phosphates, lime, and potash, but the amount of humus, containing nitrogen, should be varied in accordance with the general atmospheric influences obtaining in the locality. In no case should what is termed strong growth be encouraged in any peach tree grown out of doors in a variable climate, low-lying, or moist situation, as the possibilities are that it will not sufficiently mature to ensure robust blooms and a free "set" of fruit. A rather poor soil with a liberal sprinkling of bone-meal or basic slag and old plaster will prove an excellent medium. If there is a deficiency of potash in the compost, and it is generally the case, this can be added by surface dressings of sulphate of potash of from 1oz. to 1½ozs. to the square yard during the growing season.

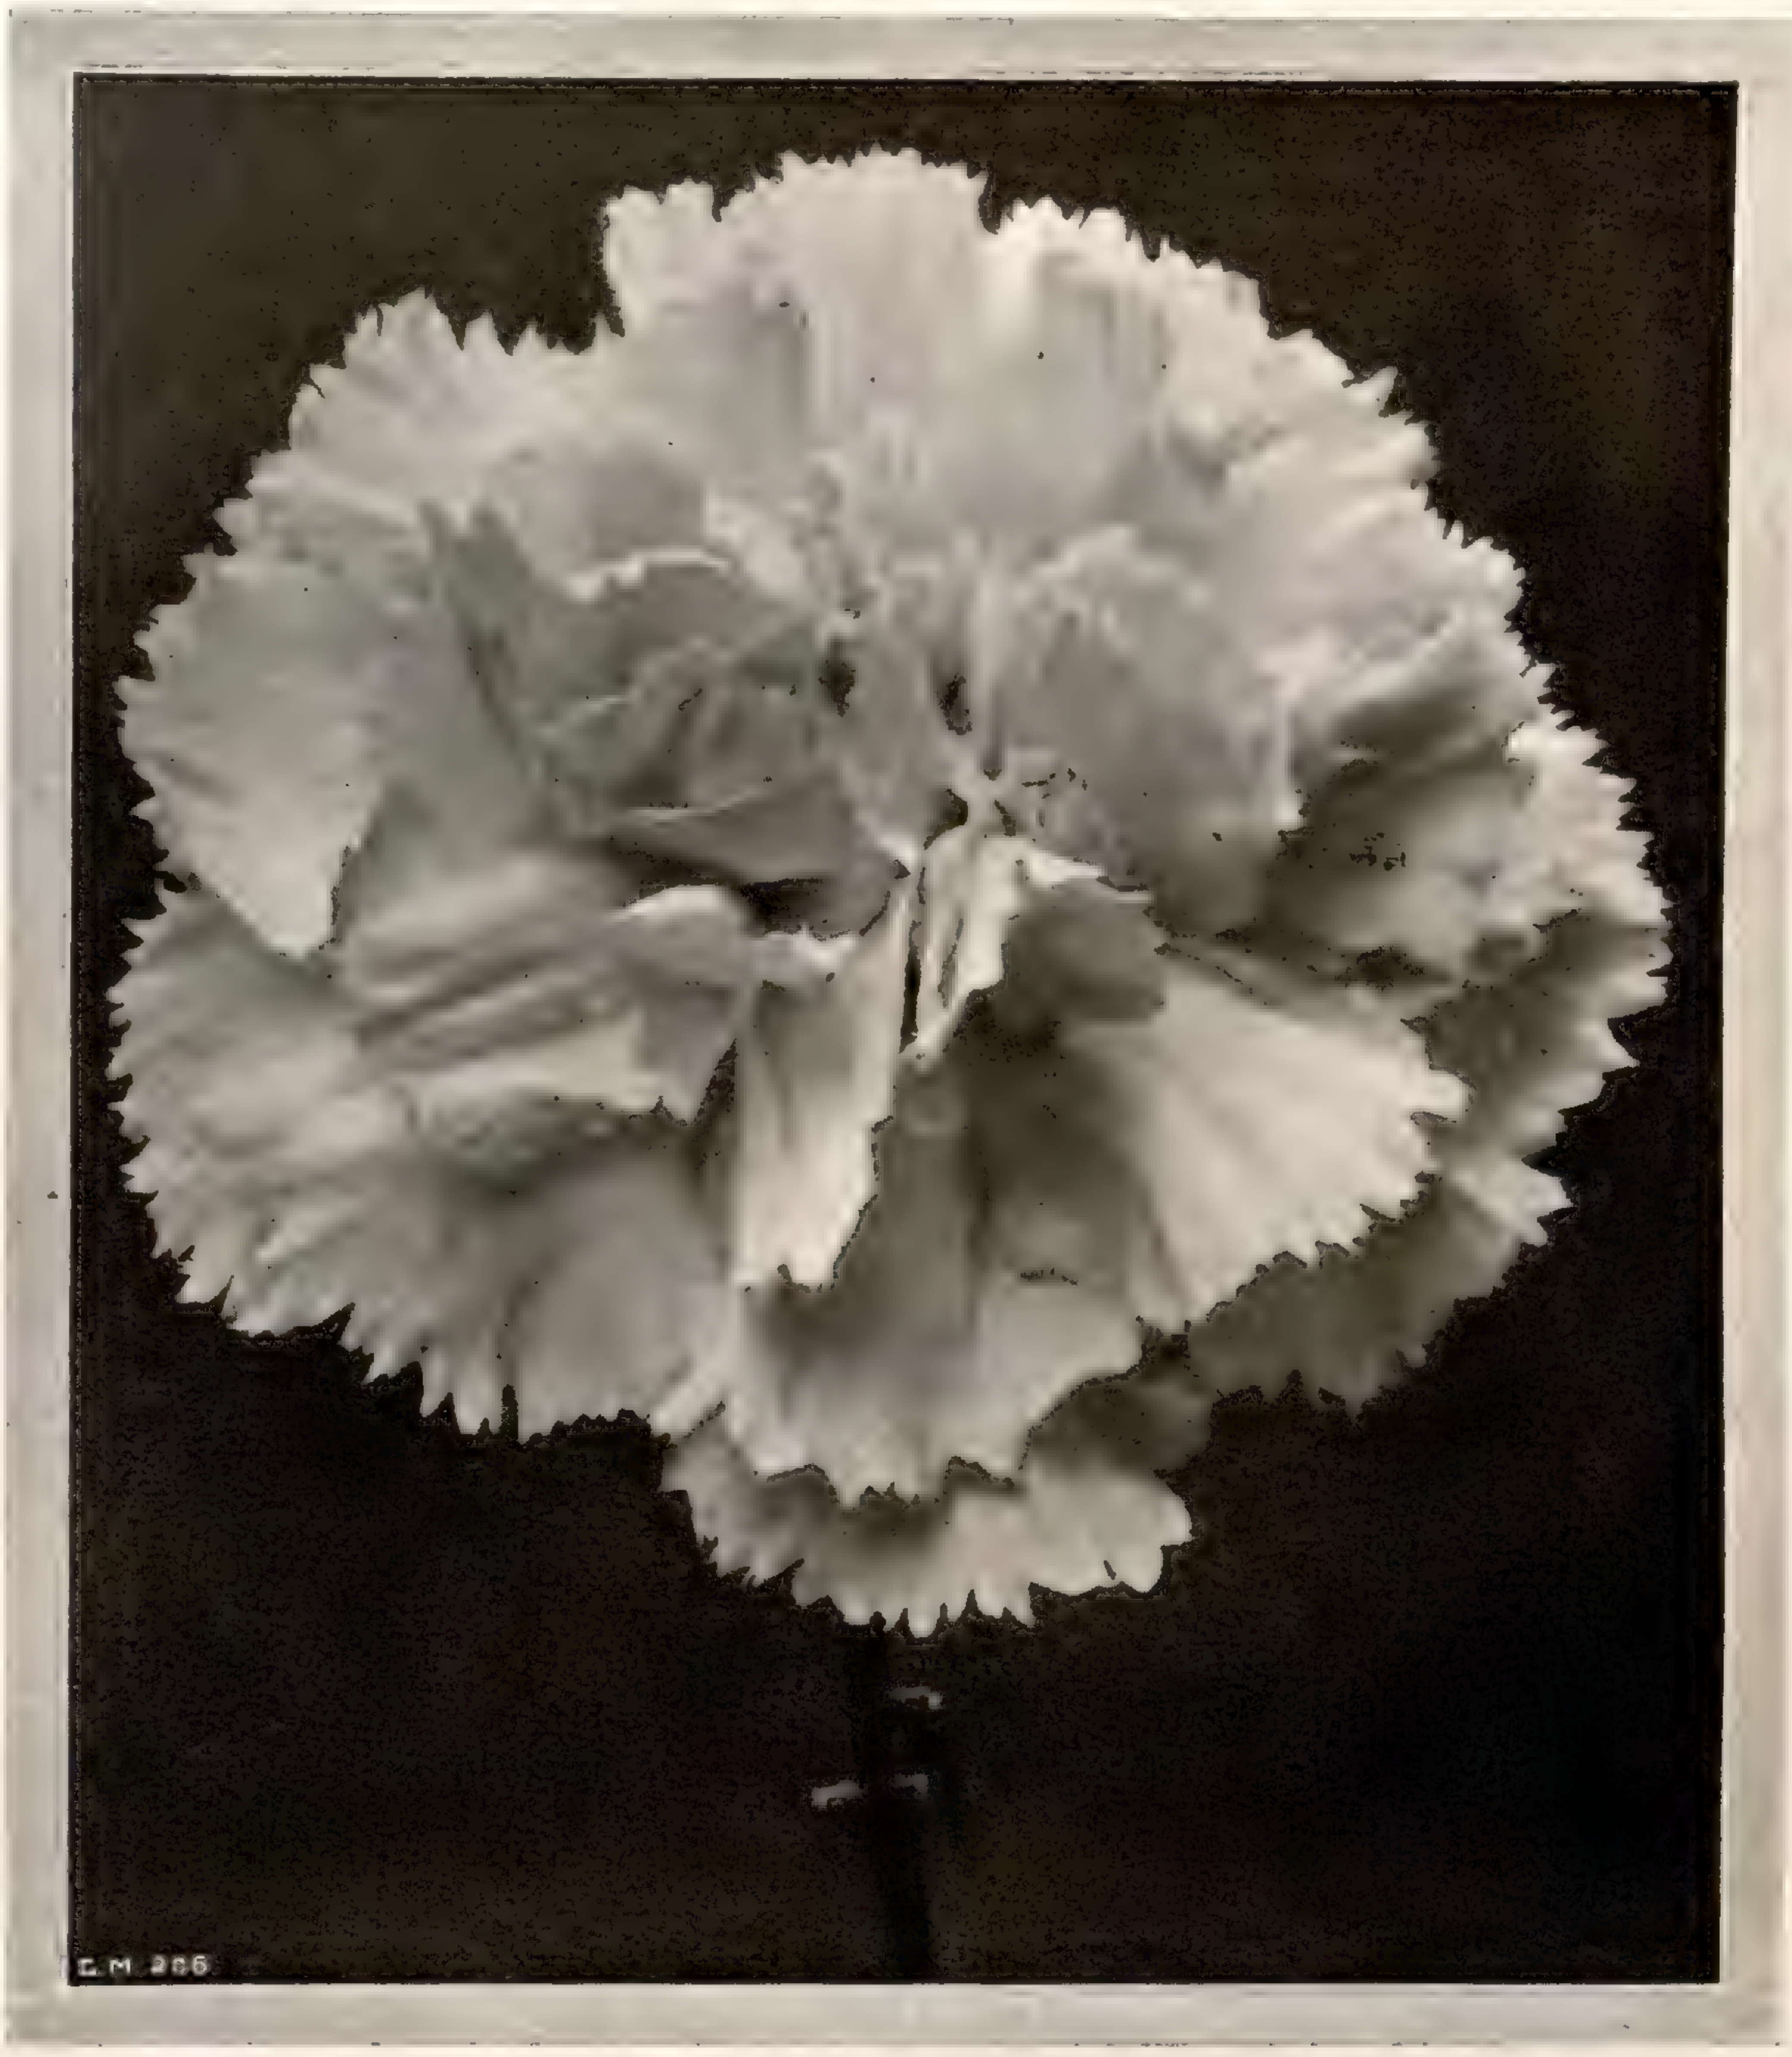
Like most stone fruits, the peach makes roots early, and for this reason autumn is the best time to plant it. When carrying out this operation it is well to remember that the stem will swell with time, and if placed near the wall will get damaged on coming in contact with it at the base. The shoots may be fastened to the wall then with nails and twine, but no pruning attempted till the following spring. At this period it is usually found that a portion of the points of the growths have died. These, and these only, should be removed with a sharp knife, or secateurs with two blades. It is at this stage of growth that real cultivation starts, and the success or failure will depend materially upon the attention bestowed.

Disbudding, as the buds push forth, should be systematically performed by rubbing off about a third of those not required. Allow about four days to pass, and then remove another third, and after another like period reduced the number on the plant to what is required to cover the allotted space so that the shoots will be from 4in. to 6in. apart. It is by attending to this item of management that the vigour of the tree is concentrated in the growths required, and light and air are enabled to play around and ripen them. Although these details of management are familiar to those who grow peaches under glass, yet, although it may seem incredulous, not ten per cent. of those I meet with, who are attempting to grow them out-of-doors, have any idea of thinning the shoots, or the advantages gained by doing so. In fact the majority treat their peaches in much the same way as they do a pear, and then wonder why they do not get fruit.

Established trees under good management will be in flower at the time disbudding is taking place, so that syringing cannot be commenced until the petals have fallen, but with newly-planted trees this operation can be carried out in the afternoons of warm, sunny days. With the object of keeping the plants free from green-fly and spider, a little soft soap should be mixed with the water once a week, and the plants themselves liberally supplied with water at the root on all occasions when moisture is deficient in the soil.

During the summer months the young growths should be periodically attended to, and tied to the wall, in order that they may have the advantage of its warmth to mature them. Any trees carrying a heavy load of fruit could be assisted with nitrate of soda or liquid farmyard manure, but in the use of either, care should be taken not to encourage a too strong growth. As syringing should be discontinued when the fruit is ripe, a thorough drenching, with force, should be given once the trees are cleared.

As a protection against the various mildews, that attack the peach tree out of doors, I have found nothing to equal sulphur and a little clay syringed on trees and walls in winter in no half-hearted way. The only virtue clay possesses in this case is its binding property, and only sufficient of it need be employed to induce the mixture to adhere to the wall and wood throughout May and June. About four parts of sulphur to one of clay, mixed in water, and of the consistency of thin paint, are the proportions I have found most effective. **Hibernia.**



CARNATION WODENETHE.

A pure white, fringed and fragrant perpetual-flowering carnation; blooms of large size and fine substance. A.M., R.H.S., April 16. Messrs. W. Wells and Co., Merstham.

## RHODOCHITON VOLUBILE.

This is a beautiful and useful climber which should be grown in every garden. It is usually treated as a greenhouse plant, but when planted out of doors it succeeds equally as well. In the North of Scotland I have seen it attaining a height of 10ft. and blooming from June till October, when planted against a south wall. It is a rapid grower, and is useful for covering old tree stumps and bare, unsightly walls.

The flowers are borne in long trails; the calyx is of a reddish colour, and the corolla blackish, while the stamens are white. In autumn the leaves turn a deep red colour, giving the whole plant a handsome appearance. Seeds are generally sown in the autumn, but if sown at the present time in pans, good results will be obtained. Sow the seeds thinly, and place the pans over gentle bottom heat. When the seedlings are large enough pot them off singly into 3in. pots, and put a stake to each one. Planting out can be done with safety towards the end of May. During dry weather applications of weak liquid manure will prove beneficial. Those who have not already tried this charming plant should grow it, as I feel sure that they will be delighted with it. **D. S. Anderson.**

Wemyss Castle Gardens.

## ROSE SERICEA AND ITS VARIETY PTERACANTHA.

Rosa sericea has been for many years in cultivation in this country, and is commonly known as the four-petalled rose, from the fact that the bulk of the flowers produce only four petals, instead of the normal five, as with other species of Rosa. It was originally introduced from India, where it is common throughout the Himalayan range of mountains. It also is found in Tibet, and extends far into China. From the fact that it inhabits the mountains at altitudes up to 11,000 feet its hardiness is beyond question.

It is extremely variable in habit, size of flower, and fruit, and even in the colour and size of the prickles with which this species is well supplied. For a hot sunny bank, in rather poor or sandy soil, few plants will give better results. The flowers are creamy-white, one and a-half to two inches in diameter, with rich yellow anthers, rather sweetly scented, and produced in profusion all over the bush. The fruits vary considerably in size and colour, being bright red to almost black, and from the size of a pea to that of a walnut, and in shape may be globose, oval, or even pear-shaped. It is said that the fruits are largely eaten by the natives, and have a pleasantly acid flavour.

In the variety R. s. pteracantha the flowers are smaller than the type, but the charm of this plant lies in its large bright-red, winged prickles, which clothe the young stems, and give this plant quite a distinct appearance, even when grown amongst other roses. When first exhibited by Messrs. Paul and Son, Cheshunt, a few years ago, it attracted much attention. Mr. E. H. Wilson, when collecting for Messrs. J. Veitch and Sons, was fortunate in securing a goodly number of seeds of this fine variety, from which a fine stock of plants has been raised. It was also found later on in North-west Yunnan by Mr. G. Forrest, when collecting for Messrs. Bees, Lim.

C. P. Raffill.

## MADRESFIELD COURT GRAPE.

Some cultivators succeed in growing this noble grape to perfection, while others fail to achieve entire success. Hundreds of growers produce crops of fruit of moderate quality; and when one sees perfect bunches one is compelled to closely examine them, and admire them fully.

The bunches I admired first were staged by Mr. E. Molyneux at Southampton, when the exhibitions used to be held in Westwood Park. These bunches were not extra large, but they were, as regards size of berry, form, and finish, perfect, and no one would wish to have bunches larger. This was about twenty years ago, perhaps a little more. In more recent years I have seen grand bunches staged by other growers in various parts of the country, notably by Mr. Doe, of Rufford Abbey, at the Hanley Floral Fête.

The perfecting of the grapes depends chiefly on the management. In a few instances, no doubt, the best management fails if the roots are not under control, or the structure is an unsuitable one. I have both succeeded and failed with grapes grown under exactly the same circumstances. The success followed close attention to general treatment, and the failure a certain amount of inattention, owing to the claims of other matters.

Madresfield Court grape is very often recommended as a greenhouse variety for cool structures, etc. The vine is one of the best as regards growth; it is remarkably fruitful, but if overcropped while young it will take a period of three years to bring the vine back to its normal state of good health. Inexperienced cultivators are tempted to leave on too many bunches before the vines are five years old from the date of planting. Overcropping at all times militates against good colour. A close, moist atmosphere is also inimical, and such we often find in amateurs' greenhouses, where a miscellaneous collection of pot plants is grown. If there are chiefly zonal pelargoniums in the house, the atmosphere may be maintained in a suitable condition for the grapes.

When I have had the most satisfactory bunches of Madresfield Court, it has been after watering the border freely with water heated to over 100 degrees, and after each watering covering the surface immediately with dry cut straw. At such times when one could see the heat shimmering on the roofs of houses, and just above the ground, the ventilators were opened to their fullest extent. A good wind at the same time improved matters. In such circumstances the berries coloured splendidly in twenty-two days. Splitting or cracking of the berries did not occur. But when the weather was dull at times, bright at others, and no heat was put on during the nighttime, a few berries cracked every morning, the berries did not colour satisfactorily, and the process was much slower.

These conditions prevailed in other years. But when the pipes were warmed on dull days, and throughout the night, the colour was better, and splitting did not occur. Splitting occurs when the soil has been allowed to become dry, and is then thoroughly saturated with water, but I think a very low temperature and close, moist atmosphere, the chief causes, combined with overcropping, of bad colour, and cracking.

Geo. Garner.

# HORTICULTURAL EDUCATION IN AMERICA.

The following is the text of the paper by Professor L. H. Bailey, of Cornell University, Ithaca, U.S. America, read at the Conference on Horticultural Education held in conjunction with the Royal International Horticultural Exhibition at Chelsea.

General horticultural education in the United States is mostly a part of a national system of industrial education of collegiate grade or name. There is little development, as yet, of the training-school idea on either a private or a public basis, and relatively few institutions or establishments in which persons are trained for "gardening" as they are trained in the Old World. There is no recognised apprentice system for gardeners.

The whole subject, therefore, needs to be considered quite by itself, and not in comparison with systems or methods of education in horticulture in other countries; and it is necessary to understand something of the system of publicly endowed industrial education, of which this is but an incident or a part.

The public industrial education of the United States, of college grade, is founded on the Land Grant Act of 1862. By the terms of this great instrument, every State received from the Federal Government 30,000 acres of land for every representative that it had in Congress, the proceeds of which are to be used for "the endowment, support, and maintenance of at least one college where the leading object should be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, in such manner as the legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life." This endowment has been supplemented by subsequent direct federal appropriations, to further the objects for which the original grant was made. On this liberal foundation all the forty-eight States comprising the Union have established colleges of agriculture and the mechanic arts, about half of them separate institutions and about half of them connected with, or part of, State universities or other general institutions. The States themselves have supplemented the proceeds of the land grant, often many times multiplying their incomes. These colleges represent many types of organisation and method. Many of them cannot be called technical colleges. Their purpose is increasingly to train young men and women broadly by means of agricultural and country-life subjects. They are now exerting great influence in re-directing rural civilisation in the United States. They are rapidly putting agricultural and rural subjects into educational form, and are demonstrating that such subjects may have training and even cultural value equal to that of historical subjects.

The land-grant colleges contain many departments, and horticulture is usually one of these departments, co-ordinate with the others. In one college of agriculture, for example, which is part of a university, there are twenty-two teaching departments, aside from the work in the fundamental arts and sciences, as follows: Chemistry in its relation with agriculture; entomology, biology, and nature-study; plant physiology; plant pathology; plant-breeding; soil technology; farm crops; farm management (the principles of business as applied to farming); horticulture; pomology; forestry; animal husbandry; poultry husbandry; dairy industry; home economics; farm mechanics; rural economy; landscape art; drawing; rural education; meteorology; extension teaching. It will be seen, therefore, that horticulture is only one contributing part in an educational establishment for the teaching of agriculture in a broad way; and the same may be said of all the other land-grant colleges. There are a few other regular colleges that teach horticulture with other work, but they have not made great headway, although the subject will assert itself strongly in many of these institutions in the future. There are two or three training schools, one for women.

The students in agriculture in the land-grant colleges number many thousands, in some cases a thousand and more in one institution. They come from all walks and conditions of life, and from city and country alike. Some of them, of course, have strong inclinations for horticulture, and soon specialise in that subject. The full course of instruction is uniformly four years, following college-entrance requirements, and the student at graduation receives a diploma carrying Bachelor of Science or a similar degree. In many of these institutions, post-graduate work in a variety of subjects is provided, leading to a master's degree, or even to a doctor's degree.

## The Horticultural Work.

We may now consider the horticultural work of these colleges in more detail.

In the early days of such instruction, the horticulture was set over against the agriculture, and these two comprised the main applied groups. The breaking-out of the group of horticulture was really the beginning of the broadening of these institutions and of their more perfect articulation with the conditions before them.

Horticulture, as understood in these colleges, comprises fruit-growing, flower-growing, vegetable-gardening, together with the nursery and glasshouse subjects naturally associated with them. With the further differentiation of the curriculum, horticulture tends to be split or separated into its three main parts, with separate units or teacherships for each, but this division has not yet proceeded far. If this division is ever carried to its conclusion, the name "horticulture" as an administrative unit will pass out.

In the colleges horticulture is regarded as a phase of agriculture. For the most part, the student approaches the subject from the point of view of farming by means of fruits or vegetables, or even of flowers. The strictly amateur or plant-love phase is incidentally emphasised, as a rule, and this undoubtedly is one of the weaknesses of American horticultural instruction. The amateur attitude, however, will appear more markedly as time goes on. The present attitude very well represents the development that America is now making, as expressed particularly in the great orchard interests. The gardeners, as a group, have had relatively little touch with these institutions in the way of dictating or even influencing their development. So far as institutions are concerned, the gardening phase of horticulture is best expressed where the great collections are, as at the Shaw or Missouri Botanical Gardens, Arnold Arboretum, Bussey Institution, New York Botanic Gardens, and the like; and these institutions will also produce highly trained specialists in related scientific lines. This excellent class of institutions I am not discussing in this paper.

## Courses of Instruction.

The content of the work in the land-grant colleges varies greatly, depending, of course, on the constituency of the particular college, as well as on the staff. Naturally, in the States in which horticultural interests are large, the work will express itself strongly in the college. At one of the colleges, in which there are four professorships and a number of minor posts in horticulture, about two dozen separate courses are given. These are transcribed here, not at all as patterns, but merely as an indication of the kind and scope of work that such institutions may offer:—

Elementary Pomology.—First term. Three hours. A study of the methods of propagation and early care of commercial fruits, including the growing of seedlings, cuttings, and layers; the principles of budding, grafting, pruning, and planting; the soils, varieties, and planting plans for the orchard. (See following course.)

Elementary Pomology.—First term. One hour. Required of students taking the advanced courses in Pomology. Laboratory course to accompany preceding course. A study of the methods of budding, grafting, pruning, and planting; varieties, nursery trees and fruit buds.

Practical Pomology. — Second term. Three hours. Pre-requisite first course above. A study of the soils and varieties for the orchard; cultivation, cover crops, fertilsation, spraying, pruning, and thinning as practised in orchard management; the picking, grading, packing, storing, and marketing of fruit. This course considers the apple, pear, quince, cherry, plum, apricot, peach, and the nuts.

Bush Fruits.—Second term. One hour. Pre-requisite first course above. A lecture course which considers the grape, raspberry, blackberry, dewberry, currant, gooseberry, and strawberry. The topics discussed are: Varieties, planting, culture, picking, grading, packing, and marketing.

Spraying of Fruit Trees.—Second term. Two hours. Pre-requisite first course above, a course in Plant Pathology, and a course in Entomology. A study of the preparation and application of the spray mixtures used in orchard practice.

Advanced Practical Pomology. — First term. Two hours. Pre-requisite first two courses above, and a course in Botany or one in Biology. The course considers the packing of apples in boxes and barrels; a comprehensive study of the varieties of peaches, plums, grapes, pears, and apples; the judging of fruits; the preparation of planting and working plans; the disposition of inferior grades and culls. From the students in this course, teams will be chosen to do practical judging at the annual meetings of the State societies at Rochester. The preparation of the fruit exhibit at the college is required of the students in this course.

Systematic Pomology.—Second term. Two hours. Pre-requisite, first three and last courses above, and a course in Botany or one in Biology. A course designed primarily for graduates and students who are preparing to do experimental work. A study of the characters and botanical relationships of the fruits of the United States. Each student is required to collect and mount a number of varieties and species.

Research in Pomology. Throughout the year. One or more hours a term. Pre-requisite first three courses above, and last course but one above; students taking this course are required to take Seminary in Pomology, mentioned below. Original investigation of problems in Pomology. A typewritten thesis is required.

Seminary.—Second term. One hour. Open only to graduates and students taking last two courses mentioned above.

Commercial Floriculture.—Second term. Three hours. Pre-requisite first term of Greenhouse and Garden Practice (see below), or commercial experience. Students are advised to take Greenhouse Construction before entering this course. Studies in the propagation and culture of the leading florist crops. As facilities permit, students will be assigned space in the greenhouses for practical experience in the growing of roses, carnations, chrysanthemums, violets, sweet peas, etc.

Commercial Floriculture. — First term. Three hours. A continuation of the preceding course, with discussions on diseases, insects, botany, and the packing, handling, and marketing of cut flowers and plants for retail and wholesale markets. Class will participate in a required excursion.

Garden Flowers.—Second term. Three hours. This course is designed to acquaint the student with garden plants and to give practical knowledge of the propagation and culture of the annuals, herbaceous perennials, bulbs, and shrubs used for cut flowers or in ornamental planting.

(To be concluded.)

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

COOL HOUSE.—The principal occupants of this house usually consist of odontoglossums and oncidiums, but there are other species of orchids which are of interest, and worthy of attention. Among them is the sweet-scented Trichosma suavis, and where fragrant flowers are appreciated it should be grown for its perfume. The partially-developed stems are now making new roots, and if repotting is needed it should be done at once. The plants will succeed either in pots or shallow pans, which must be well drained, and a compost similar to that used for cœlogynes will answer. The plant delights in a moist damp position on the stage of the house, and must not be exposed to strong sunshine, and, when well established, may be kept moderately moist the year through.

LÆLIA MONOPHYLLA.—At the present time plants of this little gem are producing their flower spikes, and it is advisable to keep them well up to the light, but a draughty position, where they will dry too quickly must be avoided. They may receive plenty of water at the roots, and must be carefully shaded from all sunshine. When established this orchid is not a difficult subject to deal with, as, given a suitable compost, kept cool and moist, it grows satisfactorily, and flowers freely from its very slender stems. Such well-known orchids as L. autumnalis and L. albida, which are often classed as cool house orchids, succeed better if rested and grown in a cool intermediate house, suspended close to the glass in a light position. Any repotting of either of these species necessary may be done at this season.

COOL HOUSE DENDROBIUMS.—Among the different orchids that will thrive in this house are Dendrobium Kingianum, D. delicatum, D. speciosum, D. Hilli, D. teretifolium, D. glomeratum, D. japonicum, and D. Victoria Regina. Any of these now starting to grow may have fresh rooting material afforded them; they prefer rather a shallow layer of compost to root in, and succeed best when grown in a strong light. A compost as used for other dendrobiums will answer their requirements. D. teretifolium is best grown on a teak raft, with a little of the compost packed closely between the bars, and under the base of the plant. It should be suspended in such a way that the pseudo-bulbs or foliage hang down naturally. D. Victoria Regina prefers a shady position, and thrives best in teak-wood baskets, in a compost in which live sphagnum moss predominates. When in full growth these all may be well supplied with water at the roots, but when at rest water must be administered to them with great caution, as many of the species require a long dry rest to induce them to flower satisfactorily.—J. T. BARKER, The West Hill Gardens.

## STOVE PLANTS.

FERNS.—Whether grown as large specimens, or in small pots for decorative purposes, and cutting, exotic ferns are indispensable. Not only are they objects of great beauty when seen in bold groups, as was instanced at the International Show at Chelsea, but for general usefulness and beauty in association with flowering and ornamental foliage plants they are beyond price. It is pretty generally known that all kinds of ferns resent frequent disturbance of the roots, but at the same time they must have sufficient room in the receptacles for the roots to ramify, or the fronds will be soft and stunted in growth. A certain amount of shade is necessary, but in many cases this is carried to excess, the result being weak, elongated fronds that are subject to insect pests, and altogether useless for cutting. All ferns delight in abundant supplies of water at the roots, and in the atmosphere, during the season of active growth, therefore, the drainage must be of the best, or the plants will probably become water-logged and the roots perish. Established plants should be assisted by occasional applications of weak guano water, alternated with weak liquid cow or sheep manure, to which has been added a little soot. Maintain plenty of moisture in the atmosphere of the house, but avoid heavy syringings overhead. As growth develops admit a fair amount of top ventilation to the structure in order to solidify the fronds.

SELAGINELLAS.—These include many species of great decorative value, and deserve extended cultivation. Seldom has such a representative collection of these been seen as at the International Exhibition. They not only reflected great credit on the skill of the cultivator (Mr. Davis), but the exhibit went to show how pleasing these plants are when artistically arranged in association with flowering plants. The cultivation accorded the majority of stove ferns will answer for these, except that the receptacles should be shallow, as selaginellas are surface-rooting subjects.

KALANCHOE FLAMMEA.—The present time is opportune for propagating this plant, either from seeds, or stem cuttings inserted in sandy soil and plunged in a mild bottom heat. The young plants when nicely rooted should be potted off singly, using 3-inch pots, and grown on a shelf in a warm house fully exposed to sunshine, and given some air in order to ensure ripened, short-jointed wood for the production of fine flower heads. The compost most suitable for this plant consists of three parts fibrous loam to one each of leaf-soil, and old mortar-rubble, sand, and broken charcoal. A sweet porous soil is very essential to success in the cultivation of kalanchoes, and the drainage must be ample. Shift the plants into 48's when well rooted, and grow on steadily until autumn, when less water will be required.—H. T. MARTIN, Warren Wood Gardens.

## FRUITS UNDER GLASS.

EARLY VINES.—Immediately after the crop has been gathered, special efforts should be made to keep the foliage clean and healthy. This can generally be done by the frequent use of the garden engine. The water must be applied forcibly to the under sides of the leaves. Where red spider has been troublesome, and a difficulty has been experienced in keeping this pest in check while the fruit was ripe, a good dusting of flowers of sulphur should be sprinkled upon the foliage and allowed to remain for a day or two before being washed off. Give the borders several good soakings with weak liquid manure, admit plenty of air at all times, and allow the laterals to grow more freely, but not in such a manner as to cause confusion.

SECOND EARLY VINES.—The berries will be colouring, and plenty of air should be admitted, both at the top and side ventilators, allowing a little to remain on at night. Water the borders occasionally with weak liquid farmyard manure. Stop all laterals as required, to one leaf; examine the bunches, as it may be necessary to carefully remove a few berries with a sharp pair of scissors, to allow plenty of room for the full development of the remainder.

LATE VINES.—The thinning of the berries will be accomplished, so carefully tie up the shoulders with slender pieces of raffia. Stop all laterals to one leaf, and give the borders some stimulating manure occasionally. Damp down the paths and walls frequently during warm, sunny days. Keep a sharp look-out for red spider, and sponge the affected parts with soapy water immediately it is discovered. In some localities mildew is very troublesome upon the foliage and berries of vines grown in the late houses; we have found a sulphur vaporiser, if used according to directions, is a sure and speedy remedy under these conditions.

EARLY MELONS.—Immediately all the fruits have been cut the plants should be pulled out. Give the glass and woodwork a good wash down with soapy water, remove the top portion of the soil, and add sufficient new compost to bring it up to the desired level. The house should then be planted with good strong plants that have been specially grown for this purpose. In many places it is desirable, and quite possible, to grow a second crop of fruit upon the early plants, instead of replanting again; but this can only be done where the plants have been kept in a perfectly healthy condition, and are free from red spider and thrips. The plants should be top-dressed with a mixture of good loam, wood-ashes, lime rubble, and bonemeal. Remove all useless leaves and laterals, cutting them clean away; but at the same time care should be taken to retain all fully-developed leaves that are in a healthy condition. The temperature of the house should be kept at 70 degrees, allowing a rise of 10 degrees with sun heat when the house is ventilated. Close the house early in the afternoon, thoroughly syringe the plants, and they will soon respond to this treatment. Carefully select the strongest fruiting laterals, pollinate the female flowers as they appear, and follow the cultural details, as recommended in a previous calendar.—HENRY R. FARMER, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

SUMMER BEDDING.—This work should be pushed on as fast as circumstances permit, as in the coldest districts it is now safe to plant out the more tender subjects. The variety of plants suitable for bedding purposes is very wide, but those that are known to succeed in the district, and that are most suitable for the special position should be chosen. In an ordinary flower garden of formal design there is room for a considerable variety of plants, but a free use of standards in some of the beds when the intermediate spaces can be carpeted with suitable subjects is very desirable, for when employed as dot plants they remove any flatness in the whole arrangement. It is essential to have the standards of uniform height, and to plant very firmly, afterwards staking all the specimens that require support. The various subjects, like iresines and mesembryanthemums, that are used for carpeting require to be pegged down when planted, and subsequently as growth advances. In addition to regular waterings at the root tender bedding plants derive much benefit from frequent dampings overhead during bright dry weather, as humidity of atmosphere greatly encourages free growth.

CLIMBERS.—These now require a good deal of attention in the way of tying and regulating the growths. It is always an advantage to remove the weakest of the young shoots to avoid overcrowding the stronger ones, and also to allow them to mature more fully for flowering. Train them evenly over the trellises or poles, so that the space at disposal may be evenly covered. Climbing roses require similar treatment before they commence to flower, while plants that are affected with aphides must be sprayed with quassia to eradicate those pests.

GENERAL WORK.—Various plants in the herbaceous borders require further tying, and when dealing with subjects like Michaelmas daisies and phloxes remove the weakest of the growths, as they would only produce poor flowers, and by this treatment the remaining growths are allowed more space to develop, and invariably give better results. Keep flower borders regularly stirred with the hoe, and remove all dead flowers as they appear. Tulips should be lifted after flowering, and the bulbs laid out to ripen, and vacant spaces so caused must be filled in with plants grown for the purpose in pots. Pentstemons and border carnations require neatly staking as the flower stalks are developing fast. Newly-planted shrubs must not be allowed to suffer for want of moisture at the roots, and after watering a good mulching of partly decayed manure will assist in checking evaporation. Frequent sprayings overhead are always an assistance in helping them to make free growth. Give annuals a final thinning before they become overcrowded.—J. GARDNER, Batsford Park Gardens.

ROYAL BOTANICAL AND HORTICULTURAL SOCIETY OF MANCHESTER AND THE NORTHERN COUNTIES.

GRAND ROSE SHOW
and
SUMMER SHOW,
At the White City and Botanical Gardens,
Manchester,
On JULY 12th and 13th, 1912.
(Please note alteration of dates.)

PRIZES. £200 PRIZES.
FOR ROSES, GROUPS, SWEET PEAS, AND HERBACEOUS FLOWERS.

Schedules and all Particulars from P. Weathers, Secretary, Botanical Gardens, Manchester.

THE NATIONAL HARDY PLANT SOCIETY'S FIRST SHOW
will be held in the R.H.S. Hall, Vincent Square,
on WEDNESDAY, June 19th,
1 p.m. to 6 p.m.
Admission One Shilling.

Since publication of the Schedule two Classes have been added. One for Six Bunches Sutton's Pink Sweet William, and one for Six Bunches Scarlet ditto. Messrs. Sutton and Sons offer prizes, 21s., 10s., and 5s. in each class.

Entries close June 8th.

Schedules and particulars from A. J. MACSELF, 32, Beechfield Road, Finsbury Park, N.

NORTH LONSDALE ROSE SOCIETY, ULVERSTON.

29TH ANNUAL EXHIBITION
will be held FRIDAY, JULY 12th.

An Open Challenge Shield, 9 Challenge Cups, 5 Gold, 10 Silver, and 15 Bronze Medals, in addition to the usual money prizes, to be awarded for Roses, Sweet Peas, etc. Three "Single Bunch" Classes for Sweet Peas, in which £26 is offered.
All Leading Seedsmen are offering substantial prizes.
ENTRIES CLOSE JULY 6th.
Schedules, etc., apply, Hon. Secs., County Square, Ulverston.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY. 24th GRAND ANNUAL SHOW, SOPHIA GARDENS, CARDIFF, WEDNESDAY and THURSDAY, JULY 17th and 18th, 1912.
Specially good Prizes in every Section, amounting in Money and Plate to nearly £500. Two programmes of Music each day by the Band of the 2nd Batt. "The Royal Scots." Mr. John Studt's up-to-date Fun of the Fair each day. Tents lighted by Electricity by Messrs. Fred Price and Co., Lim.
Popular Prices. Tickets and Schedules may be obtained from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

RICHMOND HORTICULTURAL SOCIETY.

THE 38TH SUMMER EXHIBITION
will be held in the
OLD DEER PARK, RICHMOND, SURREY,
WEDNESDAY, 26th JUNE.
(Entries close 19th.)
For Schedules, and all information, apply to W. J. Cook, Hon. Sec., Holmsley House, Richmond.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

On June 4, close after the great International Exhibition, one expected a small meeting at Westminster, but met with an agreeable surprise for the hall was crowded, and even annexes were filled. On the whole, the quality of the exhibits was rather below the usual average, but no one complained. There was a fairly good attendance.

### FLORAL COMMITTEE.

Messrs. Dobbie and Co., Edinburgh, were again to the front with sweet peas, and set up glorious flowers in grand style, staging large bunches and stands of each variety. Dobbie's Scarlet, May Campbell, Earl Spencer, Afterglow, Chas. Foster, the lovely Melba, Eltrida Pearson, Mrs. Cuthbertson, and Rosabelle were a few of the many lovely varieties in a delightful group. St. Brigid anemones in great variety of colouring were well set up by Messrs. Reamsbotton and Co., Geashill, King's Co., Ireland.

Early dahlias from Messrs. Carter, Page, and Co., London Wall, were associated with charming violas and such annuals as dimorphotheeas, Phlox Drummondi, salpiglossis, etc. Messrs. Whitelegg and Page, Chislehurst, contributed some excellent delphiniums, a blaze of the fine Geum Mrs. J. Bradshaw, Calceolaria Clibrani, and Anchusa italica Opal.

Mr. James Box, Lindfield, filled a corner of the hall with a handsome group of cut hardy flowers. Delphinium Moerheimi, Heuchera gracillima, Papaver orientale Duke of Fife, a selection of irises, and long-spurred columbines, made up a very bright exhibit. From Messrs. G. Bunyard and Co., Maidstone, came a most effective bank of hardy flowers; pæonies were a fine feature, but Spanish irises, delphiniums, Oriental poppies, and heucheras in variety added grace and brilliant colouring.

Across the end of the hall Messrs. Kelway and Son, Langport, Somerset, displayed some of their specialities in pæonies and delphiniums; among the former the single varieties, such as Meteor Flight, Sea Shell, Heart's Desire, very fine rich rose; Nellie, Princess, Cherry Ripe, and Tinted Venus especially attracted our attention, while the deep violet-blue delphinium Zinfandel was grandly shown.

Mr. Amos Perry, Enfield, specialised in Oriental poppies, and showed a wide range of colour and size. Of special merit were Silver Queen, Queen Alexandra, Menelik, Iris Perry, Mrs. Perry, and Nancy. Mr. Perry also staged large bunches of Dictamnus caucasicus.

Messrs. Pipers, Bishop's Road, Bayswater, filled a considerable space with roses, campanulas, primulas, aubrietias, and a little group of the long-tubed Polemonium flavum.

Messrs. Paul and Son, Cheshunt, had a goodly bank of single and double pæonies, bordered by vases of heucheras, their H. purpurea marmorata being very rich and fine. Messrs. Phillips and Taylor, Bracknell, had a lily pool surrounded by irises and primulas, and a bank of Oriental poppies, pyrethrums, and invarvilleas, the whole having a neat rockwork edging.

Mr. C. Blick, Hayes, Kent, staged some superb carnations, and set up quite large bunches of Thos. a'Becket, the White King George, Elizabeth Shiffner, Rebecca, Argonaut, Donald MacDonald, and Dauntless; in every case the flowers were of fine size and good form. Messrs. S. Low and Co., Enfield, exhibited perpetual and Malmaison carnations in variety, and put up a set of the newer hydrangeas.

Superb perpetual carnations were set up by Mr. H. Burnett, Guernsey, whose blooms of Mrs. Tatton, R. F. Felton, Mrs. C. F. Raphael, Mikado, White Wonder, and Mandarin were glorious. Mr. J. Douglas, Great Bookham, exhibited border carnations and pinks in variety and of high quality, especially noteworthy being the brilliantly-coloured yellow-ground fancy Margaret Lennox.

Eremurus robustus was finely shown by Messrs. Thos. S. Ware, Lim., Feltham, who put up great sheaves of this stately flower among vases of delphiniums, pyrethrums, Oriental poppies, campanulas, and the lovely Fair Maid antirrhinum.

Messrs. E. W. King and Co., Coggeshall, had a quite artistic display of sweet peas, staging these dainty flowers in vases of varying heights and in tall stands and on arches. Yankee, Anglian Blue, Anglian Pink, Gladys Burt, and Mrs. W. King were prominent varieties. Messrs. S. Bide and Sons, Farnham, exhibited sweet peas in neat bunches, their Edrom Beauty, Isobel Malcolm, Mrs. C. W. Breadmore, Scarlet Monarch, and Blue Belle standing out most distinctly.

Messrs. Frank Cant and Co., Colchester, presented vases of beautiful blooms of such roses as Mdme. Melanie Soupert, Una, Queen Mab, W. A. Richardson, Braiswick Beauty, the exquisite Margaret Molyneux, and the yellow climbing Braiswick Gem. Roses from Messrs. B. Cant and Sons, Colchester, made a brave show, and the pillar plants of Blush Rambler, White Dorothy, Christian Curle, the new White Sweet Pea, and Lady Godiva formed a fine background. Elizabeth, Colcestrea, Claudius, and Lady Reay were roses finely shown in the foreground.

Mr. E. J. Hicks, Hurst, Berks, put up a bank of climbing and rambling roses in the orchid annexe, and made a very pretty exhibit with Claire Jacquier, Jean Giuchard, Trier, Alberic Barbier, Aglaia, Electra, Harrison, etc. Mr. G. Prince, Longworth, Berks, exhibited rambling and garden roses in the fruit anexe, but the position was not a good one, and the flowers were crowded; W. A. Richardson, Mdme. Abel Carriére, and Gruss an Zabern were three varieties effectively staged. Messrs. Paul and Son, Cheshunt, displayed garden roses, among which the old Black Moss, Shower of Gold, Gerbe Rose, Sinica, and Austrian Yellow were notable.

Messrs. Wm. Cutbush and Son, Highgate, presented a bold group of palms, crotons, and dracænas, these forming a background for fine examples of such handsome hydrangeas as Mdme. E. Mouillière, La Perle, Monsieur Ghys, the pink Pres. Viger, and General de Vibraye. A very pretty group from Mr. L. R. Russell, Richmond, consisted of graceful Japanese maples, cytisus, etc., as a background to a sloping face of rockwork, well filled with dianthuses, iberis, sedums, campanulas, and other alpine and dwarf herbaceous plants. Messrs. R. H. Bath, Lim., Wisbech, had a very bright exhibit of pæonies, delphiniums, Spanish irises, pyrethrums, among the latter Louis Figuer, Hampton, Toreador, Persimmon, and Mrs. K. F. Carron were excellent. A little group of dwarf yellow and red-brown calceolarias, the variety named Tortoiseshell struck us as being a remarkably good bedding plant.

Mr. T. Hobbs, gardener to Vivian Phillips, Esq., Crofton Court, Orpington, displayed a magnificent lot of herbaceous calceolarias; the plants were not exceptionally large, but grandly flowered, and the individual blooms were of enormous size, some of these measuring four inches in width. The range of colouring, too, was splendid—indeed, the whole exhibit was of high quality.

Messrs. H. B. May and Sons, Edmonton, filled a table with well-grown pot verbenas, Swainsonias, ixoras, heliotropes, and bright lantanas. Messrs. Jas. Veitch and Sons, Chelsea, occupied their usual position. Under graceful standard heliotropes and fuchsias they put up a brilliant set of the very finest cannas, Calceolaria Clibrani, the glorious Clianthus Dampieri, the pretty Lavatera assurgentiflora with satiny flowers, and the beautiful drooping, white-flowered Elæocarpus cyaneus. The same firm contributed a bank of their excellent strains of Nemesias; Blue Gem and White Gem were particularly fine and freely flowered.

Mrs. Lloyd Edwards, Bryn Oelog, Llangollen, brought up a collection of heucheras, and staged these in baskets in the manner she has adopted previously with saxifragas; H. Princess Mary, H. Liberty, H. Cherry Spray, H. Queen of Roses, and H. Corallina appealed to us by reason of their grace and special beauty. Mr. G. Reuthe, Keston, showed some hardy cypripediums, ixias, Calochortus pulchellus, pæonies, and a collection of alpines. Messrs. J. Peed and Son, West Norwood, filled a corner with a little rock garden with flanking groups of their excellent strain of gloxinias.

Mr. F. W. Smith, gardener to E. Ferguson, Esq., The Hollies, Weybridge, well-known as a raiser of new delphiniums, exhibited a large set of new varieties, all characterised by strong spikes and a graceful setting of the flowers on the spike. Among cream and white varieties Mr. Smith has good things in Snowdon, Ben Nevis, Floreat, and Nellie, the latter especially good in size and form.

Rhodesia and Neapoli among soft blue forms were also excellent. Mr. Downes, gardener to J. T. Bennett Poë, Esq., Holmwood, Cheshunt, brought up a little group of Utricularia montana, the plants all finely flowered. Zonal pelargoniums, a collection of fuchsias, cannas, and irises made up a bright group from Messrs. H. Cannell and Sons, Swanley.

Mr. Delmard, gardener to the King of Bulgaria, Sofia, exhibited interesting photographs of Bulgarian gardens and scenery. The Hon. F. Wolseley, Glynde, exhibited a model garden.

Messrs. Bakers, Wolverhampton, were also exhibitors of hardy flowers, and presented a pleasing little display.

### ORCHID COMMITTEE.

A superb bank of orchids, every plant a specimen and grandly flowered, was staged splendidly by Mr. H. Alexander, grower to Lieut.-Colonel Sir G. Holford, Westonbirt, Gloucester. There were beautiful examples of Lælio-cattleya Aphrodite, L.-c. Luminosa Canary Bird, L.-c. Canhamiana, with from twenty-five to thirty flowers; L.-c. Martineti The Prince, a grandly coloured and large-flowered variety; the chaste Odontoglossum armainvilliersense xanthote Westonbirt var., a specimen of Miltonia vexillaria Snowflake with thirteen spikes and seventy-three flowers, M. v. Empress Augusta represented by eight specimens carrying an aggregate of 295 flowers, M. v. marmorata carrying nine spikes and forty-one flowers on one plant, Cattleya Warscewiczi, one having five spikes and twenty flowers, and the graceful Oncidium dwaricatum, as well as many other good things. A grand group, especially after the Westonbirt effort at Chelsea.

Messrs. Charlesworth and Co., Haywards Heath, had a very pretty and graceful group of orchids. In the centre they grouped about three dozen spikes of Phalænopsis Rimstadiana. On either side of these they staged Lælio-cattleya Fascinator, Cattleya Mossiæ Wagneri, Sobralia Cliftoni—a lovely white flower with pink-tinged lip, Bulbophyllum vivescens, miltonias, and numerous hybrid odontoglossums and odontiodas.

Messrs. Sander and Sons, St. Albans, put up an effective exhibit of orchids, and showed capital plants of Lælia purpurata, Dendrobium Gouldei, fine forms of Cattleya Mossiæ, Maxillaria Sanderiana, Cattleya gigas Sanderiana in splendid form, thunias, odonticdas and odontoglossums in variety, and a few graceful phalænopsis.

Mr. J. and A. McBean put up some beautiful forms of Cattleya Mossiæ, several fully grown plants of Miltonia vexillaria, M. Bleuana, white forms of Odontoglossum crispum, and several good odontiodas. Messrs. Hassall and Co., Southgate, displayed Cattleya Mossiæ in variety, a white form of C. Mendeli, C. gigas, Angulosa Clowesi, etc. Lælio-cattleya Martineti Southfield var., with yellow sepals and petals, was sent by W. Waters Butler, Esq., Southfield, Edgbaston.

Mr. Stables, gardener to De Barri Crawshay, Esq., Sevenoaks, submitted the handsome Odontoglossum Leonides (Hallio-crispum x triumphans), Odontioda Devoniana and the lovely O. Rosefieldiensis with a pair of beautiful spikes of rich-hued flowers. Odontoglossum Thais from Mr. E. G. Phillips, The Glebes, Sevenoaks, was greatly admired.

From the Liverpool Orchid Nursery Company, Liverpool, came a group of hybrid lælio-cattleyas, such as L.-c. Cowani, L.-c. Aphrodite, L.-c. dominiana, and the bright L.-c. Eudora. Mr. A. W. Jensen, Haywards Heath, showed a little group of Cattleya Mossiæ and C. Mendeli in fine varieties.

A large group from Mr. G. Day, gardener to H. S. Goodson, Esq., West Hill, Putney, occupied a prominent place in the orchid annexe. The plants were capitally arranged over ferns, and included a host of odontoglossoms, Brasso-lælio-cattleya Veitchi Goodson's var., and lælio-cattleyas in variety. A few odontiodas and masdevallias were also included. Mr. H. A. Tracey, Twickenham, put up some lovely forms of Cattleya Mossiæ, C. Mendeli, Disa Veitchi, and odontoglossums.

Messrs. Stuart Low and Co., Enfield, had a very bright exhibit of orchids that included Lælio-cattleya callistoglossa, Dendrobium thyrsiflorum, Cattleya Mossiæ, Dendrobium Dalhousianum, miltonias, and Renanthera Imschootiana.

### FRUIT COMMITTEE.

Messrs. Laxton Brothers, Bedford, exhibited a splendid, highly-flavoured strawberry of light colour, named The Queen; it may be regarded as an improved British Queen, and a better cropper and grower than that fine variety. Of its flavour we can speak very highly.

### CERTIFICATES AND AWARDS.

First-class Certificate.—To Elæocarpus reticulatus, from Messrs. Jas. Veitch and Sons, Chelsea; and to Miltonia vexillaria Snowflake, from Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury.

Award of Merit.—To Dendrobium Goldei, from Messrs. Sander and Sons, St. Albans; to Odontoglossum Lambeauianum Princess Mary, from H. S. Goodson, Esq. (grower, Mr. Day), West Hill, Putney; to Delphinium Dusky Monarch, from Messrs. J. Kelway and Son, Langport; to Carnations Queen Mary and Attraction, from Mr. Chas. Blick, Hayes, Kent; to Silene Hookeri, from Messrs. T. S. Ware, Lim., Feltham; to Zonal Pelargonium Champion, from Mr. P. Ladds, Swanley Junction; to Gladiolus Rosina, from Mr. Blamfield; to Sweet Peas Dobbie's Lavender George Herbert, Thos. Stevenson, and May Campbell, from Messrs. Dobbie and Co., Edinburgh; to Carnation Margaret Lennox, from Mr. Jas. Douglas, Great Bookham; to Lælio-cattleya Aphrodite Cowan's var., from the Liverpool Orchid Nursery Company, Liverpool; and to Odontoglossum Thais, from C. G. Phillips, Esq., The Glebes, Sevenoaks.

### MEDALS.

Gold.—To Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester, for orchids; to Messrs. Dobbie and Co., Edinburgh, for sweet peas.

Silver-gilt Flora.—To H. S. Goodson, Esq. (grower, Mr. Day), West Hill, Putney, for orchids; to Mr. H. Burnett, Guernsey, for carnations; to Messrs. J. Kelway and Son, Langport, for pæonies and delphiniums; to Messrs. Paul and Son, Cheshunt, for roses and pæonies.

Silver Flora.—To Messrs. B. Cant and Sons, Colchester, for roses; to G. Ferguson, Esq. (gardener, Mr. F. W. Smith), The Hollies, Weybridge, for new delphiniums; to Messrs. J. Peed and Son, Norwood, for gloxinias; to V. Phillips, Esq., Orpington, for calceolarias; to Mr. G. Prince, Longworth, for roses; to Messrs. J. Veitch and Sons, Chelsea, for greenhouse flowering plants; to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; to Mr. Amos Perry, Enfield, for poppies; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver Banksian.—To Messrs. J. and A. McBean, Cooksbridge, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Hassall and Co., Southgate, for orchids; to Mr. J. Box, Lindfield, for hardy flowers; to Messrs. F. Cant and Co., Colchester, for roses; to Mr. A. Delmard, gardener to the King of Bulgaria, Sofia, for photographs; to Mr. E. J. Hicks, Twyford, for roses; to Messrs. E. W. King and Co., Coggeshall, for sweet peas; to Messrs. H. B. May and Sons, Edmonton, for greenhouse plants; to Mr. C. Blick, Hayes, for carnations; to Mrs. Lloyd Edwards, Llangollen, for heucheras.

Bronze Flora.—To Messrs. Whitelegg and Page, Chislehurst, for hardy flowers.

Bronze Banksian.—To Messrs. Bakers, Wolverhampton, for hardy flowers; to Liverpool Orchid Nursery Company, for orchids; to Mr. H. A. Tracey, Twickenham, for orchids; to Mr. A. W. Jensen, Haywards Heath, for orchids.

## Croydon Gardeners' Society.

This society completed its first session of this year a few days ago, and the programme was slightly altered owing to the unavoidable absence of the scheduled lecturer. However, there are members who can at short notice come forward and give a lecture instructive and entertaining, and Mr. M. E. Mills, Coombe House Gardens, entertained his fellow-members with an illustrated lecture on "The Cultivation of Rock Plants in Pots and in the Rock Garden." The gardens at Coombe are well known as possessing an ideal rock garden, and it has been the members' pleasure to inspect this garden on past occasions. For pot culture, Mr. Mills' advice was to first know the natural habitat of the plants to be grown, and in drainage, as well as soil, the idea should be to make as near alike to its natural position as possible. Generally speaking, the soil should be firmly pressed into the pot, and where the plant thrives in dry altitudes a few small pieces of tufa or sand-stone should be placed on the surface for the plant to rest upon. They require no artificial heat, simply a cold frame, and the pots or pans plunged in spent ashes is sufficient for them. During the winter months very little moisture is required, and it is only during their flowering period they require the aid of the water-can.

Perhaps pot culture does not show them off to the best advantage, and good clumps of different kinds growing in the rock garden, or at edges of garden paths, better conveys the beauty they possess. The views shown were mostly from photographs taken by the lecturer, and to his audience they opened up a picture of pleasing character. Mr. Mills emphasised the fact that in a collection one must study the colour scheme, and also the different times of flowering, for in the latter one can find bloom all the year round.

The big selection of slides shown on the screen gave evidence of photographic skill as well as cultivation, and it was with much applause and congratulation the hearty thanks of the meeting were given to Mr. Mills when he concluded his discourse.

An interesting exhibit came from Mr. F. W. Moore, who put up a pot of Ornithogatum pyramidalis. Mr. O. Jeal staged a capital brace of cucumbers, and Mr. T. W. Hayden a dish of Mayduke gooseberries.

**Aralia Sieboldi** — This shrub, which botanists tell us should be known as Fatsia japonica, is well known, and a favourite one for indoor decoration. It is often popularly though erroneously referred to as the Castor Oil Plant, which is really a member of quite a different order. Plants of it in the dwelling-house are apt to become tall and leggy, and cutting down is often practised. It is not so generally recognised that this aralia is quite hardy, and forms a very valuable evergreen, hence plants that have grown too large indoors may be safely planted out towards the end of May. They will then become hardened before the winter. Aralia Sieboldi is one of the best of all evergreens for towns.—W. T.

→ **Spraying** ←
The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested

"FOUR OAKS"
which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-.** No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 C, SUTTON COLDFIELD.**

## ANSWERS TO CORRESPONDENTS.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

---

CRICKET BAT WILLOW.—Bats, Falmouth: I am becoming interested in the matter of willow timber for bat-making purposes, and, remembering you have referred to the matter on several occasions, I am writing to ask if you could tell whether the subject is dealt with fully in any special publication.—You will find this subject of cricket-bat willow (a form of Salix alba var. coerulea) dealt with fully in the "Kew Bulletin" of 1907. It may be possible to get the special issue separately, but the volume for that year can be obtained from Messrs. Wyman and Sons, Lim., Fetter Lane, E.C., for 5s. 5d., post free. In a recent issue (No. 4, 1912, price 4d.), of the "Bulletin" further reference is made to the subject.

"G. M." SPECIAL EXHIBITION NUMBERS.—B. M. J., Dublin: Is it possible for me to obtain copies of the Gardeners' Magazine of May 18, May 25, and June 1, containing reports and illustrations of the Great International Exhibition? I cannot get copies here, and several friends are anxious to have them.—The issues of May 18 and June 1 may be obtained from our Publisher, 148, 149, Aldersgate Street, London, E.C., but at the moment of writing there are no copies of May 25. However, a few may yet return from provincial newsagents, and if you send your full address a postcard will be sent stating whether that issue can then be supplied.

BUDDLEIA VARIABILIS VEITCHI.—S. B. C., Godalming: What would be a good position for Buddleia variabilis Veitchi? I can place it in the open, where it will be sheltered from cold winds, or plant it against the house wall, having a south by south-west exposure.—As the plants are not costly, and can be supplied in pots at this season of the year, we suggest you try one in each of the positions suggested, or, better still, try B. variabilis Veitchi in the open, and B. variabilis magnifica against the house. These Buddleas will stand hard pruning in the late winter, or early spring, and so can be kept well secured to the wall. Growth is vigorous, however, and the grace of the plant would be spoiled if this were tied in closely during the summer. The soil should be rich, light, and well drained, and in a border close to a house wall, some attention to watering and feeding will be desirable in due course.

HORTICULTURE AND THE BOARD OF AGRICULTURE.—R. E. N., Banbury: Can you give me any idea of the programme which the proposed Horticultural Division of the Board of Agriculture will follow. Until the matter is officially published we can say little about the working of the Horticultural Division, which Mr. Runciman is instituting. The statement that £3,000 a year will be set apart for horticultural purposes, from the Development Fund, is erroneous, as also is the statement that intensive gardening is to be a great part of the work of the Division. Judging from what Mr. Runciman has said, special attention will be given to—more effective administration of the Destructive Insects and Pests Acts; issue of more and better advice to horticulturists in the form of leaflets; expert answers to inquiries on all horticultural subjects; stimulation of horticultural education in the counties; and extension of the present system of granting clean bills of health with reference to plants for export. Bee-keeping in its relation to fruit culture is to receive special attention. We understand that in a month or so the arrangements for putting the new Division into working order will be completed. There are rumours to the effect that Mr. A. D. Hall, who is leaving Rothamsted in the autumn to take up an appointment under the Government, is to take charge of this Horticultural Division, but so far there has been no official pronouncement in this connection.

VARIEGATED GROUND IVY.—L. L. C., Swanage: We have a plant of the pretty variegated ground ivy in the rock garden, but it never seems quite happy, quite failing to grow as vigorously as some examples I have seen elsewhere. It is a sunny position and good soil. Can you suggest a reason for its partial failure under those conditions?—The variegated ground ivy (Nepeta Glechoma variegata) does better in a rather shady place than in a sunny one, and it also loves a moist situation. If you can provide these conditions in some other part of the rock garden you will find the plant succeed quite well.

GERMAN OR BEARDED IRISES.—C. P., Hunstanton: Having a number of good varieties of German or Bearded irises, and wishing to plant them in a new position for a special purpose, it has occurred to me that I have seen statements in the Gardeners' Magazine to the effect that planting is best done just after flowering. Am I right?—Yes; the best time to divide and replant German irises is as soon as they have finished flowering, as they are then making new roots, and soon become re-established. Select a site where the soil is rich but thoroughly well drained; see that the soil is moist before planting, and also give the plants a good watering a few hours before lifting them. Plant firmly, but barely cover the rhizomes, and take care that sufficient water is given until the plants are quite at home in their new quarters.

LIST OF SWEET PEA NAMES.—G. C. M., Beckenham: I believe the National Sweet Pea Society has issued a List of Sweet Pea Names, and is offering the same as a modest price. Kindly tell me from whom I can obtain a copy.—The official "List of Sweet Pea Names" is 7d. post free, and can be obtained from Mr. C. H. Curtis, hon. secretary, N.S.P.S., Adelaide Road, Brentford.

---

### NAMES OF PLANTS.

S. S., Epsom.—Cotoneaster horizontalis.

J. R. S., Boscastle.—Santolina Chamæcyparissus.

J. M., Wells.—1, Euonymus europæus; 2, Ilex crenata major; 3, Ononis luteus.

F. L. S., Chester.—1, Lychnis viscaria; 2, Saxifraga pyramidalis; 3, Chrysogonum virginianum.

M. E., Chippenham.—1, Anchusa italica; 2, probably Gaura Lindheimeri, too small for proper identification.

C. K., Gloucester: 1, Dracocephalum grandiflorum; 2, Iris sibirica; 3, Sprekelia formosissima; 4, probably Pyrola rotundifolia.

A. G. B., Swanley.—1, Daphne alpina; 2, Verbena venosa; 3, Lycium barbarum; 4, Aciphylla squarrosa; 5, Fabiana imbricata.

W. R. J., Felixstowe.—1, Trollius europæus; 2, Swainsonia galegifolia; 3, Ajuga Brockbanki; 4, Phlox divaricata; 5, Streptosolen Jamesoni.

C. M., Lincs.—1, Cytisus purpureus; 2, probably Heuchera cylindrica; 3, the pelargoniums are hybrid forms obtained by crossing large-flowered kinds with the scented-leaved species.

---

## TRADE NOTE.

From Messrs. McDougall Brothers, of Port Street, Manchester, so well known for their special insect-destroying preparations, we have received a sample of "Katakilla" wash, manufactured expressly for the purpose of combating caterpillars, green and black fly, psylla, and similar garden pests. Used according to directions, this is a most effective wash, and it has the very great merit of being non-poisonous. A special measure is supplied free with each tin.

Canary Guano

"THE BEST IN THE WORLD."

There is no Fertilizer that gives such good all-round results as Canary Guano. It is used by the leading Amateur and Trade Growers all over the country. A postcard to the Manufacturers will ensure full particulars. . . . . .

Sold by practically all Seedsmen in Tins, 6d., 1s., and 2s. 6d., and in Bags (14lb.) 3s. 6d.; (28lb.), 6s.; (56lb.), 11s., and 1 cwt., 20s. each.

Manufactured by:

The Chemical Union, Ltd.
IPSWICH.

## OBITUARY.

### MR. HUGH RANGER.

We regret to record the death of Mr. Hugh Ranger, which occurred after a long illness at his residence at Cressington, Liverpool, on the 27th ult., in his 61st year. From 1878 Mr. Ranger occupied the position of nursery manager to Messrs. R. P. Ker and Sons, at Aigburth, Liverpool, and during his long period of service did excellent work both as a cultivator and raiser. With the co-operation and generous encouragement of the firm, he first devoted attention to the raising of crotons, and, as evidence of the result achieved, several of the varieties now occupy a prominent position among those in general cultivation. Subsequently, on the suggestion of the firm, he turned his attention to the improvement of amaryllis. In this work he was assisted by the advice and the encouragement of Mr. R. Wilson Ker, V.M.H., F.L.S., who, by the purchase of the finest varieties of the day, both at home and abroad, as supplementary to the fine collection in the nurseries of the firm at Aigburth, contributed materially to the rapid strides that were made in the improvement in the form of the flowers and the development of new shades of colour. Mr. Ranger was, it should be added, a skilful cultivator as well as a successful raiser.

## FORTHCOMING ENGAGEMENTS.

MONDAY, June 10.—United Horticultural Benefit and Provident Society.

TUESDAY, June 11.—Royal Counties' Agricultural Society: Flower Show; three days.

LANGPORT, SOMERSET.

---

DAFFODILS. — Surplus Bulbs, choice varieties. White Queen, 5s. 6d. each; Maggie May, 3s. 6d.; Lord Roberts, 3s. 6d.; Weardale Perfection, 2s.; King Alfred, 2s.; Monarch, 1s. 9d.; Pilgrim, 3s. 6d.; and numerous other varieties. Good exhibition bulbs sent. Address, HEAD GARDENER, Chaddlewood, Plympton, Devon.

---

ORCHIDS FOR AMATEURS.—A practical guide to the Cultivation of Cool and Warmhouse Orchids, adapted for Small Mixed Greenhouses. The author is C. Alwyn Harrison, F.R.H.S., and the book can be obtained, by post, for 2s. 10d., from Publisher, 149, Aldersgate Street, London.

---

HAMMOCKS, very strong, white Navy canvas; Hammocks, lovely for gardens or camping out, 5s. 6d. each; list Fancy Tents free; Blue Serge Gardeners' Aprons, 2s.; Useful Stools, 18 stamps.—H. J. GASSON, Government Contractor, Rye.

---

HUTS FOR THE GARDEN. — Fruit Rooms, Potting Sheds, Workshops, Cycle Houses, Boot Rooms, Servants' Mess Rooms, Children's Playrooms, etc. Send for Illustrated Catalogue, free.—BOULTON and PAUL, Ltd., Norwich.

---

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.
XL ALL NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake.
XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.
XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are XL All WEED KILLER, XL ALL FERTILISER, XL ALL ROSE MANURE, RICHARDS' GREEN SUNSHADE, finest powder shading on the market, 1s. packet does 100 feet of glass. Don't forget to ask your Nurseryman or Seedsman for my small pink list.
G. H. RICHARDS, Manufacturer,
231, Borough High Street, London, S.E.

PERPETUAL - FLOWERING CARNATIONS.—Strong, established plants in pots, from 4s. per doz., carriage paid; 20s. per 100, carriage forward. Illustrated Catalogue describing 75 leading varieties with cultural hints, post free. C. F. A. VAN DER SLUYS, F.R.H.S., Ramee, Guernsey.

FRESH SPHAGNUM MOSS, short, clean, feathery stuff. Bag (4 bushels), 4s. 6d., free on rail. JOHN ANDERSON, Collin, Dumfries.

# Orchids for Everybody. Why not?

"ORCHIDS FOR AMATEURS."

". . . . . . . . The author's idea is an excellent one; and he is to be commended for preparing an inexpensive volume teaching the owners of small greenhouses in a simple practical fashion the delight and pleasure they may derive from growing a few orchids. The book is divided into three parts. A good index is supplied; and the work—which is admirably printed in good clear type—is embellished with twenty illustrations of beautiful cool and warm house orchids, printed on art paper. The volume is interesting, practical and helpful, and may be heartily commended to owners of small greenhouses as a reliable and sound guide."

A PRESS CRITICISM.

READ

# ORCHIDS FOR AMATEURS.

By C. ALWYN HARRISON, F.R.H.S.
Edited by T. W. SANDERS, F.L.S., F.R.H.S.

CONTENTS.

Part I.—COOL HOUSE ORCHIDS. Oncidiums, Odontoglossums, Cypripediums, Cymbidiums, Lælias, Dendrobiums, etc.

Part II.—WARM HOUSE ORCHIDS. Cattleyas, Lælias, Dendrobiums Cypripediums, etc. Potting and Composts, Watering, etc.

Part III.—MISCELLANEA. Imported Orchids and their Treatment, Propagation, Insects and Diseases Injurious to Orchids, etc.

TWO SHILLINGS AND SIXPENCE NET.
(By Post 2/10 Net.).
Bound in Cloth. Printed on Antique Paper. Twenty Fine Illustrations on Art Paper.

## NOTE OF THE WEEK.

◆

### Xerophitic Plants.

MR. J. W. McHATTIE.
Superintendent of the Edinburgh Parks and Gardens.
Neill Prizeman for 1912.

Xerophils, or drought-loving plants, and hydrophils, or moisture-loving ones, are the outcome of evolution in environments of quite opposite character, and form a most interesting study as to the immense range of conditions to which plants have been able to respond. With regard to the first-named class they are undoubtedly the more interesting of the two, though naturally not the more beautiful, since they inevitably lack the charm of delicate foliage and in point of fact, the two great races of cacti and euphorbias are largely devoid of foliage proper, true leaves having been suppressed, and their function delegated to thickened fleshy stems beset with thorns. In the euphorbias of the cactus type, leaves have not yet been entirely suppressed, since the thorny excrescences are at first accompanied by small leaves which, however, soon become useless, and fall off. Some of the cacti, such as the Phyllocacti, produce apparent leaves of a flat fleshy character, but closer examination shows even these to be merely flattened and expanded stalks, and not leaves proper, the flowers when produced springing, as with the rest of the tribe, direct from these edges or terminals. One must, however, have travelled in countries such as Mexico, where, on the sunburnt plains and plateaus the great bulk of the vegetation is subjected through the greater part of the year to absolute drought unrelieved by even a shower, to appreciate the full effect of such conditions. It would be imagined that no plant could live, much less thrive, with such an absence, or apparent absence, of the all-essential water, and yet we may see the ground bristling here and there with cacti, like bunches of huge erect cucumbers, ten to twelve feet high, and occasionally with a group of the great Cereus giganteus, thirty feet high and more, and if we sever a branch of these, we shall find it full of sap, though the scanty roots may be anchored in the hardest of rocky soils, and so hot that the hand can hardly bear to touch it. Cacti there imitate, at a distance, the most rampant of brambles, like bunches of tortuous snakes, and every here and there, weird little, or large heaps of, cannon-ball like species, are piled like oranges on each other, each one a veritable vegetable hedgehog or porcupine, so far as its abundance of prickles, short and long, are concerned. The long thorns look the more formidable, but it is the myriad tiny barbed ones at their bases, which the traveller dreads, for at a touch they attach themselves to the skin, set up a little irritation, just enough to induce a rub, and straightway they embed themselves, and are only removable by the judicious use of tweezers. In some places the opuntias or prickly pears cover the ground as densely as does the bracken on our heaths, mostly showing the characteristic tennis-bat shape, but sometimes, as with O. horrida, covering acres with plants formed of branches like close-set chains, beset with innumerable thorns two inches long, and so brittle that a blow with a stick will shatter a plant into scores of short lengths, each of which will root where it falls, and so multiply itself indefinitely. Even the very fruits, of the usual pear shape, fall and root in the same fashion, independently of the contained seed. Succulent as all these species are, they seem absolutely incapable of shrivelling, and in this respect are marvels of natural adaptation and provision against undue transpiration. Here and there we find orchards of opuntias of very large growth, in which it is curious to note how the primary bat-shaped leaf, from which they started, has swollen and thickened into a sort of trunk nearly a foot thick and quite round, while the old leaves, if dissected, are found to be built up of numerous extremely hard, flat, woody internal plates of very beautiful pattern, each thorny knob on the fleshy exterior being represented on them by a perforation in the woody framework, so as to form, in conjunction with innumerable fellows, the charming patterns aforesaid. These cultivated opuntias grow to a considerable height, and are almost entirely devoid of thorns. Their fruits are used to make a sort of sweetmeat, which is somewhat insipid. In some species of cacti, the thorns are greatly modified; in the species popularly called the Old Man Cactus they are transformed into long whitish hairs, the ball-like plant resembling an old man's head covered with long unkempt hair, fully justifying the name. In these small-growing spherical species, the flowers usually appear as a sort of circlet near the top of the ball and are of varied colours, bright rose, yellow, etc., but are very short-lived and usually eaten by the ants and other insects of the locality. Incidentally, an interminable procession of ants, each bearing a portion of a leaf from some leaf-bearing stem, such as the Mesquit, an acacia-like plant, suggests a factor inducing leafless vegetation, in addition to the drought. Mingled with the cacti are other xerophitic plants, the hills in many places bristling with species of yuccas, agaves, and other sword-like vegetation, the yuccas especially forming grand specimens, which manage to produce magnificent spikes and bunches of their white lily-like flowers. From the agaves the natives obtain the potent spirit "Mescal." The fleshy leaves are all cut away leaving a central mass like an immense pine apple, from which they distil the spirit, mostly, we imagine, in unlicensed stills. In Arizona, a very insidious opuntia grows in the fields among the grass; it lies quite flat on the ground, and, having very formidable spikes, would be apt to give considerable trouble to anyone thinly shod. At a short distance it is quite imperceptible. At the railway stations children offer specimens of the Resurrection plant, the curious Selaginella lepidophylla, in some respects one of the most interesting xerophites known, since it belongs to a moisture-loving genus, and yet grows on the exposed prairies. In the dry season it is represented by curious brown inrolled balls which are blown about loose, and when the rainy season comes, root where they lie, and unfold into beautiful green rosettes.

**Mr. J. W. McHattie.**—The Council of the Royal Caledonian Horticultural Society have awarded the Neill Prize for the biennial period of 1910 to 1912 to Mr. John W. McHattie, City Chambers, Edinburgh. The prize is one which is in the gift of that society, and commemorates the late Dr. Patrick Neill. It is awarded to distinguished Scottish botanists or cultivators. Mr. McHattie is a native of Morayshire, and began his gardening career in the gardens of the Mackintosh of Mackintosh, at Moy Hall. He served at various other places, including Altyre Forres, Raith House, and Oxenford Castle, and was afterwards appointed to take charge of the gardens of the Marquis of Lothian, and later those of the Duke of Wellington at Strathfieldsaye, Berks. He then was entrusted with the laying out of the grounds and gardens at Lea Park, Surrey. In 1901 he took charge of the City gardens in Edinburgh. He filled all these positions with marked success, and the state of the gardens and parks in Edinburgh testifies to his ability. That Mr. McHattie deserves the honour conferred upon him is demonstrated by his success as a cultivator of fruits and flowers. In these directions he has few equals, having won the Royal Horticultural Society's Gold Medal for a collections of fruits, the Banksian Medal for a collection of trees and shrubs, the Veitch Memorial Medal twice for fruits, the City of Edinburgh Cup three times for chrysanthemums, the National Chrysanthemum Society's Gold Medal for chrysanthemums, and many other notable prizes at London, Manchester, Newcastle, Edinburgh, and Glasgow. He devoted much of his attention to landscape gardening, and successful examples of his work may be seen at Strathfieldsaye; Tylney Hall, Hampshire; Lea Park, Surrey; Saughton Hall Park, Blackford Hill, Colinton Hospital, and Princes Street Gardens, Edinburgh. In addition, Mr. McHattie has rendered valuable services to various societies, both horticultural and arboricultural. He also contributed largely to the gardening Press, and wrote under "Work for the Week" in the Gardeners' Magazine for some years. His services as judge are in request at international and other exhibitions at home and abroad, and are much valued.

**The Royal Society** will celebrate its 250th anniversary this year, and the functions in connection therewith will commence on Monday, July 15, when there will be an evening reception of the delegates in the rooms of the society at Burlington House from 8.30 to 11. On July 16 there will be a short commemorative service in Westminster Abbey, beginning at 12 o'clock. In the afternoon at 2.30 the formal reception of the delegates will take place in the Great Library of the Royal Society. In the evening the Royal Society will entertain the delegates and other guests at a dinner in the Guildhall. On July 17 the Duke and Duchess of Northumberland will give a garden party at Syon House, and in the evening there will be a conversazione at the Royal Society's rooms. On July 18 the King and Queen will receive the President, Council, and delegates of the society at Windsor Castle, where a garden party will be held. The Universities of Oxford and Cambridge will entertain the delegates on the following day.

**Horticultural Club.** — A house dinner of the club will be held on Tuesday, June 18, when a lecture, entitled "Pictures from a London Garden," illustrated by lantern slides in colour, will be given by Mr. H. J. Wright. The dinner will, as usual, commence at 6 p.m.

**Herbaceous Pæonies** are among the choicest flowers of modern times, and are very largely the result of the careful crossing practised for years past by Messrs. Kelway and Son, of Langport, Somerset. We have received a box of blooms of some of Messrs. Kelway's latest introductions, among which were charming varieties named Lady Godiva, Exquisite, Mrs. Richmond, Emperor of Russia, Purple Emperor, Louis N. Parker, Miss Brice, Pink Domino, and Viscountess Cross. These form a choice little collection in varied colours, and both double and single blooms, all modern representatives of our grandmothers' "pæony roses."

**Vacant Land Cultivation Society.**—From Mr. R. L. Castle, who superintends the preparation and cultivation of waste lands that come under the care of this society, we have received a copy of the fourth annual report. It appears that there are 14,000 acres of waste land in the Metropolitan area, but so far only 60 acres are controlled by this society, although 470 applicants are anxiously waiting for the opportunity of cultivating rent-free plots. About 500 persons are cultivating plots on what was waste land, and it is estimated that 2,500 people are deriving benefit from such cultivation; and these benefits include fresh vegetables, improved health, lessons of self-reliance, patience and perseverance, and a knowledge of the reward that follows well-directed industry in connection with land cultivation. Mr. Joseph Fels is the moving spirit of the society, which was founded in 1908 for the purpose of obtaining the loan of land and letting it rent free to needy working-men and women. The society cannot do all the work it would like to do because of lack of funds; anyone interested in this excellent work should write to Mr. J. Fels, 39, Wilson Street, E.C., or Mr. R. L. Castle, 7, Caxton Road, Wimbledon, for further particulars.

**Professor J. S. Henslow as Œcologist** is the subject of the lecture that will be given by the Rev. G. Henslow, M.A., V.M.H., at the general meeting of the Royal Horticultural Society on Tuesday next, the 18th inst. The relationship of flowering and other plants to their environment is a most interesting and instructive study, and the lecture should prove highly instructive to those who are giving special attention thereto.

**National Hardy Plant Society.** —This comparatively young and vigorous society will, as we have previously announced, hold its annual exhibition at the Royal Horticultural Hall, Vincent Square, Westminster, on Wednesday, the 19th inst., and it has the promise of proving a decided success. As this is the first show held by the society in London, it is creating much interest among lovers of hardy flowers resident within a short distance of the Metropolis, many of whom will be found among the exhibitors. The Gardeners' Magazine is offering a gold medal, to be awarded to the best competitive exhibit in the show.

**The Westonbirt Hippeastrums,** so ably grown by Mr. A. Chapman, gardener to Lieut.-Colonel Sir G. Holford, secured a Large Gold Medal, apart from the orchids exhibited, at the recent International Horticultural Exhibition, while two dozen particularly fine examples secured the Silver Cup offered by Messrs. Guillemans and Sons. Every variety exhibited was raised at Westonbirt, Tetbury, by Mr. Chapman.

**Gardeners' Royal Benevolent Institution.**—Sir Jeremiah Colman, Bart., writes from Gatton Park: I am anticipating the pleasure of presiding on the occasion of the anniversary festival dinner of the Gardeners' Royal Benevolent Institution on Tuesday, June 25 next, which will be held in the ancient Hall of the Worshipful Company of Grocers through the courtesy of their Court. The Institution has for its laudable object the permanent or temporary assistance of gardeners and others, including their widows, engaged in horticultural pursuits, who, through fortuitous circumstances, have become incapacitated, or are in distress. No fewer than 253 persons are at the present time receiving permanent aid at a cost of upwards of £4,500. The great work accomplished in the past has been recognised by the substantial support accorded by lovers of horticulture, and to-day it is more than ever necessary that the members of the committee, who devote so much valuable time in the able administration of the funds at their disposal, shall be loyally and generously supported not only by those who may become entitled to the benefits of the Institution, but by all lovers of flowers and gardening. The growing popularity of horticulture in the present age has been little short of phenomenal, and with it has come as a natural sequence the demand for a much higher standard of gardening and gardeners, and an ever-increasing demand upon the resources of the Institution. I invite with confidence your sympathy and generous aid in support of an Institution which is doing so beneficent a work amongst those whose vigilance and care in attending our gardens adds so much to the pleasures of our home life, and who are, I think, thoroughly deserving of any help we can secure. Your hearty co-operation and generous support will be much valued, and any contributions sent will be gratefully acknowledged by the Secretary, Mr. G. J. Ingram, 92, Victoria Street, S.W.

**Headquarters of the B.G.A.**—Mr. Cyril Harding, the new secretary of the British Gardeners' Association, asks us to state that his address and the offices of the Association, are now Ulysses, Fortune Green, London, N.W.

**Library of the Royal Gardens, Kew.**—A catalogue of the books that were added to the Library of the Royal Gardens during 1911 has been published as an appendix to the "Kew Bulletin," and may be obtained in the usual course, the price being twopence. As in the case of the catalogue, the list is printed on one side of the page to allow of its being cut up. It is thought probable that many persons and institutions will make the Kew catalogue the basis of their own, and will use the lists of additions to supply printed slips for fresh titles.

**Protecting Fruit Crops.**—Professor Willis L. Moore, chief of the Weather Bureau, United States Department of Agriculture, when speaking the other day at the Royal Institution on the practical value of the study of meteorology, said that by the River and Flood Service of the United States Weather Bureau they were able to estimate the height of floods, almost to the inch, even three weeks in advance, and by the Wheat and Corn Service and the Cotton District Service they telegraphed to all parts of the States the conditions of vegetation over the whole area. Probably ten million dollars' worth of property was put into safety in consequence of a single forecast by the bureau officials of the approach of a cold wave, and they probably had as many as 20 or 30 such passing across the Continent in the course of the winter. A warning of only 24 hours to the fruit cultivators of Florida enabled them to gather everything that was ripe, to protect their beds with straw, and, by means of the heaters, entirely to protect their orchards. With the aid of these heaters, which were distributed throughout the orchards, they were able to maintain a temperature 14 degrees higher than in the neighbouring region, which, as a rule, was sufficient to save the industry from the disaster which threatened it.

**American Gooseberry Mildew.**—Eleven baskets of gooseberries, from the Wisbech district, were seized at Hull recently under the order of the Board of Agriculture, because they were infected with the Gooseberry Mildew. A Pinchbeck market gardener was fined 10s., and costs, in each case for not pruning affected trees and failing to destroy clippings from affected gooseberry bushes; this was the first prosecution of the kind in Lincolnshire, but it was pointed out that offenders were liable to a fine of £10, and costs. Referring to the American Gooseberry Mildew Order of 1912, Dr. Collingridge, Medical Officer of Health for the City of London, states in his report that "It has been suggested that a repeated spraying with a 4 per cent. solution of potassium sulphide is effective in destroying the spores or threads of the fungus, but it must not be overlooked that the American Gooseberry Mildew is not confined to the surface of the fruit only, like other kinds of mildew, but exists within the diseased shoot itself, ultimately thoroughly infecting the entire bush. It appears that unless energetic measures are taken growers of gooseberries in Europe are threatened with serious loss."

**The Fairchild Sermon.** — The Master and Wardens of the Worshipful Company of Gardeners attended in state at Shoreditch Church on May 29, to hear the annual Fairchild Sermon, which was preached this year by the Venerable E. E. Holmes, Archdeacon of London, who took for his text a passage from Genesis ii., "God made the earth and the heavens, and every plant of the field before it was in the earth, and every herb of the field before it grew." As we have previously stated, Thomas Fairchild was a famous Hoxton gardener, who in 1722 wrote "The City Gardener," and on his death in 1729 left a sum of £25 for the preaching of an annual sermon on "The wonderful works of God in the Creation" or "The Certainty of the Resurrection of the Dead, proved by certain changes of the animal and vegetable parts of the Creation."

**Preservation of Commons and Footpaths.** — At the recent monthly meeting of the Commons and Footpaths Preservation Society, at which Lord Eversley presided, it was decided to request the Home Secretary to receive a deputation to urge that facilities should be given for the second reading of the society's Rights of Way Bill. The object of the Bill is to simplify the proof of rights of way. Arrangements for the settlement on lines indicated by the society, of questions affecting 39 footpaths and bridle paths, were approved, and it was reported that 49 other cases had been referred to the society for arbitration. It was stated that the society was assisting to secure the preservation of Leziate Heath, Norfolk, and Hollesley Common, Suffolk, and that £300 was still needed to complete the fund for acquiring Minchinhampton Common, Gloucester, in order that the land might be vested in the National Trust.

**Casual Workers in Market Gardens, etc.**—The Insurance Commissioners have decided that, under certain conditions, casual workers employed in gathering fruit, hops, peas, and flowers, and lifting and picking up potatoes, are to be excluded from the provisions of the Insurance Act as persons engaged in a subsidiary employment. It is provided, however, that where a person engaged for a time in one of these excepted occupations is at other times engaged in work in connection with which he or she is an insured person, the exclusion referred to will not apply. For example, if a person engaged as a fruit or hop picker for a few weeks is at other times regularly engaged in agriculture or any other employment, and is an insured person, he or she and the employer will be required to pay insurance premiums while the fruit or hop picking is going on.

**Proposed Extension of Wimbledon Common.**—The progress with the fund that is being raised for the purchase of a considerable area of land with the object of extending Wimbledon Common is not so satisfactory as could be wished. At a meeting of the Wimbledon District Council, held the other evening, it was decided to defer for six months the question of obtaining from the Local Government Board power to raise by means of a loan the £10,000, which the Board voted in aid of the scheme at a meeting held in October, 1910.

## FERN SPORE VARIATION.

To those who devote their careful attention to the raising of varietal ferns from spores, phenomena are frequently presented of a very puzzling nature, and which certainly merit record, since it is only by the accumulation of such records that any laws underlying these apparently erratic phenomena can ever be discovered. That spores or seeds from variable plants, possibly of mixed origin, should give rise to diverse progeny appears natural enough, hence in the case of seeds, cross-fertilisation is the rule rather than the exception, and therefore the offspring are naturally the outcome of a sort of compromise between diverse parental influences, with the result that adjustment of the diverse potencies occurs in different degrees.

With the fern spore the case is rather different. From the nature of the prothallus, or small green scale, produced by the spore prior to the development of the sexual apparatus beneath the scale, self-fertilisation must be the rule and crossing the exception, the homologues of the pollen grain, and the incipient ovule being so close together, and the process of fertilisation of the one by the other so dependent upon the presence of a minute drop of water which forms the conveying medium, that any other mode of conveyance which can bridge the gap between one prothallus and another is almost precluded. Nevertheless, it has been abundantly demonstrated that such transference does occur, since a number of easily recognisable crosses between diverse types are well known to exist.

It is not, however, with these easily accountable cases that we desire to deal, but with cases where normal self-fertilisation may be reasonably assumed, and yet in which the progeny are of the more diversified character. The comparatively recent introduction of a new strain of Polystichum aculeatum, known as the "gracillimum" type is a case in point. We commence here with a wild plant of P. aculeatum, found in a Dorsetshire hedge as a huge specimen. Instead of the robust, somewhat dense, normal form of the species, it was of much slenderer make, the secondary pinnules of the fronds being much smaller and further apart, and the primary ones or pinnæ running out into very slender terminals. The fronds, much longer than the normal ones, terminated uniquely by the pinnæ curving inwards and overlapping the midrib, the tip finally extending very slenderly to match those of the subdivisions. Finally, the tips of both fronds and pinnæ showed a tendency to expand fan-like, suggesting minute tassels. So unique a form was naturally greatly prized, but despite robust growth and a marked tendency to produce lateral offsets, which enabled it in time to be widely distributed, some forty years elapsed before any spores were discovered.

In view, however, of recent experience since that discovery, it appears probable that the supposed barrenness was really due to the fact that it bore no obvious spores or spore-heaps accompanied by an indusium or spore cover, but only produced sporangia or spore capsules in twos or threes on the very edges of the subdivisions, and these only here and there on very robustly-grown specimens. Hence they escaped observation, and were eventually only discovered with the aid of a lens. Since, however, the sporangia were well developed and each contained the normal number of spores, some thirty or forty each, the first batch discovered yielded considerably over a hundred plants, which it was anticipated would yield as many specimens of the parental type. As they developed, however, it was soon seen that a number of them were extremely unlike the rest, the little fronds bearing almost thread-like subdivisions, and these being separated and specially tended, eventually produced some thirty plants of the most remarkable type.

The normal sized half-inch pinnules grew in many cases to over two inches in length, very slender and lineal until near the tip, where they expanded into a fan-like arrangement of points. The most unusual feature, however, was that, while the parental pinnæ were widest near the midrib of the frond and narrowed regularly, as we have seen, to a slender point, the pinnæ here were narrow near the midrib, and the linear pinnules grew longer and longer as they approached the terminal, which consisted of a long serrated tongue with an expanded fan-like end. These fan-shaped tips, though tassel-like, appeared to consist of short pinnuloid extensions rather than crests proper, and were evidently extensions of the parental tendency to tip expansion. Of the very long hair-like growths, and their lengthening in the reverse direction to the normal, the parent form did not betray the slightest sign. Although all but one of the thirty plants were singularly alike, there were marked individual differences in the ultimate development of their growth.

The exception, named "plumosum" (Green), assumed a beautiful decomposite development, since instead of the long pinnules, the pinnæ divided and sub-divided on feathery lines, the fronds were broader and more imbricate in growth, and hence quite distinct. Of the remaining seedlings a good percentage reproduced the parental form exactly, while the balance presented several grades of reversion, some presenting the broad, stalkless pinnules of aculeatum; while several, strange to say, had unmistakably the plainly stalked pinnules of P. angulare. This naturally suggests the idea that the original wild find of P. aculeatum pulcherrimum, as the plant was named, owing to its exceptional beauty, was and is a hybrid between the two.

On sowing, however, by way of test, from one of the reversions which most nearly approached P. angulare, nothing but a batch of unmistakably aculeatums resulted, though Mr. Cranfield reports that one gracillimum occurred in his sowing, showing that the sportive tendency in that direction had been inherited. No variation at all occurred in the writer's batch. A peculiar feature in this case is the sharp line drawn between the gracillimums and the rest, only one plant appearing, which we named dimorphum, and which resembled the parent strongly, but in which the lengthening tendency of the sub-divisions showed itself erratically in some of the fronds, hence the name.

A second batch raised from the spores of another season, discovered in some quantity on another plant, but, of course, a division of the original, hence practically the same, yielded very similar results, but on a larger scale. In the progeny, however, which inherited the true pulcherrimum character, a number showed very little of this until planted out, when the coarser set of first fronds was followed by fronds of even improved pulcherrimum type, which, at the time of writing, promise to become very handsome indeed, seemingly as a sort of after-thought on their part, since they began very unpromisingly as apparent reversions.

We have here consequently a case in which the spores from one and the same symmetrical and constant plant are endowed with the faculty of producing several quite distinct types, and in fairly definite ratios since the proportions in which the gracillimum, pulcherrimum, and reversional types occur are about the same with both sowings, with plumosum thrown in as a fourth, though solitary, exception. None of the reversions showed the faintest trace of the characters of the rest; all the sections stood clearly apart. Even the theory of a hybrid origin of the parent, which is by no means established, affords no explanation, since P. angulare, the possible other parent, has yielded no sport on similar lines except perhaps plumosum, and in any case a wild hybrid, is little likely to be other than a normal form as would also presumably be the P. aculeatum concerned in the cross.

Chas. T. Druery, V.M.H., F.L.S.

## MARKET GARDENERS AND RAILWAY COMPANIES.

As the outcome of negotiations carried on between the Agricultural Organization Society and the railway companies a short time since, the latter have agreed to make special provision for cucumbers in the General Railway Classification of Goods by entering "cucumbers, in cases or boxes, or in baskets with wicker or wooden lids, owner's risk."

This announcement is of interest from the point of view both of the market gardening industry and of the circumstances under which the concession has been secured.

The production of cucumbers, mainly under glass, has undergone very considerable expansion of late years in various parts of the country, and more especially so at Worthing, where the glass-houses devoted to the raising of vegetables, fruits, and flowers for the market have a total length of over thirty miles, while the output there of cucumbers alone, apart from other commodities, is estimated at about 1,200 tons a year. Hitherto, however, there has been no special entry of cucumbers in the General Railway Classification, in which they have counted as "vegetables," either "hot-house" or "not hot-house." Inasmuch as all the cucumbers at Worthing are grown under glass, they have thus come under the definition of "vegetables, hot-house," and have been allotted to Class 4, and charged the rates of that class when consigned from Worthing; though it is alleged that from London the cucumbers are reconsigned by Metropolitan dealers to Northern markets as "vegetables, not hot-house," thus coming under Class 2, and so being carried at cheaper rates.

It has also been especially complained by the Worthing market gardeners that they have paid much higher rates than the growers in the Broxbourne, Enfield Lock, and Waltham Cross districts of Hertfordshire, Middlesex, and Essex respectively, who have the advantage of sending their cucumbers to the Northern markets, as "vegetables packed," at "exceptional" and certainly much lower rates; though, in point of fact, these exceptional rates apply only to minimum consignments of either one ton or two tons, which allow of the railway company running a through truck to destination. The rail traffic in cucumbers from the districts in question to the North generally moves in these quantities, while the average consignment from Worthing is between 1 cwt. and 5 cwt. To the Covent Garden Market the growers in the three districts mentioned—situate at distances of from twelve to seventeen miles from London—can forward by road motor, and from Broxbourne, it is understood, no cucumbers at all are sent to London by goods train.

The Worthing growers have hitherto been unable to consign direct to the Northern markets, and they have had to submit to seeing the advantages of those markets gained by growers in the Broxbourne and other districts, by wholesale dealers in London handling the Worthing supplies, or by importers of Dutch cucumbers received via Hull, and distributed by rail throughout Lancashire and Yorkshire under the designation "not hot-house."

Certain material concessions were obtained from the London, Brighton, and South Coast Railway Company, but the Worthing growers especially desired that cucumbers should be placed in Class 2 of the General Railway Classification (on the same basis as tomatoes in wicker baskets) and thus be charged, on all the railways alike, a lower rate than if they were carried in Class 4. At the request of the Worthing and District Market Growers' Association, the Agricultural Organization Society—to which the Worthing Association is affiliated—took the matter up, while on the suggestion of the railway goods managers, a deputation, representing the two societies mentioned, waited upon them at the Railway Clearing House, the final outcome of the negotiations being the making of the desired concession, as stated.

The fact that this result should have been brought about through the instrumentality of the Agricultural Organization Society affords gratifying evidence of the useful purpose which that body is able to fulfil, not only in its efforts to improve the general agricultural conditions of the country, but also as an intermediary between growers and railway companies in the attainment of improved transport facilities on an organised basis. The granting of the concession asked for is also no less evidence of the desire of the railway companies to encourage the efforts which the federated agriculturists are making to better their economic outlook.

Under the new arrangement in regard to classification, Worthing growers will be able to consign their cucumbers to Liverpool, Manchester, Sheffield, Leeds, Bradford, Nottingham, and Leicester, instead of having to be content to forward them only to London dealers, who themselves would undertake the further distribution; and in this way there should be, in addition to a saving in railway rates: (1) a saving in intermediate profits; (2) decreased risk of gluts in the Covent Garden Market; and (3) the obtaining of better prices, not only on this account, but through the direct dealing with the great centres of population in the North.

These various advantages constitute important phases of that system of "scientific marketing" of English-grown market-garden produce, which it has been one of the main purposes of the agricultural organization movement to effect. They are of still greater importance in view of Mr. Runciman's announcement that the Board of Agriculture is creating a Horticultural Branch which, it is understood, will include, in addition to horticulture in general, market gardening, flower and fruit growing, and nursery gardening. The scientific production it will, presumably, be the special purpose of the new branch to promote, will obviously fail to confer adequate advantages to the growers unless it is supplemented by the scientific distribution, which can alone render production sufficiently remunerative as a business proposition.

**Outdoor Tomatoes.**—These have made very rapid growth during the long period of dry and sunny weather; those in five-inch pots are showing strong flower spikes. They now need a full southern aspect to be successful with them. A site on walls of outhouses, and even boardings facing south, will generally ensure profitable crops of fruit. Very little soil will be needed when first planting, rather deferring this till good trusses of fruit show, applying this by frequent top-dressing as the roots protrude from the soil. This plan will be found to counteract excessive growths, making a fair balance of flower and growth combined. A hard bottom is perhaps the best of all for tomatoes, that possessing a hard ash bottom for preference. Well ram this, and place small hillocks of turfy loam, and a slight dressing of burnt garden refuse is all that is necessary. Water as required, and for the final top-dressing use a good surfacing of horse droppings and a little soot to finish swelling up the fruit.

## NEW PLANTS, ETC.

◆

### ELÆOCARPUS CYANEUS.

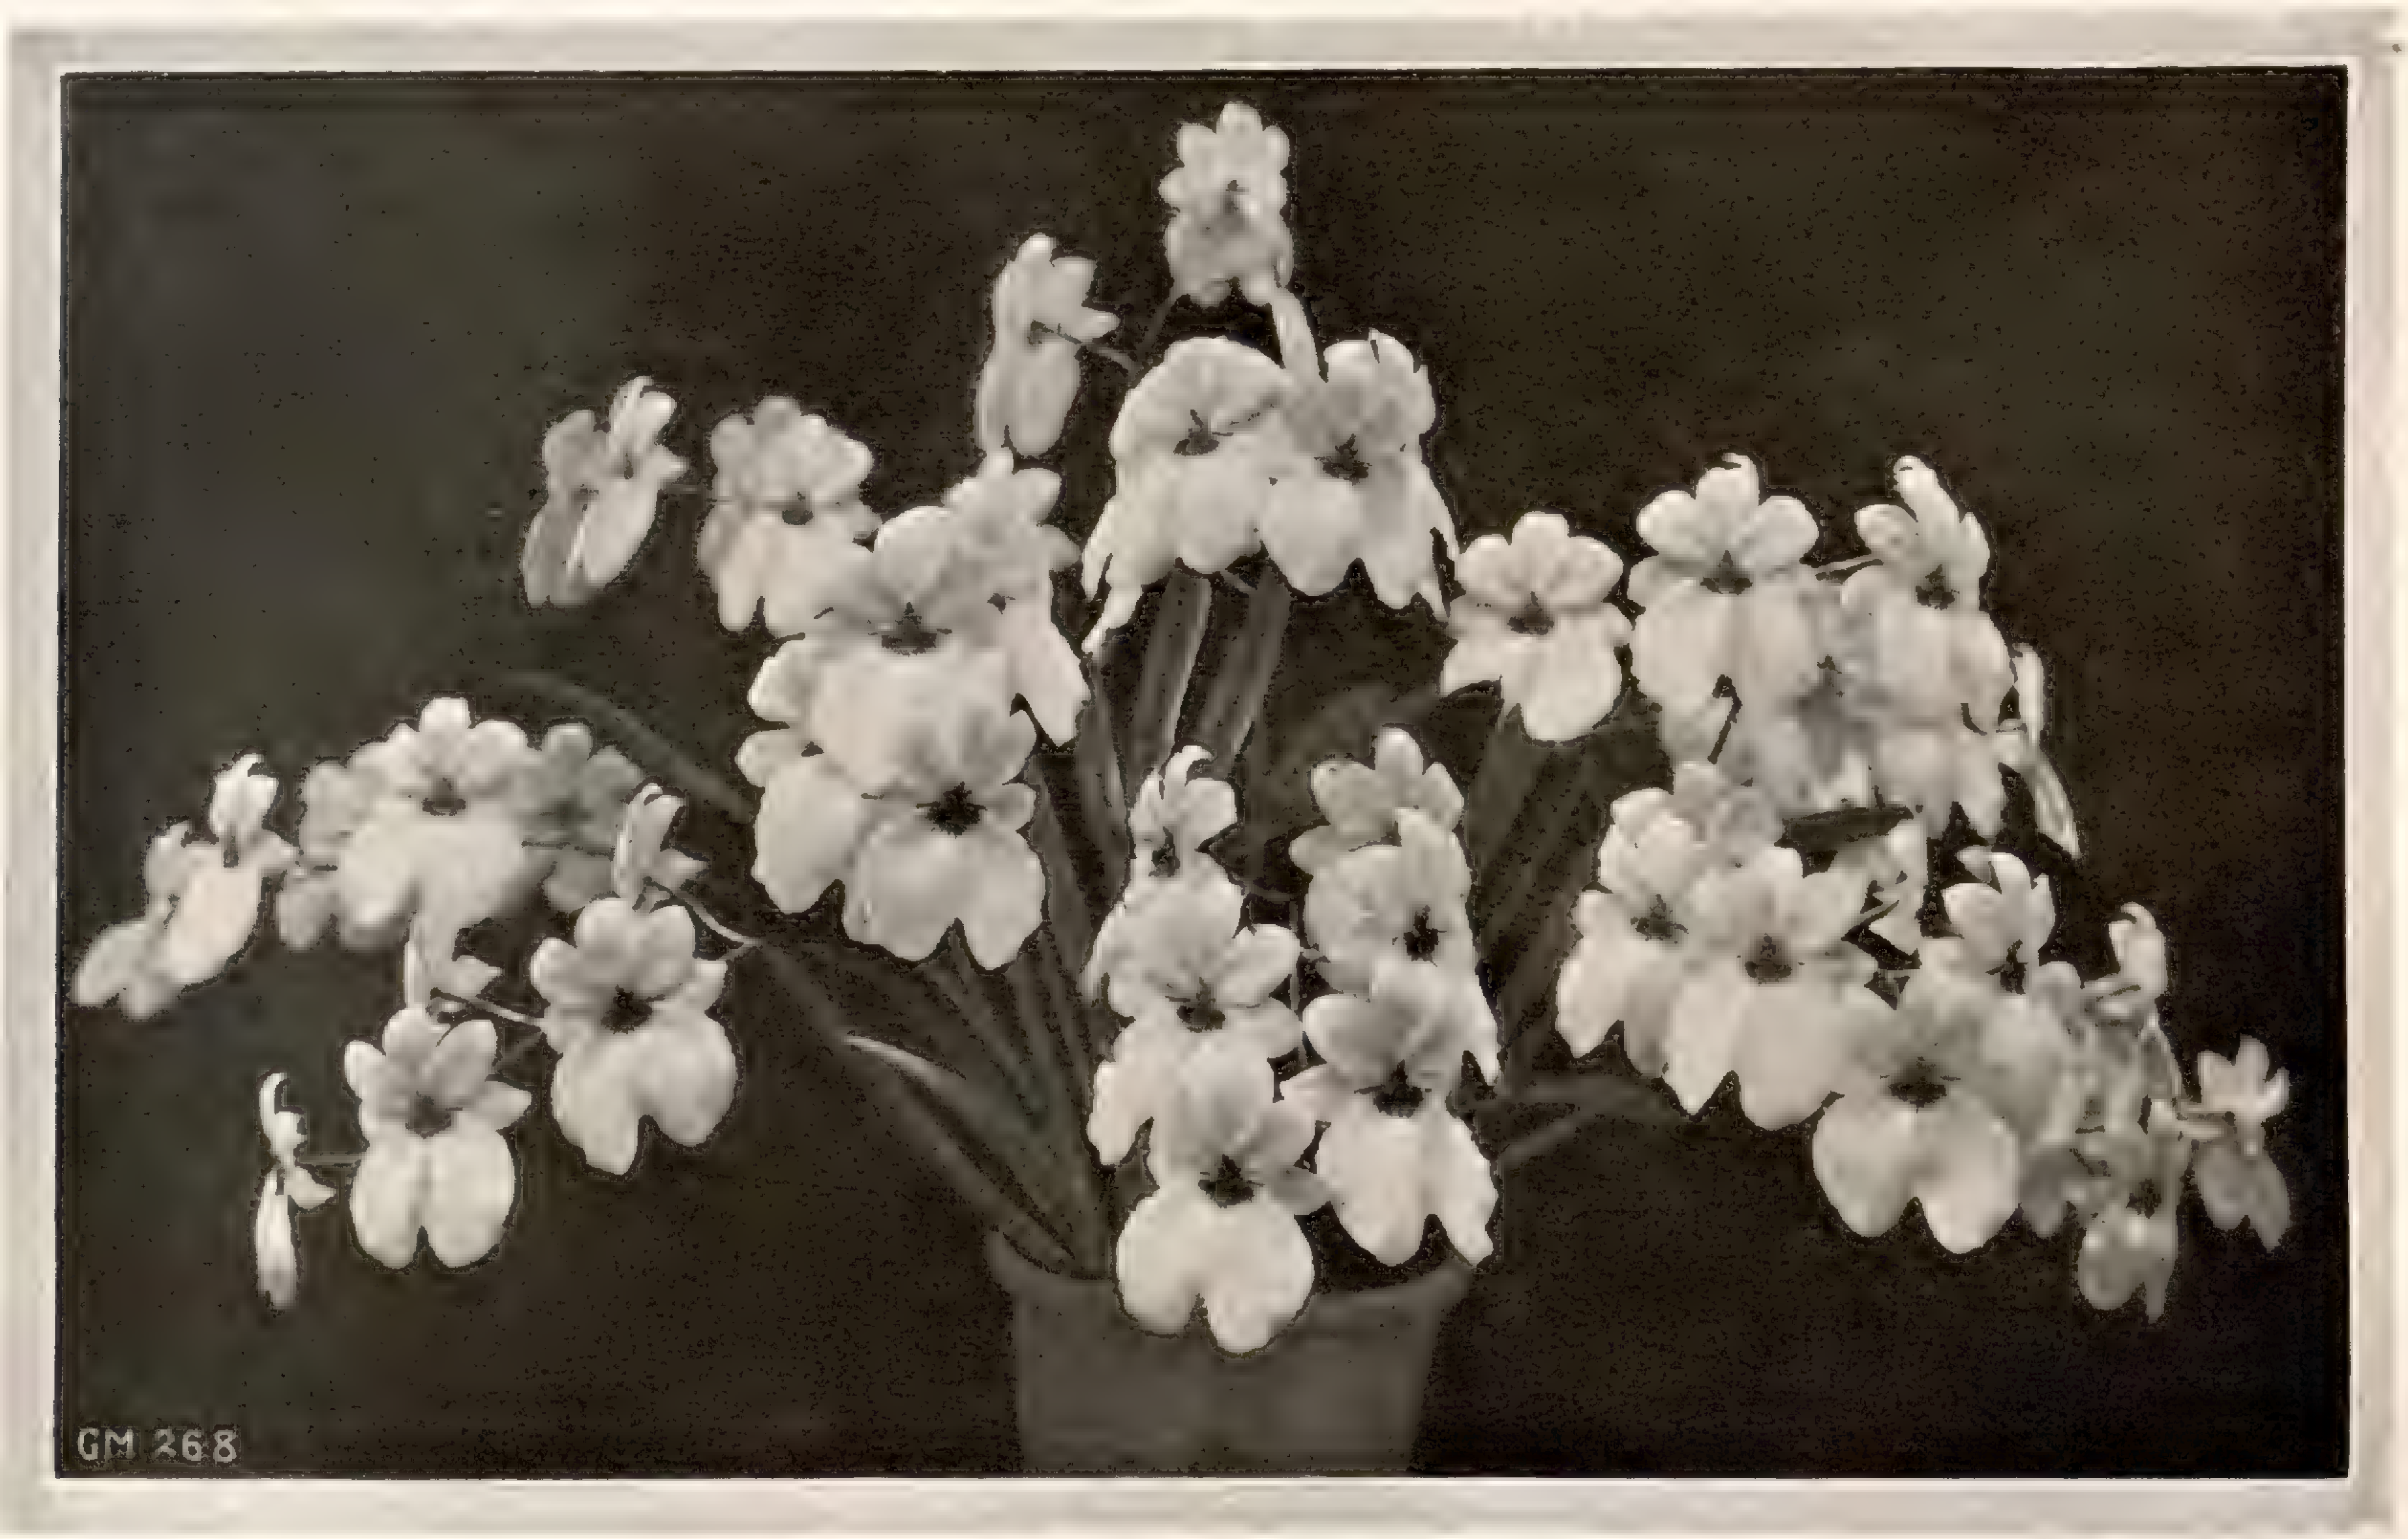
Under the name of Elæocarpus reticulatus this beautiful evergreen greenhouse shrub gained recognition. It was figured in our issue of June 8, and there described. Its chief beauty lies in the axillary racemes of white fimbriated flowers, which, as shown in our illustration, are freely produced. F.C.C., R.H.S., June 4. Messrs. Jas. Veitch and Sons, Chelsea.

### CARNATIONS.

Queen Mary.—A beautiful, well-formed, large, and clove-scented border carnation; the colour is salmon-rose. A.M., R.H.S., June 4. Mr. C. Blick, Hayes, Kent.

Attraction.—Another fine border variety of large size and purest whiteness, and also of excellent form. A.M., R.H.S., June 4. Mr. C. Blick, Hayes, Kent.

Margaret Lennox.—An especially handsome border carnation, or, more strictly, a yellow-ground fancy. The colour is rich golden-yellow, with a bright scarlet margin and markings on the petals. A.M., R.H.S., June 4. Mr. Jas. Douglas, Great Bookham.



[Photo: F. Waldock.

MILTONIA VEXILLARIA SNOWFLAKE.

A beautiful white variety that carried 73 flowers. F.C.C., R.H.S., June 4. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury.

### MILTONIA VEXILLARIA SNOWFLAKE.

A remarkably beautiful form with large white flowers. The specimen shown was not less remarkable for high culture than was the variety for its chaste beauty. It carried thirteen spikes, and a total of seventy-three flowers. F.C.C., and Cultural Commendation, R.H.S., June 4. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

### SWEET PEAS.

May Campbell.—A pretty and distinct variety with cream ground, and a flushing or flaming of rosy-carmine over the centre of the standard, and some veinings of the same colour on the wings. A.M., R.H.S., June 4. Messrs. Dobbie and Co., Edinburgh.

Dobbie's Lavender George Herbert.—A fine lavender variety, not entirely new, but, we understand, this is a fixed stock. A.M., R.H.S., June 4. Messrs. Dobbie and Co., Edinburgh.

Dobbie's Thomas Stevenson.—A very finely-formed variety of brilliant orange-scarlet colouring. A.M., R.H.S., June 4. Messrs. Dobbie and Co., Edinburgh.

### GLADIOLUS ROSINA.

This good addition to the early-flowering or Colvillei group of gladioli is a very graceful form with long spikes of soft pink flowers that have markings of a dark pink hue. A.M., R.H.S., June 4. Mr. Blamfield, St. Martin's, Guernsey.

### SILENE HOOKERI.

A charming little plant that appears to be eminently suitable for the rock garden. The rose-coloured flowers are freely produced. A.M., R.H.S., June 4. Messrs. T. S. Ware, Lim., Feltham.

### PELARGONIUM CHAMPION.

A finely habited pelargonium that appears to be especially suitable for summer bedding. It is a seedling from Paul Crampel, and carries large trusses of fine pink flowers. A.M., R.H.S., June 4. Mr. P. Ladds, Swanley Junction.

### WAHLENBERGIA GENTIANOIDES.

This pretty border or rock garden plant closely resembles a campanula in growth and flowers. It grows about a foot high, and its rather large, campanulate, drooping blue flowers are carried on slender, erect stems. A.M., R.H.S., June 4. Messrs. Piper, Bayswater.

### DELPHINIUM DUSKY MONARCH.

This very fine delphinium grows from 8ft. to 10ft. high, and bears very large spikes of fine purple flowers. A most effective variety of high quality. A.M., R.H.S., June 4. Messrs. J. Kelway and Son, Langport.

### ODONTOGLOSSUM THAIS GLEBE VAR.

This handsome variety was represented by a splendidly tall spike of nineteen large flowers, the creamy flowers are flushed with rose, and freely marked with dark red-purple. A.M., R.H.S., June 4. C. E. Phillips, Esq. (grower, Mr. R. J. Bucknell), The Glebe, Sevenoaks.

### ODONTOGLOSSUM LAMBEAUIANUM PRINCESS MARY.

A large-flowered variety, in which the sepals are white, while the white lip has purple markings. A.M., R.H.S., June 4. H. S. Goodson, Esq. (grower, Mr. G. Day), West Hill, Putney.

### DENDROBIUM GOLDIEI.

A fine Australian species, hailing from the York Peninsula. It is closely allied to D. superbiens, but has larger rounded flowers of a rich, deep rose-purple colouring. A.M., R.H.S., June 4. Messrs. Sander and Sons, St. Albans.

### LÆLIO-CATTLEYA APHRODITE COWAN'S VAR.

A beautifully rounded form of L.-c. Aphrodite. It has white sepals and petals, and a white lip, that has a wonderfully fine crimson-purple apex to the fringed front lobe. A.M., R.H.S., June 4. Liverpool Orchid Nursery Company, Liverpool.

### STANHOPEA PERUVIANA.

A handsome, fragrant species with large golden-yellow flowers, slightly shaded and spotted with purple; the column is creamy-white, with purple spots. It is a finer subject than S. Wardi, but, like so many members of the genus, its flowers are short-lived. It was discovered in Peru by Mr. Forget in 1907, when collecting for Messrs. Sander and Sons, St. Albans. (Bot. Mag. t. 8,417.)

### STRANVÆSIA UNDULATA.

A very hardy shrub, that is said to reach a height of 30ft., and to become a good tree in Central China. Apparently the species shows considerable variation, and even on the same plant the lanceolate leaves run to extremes of form. The small white flowers are freely produced, but are so short-lived that the plant has little value as a flowering subject. It is for its abundant bright orange fruits that it is desirable, and no doubt the plant will take its place in gardens for the same purpose to which the Fire Thorn is now so commonly put. (Bot. Mag., t. 8,418.)

DELPHINIUM DUSKY MONARCH.
A tall and stately variety bearing fine spikes of large semi-double flowers, of purple hue. A.M., R.H.S., June 4. Messrs. J. Kelway and Son, Langport.

### LEPTOSPERMUM SCOPARIUM NICHOLLI.

Recently described in these columns as the finest new plant at the great Royal International Horticultural Exhibition, this leptospermum bids fair to become a popular cool greenhouse shrub, while in the sheltered parts of the southern counties it will be hardy. The crimson flowers are produced with great freedom, and plants a year old from the cutting bloom in the spring time, and the blossoms last for six weeks. This new shrub was brought to England in 1908, from New Zealand, by Captain A. A. Dorrien Smith. (Bot. Mag., t. 8,419.)

### OLEARIA CHATHAMICA.

A very fine species introduced to cultivation by Captain A. A. Dorrien Smith. It has been grown and flowered out of doors by the Rev. A. T. Boscawen, at Ludgvan Rectory, Marazion, Cornwall; there it is propagated easily from cuttings, and does well in bog earth and leaf-soil. O. Chathamica makes a stoutly branching shrub from 3ft. to 7ft. high, the serrate, oblanceolate, leathery leaves being covered on the underside with dense white wool. The flower heads are about two inches across, and born singly on stout peduncles from the axils of the leaves towards the end of the branches. The ray florets may be white, usually pale violet-purple, and the disk is deep violet-purple. (Bot. Mag., t. 8,420.)

### CRASSULA BARKLYI.

A quaint little succulent plant growing not more than two inches high. Each one is a little column of closely imbricating leaves clustering round a simple stem, and at flower-time, surmounted by a little cluster of tiny white or pinkish flowers. Dry tropical conditions appear to be most suitable for the cultivation of this native of Little Namaqualand. (Bot. Mag., t. 8,421.)

### BRUNSFELSIA UNDULATA.

A beautiful West Indian shrub that succeeds in a warm house, producing its white flowers in terminal clusters in the autumn. Each flower is about two and a-half inches across the spreading, five-lobed and undulate mouth, and has a yellowish or greenish tube over three inches long. B. undulata is a plant that appears to be well worth cultivation where there is room, for it is a large stove house plant. (Bot. Mag., t. 8,422.)

### SYRINGA JULIANÆ.

A very distinct lilac found in Western China by Mr. E. H. Wilson. It is a hardy, medium-sized shrub, sweetly scented, and flowers in May and June. It is peculiarly striking because the pedicels, peduncle, and outside of the corolla tube are deep purplish-lilac, while the inner side of the corolla segments is white. The tiny calyx is violet. (Bot. Mag., t. 8,423.)

### DOMBEYA CALANTHA.

A strong-growing tree or shrub from British Central Africa. It flowers freely in the Mexican House at Kew, and bears its showy, rose-coloured flowers in rounded pelargonium-like trusses. Each flower, about one and a-half inches across, bears a close resemblance to a mallow. (Bot. Mag., 8,424.)

### COROKIA COTONEASTER.

A very curious much-branched species from New Zealand. It cannot be regarded as hardy, though on a south wall at Kew it grows well, and produces its bright yellow flowers plentifully every May. The little spathulate leaves are generally in clusters of three on the short interlacing branches, but the old stems are usually naked. The flowers of this shrub are followed by red fruits. (Bot. Mag., t. 8,425.)

### CEREUS SILVESTRI.

A very pretty species from Argentina discovered by Dr. P. Silvester, and placed in commerce by Messrs. Haage and Schmidt, of Erfurt. Its prostrate, spiny stems are rarely more than three inches long, and from these the showy orange-scarlet flowers are produced laterally and erect. Each flower is about one and a-half to two inches wide, and composed of numerous segments. At Kew it grows readily with the other succulent plants, and is so bright and attractive when flowering that it possesses a considerable horticultural value.

---

**Novel-trained Fuchsias.**—Repeating on a larger scale an exhibit of fuchsias made for the first time last year at Olympia, Messrs. J. Veitch and Sons put up a very noticeable group at the International Show. The plants, some 10 feet or so in length, were trained cordon fashion, and disposed at an angle corresponding with the roof of a greenhouse, thus showing their suitability for training to the roof of that structure. The blossoms hung down in the greatest profusion, and though treated in this way the plants presented a somewhat formal appearance, yet they attracted a good deal of attention. The varieties represented, all of which may be taken as good roof plants, were Clipper, Final, General Grenfel, Lustre, Mrs. Marshall, Mrs. Rundle, Mrs. Todman, Olympia, and The Shah.—K

## HEMEROCALLIS OR DAY LILIES.

The genus hemerocallis embraces a large group of showy garden plants, alike useful for border and shrubbery planting, while for naturalising by waterside and in woodlands they are more or less indispensable. The flowers are in the form of expanded trumpets, and borne in clusters on stout, erect stems, well above the foliage; the colour is usually some shade of yellow, orange, or orange-crimson, so that even where the various kinds are grown together the colours readily harmonise with each other. So far as their cultural requirements are concerned, the day lilies are of the easiest possible culture, succeeding in any ordinary garden soil. They take a year or two before attaining their maximum beauty, and few plants require less attention than these exact, once they are fairly established.

One of the best-known species of hemerocallis is H. aurantiaca, a native of Japan, of dwarf habit, and with rich orange-yellow flowers; the variety major is a glorified form, bearing ten to a dozen flowers of the richest orange-yellow, the segments gracefully recurving and forming widely-expanded trumpets some seven inches across.

Hemerocallis flava is a well-known garden plant, with narrow, grass-like foliage, and produces sheaves of yellow flowers. This species is distributed through part of Europe and in temperate Asia. Hemerocallis fulva, also known as H. disticha, is a vigorous-growing perennial, with large orange-crimson flowers, carried on stout stems and producing an exceedingly bold effect when massed in quantity; the variety fl. pl. is distinct, with its double flowers of orange-crimson, while another form is distinguished by having the foliage elegantly striped green and white, the latter being one of the most decorative in the whole group; the two last-named are generally known in gardens as H. Kwanso plena and H. Kwanso plena variegata.

Hemerocallis citrina is one of the most distinct, and less frequently met with in gardens, the segments are long and coloured bright citron-yellow, the flowers being produced in August and September, when many of the other species have passed their best; it is a Chinese introduction and grows to a height of 4ft. Hemerocallis Middendorffii is an Asiatic species that attains a height of 3ft., and produces soft orange-yellow flowers, above a dense mass of graceful drooping foliage.

Hemerocallis Thunbergi, another Japanese species, grows 3ft. high and bears rich yellow flowers in July. Between H. aurantiaca major and the last-named species has arisen the hybrid form luteola, the flowers of which are most freely produced on three-foot stems and are coloured bright orange-yellow. By intercrossing of the older species many hybrid forms have arisen, of the greatest value as garden plants, their chief characteristics being increased substance in the petals, widely expanded and generally large flowers, and a more or less perpetual habit of flowering. Of these one of the most desirable is Dr. Regel. This fine form attains a height of 2½ft., and has expanded flowers seven inches across, of a soft shade of apricot; the flowering season is from July onwards. Other hybrid forms of merit include Apricot, a dwarf June-flowering variety with soft apricot-coloured flowers; Buttercup, flowering in June, with bright yellow flowers on two-feet stems; Gold Dust, resembling flava, with deep orange flowers on three-feet stems; Orangeman bears orange-coloured flowers on two-feet stems, and is in season during June and July; and Sovereign, one of the dwarfest, has widely-expanded flowers of rich orange-yellow, the reverse of the petals being bronzy-yellow.

All the forms of hemerocallis are invaluable for the production of flowers for cutting, the individual blooms only last a day or two, but as the buds open readily in water, the spent flowers are practically renewed each day, and the average life of a spike is thus from five to seven days.

Thomas Smith.

Coombe Court Gardens.

---

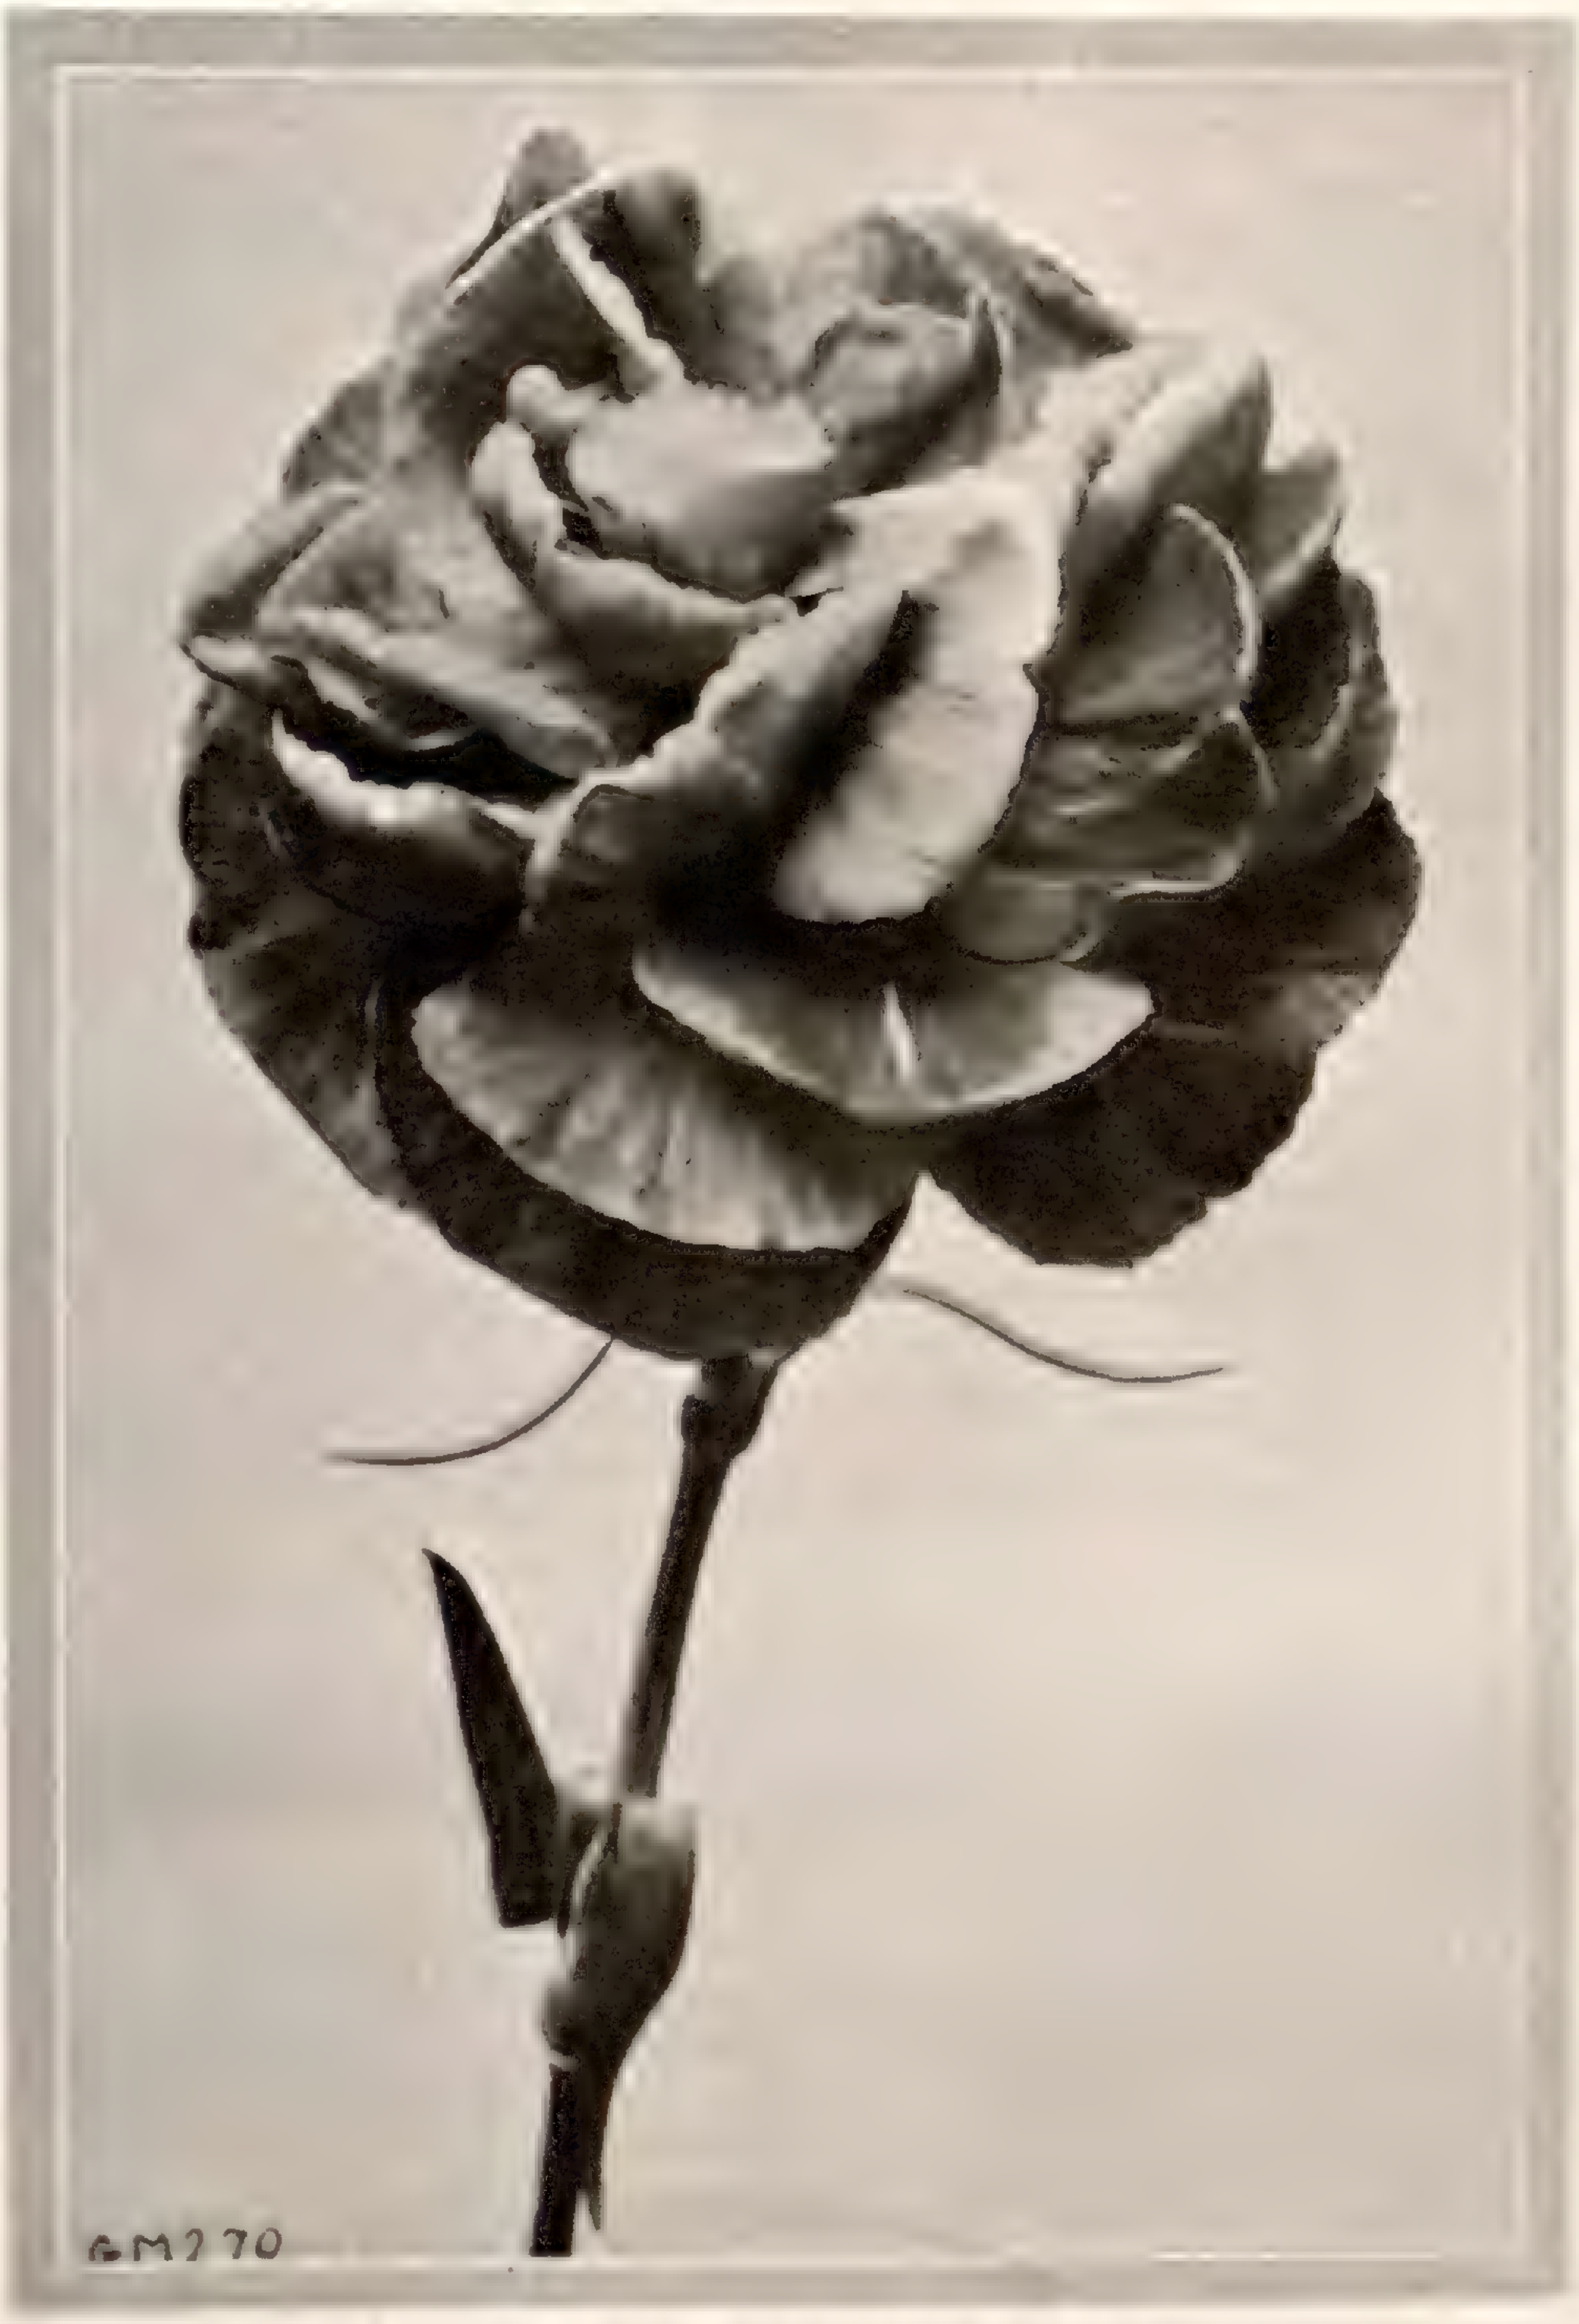
## ACANTHOPANAX RICINIFOLIUM.

An illustration of a fully-developed example of this ornamental Araliad may be found in Sargent's "Forest Flora of Japan," and at page 45 of the same work an account of the tree, as seen growing in Japan, is given. In gardens in the British Isles it is met with but rarely, and at the best is little more than a bush, its presence being due to the decorative effect of its foliage. In the forests of Japan, however, it grows to a height of 80 feet, with a trunk four or five feet in diameter, its timber being included amongst the commercial woods of the country. Boards exhibited at the Japan-British Exhibition of 1910 showed the wood to be of a light brownish colour, though it is sometimes described as white, straight-grained, moderately hard, with a fine smooth surface. In the East it is used for the interior finish of houses, furniture, packing-cases, etc.

The tree is most common in Yezo, the southern part of Saghalien, and the northern portion of Hondo, where its largest proportions are attained in fertile soil in sheltered positions. It is not found as a pure wood, but mixed with maples, birches, oaks, etc. As a small plant, it is awkward to handle, by reason of the stout yellowish spines which clothe both trunk and branches.

From a decorative point of view its principal asset lies in its large rounded dark green leaves, which are sometimes as much as nine or ten inches across, with margins divided to a depth of two or three inches by five triangular acciminate lobes. Trees which have attained a flowering age are said to be very ornamental when in bloom for the small white flowers are borne in large terminal inflorescences during August and September. It is not solely a Japanese tree, for it also occurs in China.

W. Dallimore.



CARNATION QUEEN MARY.

A handsome salmon-rose border carnation, large, and effective. A.M., R.H.S., June 4. Mr. C. Blick, Hayes, Kent.

**PROFITABLE FRUIT GROWING** for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## BRITISH FERNS AT THE INTERNATIONAL.

Although the schedule of the great show at Chelsea embraced a number of competitive classes for British fern varieties, so far as the amateur was concerned the opportunity afforded was by no means as favourable as it appeared, since the show was held several weeks too soon in the season, and as the hardy species do not take kindly to forcing, few of the splendid specimens shown had finished their growth, and none were so fully developed as to present themselves at their absolute best. Some species, indeed, Polypodium vulgare, for instance, were not even scheduled, presumably for the reason given.

Messrs. H. B. May and Sons devoted a fair portion of their space to hardy ferns, mainly British, embracing a number of the best varieties, such as the plumose and tasselled lady ferns, the plumose polystichums, including a fine specimen of P. aculeatum gracillimum Drueryi, a large number of the frilled and crested hart's tongues, Osmunda in variety, and, in short, a fairly representative number of the best forms in commerce. It was, however, left to Mr. W. B. Cranfield, of East Lodge, Enfield Chase, to exhibit as an amateur a still choicer lot, embracing some unique plants which have been rescued from the collection of the late Mr. Moly, which Mr. Cranfield acquired a year or so ago. These, though somewhat handicapped by lack of time for perfect development, were, though mainly lifted from the open, so far advanced that only the eye of the expert, acquainted with the types, could detect the lack and recognise that a week or two would have greatly improved them. The frilled or crispum hart's tongues, for instance, had unrolled their fronds to very handsome effect, but had still to lengthen, widen, and deepen the frilling considerably to their great enhancement, and so with other species. Despite this drawback, however, each class obtained a First-class award and the collection certainly merited an additional recognition as a whole.

Amongst the more beautiful specimens were to be seen finely-grown examples of the elite of the "superbum" section of Athyrium filix fœmina, viz., plumosum Druery, percristatum, grandiceps, crispatum, and, above all, as the original progenitor of these exquisite forms, a division of the original superbum itself, the parent of all of them. Several large specimens of the P. aculeatum gracillimum (Druery) and P. a. plumosum (Green), exemplified these new additions to the British fern flora, while some half-dozen of the finest frilled, fringed, and crested hart's tongues, grandly grown, and in fine shape, showed what this wonderful species is capable of in skilful hands.

The only competitive group was that of Lady Tate, which included several hardy exotics associated with some well-grown British varieties. Mr. Amos Perry, of Enfield, showed a good number of British ferns, accompanied by an interesting and instructive exhibit, showing the various stages of development, from the tiny prothallus through the full-grown one, to the picked-out and potted-off specimen plants ready for the market. A collection was also shown by Messrs. Artindale and Sons, Sheffield, covering a hundred square feet, and embracing many very pretty varieties, with, however, unfortunately, a number of wrong names.

Altogether, despite the drawback mentioned, the exhibition of 1912 will have marked an immense advance over that of 1866, if indeed, hardy ferns appeared in any shape at all in those early days, a fact the more to be doubted as the furore which they aroused in the fifties had subsided, owing to the flooding of the market, and the extinction of the popular taste by the lack of discriminaion shown by the raisers and exhibitors of those days, who, to judge by extant catalogues, put a premium on the "ugliest," and charged high prices according to the defects they presented.

C. T. Druery, V.M.H., F.L.S.

## DAHLIA CULTIVATION.

Many young dahlia plants are eaten by slugs and the worst part of the damage is done close to the surface of the ground. If growers only fully realised what a serious matter this partial, or complete, gnawing of the bark is in its effects on the aftergrowth of the plants, more care would be taken to prevent the mischief. When the weather is perfectly fine and dry very little damage is done, as a rule, but as soon as a damp or rainy day occurs, the slugs assemble round the stems as if by magic. The very best thing to do is to remove the soil immediately round the base of the stem, thus laying it bare, and then, in the evening, go round and dash a handful of quicklime round the stem. Do not be afraid of using the lime. I have frequently used it quite hot. Anyone who cares to note the after effects of slugs can easily do so by examining the cankered and unkindly condition of the stems in the autumn.

During June the plants make roots, and get well established, if planted at the end of May, and it is not till early July that any great attention is needed, beyond an occasional tie here and there. Old tubers, however, may have thrown up a quantity of growths, and these will need thinning down to three or four, selecting the best, and cutting off the weaker beneath the soil. Early in July the plants require a careful survey, and it must then be decided as to whether they shall be stopped to force them to branch out, or if already throwing side shoots, these should be reduced to six. There is a great difference in the way the varieties act at this period. In one instance they may run up two feet high, if left to grow naturally, and not produce a single lateral. A variety of this nature requires drastic measures in order to get sufficient side shoots to ensure a number of flowers, and the only way to treat stubborn varieties is to cut them back, leaving only six or eight joints with the leaves intact. Whatever course is adopted, the joints must be made to break into growth. Other varieties break very readily, and are very easy to handle. Yet others break too freely, and soon produce a mass of spindly laterals, some of which must be removed. It is by no means advisable to leave the forward ones, as these may already have formed buds, and will flower too early. In a few cases it may be worth while to cut down the entire plant if young shoots are breaking up freely from the base.

All through July the plants will need syringing or watering overhead during the evening, if the days are at all fine and dry, and, as a rule, thrips will infest the heads unless exterminated by syringing with nicotine insecticide of about normal strength. It is useless to expend time and labour on plants which are being slowly killed by the presence of thrips, and very often I have found growers quite at a loss to account for the unhealthy appearance of their plants, through being ignorant of the habits of these very small and deeply concealed enemies. During wet seasons this trouble is minimised, but may still be met with in the case of some varieties. Snowdon, for instance, being singled out as a prime favourite, from the time the cuttings push forth from the parent tubers. It is hardly, I think, necessary to state that in no instance should a young plant be allowed to flower, and just as a test it is worth while to allow one plant to produce a bloom, and note the effort on the growth, as compared with a plant of the same variety which had the buds and one or two top joints removed.

My remarks have, to a great extent, referred to cactus dahlias. In the case of shows and fancies, the young plants go to work in a business-like way, and late-planted stock left to run up and flower on the main stems, often produce very fine flowers. In the case of earlier plants they may need the bud removed, and will then produce stout laterals, which may be restricted to four or five, and as these varieties are shown as specimen blooms, the laterals left to flower should be as varied as regards age as possible, and in allowing for this always depend on the upper growths flowering first.

It is impossible to say definitely what should be done to the land during July. In very wet seasons I have had it dug all over when opportunity in the way of a dry spell has occurred. One very wet year it was necessary to dig right close up to the plants, so hard and unkindly had the ground become, whereas last year it was perfectly friable, and no digging between the rows was needed. As a rule, a light forking along the centre of the rows, and not too near the plants, is beneficial. It is a capital plan to give a good mulching of rough stable manure, immediately after digging, and if the grower has the good fortune to obtain a soaking rain on this, the plants will grow like weeds. In dry summers a free watering through a coarse rose, during the evenings will have much the same effect. From this time onwards, the exhibitor and the grower for cut flowers may be said to part company, as the one will be tying and thinning incessantly, while the other will be content to let the plants grow naturally. At the same time, it will well repay anyone to periodically thin out the weakly growths and tie up the plants.

The work of securing dahlias against damage by wind is no mean portion of the entire routine, or at least, this is so in all open situations, and three good stakes per plant are the least that can be used if the latter is to be safely guarded. One stake having been placed at the back of the plant at planting time, two others are now added, forming a triangle, wide at the top, and narrow at the base. Round the three stakes run rough string at a height just sufficient for the branches of the plant to reach when spread out. In doing this, i.e., the spreading out, take care not to strip off the laterals at the juncture of base and main stem, as when young they slip out very easily, and should there be any wind, many good laterals may be blown out, if not secured both at the top and the bottom. It is usual to see tarred twine used for running round the stakes, but a rough string is much better. As the plants grow and become loose, add other string, tier above tier, but four tiers are enough for plants of ordinary height, whilst two rounds is ample for the dwarf sorts such as Mercury and Mrs. Dyer. Once the stems are tied to two strings they are safe, and if the plants are attended to once a week and a tie given where needed, they will always be in a fit state to withstand a sudden gale, which is far better than waiting for the wind to rise, and then rushing off to secure the branches.

P. P.

## NOTES ON NEW ROSES.

The trade in new roses has been almost revolutionised during the last few years. Not that there are fewer varieties offered, but the generality of growers wait now until their merits are more thoroughly known. Nor is this any surprise when we bear in mind the enormous number of varieties now in cultivation, the majority of which are really first class. It must, indeed, be something well out of the common to tempt the average grower under these conditions; and perhaps the greatest opening lies in producing better and more reliable forms of ever-blooming varieties for pillars and archways. Although we have several good ones already there are so few that continue in flower, like Gruss an Teplitz, Alister Stella Gray, and Papillon. Something larger and sweeter, and with the perpetual qualities found in Madame Ravary, Madame Antoine Mari, Theresa Bevan, General MacArthur, and Edu Meyer would certainly be desirable. Among recent roses we have far too many pinks, of varying shades, it is true, and some of them very beautiful, but there is not sufficient distinctness from the shades already proved reliable. Naturally one does not care to give high prices for what is oftentimes no real improvement upon cheaper varieties. Of the following we have seen sufficient to form a fairly trustworthy opinion.

Rose du Barri is one of the most persistent bloomers we have among bedding roses, and is good from the bud stage until fully expanded. The name describes its colour, which is quite distinct among roses, and it is also exquisitely scented.

Rose Queen, from America, makes an extra early pink forcer, coming in as rapidly as Richmond, a variety distributed by the same firm. With very long slender and pointed buds, and a centre of glowing colour when expanded it is very taking. The flowers are borne perfectly upright and upon long stems, rendering it an ideal variety for cutting from. It is considerably fuller than Killarney, opens equally as well, and is bright and certain even in dull winter weather.

Radium is another of the few striped roses. These do not appeal to me, and this sport from Caroline Testout resembles an indifferent variegated tulip.

Sunburst, like Rayon d'Or, is now fairly well known from the great reputation of the few flowers seen. It will undoubtedly be a grand decorative variety in the open, while it appears destined to oust many erstwhile favourites under glass. It is long since a new rose promised so well in this connection, and, being of such gloriously distinct and bright colouring, it will, without doubt, become very popular. It has the advantage of being an excellent grower, with green bronzy foliage and few thorns. In the bud stage it is very long and pointed. Some large consignments have been forwarded to American growers for culture under glass in their immense establishments, and I feel quite certain it will prove a permanent variety on this side of the Atlantic.

Frau Oberburgermeister Piecq resembles a creamy-yellow form of Maréchal Niel. It is very large, full, and of good shape, each bloom carried boldly upon upright growth, and likely to be useful both to the exhibitor and for cut flowers. It has the merit of being very sweet-scented, a charm we appear to be falling away from in many of our newer roses.

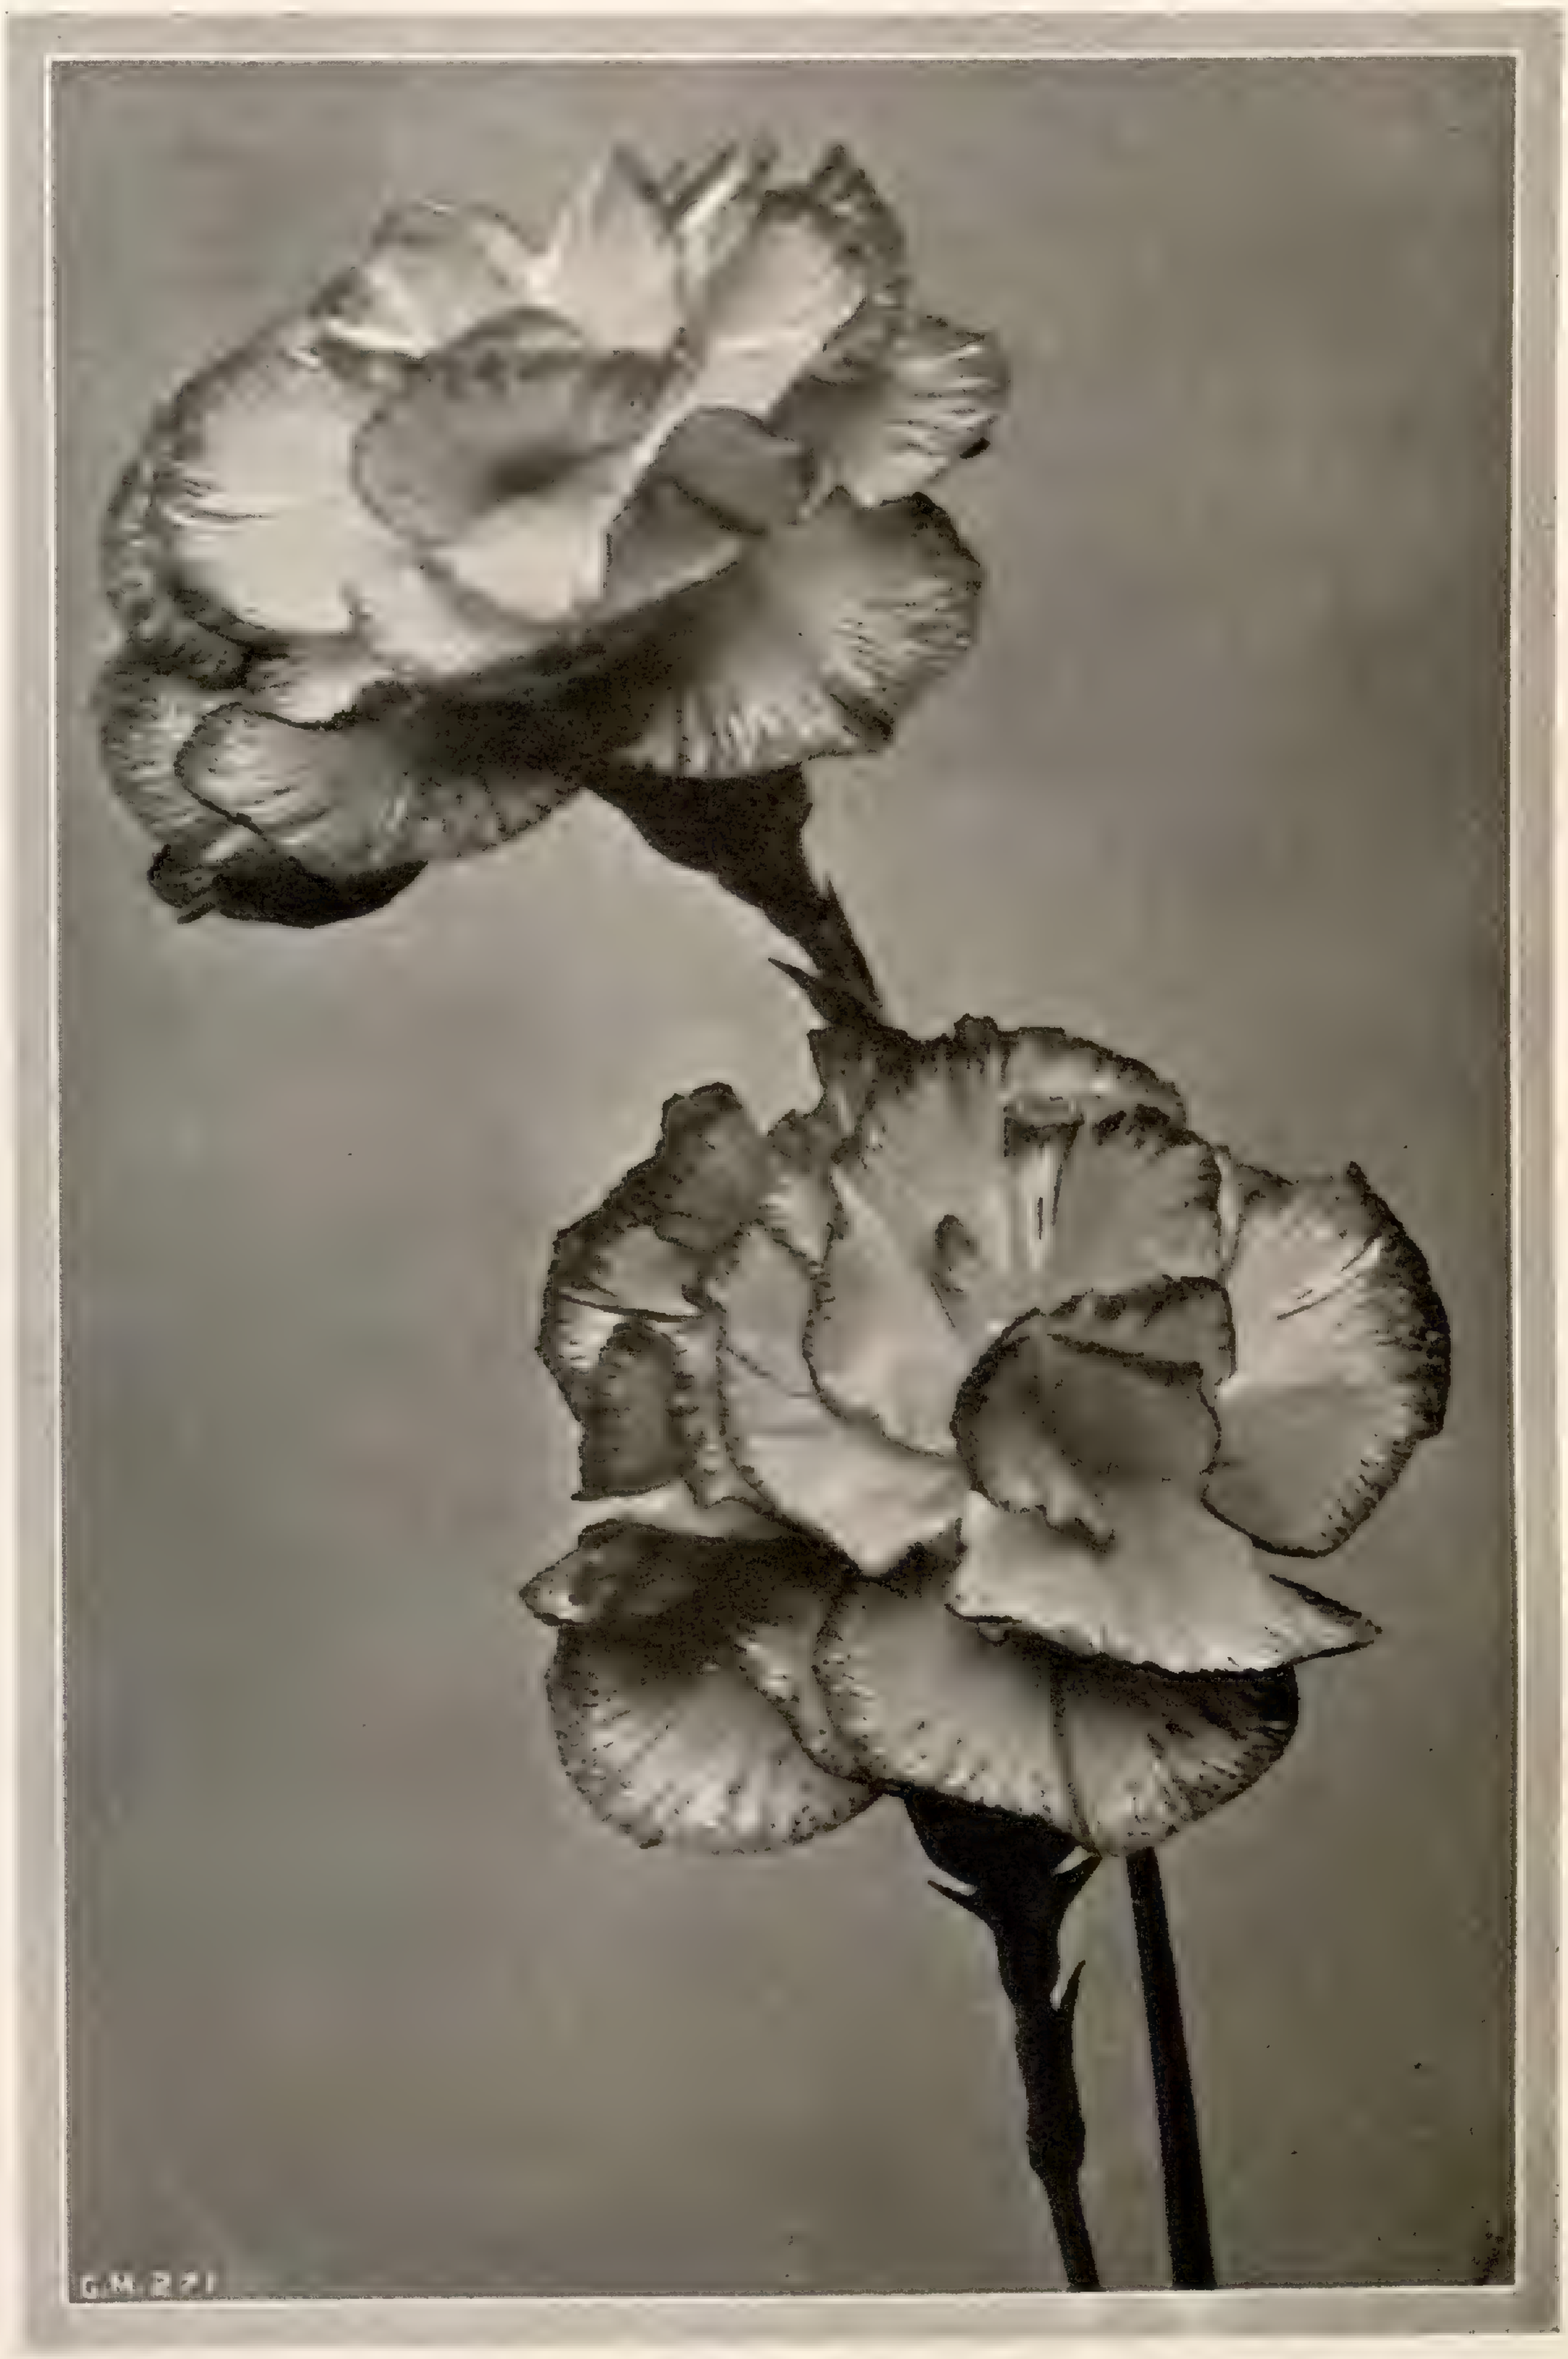
Flame, a seedling from Crimson Rambler, is one of the most distinct climbers of late years. Large trusses of brightest salmon-pink are carried well away from glossy green foliage. In other respects it resembles Crimson Rambler, and is a much brighter pink than found in other climbing polyanthas.

Edward Mawley is a magnificent example of the much-needed rich velvety crimsons to brighten up the rapidly-growing class of hybrid teas. Apparently it has no fault, being large, full, of good form, while by no means its least charm is its delicious perfume, seldom found in any but a few of the dark-coloured hybrid perpetuals.

Elizabeth is the result of a cross with the well-known Frau Karl Druschki, which it resembles in growth and form. The distinction lies in its deep rosy-pink centre, shading off lighter towards the edge of outside petals. Undoubtedly one of our most reliable pinks, and as free an autumnal bloomer as Frau Karl Druschki, which we all know as one of the last to succumb to frost and bad weather.

Deutschland affords a novel and welcome colouring. Golden-yellow, shaded with rose and orange. The flowers are large, full, and expand freely. This is one of the newer hybrid briars, being a cross between Frau Karl Druschki and Soleil d'Or. It is decidedly promising.

Later on, when we have seen a little more of the introductions of last autumn and the present spring, I hope to supplement these notes; but it is scarcely safe to write assuredly before. **Rosarian.**



CARNATION MARGARET LENNOX.

This fine border variety has large rich yellow flowers, each petal edged with scarlet. A.M., R.H.S., June 4. Mr. Jas. Douglas, Great Bookham.

**Cineraria Pompadour.**—Not so very many years ago this race of cinerarias, to which an Award of Merit was recently given by the Royal Horticultural Society would have made quite a furore. The prominent feature is the clear and distinct longitudinal striping of the florets which give them a singular appearance. At the present time, however, self-coloured flowers are far more in favour than parti-coloured ones, as these last, viewed from a little distance, do not stand out as markedly as the others.—T.

## CERASTIUM NOTES.

One is apt to regard cerastiums as common and weedy subjects, but such is really not the case, for weediness is often but the lack of proper attention. Cerastiums have a distinct value for present-day gardening, now that the ideal is for natural effects, for unrestrained freedom, for bits of mountain scenery and flora, for all that speaks of natural beauty without formalism. With these aims in view, there is surely a place for the cerastium in almost every garden.

A place may be found where these silvery-foliaged plants can make an appealing effect. It may be in roaming down from the top of an old wall, where in early summer the countless hosts of snowy blossoms may gleam like stars from their silvery cushions of leafage. The banks of the wild garden, where the sun has full play, is ideal for cerastiums. In such a position one obtains the sturdiest possible growth, and a good effect during the time of blossom. Then, again, they can be utilised in the spacious parts of the rock garden, where they will give a good account of themselves if grouped in exposed positions. Exposure to full sun and wind is necessary to bring out the fullest leaf-colouring, and it exerts a dwarfing influence upon the plants.

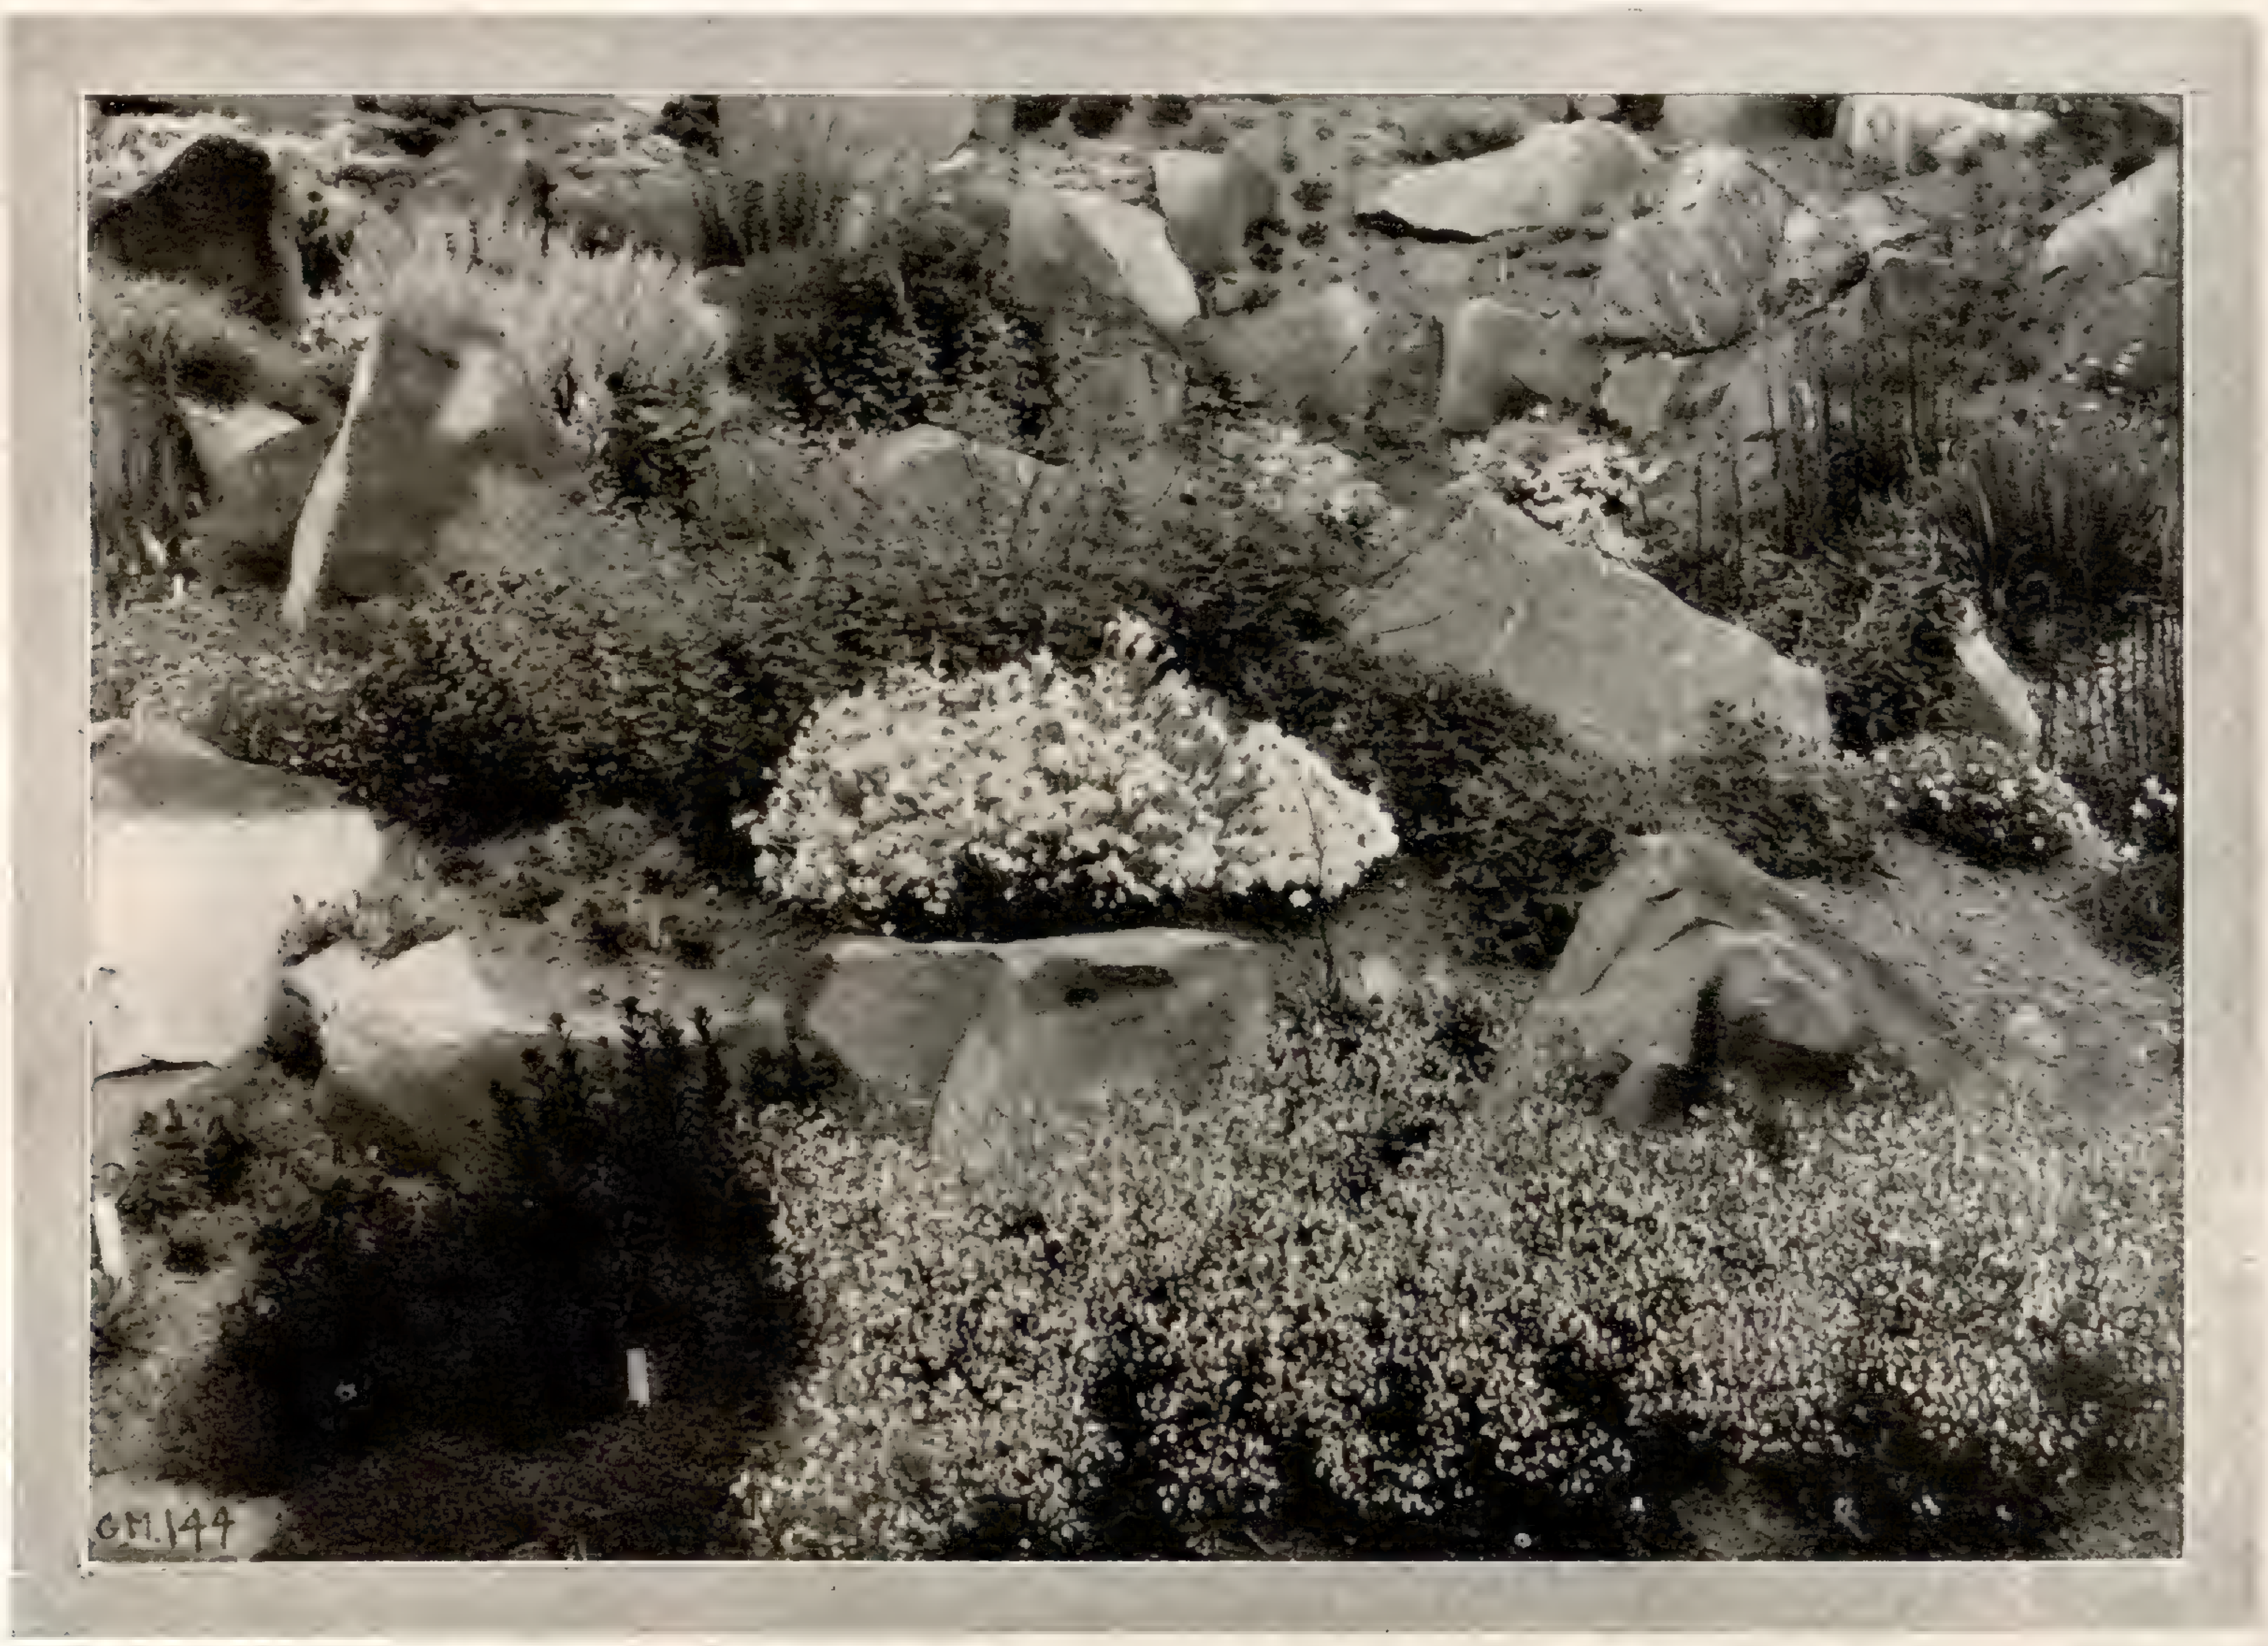
They are particularly valuable in the rock garden for contrasting, the clear white of the blossoms assisting to add to the effect of coloured flowers near by, and coming when the garden is aglow with blue, gold, purple, and other telling colours, the white of the cerastium gives an exquisite contrasting touch. The appended illustration from a photograph taken in the rock garden at Holland House, Southcliff, shows Cerastium grandiflorum as the central part. In the foreground are saxifrages of the umbrosa section, at the back a grouping of the pink Heuchera Rosamunde, while violas, aubrietias, Nepeta Mussini, and other plants are near by.

Cerastiums are chiefly confined to C. tomentosum, C. Biebersteini, and C. grandiflorum, which are readily propagated from seeds or cuttings. The latter can be rooted in quantity during late summer by placing several cuttings in sandy soil in 60-sized pots, and giving them the shelter of a cold frame until rooted. The number of pots of cuttings will be, of course, regulated by the requirements of the garden. If a large quantity is required for edging borders or a like purpose, they should be confined to one form only, for the sake of ensuring a regularity of growth. All plants should be cut over after flowering, as one gains not only neatness but a better foliage growth, and if too rampant, old plants should be cut back hard, or replaced by young ones.

In addition to the cerastiums mentioned there are a few others of interest and utility for the rock garden. The dwarf silvery form of C. alpinum (which is itself probably but a variety of the better-known C. tomentosum), variously known as C. lanatum and C. villosum, is worthy of inclusion. The dwarf woolly foliage masses are especially good, and the yellowish flowers are of certain interest. A miniature form, known as C. gracilis, is also worthy of attention. This is decidedly smaller in its parts than the usual run of cerastiums.

Several others are to be obtained, but it is hardly desirable to have a collection of cerastiums when the above typify all that is best in the group. The main thing for the grower to do is to make the most of his plants by planting simply for effect. Put them just where the silvery foliage and snowy blossoms will tell; put them where something light is required to contrast with deep-hued subjects, remembering that few situations in an English garden could prove too hot or dry for the successful development of cerastiums.

P. S. Hayward.



VIEW IN THE ROCK GARDEN AT HOLLAND HOUSE, SOUTHCLIFF; THE CENTRAL PLANT IS CERASTIUM GRANDIFLORUM.

## THE VALUE OF SHADE.

In the issue of the Gardeners' Magazine for May 25, page 408, "H. C. P." has a timely note on shading plants generally. I quite agree with all the writer advances, but would like to add a few words. Many glasshouses are built with their fronts facing due south, or as nearly so as possible. Throughout the summer months the fully-exposed soil in pots along the front stages must dry up quickly, and also become very hot. Water from taps, pumps, and underground cisterns is poured into these pots liberally, and rather frequently, and sudden chills to the roots of the plants occur. In such circumstances I favour a permanent shading on the front lights high enough to protect the pots. It does much good, and such plants as tomatoes and zonal pelargoniums receive the maximum amount of light while their roots are kept comparatively cool in the pots.

If it be necessary to put on any permanent shading on frame lights, a smear down the centre of the squares of glass is generally sufficient. A good deal of light penetrates, while the direct sun's rays are broken.

G. B.

---

**Portulacas.**—Such a summer as that of 1911 should lead to the extended culture of these brilliantly coloured annuals. When the intense heat and burning sun quickly destroyed the beauty of many of our annual flowers, the portulacas simply revelled in the conditions that then prevailed, and formed for a long time a brilliant feature in the garden. It is useless to attempt to grow the portulacas in a shady, moist spot, but given a warm, well-drained border, or the sunny part of a rockwork ledge, they are most beautiful. They belong to what are termed half-hardy annuals, that is to say, they do best when sown under glass, and the young plants are put out after due hardening off, and when the cold weather of spring is over.—W. T.

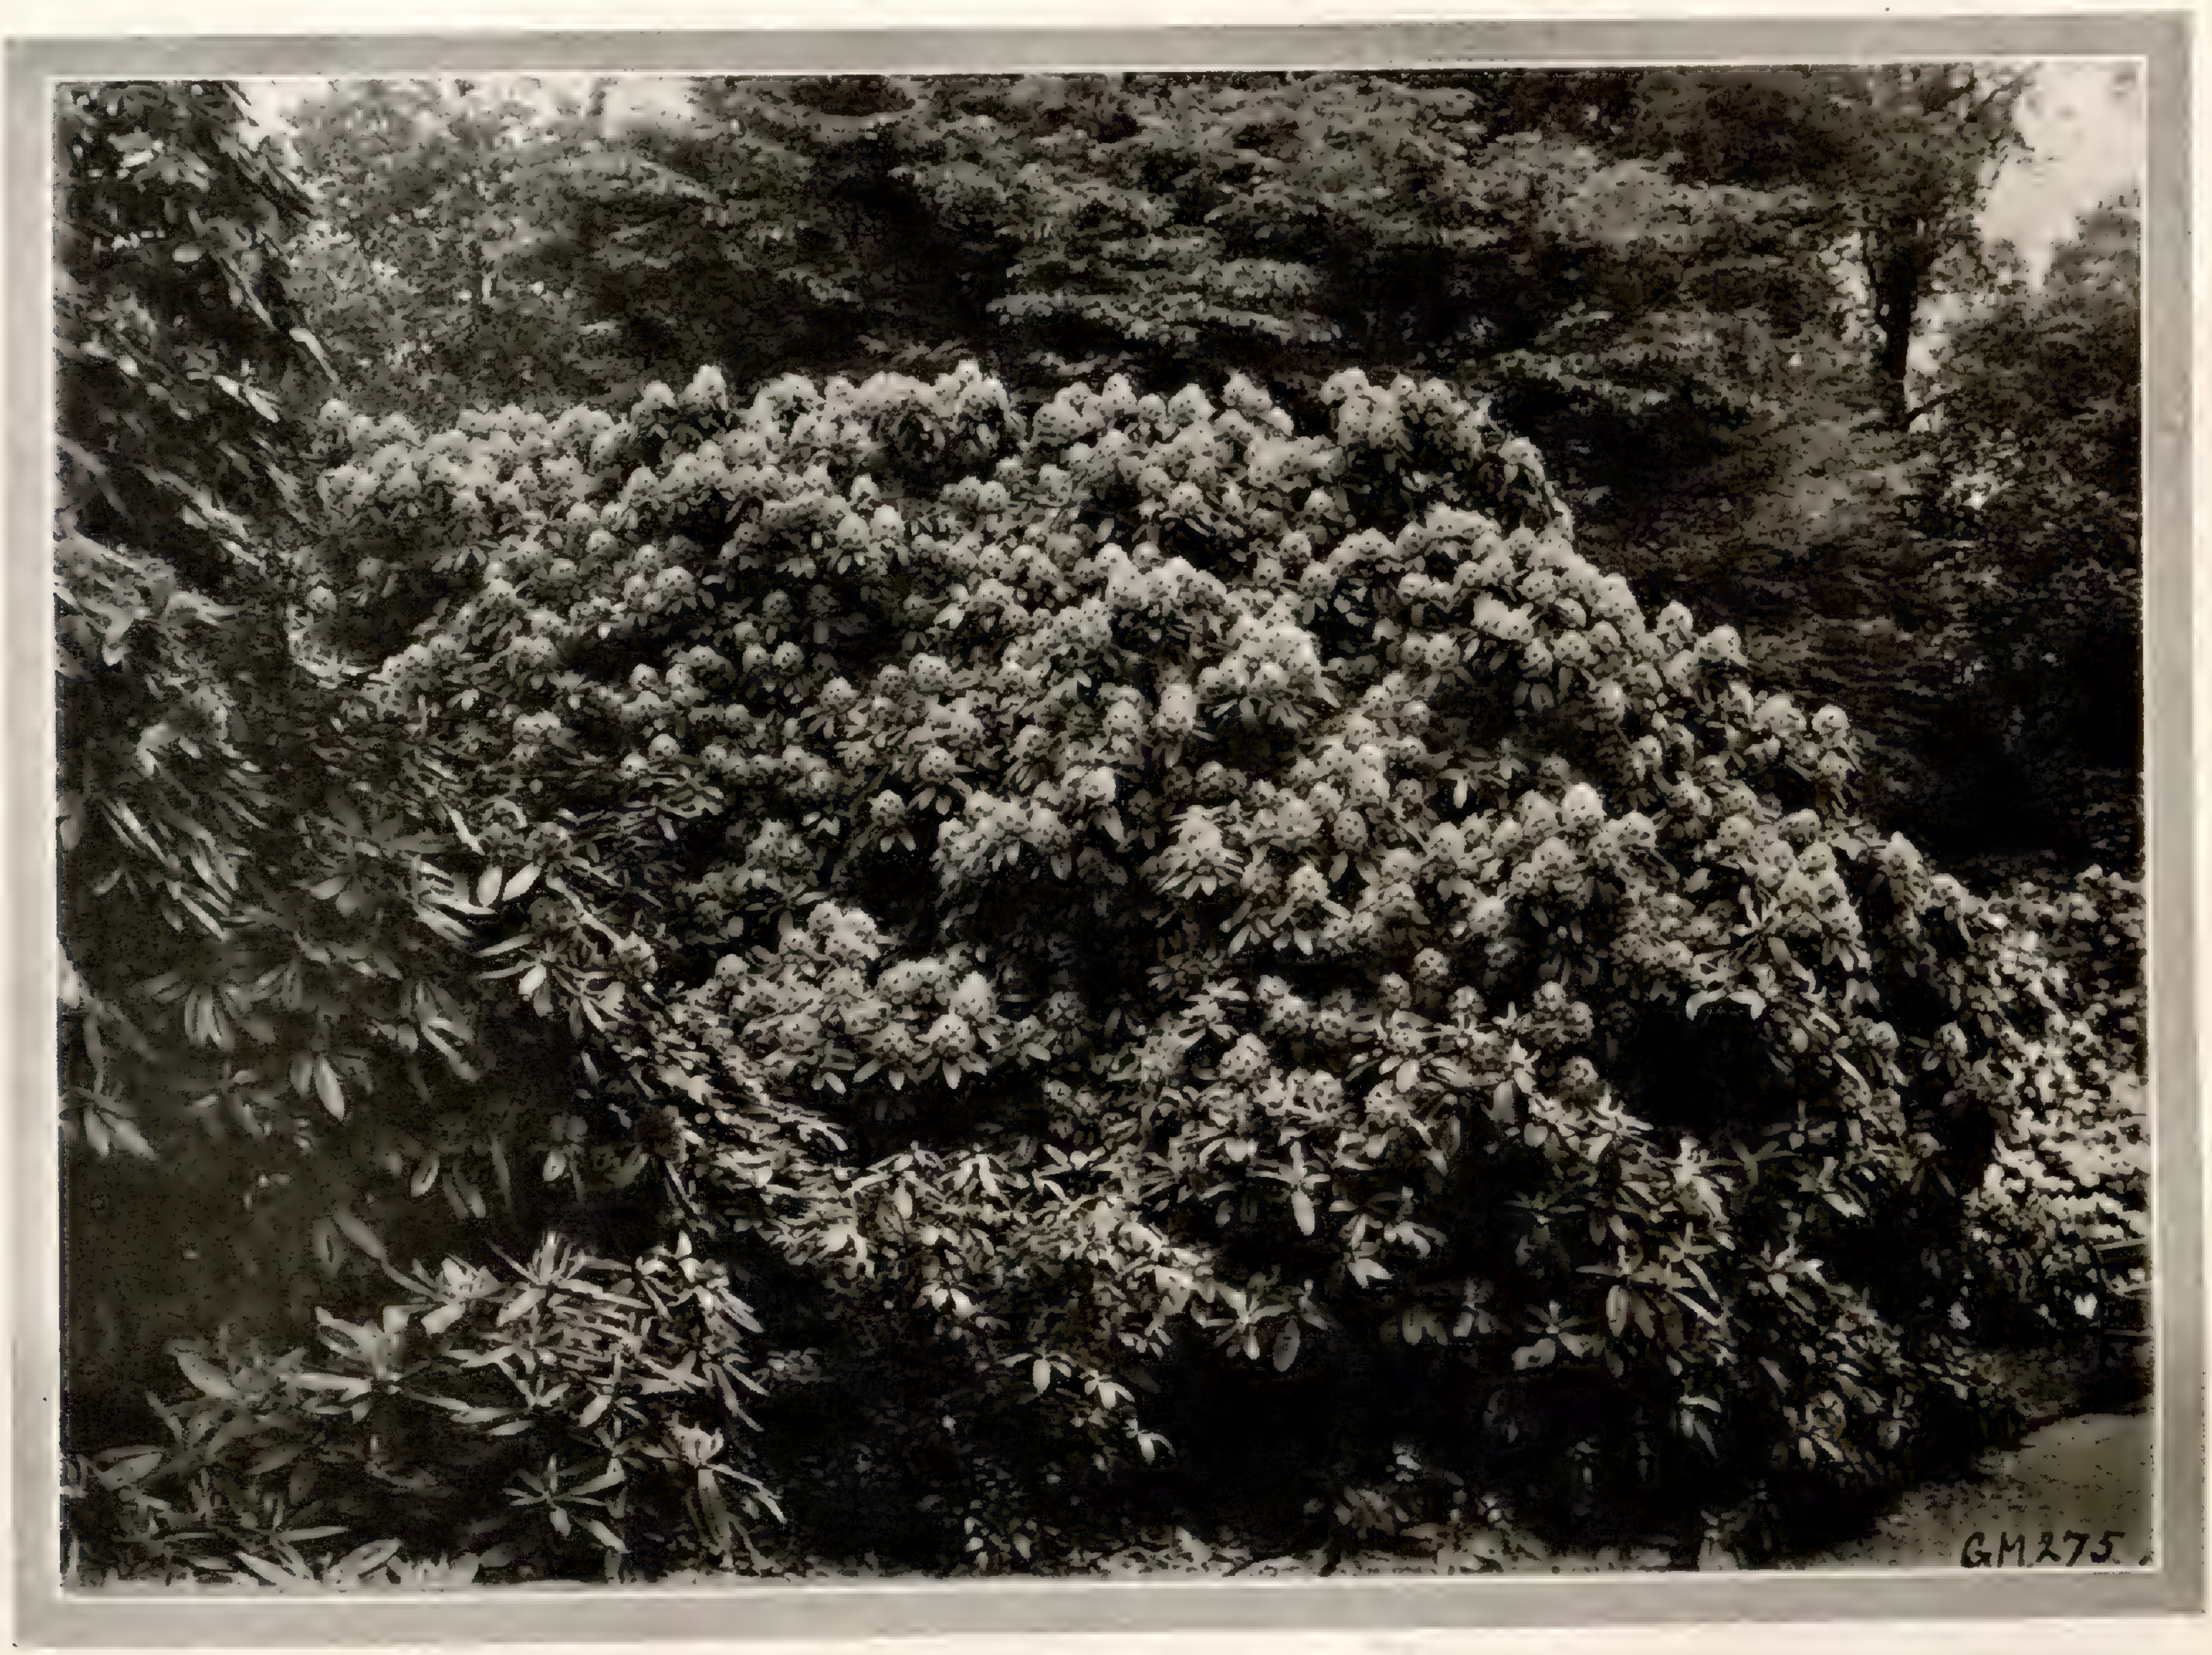
## CAMPANULA GARGANICA HIRSUTA.

Of all the plants of the class to which it belongs, best known by the typical Campanula garganica, the variety hirsuta and its forms is the best for ordinary rock gardening. Nominally, C. garganica itself ought to be more amenable to cultivation, especially in districts where there is much winter wet. Really, however, this is not the case, although the glossy leaves of the Gargano Bellflower would induce us to think this. Even in districts with a heavy winter rainfall, accompanied by intervals of severe frost—perhaps the most trying of all the troubles which await the cultivator of alpine flowers—the variety hirsuta is vastly superior, seemingly indifferent to the vicissitudes of our climate, and giving, in due season, an abundance of its light blue, white-eyed flowers, which constitute a delightful feature on any rockery.

It is of rather trailing habit, though not obtrusively so, in the way that it is not a rampant plant, and is not likely to give much trouble in the sense of overlapping other things. It has a plentiful supply of pretty leaves, grey or silvery, from the hairs which cover it, and the sprays of foliage bear an abundance of the charming flowers which attract everybody when they are open. These are borne for a long time in summer and late autumn, and ofttimes frost comes before it has finished its prolonged flowering period. It is a very beautiful and most useful rock garden plant.

Not a bit less beautiful, but a scarcer plant, is the white variety, C. garganica hirsuta alba, although it is not quite so vigorous, and is a trifle more tender. This lovely bellflower, or harebell, is easily grown in any light soil, but it seems to prefer one of loam, sand, and peat, or with leaf-soil in lieu of the peat. There should be plenty of grit in the compost, and a sunny place in the rock garden may be selected if desired. It flowers well in partial shade also, and is a most delightful thing when trailing over a low stone or ledge. It can be raised from seeds, or propagated by division.

S. Arnott.



RHODODENDRON BROUGHTONI.

A finely-developed specimen of this beautiful hybrid in the Rhododendron Dell at Kew. The flowers are bright rose-red.

## RHODODENDRON BROUGHTONI.

The rhododendron of which a remarkably fine specimen is herewith illustrated, is of special interest to those who appreciate and plant hardy shrubs distinguished by the beauty of their flowers. It is one of the most notable of the varieties now in commerce, although it takes us back to the first half of the last century when the raising of hybrid rhododendrons was being carried on with much success at Highclere, the Hampshire seat of the Earl of Carnarvon, and the late Mr. Anthony Waterer was commencing his work in the improvement of these shrubs, which made the Knap Hill Nurseries famous. An explanation of the high degree of popularity it has enjoyed for about three-quarters of a century is to be found in the fact that it combines in a marked degree finely-formed and attractively-coloured flowers with splendid foliage and a good habit.

It is interesting to have the evidence, which this hybrid and a few others that are still in cultivation afford, that raisers in those early days of the hybridisation of rhododendrons appreciated the importance of a free-branching habit, and handsome leafage, and thereby set up a standard which it is satisfactory to know has been followed by raisers of later date. It may be that not every one of the descendants of Rhododendron catawbiense and some of the other species that have been utilised in the creation of the race of hardy rhododendrons, now in general cultivation is not all that could be desired in the matter of habit. But, regarded as a whole, they are eminently satisfactory in this respect, and prove to demonstration that not only was the habit and foliage given full consideration by the raisers when making selections for distribution, but that they must have made many sacrifices to maintain the high standard which, judging from the results they had constantly in view. Large, well-formed flower trusses are essential, but it is not less important the shrubs should have a free-branching habit, and handsome leaves, for, while the flowers of any particular plant pass through their various stages within a few weeks, the leaves necessarily remain throughout the year.

We have persistently advocated the selection of rhododendrons in which both foliage and flowers contribute to their beauty, but at no time have we been able to illustrate a finer specimen in support thereof. The specimen illustrated occupies a position in the rhododendron dell in the Royal Gardens, Kew, and has a height of eighteen or twenty feet, and a spread of about thirty feet. The freedom with which it usually blooms is admirably shown, and when it is remembered that the flowers are bright rose-red, there is no difficulty in realising the fact that such a specimen is wondrously beautiful in its season of blooming. R. Broughtoni is rather early in flowering, but it is not so early that the flowers are injured by spring frosts.

G.

## GREENHOUSE PRIMULAS.

When one considers the great improvements, and the remarkable breaks from the original species that have within the last twenty years or so taken place in the case of Primula sinensis and Primula obconica, the question arises where, with the vast number of comparatively new Chinese species, will the development of these flowers end ? It is not so many years since that Primula obconica was represented only by the typical kind, a poor little lilac-coloured flower, but now the range in colour is as marked as the size and shape of the individual blossoms. Primula sinensis, too, shows a great divergence from the type and from each other, the massive blooms of the gigantea strain being arranged at one end of the scale, and the light and graceful Star primulas at the other. Another present-day feature is the clear and decided hues that generally prevail among the flowers, especially if the seed has been selected from a good strain.

Foliage distinctions, too, are both numerous and interesting among the varieties of the Chinese primula, for, beside those of the ordinary type, there is what is termed the fern-leaved section; while in some the stems and midribs are dark-coloured, whereas in the ordinary form they are green. Again, at a meeting of the Royal Horticultural Society, a group of plants with leaves somewhat resembling those of a pelargonium, was shown. The flowers of these were semi-double and salmon in colour.

Though my horticultural experience extends over many years, I can remember very few plants that have bounded into popularity as rapidly as did Primula malacoides, a recent introduction from China. The numbers to be seen in the florists' shops in London, and the quantities used for decorative purposes, serve to show that it has gained the confidence of the market grower; than which there is no keener critic. The typical lilac-coloured kind is, as a rule, more grown than the white-flowered variety. The seeds of Primula malacoides germinate readily, and it is in all stages a plant of easy culture. As a window plant for the dwelling house, it is just the thing. When one considers the great changes that have taken place in Primula obconica since its introduction, the possibility of P. malacoides proving just as amenable, cannot be overlooked.

The prospect, however, of improving any species by a gradual process of selection, is not the only light in which many of the new primulas may be regarded, for nowadays so great is the skill of the hybridist, and such an amount of perseverance is brought to bear upon the work, that races now undreamed of may make their appearance in the near future. It is somewhat singular that the finest of the yellow-flowered forms—Primula Kewensis—should have originated as an accidental hybrid, and still more singular that, though it was at first barren, yet seeds are now readily obtained. When such fundamental changes as this take place, it is impossible to say what further surprises await us. At all events, the future of the primula, from all points of view, is in every way most promising. W. T.

---

**Araucaria excelsa Silver Star.**—As a matter of individual taste, I prefer this variety of Araucaria excelsa to the newer elegantissima aurea, with foliage a yellowish tinge, which is, however, most marked in the young shoots. These last are in Silver Star almost white; in fact, it is an improved variety of the older form known as alba spica.—W. T.

## PROPAGATION OF ROCK GARDEN PLANTS.

The maintenance of a reserve stock of pot-grown plants is of great importance to the up-keep of the rock garden. So many subjects succumb to the dampness experienced during the late autumn and winter months that it is quite essential there should be a supply to fall back on. A stock of plants can be raised by the three following methods, viz., seed sowing, cuttings, and layers, and it is the intention of this note to deal with the two latter methods.

The propagation of the various subjects by cuttings demands attention during several months of the year, commencing now with aubrietias, alyssums, arabis, etc., and following on with others as they cease flowering. A small frame or hand-light is necessary for the purpose, and about six inches of clean sand should be placed within for a rooting medium. This will be found to be the quickest and surest plan of rooting some of the most difficult of plants. The cuttings are prepared in the ordinary way, and inserted in the bed of sand, well watered in, and kept shaded and close until root-action commences. The quickest way to insert the cuttings is to well water the sand first, then take a piece of glass, and make a cut across the bed about an inch deep to receive the cuttings. After the latter are placed in position, by using a little pressure when making the next cut, the previous one may be closed, and when all the cuttings are put in, a good watering will tighten them all. The sand will settle down round the bases quite closely, making them absolutely air-tight. On no account must the sand be allowed to become dry, or failure is sure to follow. Immediately the cuttings are rooted, they must be carefully lifted and put into small pots, growing them in frames until established.

Successful propagation depends a great deal on the right sort of cuttings being taken, for, whilst those of some plants root best from young growths, older and harder wood of others will be found most suitable for the purpose. A commencement should be made with arabis, and at this season there is usually an abundance of young shoots, which form splendid cuttings. To obtain good material for the purpose when dealing with the aubrietias, it is necessary to cut the plants back when flowering ceases, and young shoots are then produced from the base of the plants. These shoots root freely when taken off about two inches long, and trimmed in the ordinary way. The alyssums root freely when a "heel" or portion of the old wood is allowed to remain on the shoot. Lithospermum prostratum is rather a difficult subject to propagate from cuttings, yet if the young growths are detached from the plant by gently pulling them off, they root readily in the sand.

Androsace lanuginosa is easily rooted in the same way, and nice little plants are thus obtained for planting out in the following spring. Androsace sarmentosa and A. Chumbyi are most successfully propagated by pressing the rosettes into the soil and pegging them down, without removing them from the plant. When rooted the rosettes are lifted and potted. The various members of the Rock Pink family root freely from slips—that is, the shoots drawn off and inserted in the sand without being trimmed at all. Phlox subulata and setacea are increased either by cuttings of the young growths, or by pegging pieces down into some fresh soil. The helianthemums respond readily to the cutting treatment, and these should have a portion of the older wood attached. All the iberis family root best when the cuttings are taken from the young growths.

The young, tender shoots of Cynanthus lobatus and Codonopsis ovata quickly form roots when propagated in July. The ramondias are increased in the same way as begonias or gloxinias, by leaf propagation. Campanulas may be readily raised from seeds, yet when a true stock of any special species or variety is desired, it is necessary to resort to cuttings, as the colours vary considerably when increased by seeds. Daphne Blagayana, D. cneorum, and D. rupestris should be layered, pegging the growths into the soil, and when rooted potting them. This treatment answers for other subjects, such as Ledum palustris, Dryas octopetala, Shortia galacifolia, S. uniflora, Gaultheria procumbens, etc. In fact, there are numbers of plants which are not mentioned that will respond to these two methods of propagation, and with the necessary care and attention, a good stock of pot-grown plants is easily obtained. E .C. Pooley.

Gnaton Gardens.

---

## POTENTILLAS.

When so much thought is given to the adornment of the rock garden and the wall garden it is well to consider the claims of the potentillas. Though somewhat lacking the brilliancy of some other rock garden subjects, they furnish us with a group of exceedingly pretty species, well adapted for decorative work. It is often the misfortune of rock garden potentillas to be relegated to the least prominent positions, resulting naturally in a partial failure as far as effect is concerned. Bring them out into the front rank of the rock dwellers, provide them a situation suitable for their needs, and they will give many effective pictures, which will be worthy of the contemplation of any garden lover.

It may be remarked in passing that our subjects are chiefly sun-lovers, delighting in a fairly open situation, with a good light sandy soil as a rooting medium, while their culture is of the easiest possible character. Grown in the open points of a stone wall, many of the potentillas give fine sheets of foliage and blossoms, which for length of duration have few equals.

Picture P. Tonguei in such a position, with its trailing growths hanging pendantwise down the wall face, and studded with a host of exquisite terra-cotta, crimson-marked blossoms. Or, P. ambigua, with its dense masses of rich greenery, clouded over with a golden haze of bright blossoms, is equally charming in its own way. P. flagellaris, too, is very pretty, with its trailing stems stealing down the rock face, and its short-stemmed yellow blossoms, singly, but freely, produced.

Or go a step further, and try the effect of P. nepalensis, or, better still, its variety Miss Willmott, in a similar position, the profusion of rosy-pink blossoms given by the latter is especially fine. Or try the charming P. Hopwoodiana from the wall top, or a well set-up position among the rocks, and note the effect of yellowish-buff and rosy-carmine blossoms. P. glandulosa, a bright golden-yellow Californian species. will succeed best in a situation as noted, and the forms of the charming P. nitida will also do well, if not too hot and dry.

Speaking of P. nitida, may I remind the reader that this is one of the most exquisite of all rock plants, carrying pretty ternate silvery leaves and pale rosy flowers. It spreads by means of underground stems, and really should be found in all collections of rock plants. Its varieties are alba, a pretty white; atrorubens, with fine-sized, rosy-purple blossoms, borne above thick clusters of the silvery leaves; grandiflora, a larger and very pretty edition of the type; and rosea, a fine rosy-pink, with the colour deepening at the centre.

P. nivalis is a good white, with a neat, close habit, and is deserving of note. Other fine whites are P. alba, a continuous flowerer, with fine divisions to the leaves; P. alchemilloides, a very distinct subject; P. Clusiana, with downy leaves and terminal corymbs of white; P. davurica alba, a white variety of the little-grown yellow-flowered P. davurica; P. rupestris, a first-rate early-flowering gem, which is decidedly worthy of note; P. splendens, a finer, bolder form than P. alba; and the pretty P. tridentata, which is notable for its thick masses of foliage and its freedom.

Of other colours, the yellows claim a large proportion of the species, these necessarily include the silky-leaved P. villosa; the palmate-leaved P. recta; P. nevadensis, a very pretty dwarf species; P. montenegrina, from the mountains of Montenegro; P. opaca, which, though a native species, is worth growing for its interest and charm. P. Kotschyana, too, large, except where plenty of space can be given; P. alpestris, and its finer form pyrenaica, both very pleasing; P. aurea, a splendid, attractive, high mountain form; P. arguta, a pale yellow, and the silvery-leaved P. argentea.

I may also note the orange-hued Himalayan P. fulgens; P. atrosanguinea, a fine crimson variety of P. argyrophylla; P. valderia, a fine silver, with creamy blossoms; the shrubby native species P. fruticosa, and its miniature form humilis; and the fine North American P. Thurberi, which gives a wealth of brown-red blossoms.

Many others might be included, but the foregoing list will suffice for all but the keenest collectors, giving ample material for selection.

Potentillas plant out most satisfactorily in autumn and early spring, and one has so few losses that propagation need not be resorted to unless one has an extension of planting in view.

With the hybrid varieties of garden origin, one can also use the potentillas for garden planting, where they are distinctly pleasing when well grown, but the wealth of more attractive herbaceous subjects effectively preclude them from ever gaining a front rank position for border decoration, though I may say that an edging of P. nepalensis or P. Miss Willmott can be effectively used as a foreground to taller subjects, as these potentillas certainly gain in effect when planted in number, and an edging well kept is very pleasing. H.

---

**Crossandra undulæfolia.**—Some good examples of this uncommon yet pretty Acanthad were noted in one of the groups at the International Exhibition. Like many of the aphelandras, eranthemums, and other plants of the same order, it is of an upright sparsely branching habit of growth, the pointed oblong-shaped leaves being much waved at the edges, hence its specific name. The flowers, which are borne in compact spikes, are of a rich orange-salmon colour, a very pleasing tint. The individual blooms do not last long, but a succession is kept up from one head for a considerable time. It is of easy culture if potted in ordinary compost and given the temperature of an intermediate house; as in a stove, it is apt to run up tall and weak. This Crossandra is a native of the East Indies, and was first distributed by the late Mr. William Bull, of Chelsea, in 1881, under the name of Crossandra infundibuliformis. At present this crossandra is not nearly so popular as it deserves to be.—S. W.

## HORTICULTURAL EDUCATION IN AMERICA.

(Concluded from p. 435.)

Greenhouse Construction.—First term. Two hours. Pre-requisite course in Drawing. The development of the modern greenhouse; types of houses, materials, and methods of construction, installation of heating systems, etc. Laboratory practice in erecting section of cypress and iron-frame houses, and in planning and estimating the cost of commercial ranges. The class will participate in a required excursion.

Investigation in Floriculture.—Throughout the year. One, two, or three hours a term. Pre-requisite second course in Commercial Floriculture given above, and Garden Flowers; permission to register. Designed primarily for upper-class men and graduate students. The investigation of problems in the growing of cut flowers, exotics, and garden flowers; hybridising; study of varieties.

Greenhouse and Garden Practice.—Throughout the year. One to three hours. Designed to give the student practical knowledge of greenhouse work. Lectures and exercises in greenhouse management, propagation, composting soils, potting, watering, etc.

Conservatory Plants.—Second term. Two hours. Pre-requisite preceding course. Students are advised to take Greenhouse Construction before entering this course. A study of the culture and uses of tropical and sub-tropical plants grown in conservatories, including palms, ferns, begonias, orchids, etc.

Floral Design.—First term. One hour. A study of the principles of floral art. Practice in the arrangement of flowers in designs and bouquets, baskets, table decorations, interior decoration, etc.

Elementary Vegetable-Growing. Second term. Three hours. Open to those who have

SWEET PEA DOBBIE'S LAVENDER GEORGE HERBERT.
One of the best of lavender-coloured varieties. A.M., R.H.S., June 4. Messrs. Dobbie and Co., Edinburgh.

taken or are taking Soils 1. The principles of vegetable-growing as applied in commercial production. Important vegetable crops —their adaptation, culture, special requirements, varieties, enemies, marketing, and profits. The laboratory work includes exercises in management and planning, the growing of early plants under glass, and the planting and care of early outdoor vegetables. Each student assumes charge of his own plantings, carrying them through to the end of the term.

Vegetable-Forcing.—First term. Three hours. Pre-requisite preceding course and Soils 1. Vegetable-growing under glass. Important forcing crops. Laboratory will consist of practical work in crop production. Each student will be assigned a plot in the greenhouse on which he will grow vegetables to maturity, assuming full charge except in heating and ventilation. This will be supplemented by descriptive studies.

Systematic Olericulture.—First term. Two hours. Pre-requisite Elementary Vegetable-Growing (see above). Lectures and descriptive studies dealing with vegetable crops, their origin and botany. Special attention will be given to varieties, and their adaptation to different cultural and market conditions. The important commercial types of the different vegetables are grown in the garden each year, and there is an abundance of first-hand material for the course.

Advanced Olericulture.—Second term. Two or three hours. Pre-requisite Elementary Vegetable-growing and Vegetable-forcing. The student's time will be divided between advanced studies of vegetable crops and their culture and the study of a special problem to be agreed upon. An excursion to two or three important vegetable-growing centres will constitute a part of this course.

Home Vegetable-Gardening.—Second term. Two hours. A study of vegetables and their production for home use. The planning and management of the garden, special crop requirements, factors influencing quality, and control of pests will be considered. The laboratory work consists of actual practice in the garden. The starting of early plants in hotbeds and frames, intercropping, and succession cropping to get largest yields from small areas will be studied. Each student will assume charge of his own plants, and carry them through to the end of the term.

Elementary Horticulture. — Throughout the year. Two hours a term. Much be preceded or accompanied by Botany 1. This course aims to emphasise principles and practices involved in the cultivation of garden plants grown for pleasure or profit. It includes the propagation, botany, culture, and economic uses of plants. Some attention is also given to garden-making. Designed for teachers of Nature study or of Elementary Agriculture.

Nuciculture.—Second term. Two hours. Pre-requisite training in Systematic Botany. Lectures on the practical and systematic phases of nut culture, with special reference to the cultivation and improvement of the forms native to the United States. The Morris collection of edible nuts of the world in the Department of Horticulture furnishes abundant material for illustrating the lectures. The Robert T. Morris prize of twenty-five dollars for proficiency in propagating nut trees is offered in this course.

Sub-tropical Pomology.—First term. Three hours. Pre-requisite Botany 1 and 2. A study of citrus and other tropical fruits, with special reference to American conditions. Copiously illustrated. Laboratory work in describing and judging the various fruits.

Literature of Horticulture and Landscape Gardening.—First term. Three hours. Open to juniors and seniors, and required of graduates. A comprehensive survey of the writings of European and American authors, with special reference to the evolution of horticultural methods.

Evolution of Plants.—Second term. Three hours. Open to juniors and seniors, and required of graduates. Historical development of theories of evolution; recent theories, including a careful examination of present-day methods. Practice in the greenhouse in the technique of plant-breeding.

Investigation.—Either term. One or more hours. For advanced students and graduates. The student is assigned a subject which, as far as possible, combines original research with bibliographical methods.

Seminary.—Throughout the year. One hour a term. Required of advanced students who elect preceding course, and of all graduate students.

Gardening.—Throughout the year and the summer. Three hours. Open to a limited number of students. A personal and informal course for lovers of plants and gardens. The course consists of actual work with identification and growing plants, supplemented by conferences and informal discussions. Attention will be given garden literature and history, planning of grounds, etc.

## Equipment of Class-rooms and Laboratories.

The equipment for the horticultural work usually consists of class-rooms, laboratories with tables, and sometimes equipped for microscopic work, and herbarium; more or less rough workrooms, in which practice may be had in the mixing of soils, the compounding of spraying materials, the testing of machines, the study of vegetables and fruits, and the like; a range of glasshouses; and a number of acres of land for gardens and orchards. Sometimes the orchard area will amount to fifty and more acres. In some colleges the plant-breeding is included with the horticulture; and in some of those that are least differentiated the plant pathology and economic entomology are included, as also forestry. In the courses detailed above all these subjects are excluded as horticulture, since they are handled in regular departments by themselves in numbers of different courses. The department of plant pathology, for example, in this institution offers the following courses in horticultural applications:

Diseases of Field and Truck Crops.—First term. Three hours. Pre-requisite Plant Pathology 1.

Diseases of Fruit and Fruit Trees.—Second term. Three hours. Pre-requisite Plant Pathology 1.

Designed especially for students who expect to become practical fruit-growers.

Diseases of Forcing-house and Florists' Crops.—First term. Three hours. Pre-requisite Plant Pathology 1.

Designed especially for students specialising in forcing-house of floricultural work.

The subject of landscape architecture, or landscape gardening, has developed in the institutions in the United States from two sides. When it is an offshoot of colleges or departments of architecture, or when strongly dominated by architectural ideas, it is likely to be known as landscape architecture. In the agricultural colleges, however, the subject has developed from the horticultural or gardening side, and has usually been called landscape gardening. As a part of the curriculum, landscape gardening is given more or less attention in nearly all the land-grant institutions. In three or four of them, however, the subject is now being given special attention, as also at Harvard and at Columbia, which are not land-grant institutions. At the present moment only one institution gives a post-graduate degree in the subject, and this is the degree of Master of Landscape Architecture given by Harvard. Columbia and Cornell, however, are expecting to establish degrees for the subject, but the name of the degree is not yet determined or published. At Harvard, Columbia, and Cornell, the landscape work has taken on a distinctly professional character. At the Massachusetts Agricultural College, Amherst, the landscape work has been prominent for some years.

These colleges of agriculture are engaged rather largely in extension work, the extension meaning all educational efforts prosecuted at the homes and on the farms of the people. Some of the work at the institution itself, as brief winter courses and the like, may also be considered to be extensional in its character. The extension work is welfare work, and it is properly a necessary part of an institution that is maintained by the people for the service of the people. Some of this extension work is horticultural. It comprises tests and experiments in orchards, gardens, and greenhouses; co-operation with growers' associations; surveys of conditions and industries; the issuing of popular bulletins and other literature; lecture courses, reading courses, and much correspondence.

The Federal Government appropriates $30,000 to each of the States for the maintenance of an experiment station. In nearly every case this experiment station is connected with a college of agriculture; sometimes it is a department of it, and sometimes it is an attached unit. Horticulture has long been an important phase of the experiment-station work, and hundreds of bulletins have been published by the stations on fruit-growing, vegetable-gardening, flower-growing, and similar subjects. The United States Department of Agriculture is also engaged in large experiments in horticultural lines, and is publishing the results of them in many bulletins and reports; and, although the Department is not engaged directly in the teaching of students, it is nevertheless an educational institution in a broad way, and reaches all parts of the country.

In the public schools there is now a strong sentiment for the introduction of agriculture. This pertains in all parts of the United States. This agricultural instruction will be organised eventually on the same basis as other instruction in the common schools. Agriculture will include a great variety of subjects, the horticultural affairs being given their due consideration. This will result in a gradual re-direction of the youthful mind toward horticultural and other rural pursuits.

The nature-study movement is widespread and established, and the material of the teaching is in part of plants. School-gardening is growing in popularity and importance. All these subjects are finding their way into normal schools and colleges, in some of which there is definite horticultural work for the training of teachers. Correspondence courses, the rural press, State departments of agriculture, and other agencies and enterprises are also forwarding horticultural education as a part of the general rural betterment.

Perhaps this brief sketch will present a general view of the kind of education in horticulture that is now developing—as yet, of course, very imperfectly—in the United States. It is largely a training for citizenship on the basis of general collegiate education. I have tried to avoid comparisons with your own methods, except in the most general way, for it would be presumptuous for an American to try to measure English horticultural training. He would be carrying coals to Newcastle. The Americans have had a continental area to discover and to conquer; they are endeavouring to conquer it by many means, and the most fundamental means is by organising all industry educationally. The horticultural subjects are important not only in themselves, but in their personal appeal, and the organising of horticultural knowledge into large plans and methods of human training is one of the best privileges of any people.

---

**Crassula coccinea.**—This showy succulent, which is said to have been introduced from South Africa as long ago as 1710, is known also as Kalosanthes coccinea, while, according to the "Kew Handlist," it should be Rochea coccinea. It is, therefore, a question of taking one's choice. It is, and has been, for many years popular for market, and ideal little specimens may be frequently seen hawked about the streets of London. There are some varieties with pink blossoms, but a good form of the typical kind whose flowers are of a rich scarlet colour, is the best of them all. Of easy propagation and culture, this crassula is in every way a most desirable greenhouse plant.—K.

## INSPECTION OF NURSERY STOCK IN HOLLAND.

In the course of his paper, read at the International Conference on Legislation in connection with Insect Pests and Plant Diseases, Professor Ritzema Bos gave the following particulars of the method adopted in Holland for the inspection of nursery stock.

In no other way, he said, could the import of diseases from abroad be prevented more successfully than by efficient inspection of the stock executed in the country where it has grown. But this inspection only can give what reasonably can be required of it—a guarantee for the health of the stock—when a well-equipped Phytopathological Service exists in the country from which it comes. I hope to convince you of the truth of this opinion by telling you something of the work of the Phytopathological Service in Holland, especially of that branch of it which takes care of the export nurseries.

All nurseries in Holland where stock is grown, directly or indirectly destined for export, are inspected several times a year by a local inspector. When some pest is found the infected plants or trees are removed and destroyed, or, if possible, they are disinfected or cured by an efficient treatment. The results of the treatment are attended to by the inspector at settled times. In this way, for instance, Phytoptus, Aleyrodes, and the galls of Exobasidium are dealt with on Azalea indica, Tingis on rhododendron, Peridermium Strobi on Pinus Strobus, Mytilaspis pomorum on Buxus. Of course, a complete record of the occurrence of pests and the results of treatment is kept by the inspector, and a copy of it is sent to the Chief of the Phytopathological Service.

In the season of shipment the inspector regularly goes to the sheds of the nursery tradesmen, where the stock from their own grounds is brought together with stock of other nurserymen who do not trade to foreign countries, but only apply themselves to nursery work. Now the inspector can find—reasonably speaking—every fungus or insect attack which might be overlooked at the nursery inspection; moreover, he now finds root diseases, for instance, root and crown galls. He removes all that is not perfectly healthy, and he sends a record of the inspection of each shipment to the Chief of the Phytopathological Service. The nursery-tradesman in his turn sends the corresponding certificate, on which mention is made of the contents and other particulars of the shipment to the Chief of the Service to have it stamped and countersigned. The Chief of the Service compares the statement of the nurseryman with the record of the inspector, and when it is obvious that the stock is in good condition he authenticates the certificate by his written signature and official stamp, and he returns it to the inspector. Mind what I say: not to the nurseryman, but to the inspector. For it might be that some slight difference is found between the statement of the nurseryman and the inspector's record, or that the nurseryman packs other stock in the boxes than what has been inspected, and now the inspector has the occasion to control another time if it is all right. When nothing is wrong he gives the precious document, and now the boxes can be closed and expedited.

Of course, all beginnings are difficult, and so too, our earliest efforts were sometimes unsatisfactory, but each year renders our certificates of health more reliable, and the nurserymen gradually take more care that no act of theirs shall detract from its reliability. Of course, even by the arrangement sketched, the possibility is not quite excluded that some pest may be transported from Dutch nurseries to foreign countries. Inspectors are human; they may sometimes overlook an insect or a fungus attack. Absolute freedom never can be certified, but we may say, reasonably speaking, that the possibility of transport of pests from our nurseries is an extremely small one. Mr. Howard (the renowned entomologist of the American Department of Agriculture), Mr. Washburn (State entomologist of Minnesota), and other American authorities assure us that the certificates of our Phytopathological Service are reliable, and they greatly appreciate our method of working.

According to the authorities just mentioned, the same cannot be declared of the certificates of health delivered in several other European countries. Therefore countries which import stock are cautioned against putting too much confidence in these papers, and may be advised to combine an inspection at the port of entry with the claim for a health certificate. We have already seen that the mere inspection at the port of entry will not give the desired warrant; nor need it be repeated that it is impracticable to examine the imported stock with sufficient accuracy. But by combining the claim for a certificate with the inspection at the port of entry a country bids fair to succeed in holding out of doors all pests which can be imported by shipment of nursery stock. The fact that the nurserymen in the country of export are aware of their stock being inspected will aid in making them careful in regard of its state of health.

Of course, the inspectors at the port of landing can make allowance for the nature of the stock and for the country from which it comes. For instance, when it comes from a country ith an excellently organised Phytopathological Service the inspection needs not to be done with equal carefulness as when it comes from a country with a seeming Service. When a shipment consists in part of a species of plant, which may be the bearer of a very dangerous pest, the introduction of which should be prohibited at any cost, a very cose inspection of the stock belonging to this species is required, while the inspection of the other stock of the shipment, say, perennials or ornamental shrubs, can be executed less punctiliously.

The nursery stock is expedited late in autumn or early in spring—anyhow a season in which the frost may set in suddenly. To prevent possible damage by frost, it is necessary that the stock should not stay too long unpacked in the port of entry in behalf of the inspection. Of course, lots of work are to be done by the import-inspection Service, and care cannot always be taken to have the boxes opened, inspected, and closed in a short time. This is quite obvious to those who know the business in the season of shipment and have a notion of the enormous quantities of trees and shrubs which by artificial means are pressed and tied together and packed in bales and boxes. So the bringing of the contents after inspection in its former condition being almost an impossibility, it might occur that some stock on its further expedition to the consignee is injured by frost. This trouble may be prevented by putting the inspection off till the cases have arrived at the place of their destination. So, in fact, the inspections of imported stock are executed in several of the United States of America.

In conclusion, summing up all our arguments, it may be stated that the best warrant against the importation of plant diseases and injurious animals is given by the combination of two measures: First, certificates of health, delivered by the State phytopathologist of the country of origin, are to be required for each imported consignment; secondly, inspection and, if need be, disinfection, is to be executed before the consignments are accepted by the consignee.

Only in very exceptional cases prohibition of importation is to be adopted as a method of preventing the introduction of pests; but this method is not at all to be relied upon as a never-failing expedient.

---

**Salvia splendens.**—Whereas the typical Salvia splendens used to be regarded solely as an autumn-flowering subject, some of the improved forms may be had in bloom quite early; in fact, flowering examples are now often met with in the spring. Owing to this they are now largely used for summer bedding when they vie in colour with the brightest of the pelargoniums.—W.

# WORK FOR THE WEEK.

### CONSERVATORY AND GREENHOUSE.

GREENHOUSE CLIMBERS.—Many of our most beautiful plants are good climbers, and when allowed to roam at will over the rafters, up the pillars, and on the back walls, produce a prodigious amount of bloom, and present a charming effect in any large greenhouse, conservatory, or winter garden. I would advise that these be planted out whenever practicable in suitable soils prepared for each subject.

BOUGAINVILLEAS. — These are very strong growers, and do splendidly against a back wall or trained up a pillar and allowed to ramble over the rafters or trellis. Bougainvilleas are generally classed as stove plants, but they will do equally as well in a conservatory or corridor. In fact, I get better results from plants grown in a large conservatory than from those grown in a stove. They like an open compost, and the material from a builder's rubbish heap suits them well, and they simply revel in it. A hole should be taken out 4ft. square and 3ft. deep; and at the bottom place brickbats and mortar rubble, putting one foot of sandy compost on the top. When the plant is established the strong shoots should be encouraged to go to the top of the house. At the present time the plants are just coming into bloom; the weak shoots should be cut out, and the strong branches allowed to droop as these are most effective when covered with bloom four or five feet of their length. The best to grow are B. glabra, B. Maud Chettleburgh and the new salmon variety B. Rosa Catalina.

STREPTOSOLEN JAMESONI. — This climber is at present at its best, the trusses of gorgeous orange blooms making a mass of colour on the back wall of the conservatory here. Those who have only seen this grown as small bushes in pots cannot imagine how lovely it is when grown freely. It needs a rich compost, and when planted out makes strong growth, and it will then produce a succession of bloom for six months out of the twelve. It also does well in pots when disbudded to one or three growths.

LAPAGERIAS.—These are beautiful subjects, both the white and rose forms being much prized. These plants do best trained up centre pillars. It is best to build brick pits to accommodate them, and the compost should consist of two parts peat, one part loam, and one part coarse sand, over good drainage. Slugs are very fond of the young shoots, and a strict watch must be kept for them.

BIGNONIAS AND TECOMAS. — These are all suitable for covering the roofs and rafters; they grow and luxuriate in a sandy compost when planted out. Sheaves of bloom can be gathered from them when they are well established.

CLEMATIS INDIVISA LOBATA.—This is the only member of the family worth growing inside, but when trained on the roof and kept restricted, its white ropes of flower are very effective. All thin shoots should now be cut away, the strong ones only being left.

JASMINIUM GRANDIFLORUM. — This jasminum is very chaste, and when planted out in a centre bed and allowed to ramble on the roof, it will flower abundantly, its large, starry, white flowers being very effective and deliciously fragrant. When cut and placed in small vases a succession of bloom appears which keeps the vases effective for several days. This climber is best increased by layerings

TACSONIAS.—These are rapid climbers, and they will all do well if planted out in beds of fibrous loam and peat. If allowed to ramble they soon cover a large space, and their large flowers hanging suspended from the growths always command attention. Tacsonias root readily if side shoots are placed in a sandy compost. There are many more, equally useful and effective, climbers which might be made use of, such as Swainsonias, Plumbago capensis and its variety alba, heliotrope, rhynchospermum, etc., and where large quantities of choice cut flowers have to be kept up it will be found that these plants can always be relied upon to furnish an abundance.—LEWIS SMITH, Shotesham Park Gardens.

## THE ORCHID HOUSES.

EAST INDIAN HOUSE.—In this house the Ærides, Saccolabiums, Angræcums, Renantheras, Sarcanthus, Arachnanthes, and other Vanda-like plants, now developing leaves and roots, should be given sufficient water to keep the sphagnum moss on the surface growing freely. These plants do not need large quantities of water, but great humidity in the atmosphere, therefore a moist atmosphere must be maintained until growth is completed. The majority delight in plenty of sun-heat, but an excessive amount of fire-heat quickly debilitates them. On warm, bright days the fire-heat must be kept as low as possible, and, in order to preserve a moist atmosphere, the top ventilators must be kept closed, the lower ventilators being used to afford the necessary amount of air. When both top and bottom ventilators are open at the same time, the air dries too quickly, especially in houses where it is necessary to provide a humid atmosphere. In the ventilation of the different houses it is always necessary to consider the class of plants they contain; if a buoyant atmosphere is required, the top ventilators may be brought into use; if a humid one, they must be kept closed to prevent evaporation. The whole secret to success depends on these small details. When the weather is bright the ventilators should be closed about 4 p.m.; but if the weather be dull and sunless it should be done a little earlier, and the house be at once thoroughly damped down and the temperature allowed to rise as high as possible. Where the glass is covered with stippling, the blinds may be pulled up about one hour later to allow the sun to shine full on the roof. Where there is any danger of the plants scorching, this latter operation must be deferred for some little time until the sun has lost some of its power. For several months to come a temperature of about 70 degrees should be maintained, and early in the morning, should the temperature, through rain or any other cause, fall below 65 degrees, no damping should be done until the pipes are made warm and the proper temperature is obtained. Nearly all these plants produce large, fleshy roots, which are dainty morsels for cockroaches and similar pests.

DENDROBIUMS.—The young growths of the deciduous and semi-deciduous dendrobiums are now developing fast, and the amount of water at the roots must be increased, especially where the growth is vigorous and roots plentiful. When growing strongly, the plants should be examined occasionally, and the longest of the growths looped up to prevent breakage, and admit light and air freely. Dendrobiums of the evergreen section, such as D. thyrsiflorum, D. densiflorum, D. Farmeri, and D. Bronkarti, which have passed out of bloom, should be kept cool, and rather dry, until growth recommences. Strong-growing species like D. calceolus are now producing their new growths, and those that need repotting must have attention. They should have ample rooting space, and the receptacles be well drained, using a compost as previously advised for this family. After potting, the tallest of the pseudo-bulbs should be tied neatly to stakes, so that each plant is kept firmly in position, as a rocking plant cannot form roothold. Place the plants at the warm end of the house, and when they are well rooted copious waterings can be given until the terminal leaf is completed. The above remarks will apply also to other late-flowering dendrobiums, such as D. chrysotoxum.—J. T. BARKER, The West Hill Gardens.

## HARDY FRUITS.

STRAWBERRIES.—Before the fruits commence showing colour, protection will be required against the attacks of blackbirds and thrushes; one-inch mesh fish netting answers the purpose admirably. For small beds or borders three rows of inch-square rails supported on stakes will suffice to carry the nets; the middle rail should be sufficiently elevated to prevent the net sagging on to the plants, the sides and ends of the net must be securely pegged down to the ground. Plantations of a larger area are most conveniently covered by means of stout stakes and rails, standing four feet six inches to five feet clear of the ground, each row of rails seven feet apart, with wire netting around the sides, to which the top nets may be securely fastened; this makes a neat protection, and though an erection of this description entails more work in the first instance, it amply repays the extra trouble involved. In this particular distrct the prolonged drought has had a serious effect on the plants and swelling fruits, and watering has become imperative to save the crop. The planting out of recently forced plants on well-prepared borders should be done as soon as the plants have been duly hardened off; with due care and attention these will produce a crop of fruit by the latter end of the summer, but this means the loss of an early crop the following season. If new plantations are contemplated, the required number of 60-sized pots may—on wet days—be washed and a piece of turf placed over the bottom in readiness for layering.

RASPBERRIES.—The canes springing from autumn-fruiting stools should be thinned out to five to each stool if supported by stakes, but if supported by wires a distance of ten inches apart should be allowed. The young growths on early fruiting stools should be treated in a similar manner, and as growth advances they may be looped up to the stakes or wires, otherwise many of the strongest and best growths are apt to be damaged when gathering the fruit, or by strong winds. If mulching has not yet been accomplished a good thick layer of manure should be at once applied; this will naturally assist the swelling fruits and young growths.

PEACHES AND NECTARINES.—The young growths should be regularly attended to in the way of tying in and stopping; lateral growths should be pinched at the first leaf, unless required for extension purposes; to provide an equal balance of growth it is usually necessary to keep the growths on the top portion of the tree closely stopped after the shoots have made the desired growth. The final thinning of the fruits should be done without further delay, the best placed fruits on each shoot should be selected, the remainder being pulled off. For peaches, one square foot is the general allowance for each fruit, and nine square inches for nectarines. Much, however, depends upon the health and vigour of the individual tree; trees making extra vigorous growth may be, with advantage, more heavily cropped; while those of a weakly character should carry a much lighter crop. The trees should be frequently and forcibly syringed to keep down red spider, and the border must be kept moist.—W. MESSENGER, Woolverstone Gardens.

## THE KITCHEN GARDEN.

CUCUMBER HOUSE.—The early batch of plants is almost exhausted. Pull them out and plant again with strong young plants that were raised a month previously, and are now well established in 6in. pots. The old bed should be taken clean out, the glass and woodwork washed with strong soft soap and water, the walls lime-washed, and the new bed placed in position. For this purpose use equal parts stable manure and leaves. Place thereon a compost consisting of three parts good turfy loam, and one part leaf-soil, with a dressing of lime rubble and a little soot. Plant on hillocks at 3ft. apart, after the heat from the bed has somewhat receded. Stop the leads at the first wire, and at every three and four leaves succeeding. Syringe morning and early afternoon, and damp the walls and floors at midday, to maintain a constant moisture.

COLEWORTS.—Make a plentiful sowing of this highly esteemed vegetable, perhaps one of the most important early winter crops we have. Sow in well-prepared beds or drills in a partially shady place; protect from birds, and water as required. Plants will then be ready to plant out on ground that has been occupied by early peas and potatoes.

PARSLEY.—It is a capital time now to sow a good breadth of parsley for the winter. Sown at this date it makes strong serviceable plants in good time, therefore standing the wintry weather more readily. A sowing can be made on a border facing south, and another on a border facing west. Draw drills 15in. apart, fill in with old potting compost, and scatter some over the seeds also, as this, I am sure, strengthens and invigorates the seedlings surprisingly. Sutton's Winter Curled is an excellent variety for this sowing.

WINTER GREENS.—Broccoli and late cauliflowers must be planted as fast as ground can be procured for them, planting them not less than 2ft. apart, with the exception of savoys, when 18in. all ways will answer well. If it is found that all cannot be planted out as one desires, and the plants are thick, resort to thinning them out even if many plants have to be destroyed. Give a dusting of soot occasionally to ward off fly. Water in when planting.

LEEKS.—These are growing apace, and will require every encouragement to bring up the blanching as often as necessary. Every week is not too often at this season. In this operation take the paper tube in one hand, and draw it slightly up, with the other hand add little or much soil as the case may be, but do not, on any account, put soil higher than the bottom tube-leaf, or it will get into the leaf-axils, and stain and check growth. Overhead sprinkling is very beneficial to growth.

MARROWS are growing freely, and will need copious supplies of water. Regularly stop the leading growths. As the fruits get large enough, and if not wanted for preserving purposes, cut when ready. If fruits are wanted for jams, pickles, etc., it is the better plan to grow a few plants expressly for this purpose, and the early fruits can be selected to ripen early, these being superior to late-ripened fruits.—GEO. ELLWOOD, Swanmore Park Gardens.

---

**Gerbera Jamesoni.**—The leaves of this plant somewhat resemble those of the Globe artichoke, except that they are much smaller. The flowers are borne on long stems well above the foliage, and are nearly five inches across, on strong, well-grown specimens; the colour is a very pleasing rich orange-scarlet. The plants flower in the summer time chiefly, but strong ones continue to bear blossoms until late in the autumn. They are very attractive greenhouse subjects, the temperature of this structure being suitable for them both in summer and winter. Loam, leaf-soil, rotten manure, and coarse sand form a suitable compost.—G. B.

**Chrysanthemum Mrs. G. Rundle.**—It was with great pleasure I saw in a recent issue of the widely-circulated GARDENERS' MAGAZINE references made by "S. W." and "J. B. Riding" to Chrysanthemum Mrs. G. Rundle and its sports. These are grand old favourites of mine, and I have grown them for over thirty years. We have a class for them at our show, open to amateurs and gardeners alike, and I may say that, although I am only an amateur I have won first prize in this well-filled class for many years. Mrs. Rundle has been grown and shown in this district to my knowledge for forty years, and I do not think there are any chrysanthemums to beat the Rundle family for decorative effect. I am greatly surprised so few societies provide classes for flowers that are so easily grown as these.—J. BARKAWAY, Northampton.

HANLEY PARK, STAFFORDSHIRE.
JULY 3rd and 4th, 1912.
SIXTEENTH
GREAT ANNUAL FLORAL FETE.

£500 in Prizes, Silver Cups, Gold and Silver Medals, Silver Challenge Cup, value £10 10s., offered for "Trade Exhibit" (for particulars see page 7 in Schedule).
Valuable Special Prizes offered by the Principal Firms in England.
Schedules post free on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

WINDSOR ROSE SHOW.

Patron: HIS MAJESTY THE KING.

The 21st
ANNUAL EXHIBITION
will take place on
SATURDAY, 29th June,
by gracious permission of
HIS MAJESTY THE KING,
ON
THE SLOPES OF WINDSOR CASTLE.

ADMISSION—
Free to Subscribers from Noon.
Non-Subscribers, 12 o'clock, 2/6.
" " 2 p.m. 1/-.
" " 5 p.m. 6d.
Close at 8 p.m.

Schedules on application to the Hon. Sec., Windsor Castle.

Cardiff & County Horticultural Society.
24th GRAND ANNUAL SHOW
SOPHIA GARDENS, CARDIFF,
Wednesday & Thursday, July 17 & 18, 1912.
Specially good prizes in every Section, amounting in Money and Plate to nearly £500.
Tents lighted by electricity by Messrs. Fred Price and Co., Ltd.
POPULAR PRICES.
Schedules from the Secretary,
Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

BIRMINGHAM.—The Show of the Midlands.
FRIDAY and SATURDAY, JULY 19th and 20th.
OVER £450 IN CASH PRIZES.
SIX SILVER CUPS, GOLD, SILVER-GILT, SILVER, and BRONZE MEDALS.
Stone will be supplied free of charge to Exhibitors in the Class for ROCK and WATER GARDEN.
Schedules (post free) from
WILLIAM C. CARRADINE, Secretary,
84, Hamstead Road, Birmingham.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

SCIENTIFIC COMMITTEE.—JUNE 4.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Prof. Boulger, Sir Everard im Thurn, Messrs. Wilson, Odell, Pearson, Cuthbertson, Shea, Gordon, Ledger, Bennett-Poë, Sutton, Worsley, Elwes, and Chittenden (hon. secretary), with Mr. Alexander, visitor.

AFZELIA CUANZENSIS.—Mr. E. M. Holmes showed a pod of seeds of this African tree, the seeds of which are half-black, half-scarlet.

BOTANICAL CERTIFICATES.—Professor I. Bayley Balfour exhibited the following new or uncommon plants: Oxytropis yunnanensis, Franchet (bearing deep blue flowers), Saxifraga [illegible] (very closely allied to S. Brunoniana, but much larger in all its parts), S. diversifolia var. foliata with marked veining of the ovate leaves, Primula × Edna (which received a Botanical Certificate at the last meeting), Senico Lyalli, Hook f. (with yellow flowers about 1½ inches across, from New Zealand), Aster likiangensis, Franchet (with large, deep-blue flowers about two inches in diameter on stalks three inches long, from Yunnan, a very beautiful little plant), Primula × Inverleith (P. Bulleyana × P. pulverulenta), much in the way of P. × Edina, but a shade deeper in colour and more robust in habit. Botanical Certificates were unanimously recommended for the last three plants.

VARIATION IN SWEET PEAS.—Mr. Cuthbertson brought examples of sweet peas, original forms. (1) A rich ruby-coloured unnamed variety produced waved flowers on normal plants, i.e., plants having waved leaves. Two plants of the same variety with perfectly plain leaves, like the leaves of the old type, had produced perfectly waved flowers with open keels. (2) In the white waved variety (Etta Dyke), in the waved cream variety (Dobbie's Cream), and in the pink-and-white bicolor (Mrs. Cuthbertson) he had found a deep purple-flowered plant—one in a thousand, perhaps—giving a colour approaching the colour of the wild sweet pea, but retaining the waved formation.

SWEET PEA WITH LEAFY TENDRILS.—Mr. Cuthbertson also showed some sweet pea leaves with some of the tendrils becoming leafy, the result possibly of high cultivation.

## Royal Counties Exhibition.

JUNE 11—14.

In connection with the exhibition of the Royal Counties Agricultural Society, a horticultural department was provided, and was a distinct success. No schedule of prizes was issued, the executive depending upon the trade mainly to make a display, in which they were not disappointed. Entering the tent the first exhibit to attract attention was a handsome collecton of sweet peas from Messrs. S. Bide and Son, Alma Nurseries, Farnham, consisting of such varieties in first-class condition as Mrs. Townsend, Dorothy, Orange King, Blue Bells, Thomas Stevenson, Mrs. D. Hallam, Melba, Mrs. Stewart Champion, Edna Harland, and Harold (Silver-gilt Medal).

Messrs. Jarman and Co., Chard, arranged a nice table of centeaureas, roses, etc. (Silver Medal). Messrs. H. B. May and Sons, Edmonton, filled the end of the tent with choice ferns, consisting of such kinds as Nephrolepis Marshalli compacta, Adiantum farleyense gloriosum, Osmunda palustris undulata, and Nephrolepis Whitmani (Silver-gilt Medal). Messrs. Maurice Young and Sons, Milford, Godalming, exhibited carnations in variety (Award of Merit). Messrs. E. W. King and Sons, Coggeshall, Essex, contributed a most attractive collection of sweet peas, arranged in huge masses, notably Mrs. W. King, Elsie Herbert, Anglian Cream, Mrs. H. Sykes, Rosabelle, and Constance Oliver (Gold Medal). Mr. Goatley, gardener to Lord Northcliffe, Sutton Place, Guildford, displayed a tasteful group of miscellaneous plants (Silver-gilt Medal). Mr. Blake, gardener to the Earl of Onslow, Clandon Park, Guildford, had a group of well-grown plants of Lilium Harrisi, arranged on a base of ferns (Silver Medal).

Messrs. John Waterer and Sons, Bagshot, formed an attractive group with rhododendrons, kalmias, etc. (Gold Medal). From Messrs. B. Ladhams and Co., Shirley, Southampton, came huge masses of pinks and gaillardias, also pæonies, campanulas, and rockery plants (Silver-gilt Medal). Mr. Elisha J. Hicks, Twyford, prettily displayed climbing roses and other garden varieties. Especially noticeable was Rose Moyesi Sarah Bernhardt, Irish Beauty, Trier, Comtesse du Cayla, Seagull, Richmond, and Edu Meyer (Gold Medal). Mr. C. F. Waters, Dearland Nursery, Balcombe, contributed carnations in large numbers and of high quality, the varieties including Edith Waters, Rose Pink Enchantress, Carola, A. E. Marden, and Mrs. Bennett (Silver-gilt Medal). From Messrs. W. H. Rogers and Son, Southampton, came a small but interesting exhibit of rockery plants, which included Rubus australis or the Australian Bramble, R. foliosa, and Philesia buxifolia, clematis in variety, and choice herbaceous plants.

Messrs. Stuart Low and Co., Bush Hill Park, Middlesex, exhibited orchids in quantity, among them being Cattleya Mendelli, Miltonia vexillaria, Lælio-cattleya Canhamiana, and numerous cypripediums and odontoglossums; carnations were attractive as Baroness de Brienen, Lady Alington, Calypso, Lady Coventry, Maggie Nettlefield, and Princess Juliana (Gold Medal). Orchids were also admirably shown by Mr. H. A. Tracey, Amyand Park Road, Twickenham, the most noteworthy examples being Cattleya Mendelli White Queen, Lælio-cattleya Canhamiana Our King, Odontoglossum grande Williamsianum (Silver Medal).

The Guildford Hardy Plant Nursery arranged an effective rock garden at one end of the tent, planting it with such useful subjects for the purpose as Cypripedium spectabile, heucharias, dianthus, double poppies, Onosma taurica, Aster alpinus albus, and Edelweiss (Gold Medal).

Messrs. Sutton and Sons, Reading, had as usual a capital display of flowers and vegetables. The potatoes, which comprised thirty-five varieties, were most interesting; they included the new Balmoral Castle and Acquisition, White City, Supreme, Satisfaction, and May Queen, the last named being still the best early variety; cabbage, Sutton's Earliest, the result of seed sown in January; tomatoes Best of All, Princess of Wales, and Golden Perfection, with grand pods of Sutton's Centenary marrowfat pea, were also of much interest. In the decorative portion of Messrs. Sutton's display were magnificent gloxinias, double begonias, etc., with effective borders outside of lobelias, Chrysanthemum coronarium, Verbena Miss Willmott, etc. Messrs. Toogood and Sons, Southampton, had an attractive vegetable display in the horticultural tent, as well as at their stand (Gold Medal).

## Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 4th inst. Mr. Massie, the president, was in the chair, and there was an attendance of seventy-five members.

The evening was devoted to papers by juniors, for which book prizes were offered by the President. Fourteen young men contributed papers, the subjects being of their own selection, and the first prize (Wright's Vegetable Grower's Guide), was awarded to Mr. A. Brotherston, Shiplake Court Gardens, Henley-on-Thames, for a paper on "The Early Treatment of the Perpetual-flowering Carnation"; the second (Robinson's English Flower Garden), to Mr. Wm. Reach, Cullen House Gardens, for a paper on "Primula sinensis"; and the third to Mr. Charles Cook, Dalkeith Gardens, for a paper on "Violets in Winter." A paper on "Malmaison Carnations," by Mr. Wm. Smith, Whittinghame Gardens, East Lothian, was highly commended; and papers on "The Cultivation of Schizanthus Wisetonensis" and "The Culture of Begonia Gloire de Lorraine," by Messrs. D. Armstrong, Riccarton Gardens, Midlothian, and Thos. Cload, Keir Gardens, Dunblane, respectively, were commended. On the motion of the President, a hearty vote of thanks was accorded to the judges—Messrs. Whytock (Dalkeith), Fife (Dobbie and Co.), and Cairns (Murieston)—and a similar compliment was accorded to the President, on the motion of Mr. Comfort, for his kindness in providing the prizes.

The exhibits were: New hybrid Primula Leddy Pilrig (P. Bulleyana × P. Beesiana), from Mr. Wm. Robertson, Pilrig House Gardens, Leith (awarded a First-class Certificate);

collection of collarette dahlias and early-flowering chrysanthemums, and Calceolaria Veitch's Glory, from Messrs. Dobbie and Co. (awarded a Cultural Certificate); collection of pansies and violas, from Mr. C. Cockburn, Pencaitland, who drew attention to the differences between the various kinds of pansies and violas (awarded a Cultural Certificate); Hydrangeas Fraicheur and Mdme. Emile Mouilliere, from Mr. A. Porter, Davidson's Mains (awarded a Cultural Certificate); seedling perennial lupines, from Mr. John Fraser, The Old Manse Gardens, Inverkeithing (highly commended for strain); seedling amaryllis and pelargonium, from Mr. J. K. Brown, Dunnikier Gardens, Kirkcaldy; seedling Ox-eye Daisy, from Mr. F. Baillie, Liberton; Pelargonium Martha Bouchier, from Messrs. Todd and Co., Edinburgh.

At the meeting on July 2, Miss Burton, Polton, will read a paper on "Geraniums."

Several of those present who had visited the Royal International Horticultural Exhibition, at Chelsea, gave their impressions of the show at the close of the meeting.

## Wimborne Gardeners' Association.

JUNE 10.

On the above date Mr. G. Garner gave a lecture on "Grape Growing," at the Technical Institute, before the members of the above society. There was a good attendance, and a capital exhibition of roses for competition by some of the members. Mr. Garner directed the attention of his audience to the principal points connected with successful vine culture, briefly dealing with each one. He advocated the building of vineries in warm positions, with adequate shelter on the north and east sides. The walls of span-roofed and the front wall of lean-to houses should be low, the remainder glass, so that as much of each vine as possible and the border might be exposed to the influence of the sun. He deprecated deep borders, but preferred those from 20in. to 24in. deep, with sound drainage and drain pipes inserted in the border, connecting with the drainage, for ventilation. Permanent vines should be gradually built up, the annual pruning being rather severe as regards leader, so that the vines would be strengthened from the base upward.

The "setting" of the berries of various varieties was illustrated by diagrams drawn by the lecturer.

Mr. Garner did not recommend the constant drenching of vine borders with water (clear or liquid manure), but said their treatment should be similar to that of plants grown in pots. Water and stimulants being applied as the vines required them. He advocated the admission of air at night in moderation, and warm pipes after the berries had stoned, and not much atmospheric moisture. The colouring of the berries was particularly dealt with.

During the discussion Mr. Garner answered a number of questions, cordial votes of thanks being passed to Mr. Welch and Mr. J. Stevenson, chairman, and the lecturer.

## Bournemouth Gardeners' Association.

AN EVENING OUTING.

By the kind invitation of J. J. Norton, Esq., the members visited Ashton Court Gardens on Tuesday evening, June 4. Mr. Norton, and his able gardener, Mr. C. Nippard, gave the visitors a very hearty welcome, and they at once commenced a tour of the beautiful gardens, the principal feature of which is the magnificent collection of rhododendrons, probably the finest in the country, in any private garden.

Every specimen seemed to be in perfect health, and out of a collection of several thousands of plants, fewer than a dozen were lost as a result of the exceptionally dry weather of last summer. The display of blossom was grand indeed, Pink Pearl being represented by very fine specimens carrying huge trusses of flowers. The following new varieties have been added to the collection recently, namely: Mdme. Albert Moser, Mdlle. Jeanne Bois, Fritz Benary, Lady Mosley, and Auguste Lemaire. A fitting bordering to the beds is Retinospora aurea, which is kept trimmed at a height of 1ft.

There are many pine trees towering above the rhododendrons, their stems nicely clothed with climbing roses. Apple and other fruit trees are also grown among the rhododendrons, and are bearing fine crops; they are mostly standard and half-standard trees, and the stems are clothed with the climbing roses. Standard roses are interspersed among the shrubs, and lovely specimens of climbing varieties treated as tall standards, are planted in groups on the lawn. Indian and Mollis azaleas, and many kinds of spring-flowering shrubs are judiciously mixed with the rhododendrons, and in front of them. Very fine are the azalea plants grown in large pots for flowering under glass; zonal pelargoniums, winter-flowering carnations, tuberous begonias, and gloxinias are grown in large numbers. Sweet peas looked well, and were just beginning to flower freely.

The bush fruit trees of apples and pears were well laden with young, clean fruits, thus proving that by good management fruit as well as flowers can be grown in the light soil of Bournemouth. Before leaving, the members very heartily thanked Mr. Norton and Mr. Nippard for all they had done to make the visit interesting and instructive.

## TRADE NOTES.

At the Royal International Horticultural Exhibition Messrs. J. Kelway and Son were awarded a silver cup for a group of hardy plants, including their delphiniums, gaillardias, lupines, tree pæonies in pots; and a silver-gilt medal for cut flowers of herbaceous pæonies, pyrethrums, lupines, gaillardias, etc. These awards were not included in the official list.

We have received from Messrs. Robinson Brothers, Lim., West Bromwich, Staffordshire, a report on some investigations that have been made by an eminent biologist on the effect of Clift's Fluid Insecticide on the various forms of insect life that are found in the soil. Two sets of experiments were carried out, one in the laboratory and the other in the open, and as the result it was found that it had a most destructive effect upon pupæ of various moths that are injurious to plant life, wireworms, millipedes, etc. The matter is one of such general interest that we advise those who have to deal with insect-infested soils to obtain a copy of the report from Messrs. Robinson Brothers, who are the manufacturers of the insecticide.

## FORTHCOMING ENGAGEMENTS.

MONDAY, June 17.—United Horticultural Benefit and Provident Society, Special General Meeting at the Royal Horticultural Hall, at 7.30 p.m.
TUESDAY, June 18.—Royal Horticultural Society: Committees meet at 12 o'clock; lecture at 3 p.m. by Prof. E. Henslow, on "Prof. J. S. Henslow as Œcologist." Scientific Committee at 4 o'clock.
Horticutural Club: House Dinner at Hotel Windsor, Victoria Street, Westminster, at 6 p.m.; to be followed by lecture entitled "Pictures from a London Garden," illustrated by coloured lantern slides, by Mr. Horace J. Wright.
WEDNESDAY, June 19.—York Floral Fete and gala; three days.
National Hardy Plant Society's Exhibition at the Royal Horticultural Hall.
THURSDAY, June 20.—Linnean Society Meeting.
WEDNESDAY, June 26.—Southampton Rose Show.
Colchester Rose and Summer Show.
Richmond Horticultural Society.
Royal Botanic Society Meeting.
Royal Society of Arts.
THURSDAY, June 27.—Isle of Wight Rose Show.
FRIDAY, June 28.—Canterbury Rose Show.
SATURDAY, June 29.—Windsor Rose Show.
Reigate Rose Show.
Sutton Rose Show.
TUESDAY, July 2.—Holland House Show: three days.
Gloucester Rose and Sweet Pea Show.
Baltic Rose and Summer Show.
Epsom Horticultural Society.

## NOTES OF OBSERVATION.

◆

**Polypodium Mandaianum.**—Brought all the way from South Orange, New York, by Mr. W. A. Manda, this fern promises to be a very valuable one for decorative purposes. It is a markedly plumose form of Polypodium aureum, and is of good free growth with bold arching fronds of a pleasing glaucous hue.—W.

**Staking Plants.**—This work calls for a good deal of attention, and it is important that it be done before the plants are in actual need of support, otherwise they become twisted, and rarely recover fully. Delphiniums and pæonies are among the first subjects to require attention. The stakes should not be too heavy, but sufficiently strong to support the plants they are used for. One stake will suffice for each root of delphiniums, but pæonies require several stakes around each clump, so that a piece of tar twine can be placed right round to keep them in position. Proceed with other plants as necessity arises, and cut all stakes neatly and evenly to present a tidy appearance.—J. Gardner.

**Tydæas.**—By some cultivators these are given a period of rest during the winter, while by others they are kept in a growing state throughout that time, and flowers are produced more or less freely in the dull season. Plants that have been allowed to grow unchecked will run up to a height of two feet to four feet, and flower profusely at this season. They are in this way of considerable value for decorative purposes, not the least notable feature being the quaint but pretty markings of the flowers of some varieties. They may be as readily raised from seeds as Gloxinias are, while dormant rhizomes can be purchased at a comparatively cheap rate. —S. W.

**Plumbago rosea.**—The flowering of this pretty rose-coloured plumbago, and its brighter-coloured form (coccinea superba), extends over such a lengthened period as to almost overlap at both ends with the summer and autumn flowering Plumbago capensis, whose porcelain-blue flowers are so much admired. Plumbago rosea will flower profusely when grown as bushy plants from 2 feet to 4 feet in height, or even more. Its cultural requirements are not at all exacting, as cuttings of the young shoots strike root readily in the spring, and the young plants so obtained grow freely in an intermediate temperature. They prefer a liberal amount of leaf-mould in the potting compost.—K.

**Apple Court Pendu Plat.**—If the extent of the popularity of a fruit may be judged by the number of synonyms it possesses, this apple should be very widely grown indeed, for Dr. Hogg enumerates twenty different names by which it is known, though they are of French origin for the most part. There has been much discussion as to the origin of the name, which is generally held to mean "short suspended," from the shortness or almost entire absence of stalk to the fruit. There are some apples which are very handsome, and of the highest excellence when grown under the best conditions, but, in ordinary circumstances, insignificant to look at, and tough in texture. Court Pendu Plat is an example of such. On the exhibition table it sometimes has the size and colour of a dessert Blenheim, and is as firm in texture in March as when picked, but it is more often small, russety, and wizened. Therefore a planter should consider whether he has the best conditions to offer it—a good warm soil and a sunny situation. It is almost the last variety to come into flower, and is hence known as the Wise Apple. It is a good bearer, almost too good for its rather weak growth, hence the strongest trees should be selected for planting. It is scarcely strong enough for a standard as a rule, and is short-lived in that form; but, given a strong tree, it makes a good compact pyramid or bush on the Paradise or crab. At its best it is one of the firmest and best-flavoured apples we possess in April.—A. P.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

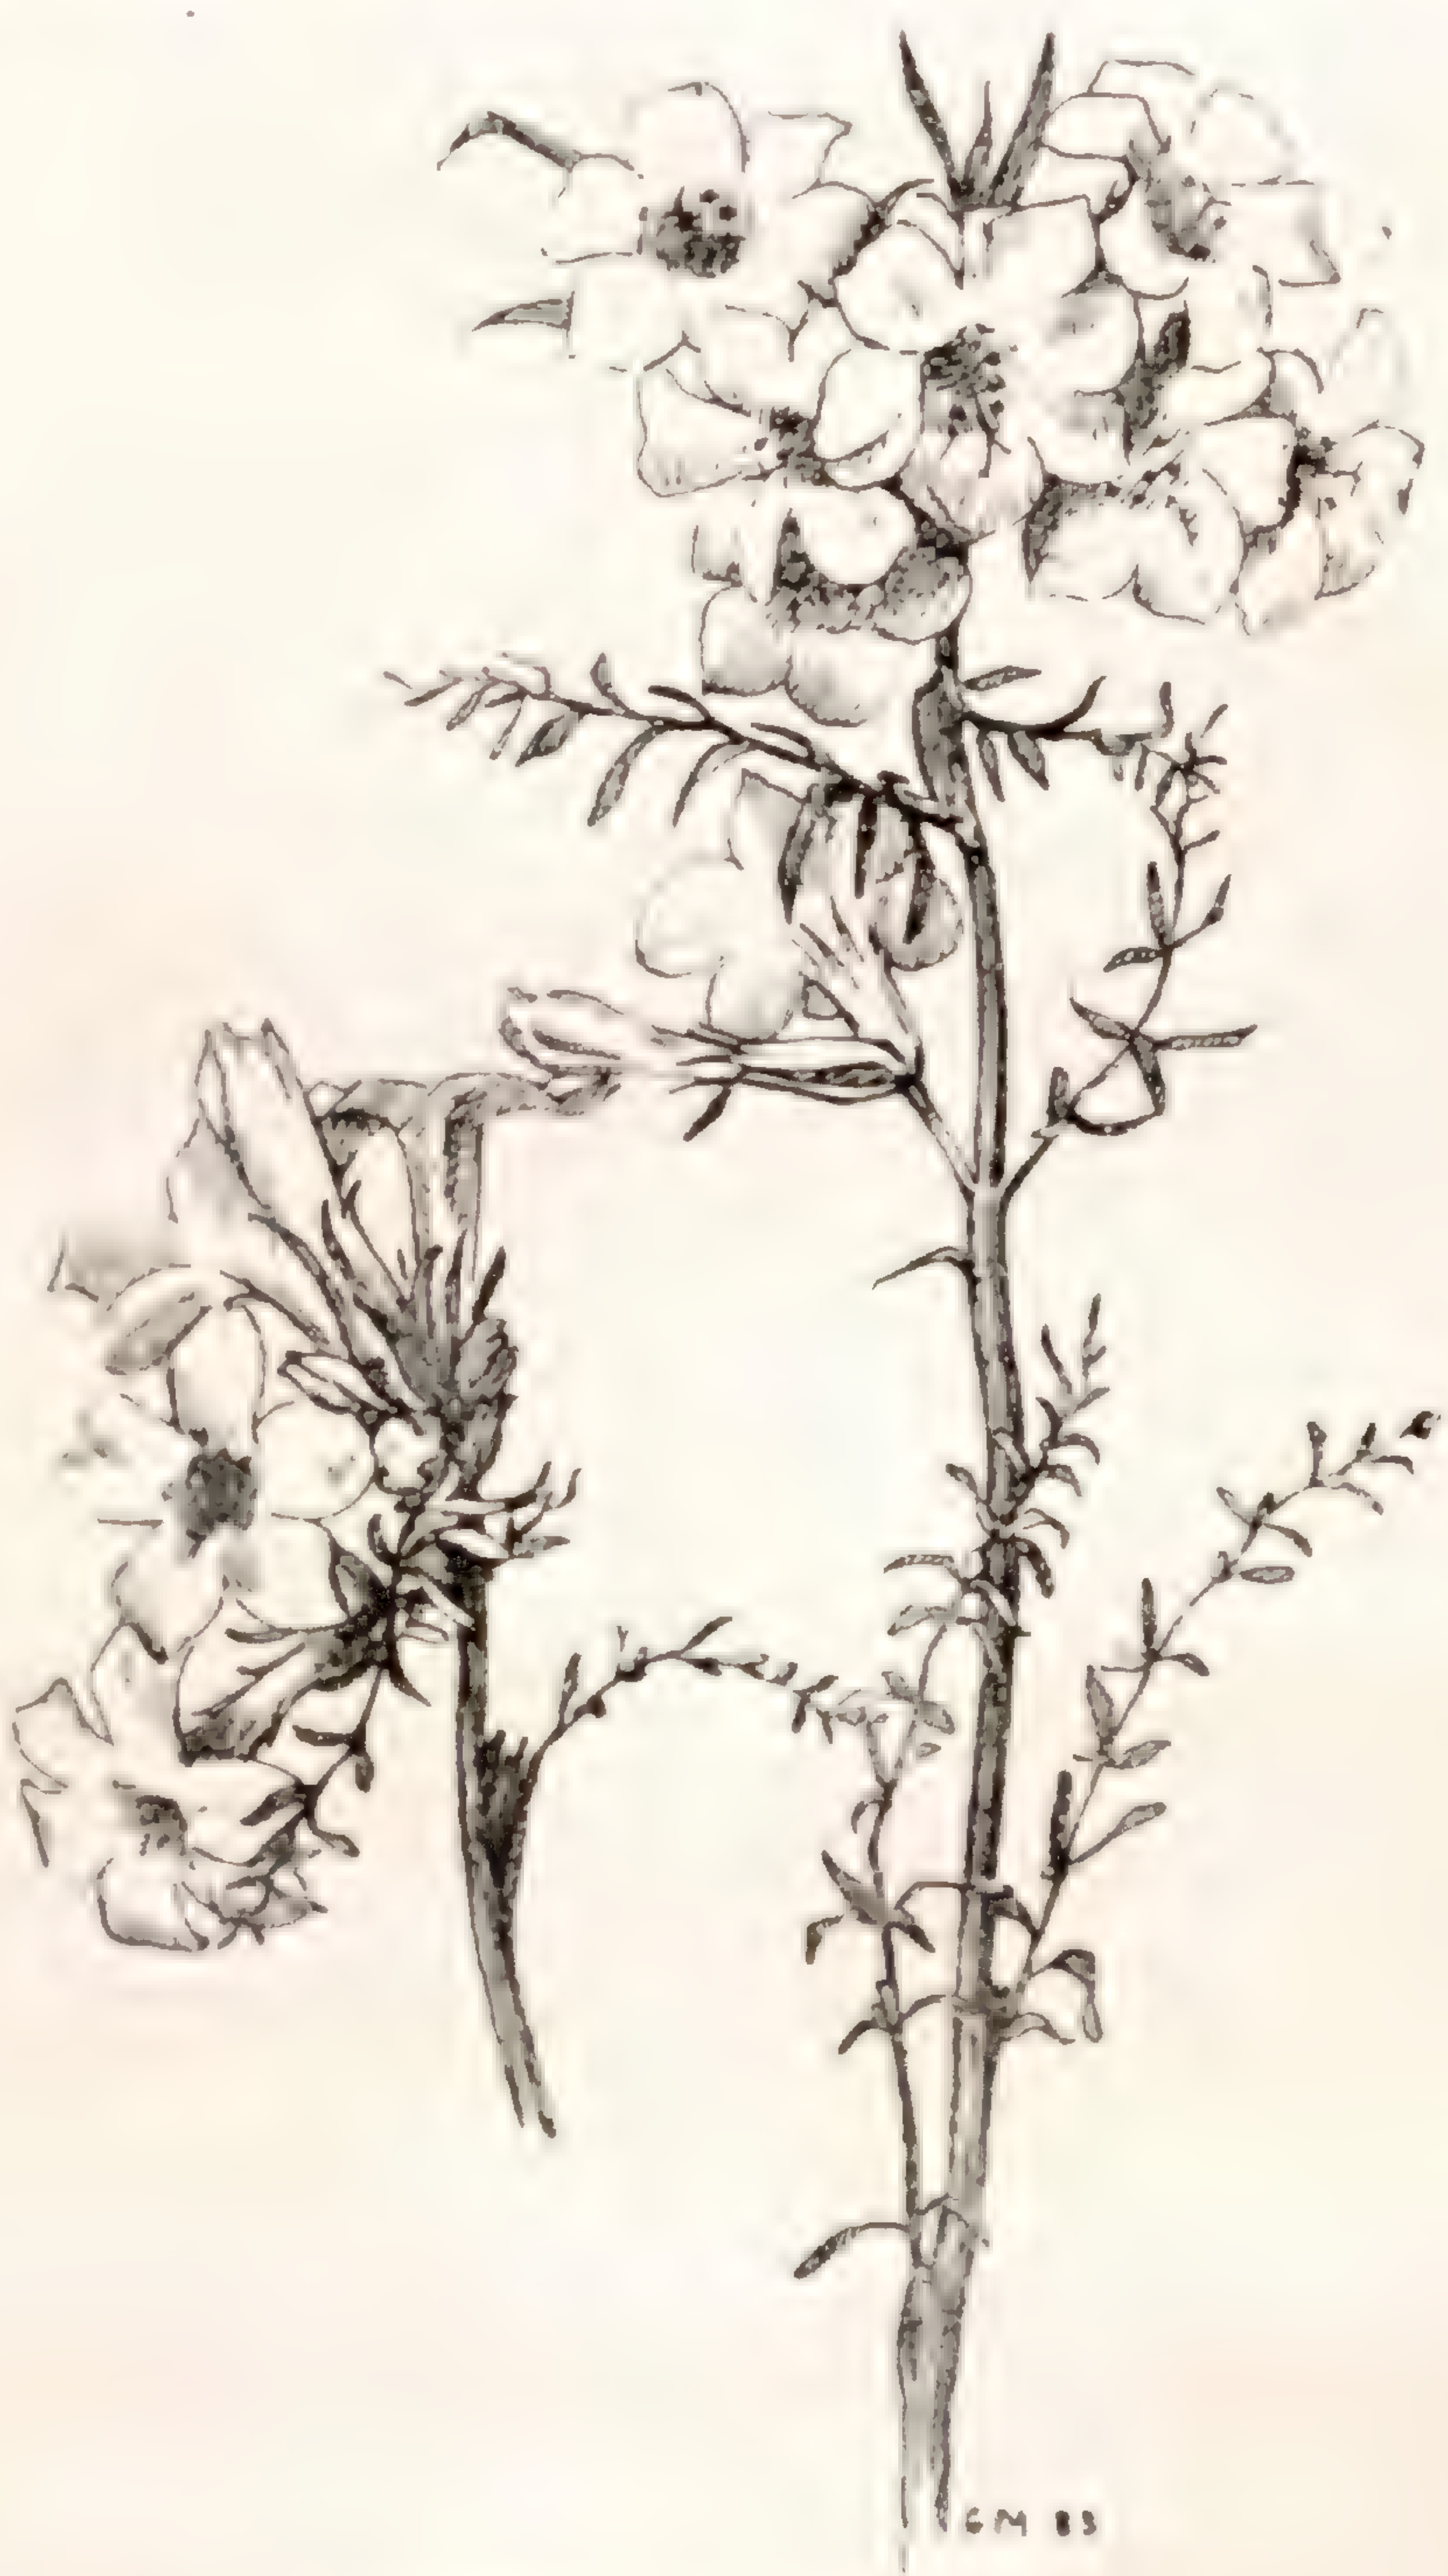
Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

NON-FRUITING OF STRAWBERRIES.—B. M., Maldon: We have not received any communication from you respecting the non-fruiting of strawberries. Your postcard received on Monday was dated May 10. Was this a clerical error, or has your correspondence been accidentally mislaid by someone?

SEAWEED AS MANURE.—I. S. P., South Wales: Kindly tell me what seaweed is worth as a manure in comparison with some other kinds, and also wherein lies its special value?—The average content of British seaweed, as gathered, for manurial purposes, is as follows:—Water, 75 per cent.; organic matter, 18; nitrogen, 0.5; potash, 1.2; phosphoric acid, 0.09. A considerable amount of water is lost on drying in the air, and if the weed has not been washed by rain in the meantime, its content of nitrogen, potash, and phosphoric acid is increased four-, five-, or even six-fold. It is difficult to form an estimate of the money value of seaweed to the farmer. The fertilising materials present in one ton of seaweed possessing the average composition would cost 8s. to 10s. if purchased from a dealer in the form of a merchantable manure in a finely divided state ready for putting on to the land. This value is arrived at by allowing 12s. for each per cent. of nitrogen, 4s. for each per cent. of potash, and 3s. for each per cent. of phosphoric acid. No account is taken of the sodium, calcium, and magnesium salts, which on most soils, but especially light soils, would be distinctly beneficial; nor is any allowance made for a possible stimulating effect of the iodides present. It does not, however, follow that seaweed is worth 8s. to 10s. a ton on every farm near the sea coast. The question of availability of its constituents—i.e., of its decomposition under various conditions—would have to be ascertained by careful trials before even a tentative estimate of its money value could be made. In farm practice seaweed more or less takes the place of dung, but there are several important differences. Seaweed contains no fibre, and, consequently, does not produce the black structureless material characteristic of the dung heap: in decomposing it forms soluble substances which easily wash away. For the same reason it decomposes more completely than dung. It is even said to facilitate the decomposition of dung on light soils and in dry districts, but there is no definite proof of this. A ton of dung and seaweed would break down in the soil more quickly than a ton of dung alone, and would therefore have less of a drying effect if put on late. The freedom of seaweed from weed seeds and from spores of disease organisms is of considerable advantage on light soils where weeds are common, or on soils liable to such diseases as finger-and-toe, the spores of which can hardly be kept out of dung. Experiments to test the manurial value of seaweed have been made at Trondhjem, at the Rhode Island Experiment Station, and by a few workers in Great Britain. In Hendrick's trials seaweed proved fully as effective as dung for early potatoes so far as quantity of produce was concerned, but it somewhat retarded ripening. On the other hand, seaweed and superphosphate proved better than dung and superphosphate. It is, however, on such gross-feeding crops as mangolds and the cabbage tribe that seaweed would be expected to show its fullest effects.

POLEMONIUM CONFERTUM.—S. L. C., Winchester: We have a little plant in the rock garden labelled Polemonium confertum; it has pinnate leaves and blue flowers, but I do not find it mentioned in the catalogues I have. Is the name correct?—Polemonium confertum is a dwarf species from the Rocky Mountains, summer flowering, with pinnately divided leaves, and clusters of funnel-shaped, deep blue flowers. We expect your plant is correctly labelled, and the accompanying illustration will help you to decide. P. confertum is a fine plant, and very widely grown, but fully deserving of attention; it is hardy, and thrives in good, rich, well-drained soil.



POLEMONIUM CONFERTUM.
A pretty, blue, summer-flowering hardy plant.

EXCRESCENCES ON VINE LEAVES.—H. W. T., Devon: Will you kindly tell me what you consider the cause of the excrescences on the back of the vine leaves enclosed? The only thing I can think of as the cause is that about a fortnight ago the hot water pipes were sulphured to check red spider, and on one or two occasions the pipes got rather hot.—The excrescences are due to an excess of moisture in the atmosphere, this probably resulting from heavy waterings and failure to commence ventilating early enough in the day. The trouble is not serious, however, and the leaves are sufficiently large and substantial to carry out their duties provided no error in cultivation follows. The blackening of some of the burst cells is due to the sulphuring process acting upon the infected watery cells that form the excrescences. Use fire-heat with the utmost care, and in fine weather commence to ventilate quite early, increasing the ventilation as the temperature advances.

## NAMES OF PLANTS.

T. AND S., Windsor.—Appears to be Tellima grandiflora. What were the flowers like?

B. B., Harpenden.—1, Delphinium Zalil; 2 Arnebia echioides; 3, Campanula persicifolia; 4, Heuchera sanguinea.

G. S., Ryde.—1, A form of Veronica spicata; 2, Aster graminifolius; 3, Allium italicum; 4, a Robinia, why not send flowers?

W. H. A. T., Bristol.—The trusses of pelargoniums had all shed their petals ere the package reached us, consequently the varieties were not recognisable. We would remind, you, however, that we cannot undertake to name florists' varieties of flowers. No. 5 is Hedysarum microcalyx.

→ Syringes. ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No. 1 Four Oaks Undentable, 1½ × 20in. 21/- or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1½ × 20 in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 3C, Sutton Coldfield.

**Holidays in the West of England.**—The London and South Western Railway Company have issued their fourteenth annual official guide, and, like its predecessors, contains much that is useful and of interest to those who purpose taking their holidays at the various pleasure resorts on the company's system. Upwards of eighty of the most attractive places in the south-west of England are described, and a considerable number are illustrated. The guide contains a list of hotels and other establishments that provide accommodation for visitors.

# CATALOGUES RECEIVED.

ROBERT VEITCH AND SON, EXETER.—A descriptive and illustrated pamphlet relating to the new hybrid calceolarias raised at Exeter.

G. S. EVANS, BEXLEY HEATH.—A descriptive and illustrated catalogue of American and British perpetual carnations, and malmaison varieties.

WM. PAUL AND SON, WALTHAM CROSS. — A timely catalogue is the one listing roses in pots from Waltham Cross. The list is descriptive and illustrated, and contains a full-page coloured plate of the firm's new H.T. rose Nerissa.

J. SMELLIE, BUSBY, NEAR GLASGOW.—Mr. Smellie makes a speciality of early-flowering chrysanthemums, and he grows and shows them to perfection. He also lists dahlias, pansies, and violas.

JAMES COCKER AND SONS, ABERDEEN.—Special opportunity for securing roses and hardy plants is afforded by the removal sale the Aberdeen firm is holding through the present month. The nursery is being moved from Sunnypark to Springhill, hence the cheap offers.

AMOS PERRY, ENFIELD.—A new, comprehensive, and admirably descriptive catalogue of alpine and hardy border plants, including a large selection of hardy ferns.

(ALL RIGHTS RESERVED.)

BEAUTIFUL, FRAGRANT, CINNAMON VINES.

Beautiful Leaves, Dainty Flowers, Exquisite Perfume.

MAKE HOME BEAUTIFUL.

THE CINNAMON VINE from the Oriental Land is one of the most beautiful of climbers, the most fragrant, and the easiest to grow. No home is complete without it. They will surround your windows, porch, and trellises, making them "Perfect Bowers of Beauty." They will grow 30 feet in a single season. Nothing like them. Their abundant blossoms perfume the air for a long distance with the most delicious fragrance. No words can describe their exquisite perfume.

No one should miss planting these charming vines. They will be a constant delight to every lover of vines and flowers. They stand the hardest winter, and burst forth in all their beauty very early in the spring. When first introduced the roots sold for £2 each.

There is nothing will give a home a more homelike and cosy appearance, or is a surer index of refinement and culture, than these Ornamental, Fragrant Vines, twining and climbing about the porch, windows, and trellises. They are Nature's Own Drapery from the Oriental Land, where graceful beauty is most highly prized.

# NATIONAL INSURANCE ACT, 1911.

**ALL GARDENERS** whether employed in Nursery, Public, Private or Market Gardens, or Seed warehouses, and who will become "Insured Persons" under the National Insurance Act on July 15th, 1912, **Must Join an "Approved Society" to obtain the Full Benefits of the Act.**

**The Best Society for a Gardener to Join is**

**THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY**

*(The Gardeners' Own Friendly Society), Registered No. 208, London. Registered Office and Meeting Place:*

**Royal Horticultural Hall, Vincent Square, Westminster, S.W.**

Established in 1865,

**Managed Entirely by Gardeners, and Certified Actuarily Sound and Solvent, with over £40,000 invested.**

At the General Meeting held on June 17th, 81 members out of a total of 84 present, were in favour of the Society becoming approved.

There is no Society in the Kingdom that can give better Benefits under the National Insurance Act to the Gardener, and if additional Benefits are desired, no other Society offers gardeners such an opportunity of obtaining the same for a small additional contribution.

Application Forms for membership can be obtained from the Secretary :

THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Trials of Roses.

Encouraged by the high degree of popularity which roses of all classes now enjoy, raisers both at home and abroad have redoubled their efforts to provide new and improved varieties, and of late years the introduction of novelties has been on so large a scale as to render it extremely difficult for either the amateur or the professional rosarian to keep pace with them. Were it not necessary to do more than take into consideration the roses raised in the United Kingdom, there would be no difficulty in deciding which of those annually introduced should be added to the occupants of the rose garden. The number is comparatively small, the varieties represent careful selection from large numbers of seedlings, and with but few exceptions, they are presented to public notice at least once at the leading exhibitions and meetings, and rosarians have therefore opportunities for seeing some, if not all of them, before they are placed in commerce. This is an immense advantage to the general body of cultivators, for if all do not fulfil their promise—and it would be unreasonable to expect them to do so—rosarians are able to see them, and formulate an opinion on their merits before making purchases. Not all the home-raised roses will succeed equally well in every part of the United Kingdom, but they differ less in this respect than do the varieties that have their origin abroad, and consequently this point is a quite minor one as regards varieties that have originated within our own borders. In the case of foreign roses the number annually distributed through the usual channels of trade is large, they are selected as the result of opinions based on plants that are developed under conditions that widely differ from those which obtain in this country, and in very few instances are there opportunities for seeing plants and blooms until they have passed through the hands of trade growers and been generally distributed. Consequently those who desire to have the new roses of foreign growth within a short time of their introduction must make their purchases before much information relating to them can be obtained, and when any considerable proportion fail to realise expectations, there is necessarily much disappointment. This failure may be due, in the case of both home and foreign-raised roses, to the varieties not maintaining their initial vigour, or in the case of the latter to the great difference in the climatic conditions of the place of origin and this country. In view of the large annual output of new roses and the desirability of bringing varieties of a high order of merit into prominence within a short time of their introduction, it appears to us that we might in this country follow the example of the French rosarians, and make arrangements for subjecting such of the new varieties as are available for the purpose to a comparative test before or after their introduction, the time of the trial depending, as a matter of course, upon the assistance rendered by the raisers. It might be thought by some that the raisers would have an objection to their roses being included in trials; but we have no fear that this would be the case, provided they are conducted on proper lines and under the direction of a responsible authority. There is no objection by the raisers of this, or any other country, to sending their novelties to the Bagatelle trials, as evidenced by the fact that last autumn eighty-five varieties were contributed. It is evident also that raisers resident in this and other countries are equally ready to contribute freely of their novelties, for the varieties mentioned by Mr. Arthur W. Paul in his interesting notes on the new roses at Bagatelle, which appear in this issue, include novelties of both British and foreign origin. Much time and consideration would have to be devoted to the preparation of a scheme for conducting such trials before practical effect could be given to the suggestion here made. But it is quite obvious that the proper body for taking the project in hand is the National Rose Society, which has already done such an immense amount of useful work for the advancement of rose culture. Its enormous increase in membership within recent years is a proof that it enjoys to the full the confidence of all who are interested in roses, and its annual income would be sufficient to enable it to engage in such work under conditions that would ensure a full measure of success. It would probably be necessary to make a slight reduction in the number of exhibitions, as compared with the current year, and possibly to make some modification in the amount expended on publications, but, unless we are much mistaken, the rearrangement necessary would not be great, and it would have ample compensation in a material increase in the usefulness of the work in which the society is so actively engaged. The establishing of a trial ground would necessitate some modification in the method of making awards to novelties, and it will be readily seen that the value of a gold medal award to a new rose would be greatly increased by being made after the variety had been subjected to a comparative test than under the present method of procedure. Failing a trial on the lines of the Bagatelle trials, it is difficult to see how the present method of making awards could be greatly improved upon, for both plants and blooms have to be submitted, and the awards are made by a committee comprising both amateurs and professional rosarians of the highest eminence. This year the society has provided

MR. ALGER PETTS.

two classes for new roses, one for varieties of value for exhibition or garden decoration and the other for those specially adapted to glass culture. The innovation is a good one, and should be useful in obtaining proper recognition for the second of the two classes of roses which have become of greatly increased importance within recent years.

---

**Mr. Alger Petts** is an enthusiastic and exceedingly clever amateur gardener, residing at Chelmsford. He has become familiar to the readers of the Gardeners' Magazine for the last ten or twelve years by reason of his contributions to our pages. He believes his great love for gardening is largely due to hereditary influence, and he tells us that his father cultivated one hundred varieties of roses half a century ago. Mr. Petts was born and brought up on an Essex farm, and has always lived in the county. With a wet, clay soil, in which to practice his hobby, he has secured surprising results, especially with hardy flowers and small fruits. When reading Mr. Petts' cultural recommendations it is as well our readers should bear in mind the kind of soil with which the writer has to do. Mr. Petts studies his hobby, and takes a scientific, as well as a purely practical and economic interest in it. Not only is he a contributor to our pages, but he contributes to the "Notes and Abstracts" published in the "Journal" of the Royal Horticultural Society.

**Holland House Show.**—The summer show, which has for many years past had a prominent position in the annual programme of the Royal Horticultural Society, will this year be again held in the beautiful grounds of Holland House, Kensington. As the society did not hold an exhibition in the gardens of the Inner Temple this year, the Holland House show is likely to be of exceptional importance, and Fellows and the general public alike should make note of the dates, which are July 2, 3, and 4, the admission on the third day being one shilling.

**New Roses at Bagatelle.**—Mr. Arthur W. Paul, F.L.S., who, as for some years past, has this year been one of the judges of the new roses grown at Bagatelle, very kindly sends us the following particulars of the awards made by the judges at the recent meeting. "The beautiful rosery in the gardens of Bagatelle, now included in the Bois de Boulogne, at Paris, was at the height of its beauty on the morning of June 13, when the annual judging of the new roses sent for trial took place under the direction of the authorities of the City of Paris. The judges consisted of well-known French and foreign rosarians, both amateur and professional, and some 85 new varieties of roses sent in 1911 were examined with a view to be awarded gold medals and certificates. As the result of a rule prohibiting the same raiser from receiving a gold medal more than two years in succession, the varieties of M. Pernet-Ducher were not eligible for this distinction, but a special Diploma of Honour was awarded to his new H.T. Sunburst, and the red H.T. President Vignet, of the same raiser, was in fine condition. None of the other varieties were considered to be of sufficiently outstanding merit at the time of the judging to receive a medal, but three Certificates of Bagatelle were awarded, viz., to Madame Jules Bouché, a flesh-white H.T.; Fru Margretha Möller, a fine rose-coloured H.T. of Danish origin; and to Orleans-Rose, a rose-coloured polyantha that has been frequently finely exhibited in this country. Some other kinds that followed closely in the number of points awarded were Mrs. Edward Powell, a fine red H.T.; Erna Teschendorff, a brilliant dark-red polyantha; Ethel Malcolm (H.T.); Mrs. Herbert Stevens (Tea); Ellen Poulsen, a soft pink polyantha; and Rodhätte, a crimson hybrid polyantha. Of the varieties of 1912, provisionally examined, with a view to granting awards next year, the following appeared the most promising: Madame Faucheron, a light-coloured H.T.; Yvonne Lornago, an orange-red hybrid of Tea and Noisette; Madame C. Chambard, a pale pink H.T.; Madame Charles Lutaud, a deep yellow H.T.; Madame Edmond Rostand, H.T., flesh colour, with orange centre; Melody, a fine yellow H.T.; Merveille des Rouges, crimson polyantha; Mrs. Amy Hammond (H.T.), and Mrs. Joseph Welch (H.T.)."

**Presentation of Garden Produce to the Lord Mayor.**—The Master of the Worshipful Company of Gardeners (Alderman Sir Horace Marshall), together with the Wardens, following an old custom, recently presented to the Lord Mayor a basket of British-grown flowers, fruits, vegetables, and herbs. To the Lady Mayoress a splendid bouquet of orchids was presented. After a suitable acknowledgments of the gifts, the Lord Mayor entertained the Master and Wardens at luncheon.

**Cereus amecaensis [Heese].**—With reference to this beautiful species recently illustrated in these pages, Mr. A. Worsley writes: "In Schumann's classification, this species appears thus placed: Subgenus speciosus.* Characters—Rooting on the branches, climbing or hanging down, often epiphytic plants. Branches without nose-like appendages under the aureolæ, spines multiplied in old age. Branches 4 to 5 angled, ovary spiny, sepals and petals generally red. Habitat Mexico. Specific characters—Branches pale green when young, flowers white. My plants were given to me many years ago by Mr. H. J. Elwes, V.M.H., who gathered them in Mexico, at some elevation in the temperate zone, growing on the stumps of trees. They grow vigorously, and flower freely every year in May and June in a cool house. Each flower lasts about three days. I have raised and flowered coloured hybrids between this and garden cacti." *Of Salm. Dyke.

**Sir David Prain, LL.D., F.R.S.,** etc., has rendered such splendid service in the cause of botanical science during the twenty-eight years that have elapsed since he entered the Indian Medical Service in 1884, that his inclusion in the list of those selected for the honour of Knighthood on the occasion of the King's birthday has afforded satisfaction to his many friends, and, indeed, to all who are acquainted with his work. A native of Kincardineshire, Sir David Prain had a brilliant career at Aberdeen University, and, after filling appointments at his University and Edinburgh, he entered the Indian Medical Service, and for two or three years was in medical charge of native regiments in various parts of India. Possessing a taste with a strong trend for botanical work, he was, some three years after entering on his Indian career, appointed Curator of the Herbarium and Library of the Royal Botanic Gardens, Calcutta, and this position he held eleven years. On the retirement of Sir George King in 1898, Sir David Prain was appointed superintendent of the Calcutta Botanic Gardens and of Chinchona cultivation in Bengal, and Director of the Botanical Survey of India, and these positions he held until towards the close of 1905, when he succeeded Sir W. Thiselton Dyer as Director of the Royal Botanic Gardens, Kew. We need not now refer to Sir David Prain's remarkable capacity for work, as evidenced by what he accomplished during the eighteen years over which his appointments in Calcutta extended, neither is it necessary we should say that this capacity has been made abundantly manifest during the seven years he has been Director of the Royal Gardens, Kew. This is admirably exemplified by the splendid manner in which the traditions of this great establishment are being maintained.

**Watercress Beds in Relation to Disease.**—The medical officer of the Croydon Rural District, in his annual report, states that he has given much attention to watercress beds, as the typhoid bacillus almost invariably gains access to the human body by the digestive track—among other ways, by the eating of watercress; and he adds: "It should be clearly understood that it is extremely advisable that any persons buying watercress should not only have some idea as to where it was grown and through whose hands it may have passed, but should assure themselves before eating it that it has been thoroughly washed in running water." As we have previously stated, the importance of thoroughly washing watercress that is purchased cannot be too strongly insisted upon, and Dr. Fegen renders good service in directing attention to the point.

**An Old-time Rose Garden.**—With reference to the old-time rose garden that has been formed in the gardens of the Palace of La Malmaison, Mr. A. W. Paul, F.L.S., writes: "An additional attraction to rosarians in the neighbourhood of Paris is this year open for the first time in the gardens of the Palace of La Malmaison, where a beautiful rose garden has been laid out, and where Mr. Gravereaux is forming a collection of old roses that may be supposed to have been flowering in the gardens in the time of the Empress Josephine, one hundred years ago. This collection is already very interesting, and will no doubt improve both in the number of the plants and the quality of the flowers as time advances."

**The Yorkshire Rhubarb Industry.**—Although it is well-known that enormous quantities of early-forced rhubarb are produced in Yorkshire to meet the demands of the great markets of the United Kingdom, and some on the Continent, it is not so generally known that the industry is still growing, and that almost all the suitable available land in Hunslet, Stourton, Rothwell Haigh, and Rothwell is being utilised for the cultivation of rhubarb for forcing. At this season of the year the district just south of Leeds reveals great tracts of vivid greenery produced by the large leaves of finely cultivated rhubarb.

**Prizes for the Prudhoe Miners.**—The late Mr. Norman C. Cookson, of Wylam, proved that the best workmen among the miners of the Prudhoe district were those who took up gardening as a hobby. Evidently the same happy state of affairs continues, for the Mickly Coal Company is offering valuable prizes through the committee of the famous Prudhoe Flower Show, for the best vegetable and flower garden, the best vegetable garden, and the best kept garden. These competitions are open to the company's workmen resident at West Wylam, Prudhoe, Low Prudhoe, and Half-way House.

**Dr. D. H. Scott, F.R.S.,** ex-president of the Linnean Society, has been elected a foreign member of the Royal Danish Academy of Science and also of the Royal Society of Sciences, Upsala.

# YORKSHIRE FLORAL FETE AND GALA.

Although this is the fifty-fourth year of the Yorkshire Flower Show and Gala the northern function shows no signs of age, except that each year the authorities grow wiser, and their exhibition more beautiful. To the wisdom of years is added a youthful vigour that is most refreshing. The exhibition was held on Wednesday, Thursday, and Friday, June 19, 20, and 21, in Bootham Park, and the display in the huge tents presented a fine picture. Orchids were unusually good, and roses were fine; specimen plants were present in fairly large numbers, and the groups arranged for effect were quite up to the usual standard of excellence. The hardy flower displays were excellent, and the classes for a garden of hardy flowers and for a rock and water garden were of special interest and high merit, the former promising to become an outstanding feature at York. The trade exhibits were abundant and good, and evidence of the smartness of the staff was found in the fact that all the medal award cards were in position before the time for the admission of the public.

FINE GROUPS OF ORCHIDS AT YORK FLORAL FETE AND GALA.

The group on the left was staged by Messrs. J. Cypher and Sons, Cheltenham; that on the right by Messrs. Mansell and Hatcher, Rawdon, Leeds. These displays combined to make one of the finest features at York.

## LARGE GROUPS.

In the large group class each of the six exhibits covered an area of 300 sq. ft. The competition was good throughout, and once more our friend, Mr. J. Donoghue, gardener to J. Pickersgill, Esq., Weetwood, Leeds, gained the premier award of £20 with a beautiful effort in which he utilised rambling roses and palms in the background, and handsome crotons and odontoglossums over the centre and front; in the immediate foreground, odontoglossums, crotons, cattleyas, sonerilas, and phalænopsis were charmingly associated, and here and there over the whole rose the misty gracefulness of Humea elegans and Cyperus papyrus. Mr. W. A. Holmes, Chesterfield, won second prize, and his crotons and oncidiums were especially good. Next in order came Mr. W. Vause, Leamington, with roses and crotons as leading features; he was followed in order by Mr. F. H. Ward, Scarcroft, York; Messrs. R. Simpson and Son, Selby; and Mr. T. M. Petch, St. John Street, Bridlington.

There were three entries in the class for a group of miscellaneous plants, arranged on a space of 200 sq. ft. Here Mr. Donoghue was still to the fore with a goodly exhibit, in which miltonias and roses were conspicuous; Mr. W. A. Holmes, Chesterfield, occupied second place, and Mr. W. Vause, Leamington, was placed third.

## ROCK AND WATER GARDEN DISPLAYS.

What has come to be known as the rock and water garden class at York was again a great attraction. There were three entrants, and each filled a space 30ft. by 12ft. The first prize of £15 fell to Messrs. Jas. Backhouse and Son, York, for a fine rock garden exhibit with a central ravine, holding a lily-studded pool of water. Conifers, rhododendrons, bamboos, and purple beeches formed a high background for alpine shrubs, campanulas, and hardy ferns. Near the water were colonies of irises, choice primulas, mimuluses, orchises, and cypripediums. The front portion of the group held colonies of oxalis, cytisus, ramondias, cheiranthuses, sedums, and dainty dianthuses. Messrs. W. Artindale and Son, Sheffield, won second place with a bold design of rocky cliff, mountain pass, and tiny stream; bamboos, irises, violas, azaleas, and spiræas were plants freely used. Mr. S. Pickering, Clifton, York, came third; he used campanulas, saxifragas, and irises in masses, and a rose-clad rustic bridge spanning the pool of water was the central feature.

## HARDY FLOWER GARDENS.

It will be remembered that the York executive instituted a quite new class in 1911 for the better and more natural display of hardy flowers. The idea was to secure a garden-like effect, and the first effort was a success. This year 300 square feet was allowed each competitor, and there were four entries. Messrs. James Backhouse and Son, York, won the first prize with a garden composed of a hedge-backed border, gay borders at the end and front, and three central beds surrounded by rough flagged pathways. The entrance was by low steps in the front centre. Anchusas, delphiniums, foxgloves, lupins, liliums, and verbascums towered up in front of the background of conifers. At either end liliums, irises, spiræas, gladioli, and lupins, grouped very naturally, were the chief features, while the front border was composed chiefly of Lilium elegans, Spanish irises, pæonies, poppies, and lupins. In the central beds gladiolus, iris, and poppies were conspicuous, while the other beds were gay with delphiniums, Spanish irises, pyrethrums, pæonies, and dictamnus.

An even bolder effect was produced by Messrs. W. Artindale and Son, Sheffield, who filled a semi-circular border with grand groups of eremurus, lupins, Spanish irises, spiræas, verbascums, lupins, pæonies, etc. A narrow path divided this from a large front bed in which Astilbe Arendsi Kriemhilda, Lilium Szovitzianum, Incarvillea Delavayi, Iris Cajanus, etc., were edged with white Viola cornuta. Messrs. G. Gibson and Co., Leeming Bar, Bedale, adopted the usual herbaceous border design, using eremurus, poppies, liliums, and campanulas; and they won third prize. Messrs. J. Harkness and Sons, Bedale, was commended for their exhibit.

### ORCHIDS.

In the premier class of this section the requirements were a display of orchids on a table space of 12ft. by 5ft.; plants and cut flowers were both admitted. There were three competitors. Messrs. J. Cypher and Sons, Cheltenham, secured the first prize with a very effective arrangement of Cattleya Mossiæ, Lælio-cattleya Fascinator, L.-c. Canhamiana, white odontoglossums, Brassia verrucosa, oncidiums, cymbidiums, and miltonias. Second prize was won by Messrs. Mansell and Hatcher with a very beautiful exhibit of Renanthera Imschootiana, white odontoglossums, Cattleya gigas, C. Mossiæ, miltonias, and oncidiums. Messrs. Hassall and Co., Southgate, gained third prize, and they showed Odontioda Charlesworthi and Cypripedium niveum in good form.

Messrs. J. Cypher and Sons led for ten orchids with fine examples of Cypripedium Curtisi, Vanda teres, Miltonia vexillaria, Phalænopsis Rimestadiana, Epidendrum prismatocarpum, Lælio-cattleya Aphrodite, Cattleya Mossiæ, etc.; Mr. Barker, gardener to W. P. Burkinshaw, Esq., Hessle, Hull, was second with Lælio-cattleya Fascinator, L.-c. tenebrosa Walton Grange var. Star of York, C. gigas, Miltonia vexillaria, etc.; Messrs. Hassall and Co., Southgate, third.

MESSRS. JAS. BACKHOUSE AND SONS' FIRST PRIZE GARDEN OF HARDY FLOWERS AT YORK FLORAL FETE AND GALA.

Mr. J. Barker led for six orchids in a close competition, and his best plants were Renanthera Imschootiana, Cattleya gigas (very fine), C. Mossiæ (with twenty-one blooms), Cypripedium Shillianum, L.-c. Fascinator Schroderæ, and Miltonia vexillaria. Messrs. J. Cypher and Sons were second, and here the best examples were of Cattleya Whitei with five blooms, Lælio-cattleya Canhamiana with sixteen flowers, L.-c. Krauzlini, Cattleya Mossiæ, and Renanthera Imschootiana. Messrs. Hassall and Co., Southgate, came third.

Mr. Barker scored for a specimen orchid with a neat example of Miltonia Bleuana Hessle var., with two spikes. Messrs. J. Cypher and Sons came second with a very fine form of Odontoglossum perultum. Messrs. J. Cypher and Sons scored for three orchids, and Mr Barker was second.

### ROSES.

Roses were a very fine feature of the gala, the flowers being of good size and fine colouring, and they were largely displayed by leading growers. The class for seventy-two blooms, not less than three dozen varieties, found Messrs. D. Prior and Sons, Colchester, to the front among three competitors. A few of the best blooms were Mons. Joseph Hill, Hugh Dickson, Yvonne Vacherot, Florence Pemberton, Mrs. W. J. Grant, Countess of Caledon, A. K. Williams, Bessie Brown, Mdme. Jules Gravereaux, and Mrs. Coxhead. Messrs. Frank Cant and Co., Colchester, came second, with Messrs. Jarman and Co., Chard, third. For forty-eight blooms, Messrs. D. Prior and Sons were again chief prizewinners with fine flowers of Mildred Grant, White Maman Cochet, La France, Dean Hole, Mdme. Jules Gravereaux, Lyon, Juliet, and Countess of Caledon; Mr. George Prince second, and Messrs. Frank Cant and Co. third. For thirty-six blooms, Messrs. D. Prior and Sons were again to the front, with Messrs. Frank Cant and Co. and Mr. H. Drew, Longworth, following in the order given.

Five competitors staged two dozen blooms, and here Messrs. Frank Cant and Co. came to the front with fine examples of Gloire de Chedane Guinoisseau, J. B. Clark, Helene Guillot, Maman Cochet, O'Donel Brown, Boadicea, and the good old Mrs. John Laing; Messrs. D. Prior and Sons came second. The last-named firm annexed the first prize for a dozen flowers of white roses with Frau Karl Druschki, Mdme. Constant Soupert, Medea, etc.; Mr. George Prince second; and Messrs. F. Cant and Co. third.

The premier award for eighteen roses, distinct, fell to Mr. George Prince, whose examples of Ethel Malcolm, Mrs. Hubert Taylor, Bessie Brown, Mdme. Jules Gravereaux, W. Shean, and Lady Ursula were notably good; Messrs. D. Prior and Sons had to be content with second place, and Mr. E. J. Hicks came third. Mr. W. Hutchinson, Kirby Moorside, scored in the amateur classes for twelve and for eighteen blooms with fair specimens.

### SPECIMEN STOVE AND GREENHOUSE PLANTS.

These continue to figure at York Gala, and as they are very effective, and show evidence of high cultural skill, they invariably attract a great deal of attention. As each competitor places his plants together, instead of setting them out in their respective classes, it is not always easy to pick out the prizewinners in due order.

The best collection of stove and greenhouse plants, in bloom, came from Messrs. James Cypher and Sons, Cheltenham, who, in a space 20ft. by 10ft., arranged many famous examples of Statice profusa, Erica ventricosa, E. Cavendishi, Clerodendron Thomsonæ, Franciscea eximea, Clerodendron Cypheri, and anthuriums; Mr. W. Vause, Leamington, came second, and he showed fine examples of Pimelea Hendersoni, and Erica Cavendishi. Noble specimens of Clerodendron Thomsonæ, and Erica Cavendishi and E. ventricosa, the latter a giant, won for the Cheltenham firm first prize for three greenhouse plants in bloom; Mr. W. Vause second. For one stove plant in flower Messrs. J. Cypher and Sons scored with a handsome Ixora Williamsi, and Captain Walker followed with a large Anthurium Scherzerianum.

### FRUIT AND VEGETABLES.

The fruit classes provided a capital display. There were three tables of ripe fruit, decorated, and here Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, won first prize. His decorations consisted of odontoglossums, Lilium speciosum, and thalictrum. His fruits were excellent specimens of Madresfield Court (10) and Muscat of Alexandra grapes (13), Peregrine and Royal George peaches (13), Lord Napier and Pineapple nectarines (13½), Eatonian and James Grieve apples (10½), Kirk's and Jefferson plums (9½), Dr. Jules Guyot and Triomphe de Vienne pears (10), Hero of Lockinge and Eaton Seedling melons (9). For decoration

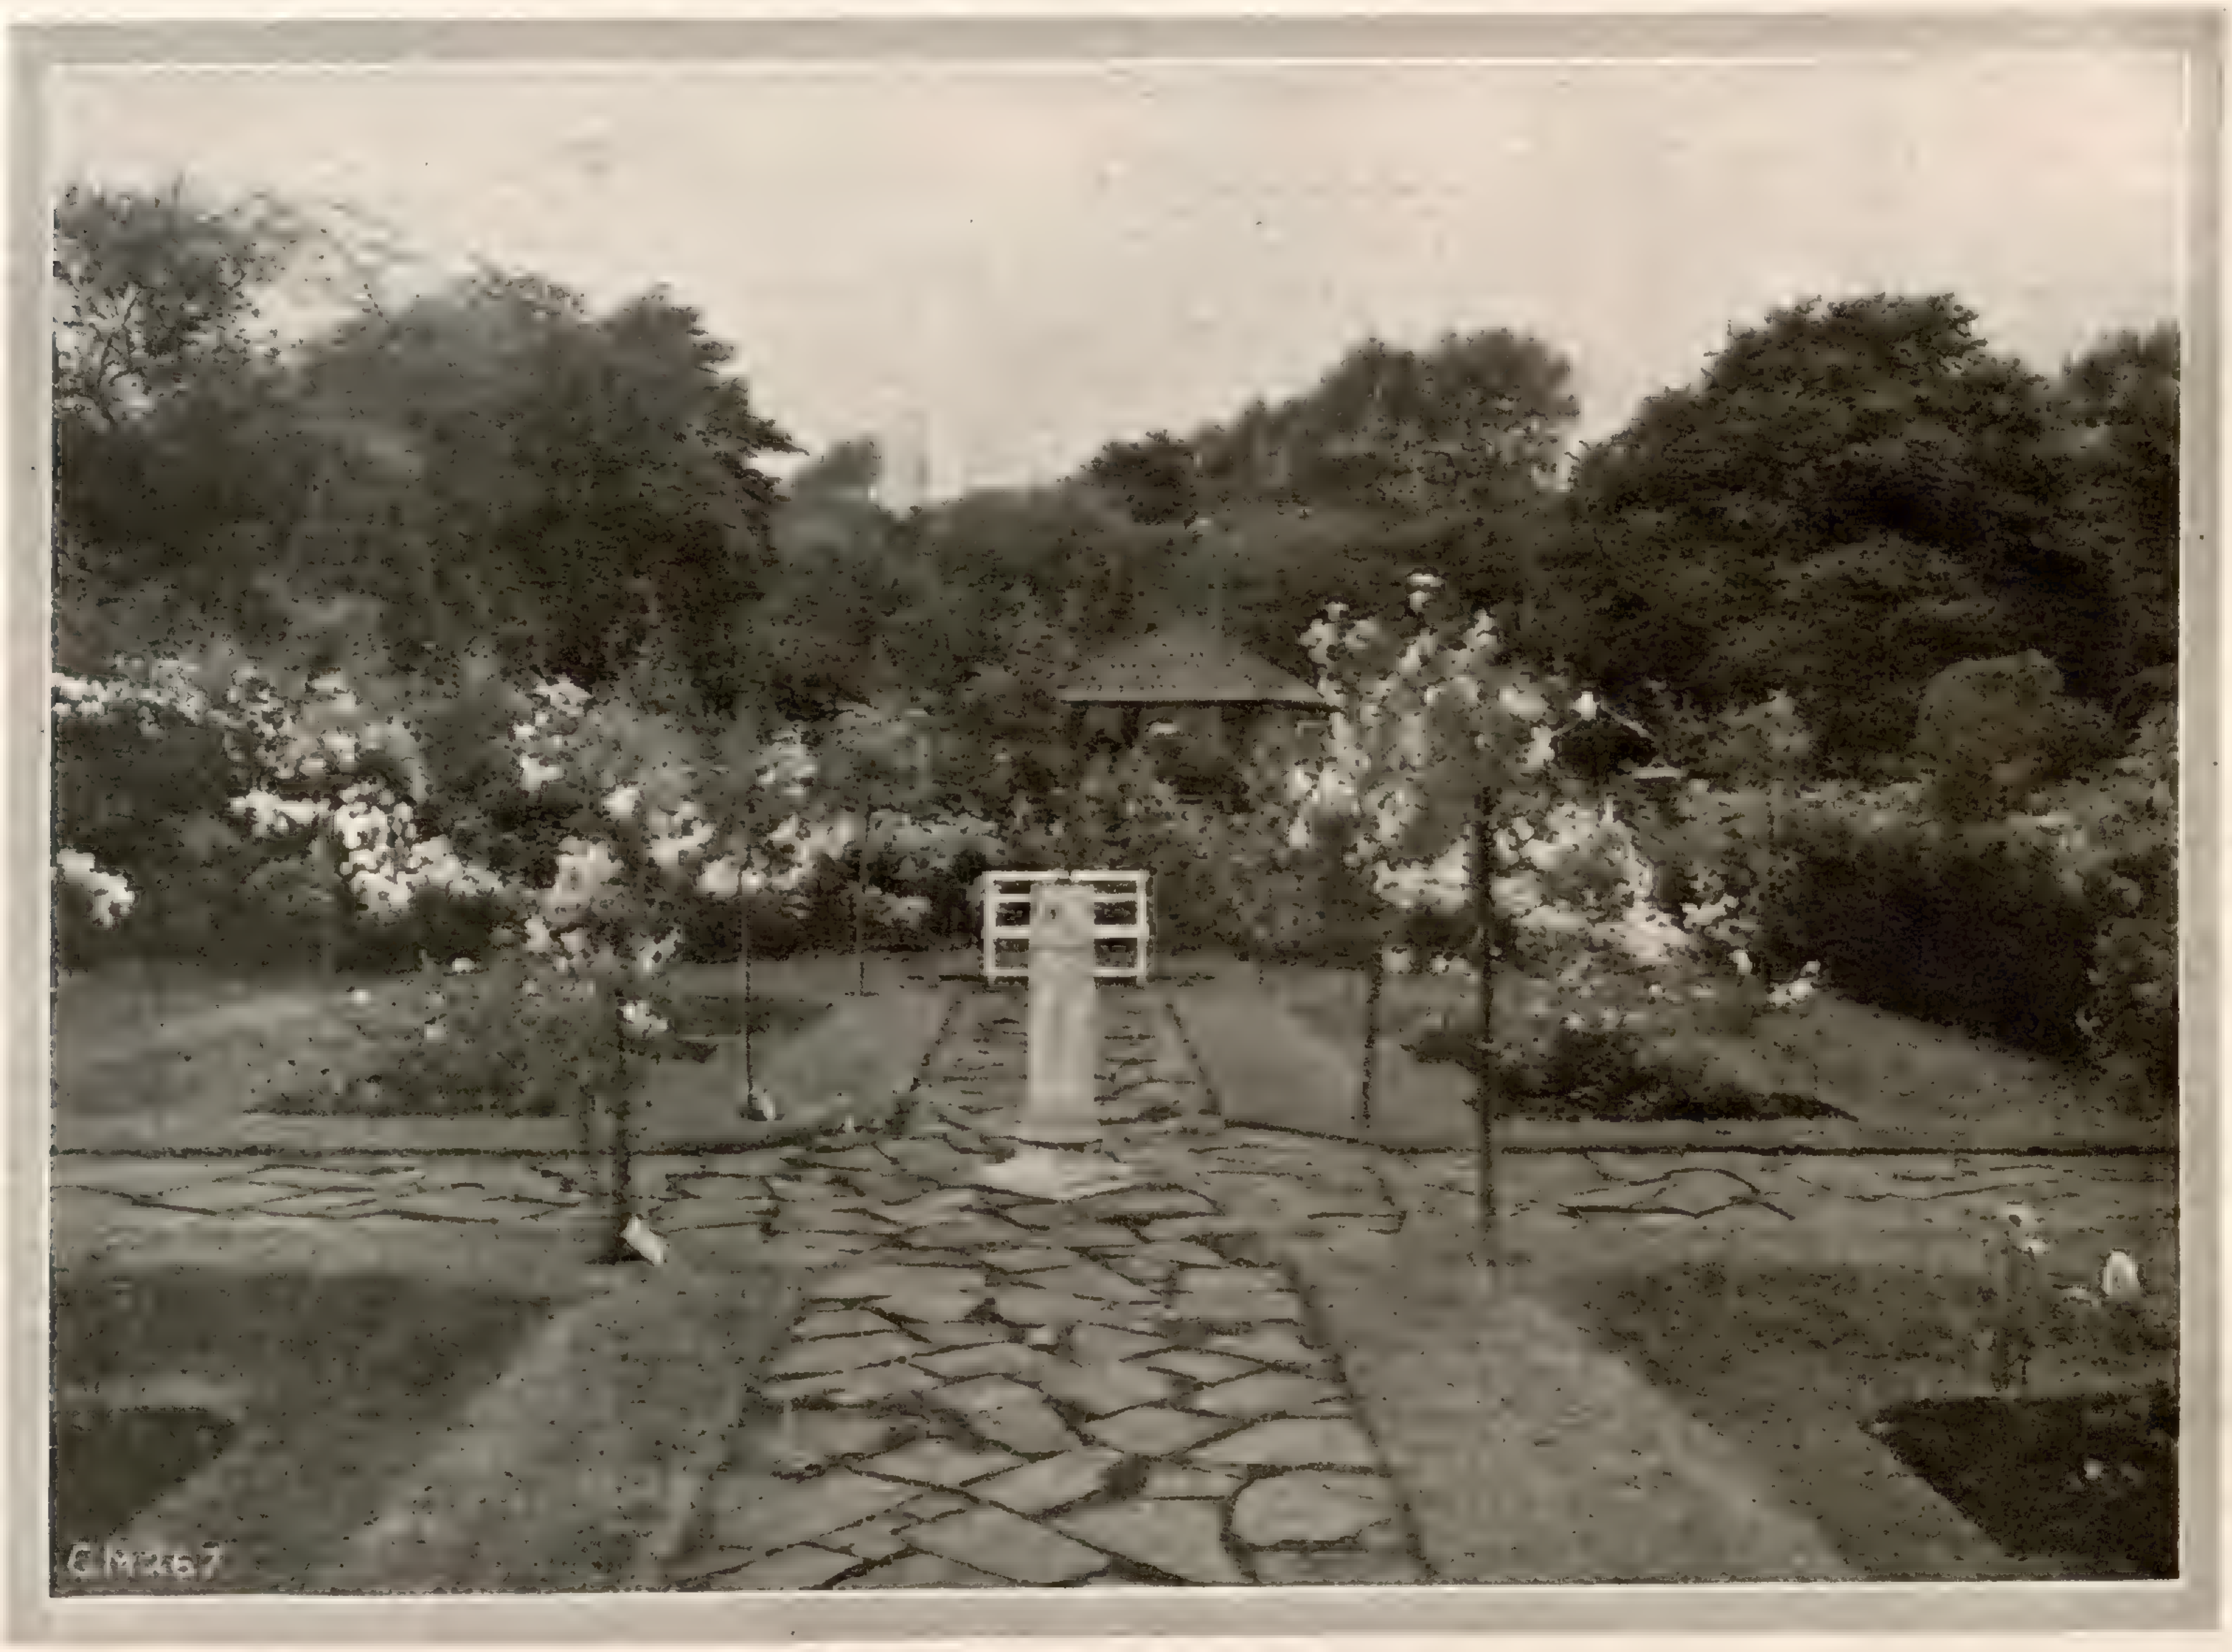
(Continued on page 478.)

## A FORMAL ROSE GARDEN.

Notwithstanding the wonderful expansion of rock gardening and wild gardening during the last ten years, or, perhaps, because of this expansion, there has been a steady increase of formal gardening. But whereas in the olden times the whole garden was laid out in rigidly formal fashion, or, at least, the part around the mansion was so treated, it is now the pleasing custom to set apart a portion of the grounds for the display of formal gardening. Even then, however, the old-time formality of clipped hedges, carved trees and shrubs, geometric beds of formal plants, or of coloured gravel, is not rigidly adhered to, but within a close clipped hedge the disposition of paths and beds is formal, but the plants used to beautify such a garden are free and graceful.

Such gardens as here indicated are by no means uncommon, but they differ widely the one from the other in arrangement and in the subjects selected by the planter. At the recent International Horticultural Exhibition, Mr. R. C. Notcutt, of Woodbridge and Ipswich, planned and planted a formal garden. Along one side was a high sheltering bank of rhododendrons, lilacs, and pillar roses. A flagged pathway ran the length of the yew-hedged enclosure, and another crossed this in the centre, the point of intersection being marked by a sundial, with numerous alpine plants about its base, growing in the crevices of the flagstones.

Four large rose beds, each set in a sunken lawn, were leading features, and these were filled with dwarf and standard roses, chiefly free-flowering hybrid tea varieties. Four tall weeping standard roses, such as Dorothy Perkins, White Dorothy, Hiawatha, and the like, stood in graceful stateliness around the sundial, while a pair of these stood sentry-wise just inside the entrance, and at either end of the longest walk, another pair kept fragrant watch over the comfortable garden seats.



A FORMAL ROSE GARDEN.
Designed and planted by Mr. R. C. Notcutt, Woodbridge and Ipswich, at the Royal International Horticultural Exhibition.

There is a great danger in the present taste and fashion of rock and wild gardening, and it lies in the possible excess of either or both. Fashion is ever fickle, and her pendulum has a knack of swinging right back at short notice. With this in mind, it is as well to remember that formal gardening has much merit, rightly planned and planted, and, in a large garden, it provides pleasing shelter and a fine contrast to the informality of the rock garden, the beauty of the water garden, and the natural style of the wild garden. B.

## SHRUBS IN FLOWER AT CHRISTMAS.

One of the prettiest and most easily grown shrubs is Jasminum nudiflorum; it is always in flower at the festive season, and well repays for a little extra trouble in summer. A good mulch of manure and an occasional good watering will work wonders. It is happy on a north wall or a south-west wall, and is very pretty growing up the trunk of a small tree, and in such positions is attractive and beautiful at this season. It is not at all particular to soil when once established.

Chimonanthus fragrans grandiflora is another remarkable and much-admired shrub, and was originally introduced from Japan as long ago as 1766. The flowers are deliciously fragrant, and they should be picked and placed in small china saucers, and put about in the rooms, when their perfume will be much appreciated. The plant makes a lot of growth, which should not be cut away until flowering is over, as the young shoots are studded with flowers. It does best when planted against a warm wall, otherwise the flowers are much later. We have one large plant which covers the whole wall on the south side of a fernery, and this makes strong shoots 3 to 4ft. in length each season. Plants will flower without wall protection, but so much later that they are not so valuable, though at all times their fragrance is an attraction.

The beautiful Erica lusitanica (codonodes) is a mass of bloom. It is quite easy grown, and easily raised from seeds, making good plants in three years. This heath is very valuable for cutting, as large branches may be cut from good-sized trees. We have five or six hundred trees about the grounds here, but, of course, the older trees, and those in favoured spots, afford the earliest bloom.

Erica carnea is one of the most desirable of hardy heaths, as from Christmas to the end of April it is covered with bloom. It is a dwarf, compact grower, and when planted in clumps soon becomes effective. Plants may be placed round the base of a standard shrub with good effect.

Azara integrifolia produces pretty, sweetly-scented flowers, and makes its presence known by its delicious vanilla perfume. It flowers earlier than A. microphylla, and is therefore much prized at the Christmas season. If treated in the same way as the chimonanthus it will grow perfectly, but should be planted against a wall for early flowering. W. A. Cook.

Leonardslee Gardens.

**Aotus gracillima.** — This hard-wooded plant is still grown to a certain extent, and very pretty it is, as the habit is very loose and graceful, the exceedingly long, slender shoots being packed for the greater part of their length with small pea-shaped flowers, in colour bright yellow, marked with red. It was introduced from Australia about sixty years ago.—S. W.

## AQUILEGIAS.

These flowers have become immensely popular, since the introduction of the improved forms of the long-spurred varieties. During recent years a great development has taken place amongst them, and a high standard of excellence attained. It is not very long ago that aquilegias were looked upon as commonplace, but now they are considered as well deserving a foremost position among herbaceous plants. Their hardihood goes without saying, although some are apparently not of such strong constitution as others. They are exceedingly accommodating, and will thrive where many subjects fail. Beautiful effects are to be obtained by freely planting them in the wild garden and in shady walks, in bold groups of two or three dozen plants.

Although not commonly used for decorative purposes in pots, they are excellent for furnishing the conservatory, and a group in flower is very pleasing. Two-year-old plants are most suitable for potting in October, and wintering in cold frames. In the early part of the year they should be placed in a cold house when the flower spikes soon appear. On no account must there be any attempt at undue forcing, or few flower spikes will be the result of the treatment. When the spikes are a few inches high, a little stimulant should be given to the plants, which will greatly assist in the production of good flowers.

The result in the second flowering season are no doubt the best, the blossoms are finer and more numerous than they are at any time. After the plants have flowered the third year, it is advisable to dig them up, throw them away, and plant young stock. To carry out this scheme of cultivation, it is necessary to raise a batch of seedlings annually, which will enable one to maintain a succession of strong flowering plants, from which satisfactory results will be obtained. Raising the seedlings is a simple matter, but it is absolutely necessary that a good strain be obtained or disappointment will surely follow, and time and labour be wasted.

Hundreds of plants are easily raised from seeds in a cold frame or hand-light, no artificial heat whatever being required for the purpose. May is the most suitable month for seed sowing, and the plants thus raised are able to make a good season's growth before the first winter. We use pots or boxes for sowing the seeds in, and these are filled with a mixture of leaf-soil and loam in equal parts, adding sufficient sand to keep it open. When the seeds are sown the pots or boxes are placed in a cold frame or hand-light until germination takes place, covering the former with glass and paper to prevent undue evaporation. It frequently happens that the seeds germinate very irregularly. The young seedlings are transplanted into other boxes and afforded cold frame treatment until they are well established, when they are gradually hardened off and transferred to well-prepared nursery beds, being planted out in rows, twelve inches apart, and about nine inches from plant to plant. Here they will become well established before the winter arrives, and be quite capable of looking after themselves.

Given good treatment during the first season, that is, from the sowing of the seeds until the plants are put out into nursery beds, many plants will flower the following season. It is an easy matter to determine which crowns are likely to produce flower spikes when growth commences by their plumpness, and all such may be planted in their flowering quarters, and the smaller crowns be replanted in the nursery beds for another season.

Slugs are extremely fond of the young tender growths, and they quickly ruin a batch of seedlings if measures are not taken to prevent them doing so. A slight dressing of artificial manure, lightly forked in between the plants before growth commences, acts as a protection from slugs, and as a stimulant to the plants.

As aquilegias are early summer-flowering plants, the question of what shall be done with the gap caused by the cessation of their flowers arises. This may be filled by planting gladioli between them, as these former produce a display when the aquilegias are over. Again, the aquilegias may be safely lifted when their flowering season is over, and the gap made good with early-flowering chrysanthemums. Of course, the latter must be grown in nursery beds for this purpose, but the extra trouble is amply repaid. The operation of lifting both the aquilegias and chrysanthemums must be carefully carried out, and if dull, showery weather can be selected for it, success will surely follow. E. C. Pooley.

Gnaton Gardens.

## A SUCCESSION OF PEAS.

The season of green peas is now with us, and it is worth while to remember that there has been a considerable increase in the number of varieties of culinary peas during recent years. In many cases vast improvements have been made, and, as a general rule, the green wrinkled pea has almost outclassed the white round-seeded. Improvement is generally to be noted in the increase in the crops and the size of the pods, especially in the early varieties, and to make a selection of a few really good peas is often a puzzling matter. Most experienced gardeners hold that in order to grow peas to perfection trenches should be prepared in the autumn or winter by taking out two feet of soil, and breaking up the bottom, and spreading it with a layer of well-decayed cow manure. The trench is then partly filled in with soil and a layer of bonemeal, the remainder of the soil being left exposed to the winter rains and frost, so that it will become thoroughly sweetened and pulverised. Before sowing, this soil is replaced in the trench.

Two thousand years ago the Greeks sowed their peas in November, but the Romans did not plant theirs until spring—so says the historian, Pliny. The first mention of them in England appears to be in the time of Henry VIII., according to one narrative. And in 1737 there are sixteen different varieties of peas mentioned in Miller's Dictionary. Most of these varieties were various forms of the Hotspur pea. The first wrinkled marrowfat pea was introduced by Thomas Andrew Knight, the President of the Royal Horticultural Society, in 1787; it was either the result of a cross, or a sport, which had been bred true. Subsequently the old Champion of England appeared, and then came Ne Plus Ultra, Veitch's Perfection, and William I. Culverwell raised the Telegraph, and afterwards Telephone, Autocrat, and Duke of Albany were introduced.

At the present day it is the earliest varieties of peas that prove most popular. Some gardeners may be able to produce peas in April, with special facilities, of course, but the majority of growers have to content themselves with their first dish of peas in the middle of May, or even the early part of June. Channel Island pea growers are known to devote whole houses to the production of early peas, and it is said that in one large house the grower prepares the ground with a plough. The Early Giant pea is a favourite variety with these growers, but any early wrinkled varieties can be employed. Seeds are sown in November, December, or January, and the pods gathered from April onwards. Green Gem is described as a useful early pea for sowing in borders or pots under glass, where a whole house is not available. For pot culture, however, a good variety is Seedling Marrowfat, which has pointed and very free-setting pods and fine-flavoured peas. A still dwarfer pea for this purpose is Harbinger, which, with Reading Wonder, is one of the two earliest dwarf wrinkled peas in existence. Quite a new variety of dwarf pea, which is finding favour amongst many growers for pot culture or early borders, is Pioneer.

Any of the first early or second early peas may be sown in pots or boxes in December or January to follow those grown entirely under glass. After sowing, they may be grown on in cold frames, and subsequently planted out in the open. Gradus, Early Giant, Early Morn, Carter's Eight Weeks, May Queen, Thomas Laxton, Duke of Albany, and others, are all extremely useful for this purpose. Care must be taken not to make the sowings too thick, and also to prevent the plants becoming lanky and spindly in growth, they should be kept near the glass and given plenty of ventilation on all favourable occasions. At or about the middle of March these may be put out in trenches, prepared in the manner described in a former paragraph. Many growers have to keep up a successional supply of peas from May to October, so that in such cases it is essential to make a sowing every ten or twelve days. Peas sown under glass, and afterwards transplanted after this fashion, will, in the ordinary way, be ready for picking much earlier than the first outdoor wrinkled peas.

In the latter case, sowings can usually be made as early as February on a sheltered and fairly warm border, provided, of course, the weather conditions are favourable. Giant Lightning, Reading Wonder, Pioneer, Duke of York, Excelsior, Little Marvel, English Wonder, and also those mentioned above, can all be treated in this manner. For more exposed situations, however, and where a sheltered border is available, Bountiful, Ameer, William I., or Pilot may be used. All these are peas of a somewhat hardier constitution than those mentioned above, Pilot especially being a new and very prolific pea that has great promise. For maincrops it is exceedingly difficult to get at the best varieties, as there are so many different sorts, all of them being very free bearers, with fine quality peas, and large-sized pods. A good stock of the old Duke of Albany is difficult to surpass, while others that are equally reliable in this respect include Edwin Beckett, Centenary, Alderman, and Criterion. A dwarfer pea is Nonsuch, while among other popular maincroppers are Daisy, International, Harvestman, Dreadnought, Quite Content, Prizewinner, and Incomparable.

In a later section there are Sharp's Queen, Superlative, Perfection, Jubilee, and Dr. McLean. We also have a number of varieties of peas which, if sown at the same time as the ordinary second early types, will not mature until quite a month later. These include Autocrat, Late Queen, Michaelmas, and the most popular variety of all, Gladstone. Late pea production is not, however, a very certain business, and in some parts, where only a naturally dry and light soil is available, it is often useless to sow after May or early June. Even then a considerable amount of attention has to be given to the crop in the way of watering and mulching, otherwise it will scarcely ever be possible to obtain a good supply of late peas. During a very hot summer moisture must not be withheld from peas, either at the roots or overhead, for if this is lacking the plants quickly die off. Shade is also essential, especially in the case of outdoor sowings of early varieties during June or July, for the purpose of providing a late supply of pods. The young pea plants cannot stand up against the scorching effects of the hot sun, nor must they be allowed to become dry at the roots. J. C. Newsham.

## TRAINED FRUIT TREES.

Our neighbours in France are adepts at the art of training fruit trees, but our nurserymen at home, especially those who pay special attention to the matter, lack nothing in skilfulness in this direction. That this is so was amply demonstrated by several firms at the recent Royal International Horticultural Exhibition. The Messrs. Laxton Brothers, of Bedford, especially famous as raisers and cultivators of fine new strawberries, grow fruit trees, roses, carnations, and other things on a very large scale, and their trained fruit trees are models of clever cultivation. It is certainly not the fault of the nurseryman if, as some suggest, the art of training fruit trees on walls, trellises, etc., is suffering loss at the hands of the younger generation of gardeners. The Messrs. Laxton Brothers put up a fine exhibit at Chelsea, and a part of this is represented in the accompanying illustration. Practically every form of trained tree was exhibited, from simple cordons, to gridiron, fan shape, palmette, horizotal espaliers; standards of varying height, pyramids, dwarf bushes, etc. Apples and pears were the kinds of fruits most largely displayed, but there were also peaches, nectarines, plums, cherries, and gooseberries, and throughout this interesting collection the trees carried excellent crops of young fruits.

MESSRS. LAXTON BROTHERS' TRAINED FRUIT TREES.
As exhibited by them at the Royal International Horticultural Exhibition.

## BEAUTIFUL FOLIAGE TREES FOR SUMMER EFFECT.

Attention is often drawn to trees and shrubs that are conspicuous in autumn on account of their brilliantly coloured foliage, but the many beautiful trees that are objects of unusual beauty during the summer are not so frequently alluded to.

At the present time the foliage of numerous trees is especially bright and attractive, and the more handsome of these in no small measure add to the beauty of our gardens. Atmosphere very largely affects the leaf colouring, so much so that in some districts specimens of the same kinds are so dissimilar as to be almost unrecognisable. Contrast in colouring is essential for a good arrangement, otherwise it would not be possible to create such attractive features, for when the colours are suitably contrasted they are considerably intensified.

Few trees are more ornamental at the present time than Cedrus atlantica glauca, and a large planting of these forms a picture not readily forgotten. Their silvery-blue colour is lovely in full sunshine when associated with trees possessing green foliage, but when in contrast with Fagus sylvatica purpurea or F. s. cuprea the result is exquisite. The well-known Prunus Pissardi is very striking associated with Populus canadensis aurea, or with Negundo californicum aureum, while the same tree contrasts favourably with Cornus alba Späthi when grown dwarf in beds. Cupressus Lawsoniana lutea is exceedingly handsome, and when sparingly grouped with other subjects of a more sombre colour the effect is very noteworthy, especially when located for distant effect. C. L. Allumi, a blue-coloured form, and C. macrocarpa lutea are both unusually attractive just now.

Among the more highly-coloured subjects Taxus baccata elegantissima, Sambucus racemosa serratifolia foliis aureis, and Corylus avellana purpurea are some of the most ornamental, but, as in the case of the others mentioned, they need to be rather sparingly planted, and always in conjunction with other trees of similar character, to give the most pleasing and artistic results. Moreover, a certain number of trees of more subdued colouring should be utilised.

There are so many good things suitable for this kind of planting, and subjects that at certain seasons possess enhanced attractions, owing to their flowers or other attributes, are so numerous that it is unnecessary to give a selection here. In some cases the existing trees on the site may be requisitioned with good results, but when planting specimens of Quercus coccinea and Q. pedunculata concordia should always be included in the scheme.

To proceed with ornamental foliaged trees, Juglans regia laciniata is a very distinct and striking subject, as also is Koelreuteria paniculata, especially when the leaves are young. This tree produces panicles of bright yellow flowers later in the summer, and is worthy of more extensive planting. Hippophæ rhaminoides the Sea Buckthorn, is ornamental both in foliage and fruit. Catalpa bignoniodes aurea is an effective and handsome tree, and forms a fine specimen. Pyrus salicifolia pendula is a charming subject, with silvery foliage, and looks remarkably well near the stream side. Abies pungens glauca, A. lasiocarpa, Retinospora squarrosa, and Cedrus deodara also spica are especially attractive conifers; while Juniperus chinensis aurea and J. japonica aurea variegata, are both handsome.

When writing of ornamental trees, the Japanese maples must not be overlooked, as for beauty and diversity of colouring they are unsurpassed. To give a complete list of these is not my purpose, but Acer japonicum laciniatum, A. palmatum dissectum, A. p. sanguineum, A. p. atropurpureum, and A. p. septemlobum elegans are especially noteworthy. Acer rubrum, the Scarlet Maple, is very showy, and usually assumes considerable dimensions when given a suitable position, when it produces a glorious display of colour.

J. Gardner.

## THE GREEN OF THE GARDEN.

It is during summer droughts, when the green of the countryside is scorched and faded into brown, that we realise the true value of the colour, which can still be observed in perfection in well-kept gardens. Without derogating from the merit of gay flower hues, or the brilliance of white blossoms under sunshine, it may be claimed that green is the tint we could least do without; when the sun rises the pale greens of lawns, hops, primroses, calendulas, sunflowers, and countless others, take on a flush of rose that the grey-greens of the sweet peas, centaureas, and pinks cannot receive; when the sun sets even dark ivy will blush to a copper hue, and evergreen oaks and firs glow crimson.

Refinements of choice in planting trees and shrubs should be more practised; before the season comes for new introductions, we should do well to ponder over the nature of leaves, even as to texture and substance. A dusty high-road garden will not look refreshed during dry weeks if the foliage in borders and on walls is of the dull or rough-surfaced order; climbers and shrubs are needed of shining quality from which a slight shower, or the morning dew, is sufficient to detach the dust. Mossy saxifrages, violets, and Veronica spicata alba are instances of plants upon which dust seems reluctant to lie. A north garden, that receives scarcely any sun from the sides, requires the gayest of greens to cheer it, and, fortunately, the primrose family, and the summer calceolarias and tobacco plants, that will thrive in it, supply this. A pale green ivy is the best wall climber, but the Snowberry Tree (Symphoricarpus racemosus) can be trained against brick, and will offer several of the loveliest effects, the pea-green of early spring, the pink coral-suggesting blossom, and white cherry-shaped fruit in abundance.

A dank, dark garden often suffers in these respects because the climbers and shrubs, trees, even the tall plants are too uniformly heavy-foliaged. It should be remembered that one leaf of a nearly black-green ivy gives denser shade than a dozen leaves of a light verdant variety through which sun-colour penetrates. Similarly, a small laurel bush has a more darkening influence than a tall tree of beautiful guelder rose, with its yellow-green leaves and branches, that sway and part under each breeze.

When gazing over a distant landscape how vividly do special fields or plots stand out from others by their colours. We may call cabbages green, but their massed effect is pale blue, plantations of peas are a deeper shade, young wheat a grandly joyous yellow, but most verdant of any expanse will be a field of trained raspberries, or loganberries, such as may be seen upon the Sussex Downs, where slopes look south to the sea. In gardens immense care should be taken to locate striking green shades where they will not clash with others, or where they can form charming contrasts.

One illustration of the use of foliage edgings may be suggested: mossy saxifrages and thrift, violas and primroses or polyanthuses, will never be quite satisfactory round lawn beds, because the contour of those beds will be obliterated by the union of green leaves with green grass, whereas for gravel-cut beds, or those against stone or brick walks, they are ideal subjects; in beds in turf the use of grey-green, blue-green, silver, or gold foliage edgings and carpetings is infinitely more artistic, and allows the handsome shapes to be clearly defined.

During summer countless evergreen and deciduous shrubs and climbers can be quickly propagated by layers and cuttings. A survey of the garden should be made and sites marked where the green either needs adding to by young stuff, or lessening by winter removals.

Half the secret of good preparation for winter bedding is the cultivation of plants, also miniature shrubs, that will present an evergreen appearance; most of the hardy campanulas carry their leaves throughout the year; wallflowers, hardy stocks, pansies, pinks, sedums, heucheras, irises, arabises, hypericums, vincas, and double red and white daisies are of this nature.

The summer care of foliage is an important task. Evening syringings should be given to palms and all the leaved beauties of the beds, also to the too frequently neglected wall and trellis climbers, while any roadside beds or borders that have suffered from dust can, by a sprinkling through a fine-rosed can, be restored to their pristine excellence.

Each year sees foliage bedding-out displays more valued, but in innumerable cases the pattern designs made with leaf yellows, reds, pinks, maroons, and silvers would be greatly softened in effect if the true green of Herniara hirsuta and the curled saxifrages had been freely added.

M. H.

## ROSES AT KEW.

With the season of roses once more with us, a visit to Kew serves to show the great variety that exists among these beautiful flowers, and the various purposes for which they may be employed in the garden.

Although in the middle of June one scarcely expects the numerous groups of which the rose family is composed to be at their best, still there is already a splendid display, and the promise of a more extensive one to follow.

At Kew there are three special spots towards which the rose lover directs his steps, namely, the rose pergola, running parallel with the wall of the herbaceous ground, and situated between it and the rock garden, the formal beds near the Palm House, where the best bedding varieties are represented; and the sunken garden near the Pagoda, remarkable chiefly for the huge masses of vigorous ramblers which are allowed to dispose themselves in a totally informal manner.

Taking first the pergola, it is already very beautiful, though the display will be greater later on. Of course, such varieties as Crimson Rambler, Dorothy Perkins, Lady Gay, Hiawatha, and others of this class are not yet expanded, but there is already a good display of bloom on the following: Aglaia, soft yellow, large clusters; Bordeaux, reddish-rose; Claire Jacquier, nankeen-yellow; Euphrosyne, pink; Helène, mauve, yellow centre; Leuchtstern, bright rose; Psyche, pale pink, with a yellowish suffusion in the centre; Tausendschon, pink; Tea Rambler, coppery buds, pink when expanded, and Veilchenblau, which, under the name of the Blue Rambler, has aroused a deal of interest. It, however, requires a considerable stretch of imagination to regard it as blue, and the best that can be said is that it is distinct from the others. The true Wichurianas are very promising, but the only one actually in bloom is Gardenia, a beautiful variety with pale yellow flowers, but richly coloured when in the bud state.

Other beautiful kinds are: The Garland, with clusters of small semi-double flowers, in colour white and pink; Thoresbyana, double white; Cheshunt Hybrid, cherry carmine, remarkable as being the first of the now extensive race of hybrid teas; Madame d'Arblay, blush-white; Carmine Pillar, single, carmine; Flora, bright rose, almost an evergreen; and Longworth Rambler, a charming flower of a cherry-crimson colour. Not only are all of these very beautiful when closely inspected, but the colours are so blended that when viewed from one and the effect is delightful.

Near the Palm House a bed of the bright coloured dwarf Polyantha Jessie is full of bloom, while the Orleans Rose, another of the same class is not yet flowering. Most of the varieties, among which hybrid teas predominate, are not yet at their best, though some have a good sprinkling of blossoms. Lyon Rose, so variable in colour, is a beautiful flower that would be still better if it held up its head in a bolder manner. The hybrid teas, Madame Ravary, salmon-orange; Madame Jules Grolez, rose-pink; Duchess of Wellington, deep orange; and Liberty, rosy-crimson, are all capital bedders, while that Tea variety Lady Hillingdon, which has proved to be such a grand rose for forcing, and has such a beautifully formed deep orange bud, appears as a bedding variety.

The sunken garden near the Pagoda occupies the site of an old gravel pit, and the various climbing roses are there allowed to ramble over old tree stumps. Such a position is eminently calculated to display the members of the Rambler and Wichuriana sections to the best advantage, many of them having formed huge wide-spreading masses. The Wichurianas are remarkable for their beautiful glossy foliage, and in none is this more pronounced than that popular variety Dorothy Perkins, of which there is a grand mass which later on will be quite a picture. Those already more or less in bloom include Alberic Barbier, semi-double, canary-yellow flowers, with deeper-tinted buds; Edmond Proust, coppery-carmine; Gardenia, yellow; Jersey Beauty, rich leathery foliage and pale yellow blossoms; and Paul Transon, rosy-pink. Other bold-growing kinds of different sections are: Electra, yellowish-white; Una, a hybrid briar, grand as a bush, with large creamy-white flowers; and The Garland, Helène, and Psyche above alluded to.

The variety Tausendchon in this part of the gardens merits at least a note to itself, as it just now forms a magnificent feature, the long, wide-spreading shoots being absolutely wreathed with its charming pink blossoms. These banks of bold-growing roses are arranged in a more or less undulating manner, and in the bays thus formed many of the smaller kinds are planted. A particularly interesting feature of these is the fact that many of the varieties there displayed are not generally met with at the present day. Among them may be named the York and Lancaster, Gloire de Rosomenes, Fimbriata, fringed at the edge like a pink; Stanwell Perpetual, a form of hybrid Scotch, with pink flowers. Several forms of the Moss Rose, the golden-yellow Rosea lutea flore plena, that distinct Chinese species—R. Moyesi, and a fine group of the old bush-growing variety Fellenberg, profusely laden with its crimson-lake coloured blossoms.

A word or two must be spared for roses in other parts of the gardens; for instance, near the refreshment room is a bed of that beautiful variety Billard et Barre, whose long shoots have been pegged down, and the entire bed is now sprinkled over with the rich orange-yellow flowers.

Near the Temperate House large masses of such varieties as Electra, Una, Mrs. Anthony Waterer, and Gruss an Teplitz show them at their best, though the last-named has at present but few flowers open.

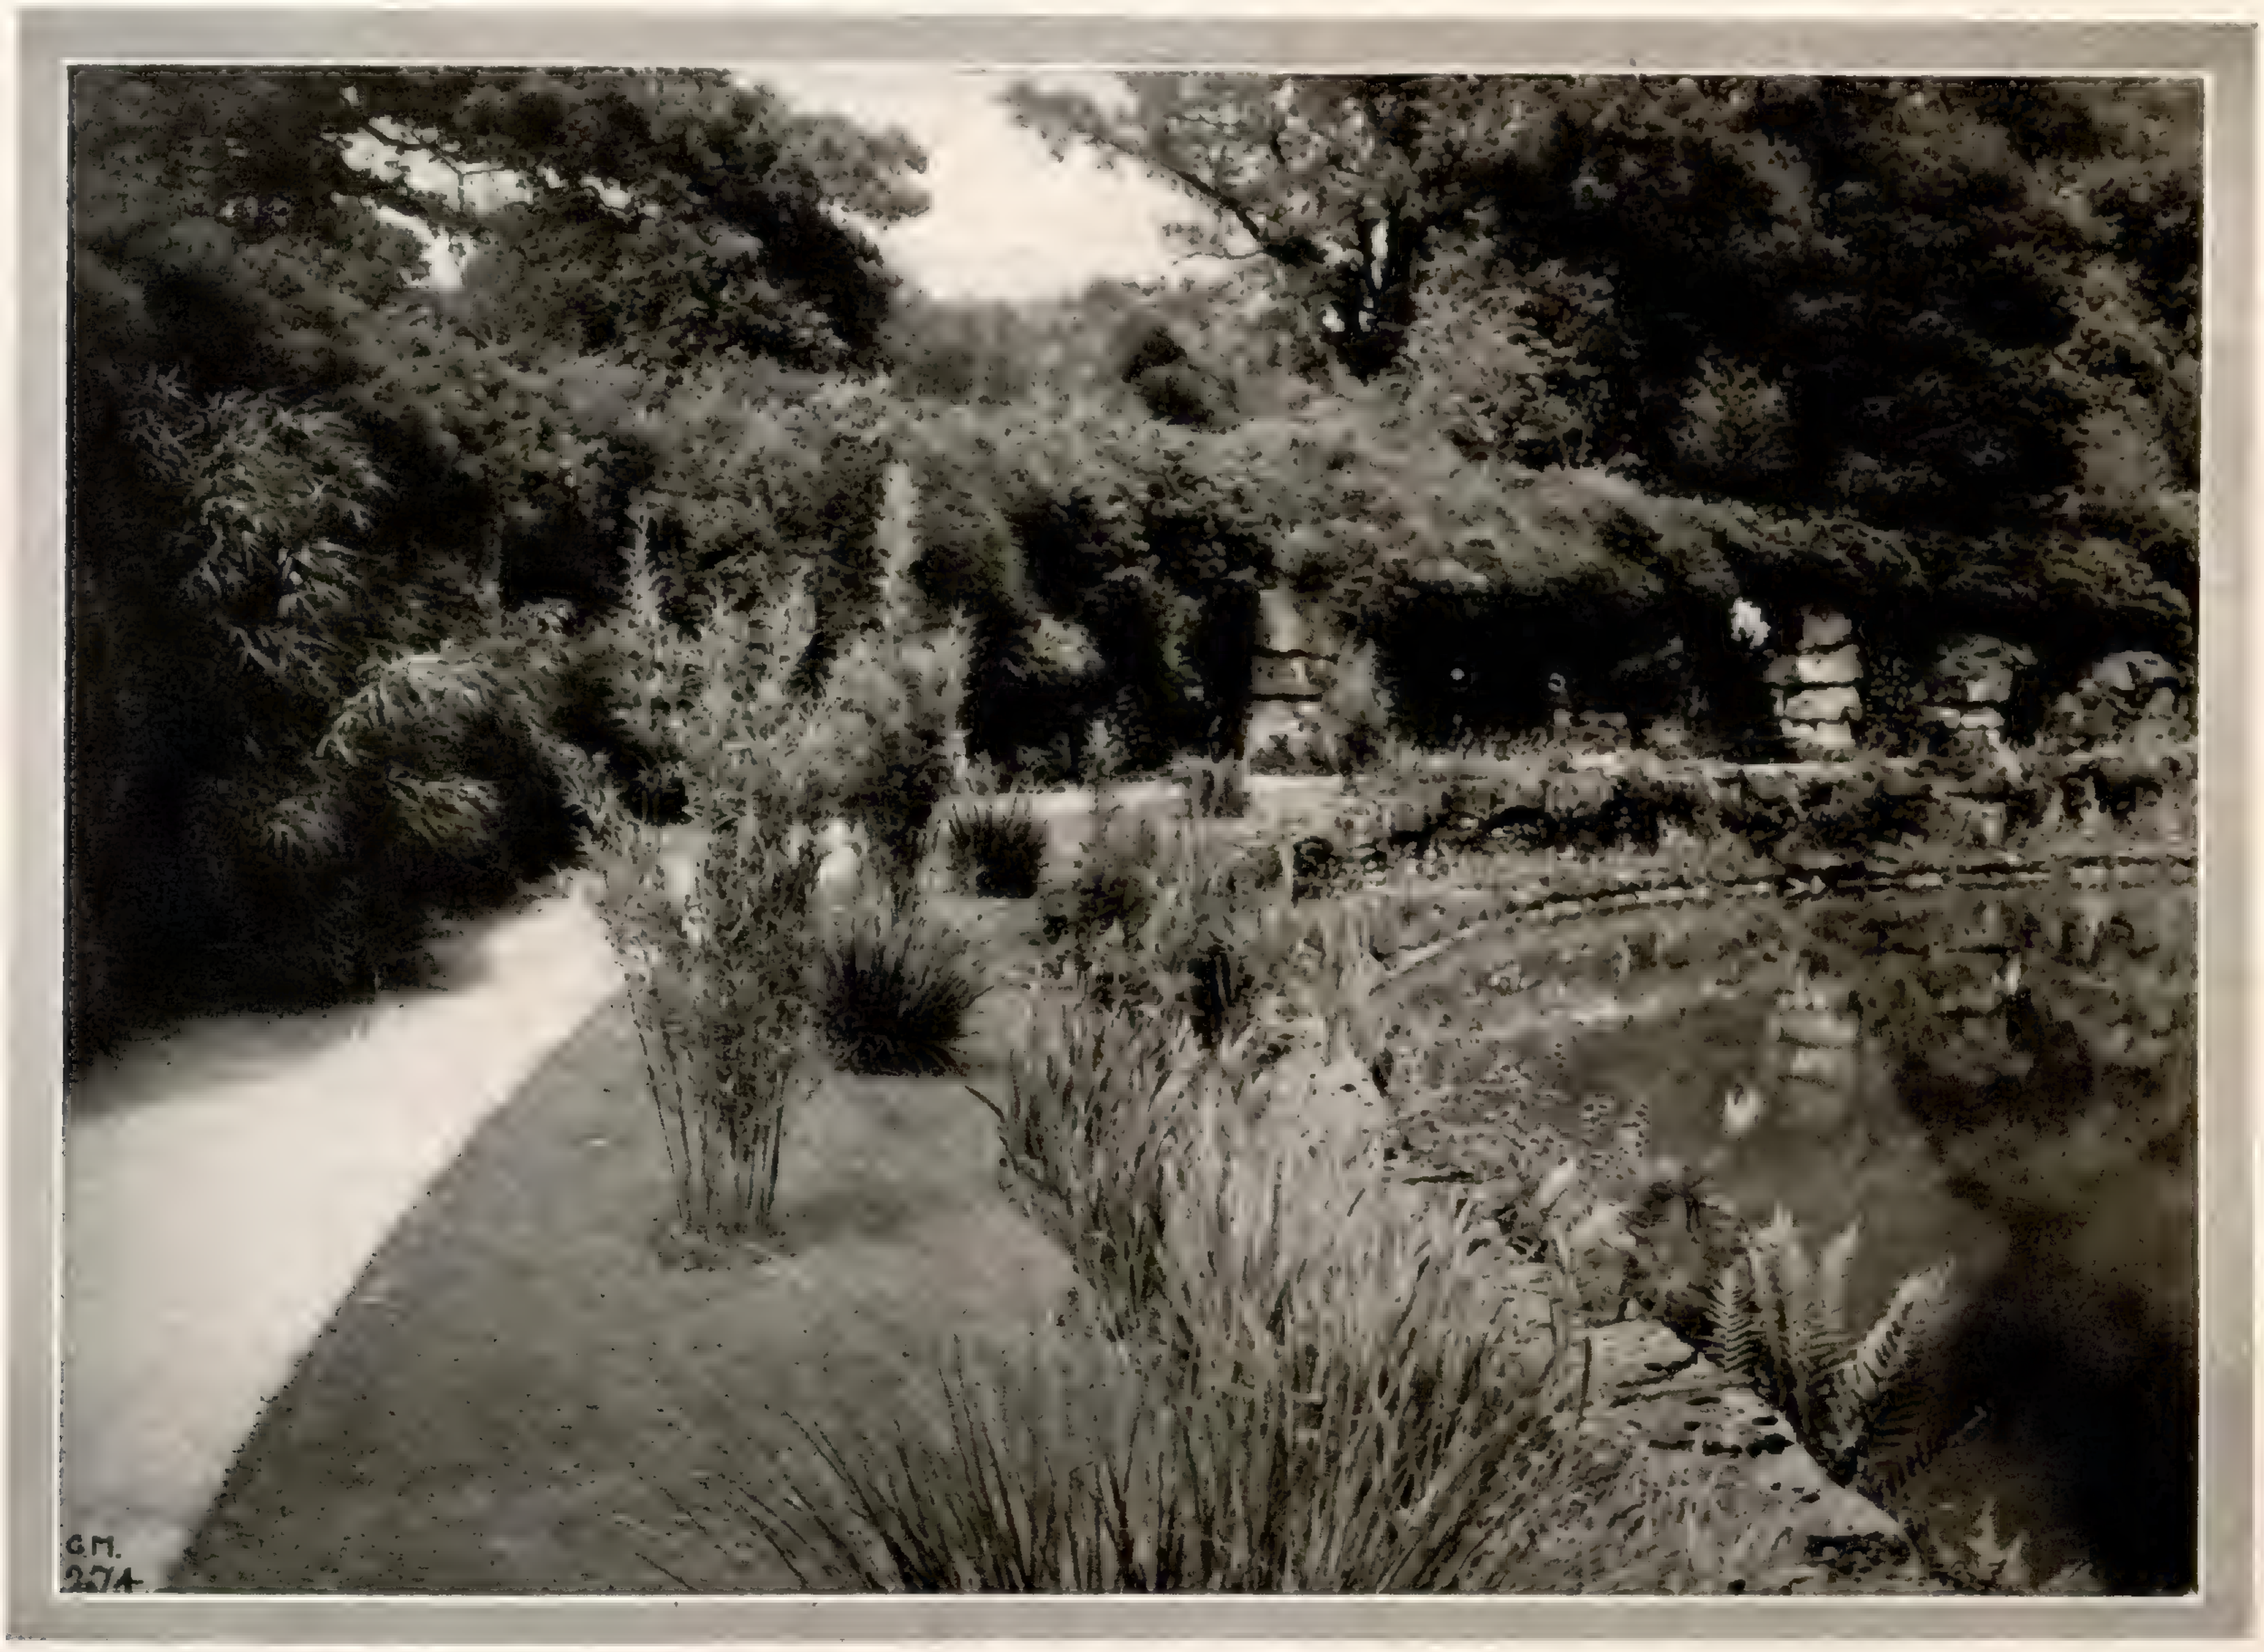
K.

## A ROCK-MARGINED POOL.

Gardens that are remarkble for their extent, interest, and beauty are well-nigh innumerable within a radius of four or five miles of the health-giving town of Tunbridge Wells, and prominent among the most noteworthy of them are those of Swaylands House, the residence of G. J. Drummond, Esq. These gardens extend over a large area, are surprisingly beautiful, and admirably kept, and they include within their boundaries so many distinct features as to afford visitors ample entertainment, whatever may be the trend of their taste in relation to garden design and management. Unless we are much mistaken, the weeping standard rose which now enjoys so high a degree of popularity, and contributes so appreciably to the attraction of the rose garden, had its origin at Swaylands House. Herbaceous plants are so largely and well grown that the spacious borders devoted to them produce glorious displays of flowers throughout the summer. So we might continue, but for the present it must suffice to say that the outstanding feature is the rock and water garden.

Notwithstanding an intimate acquaintance with what has been accomplished in the British Isles in making provision for the cultivation of plants that thrive on the ledges and in the crevices of the rockery, or luxuriate in bog or pool, we know of no garden in which rock and water is combined that has a greater area, or is more remarkable for boldness of design. This interesting feature of the Swaylands House gardens was described and illustrated in the Gardeners' Magazine of January 9, 1909. Special reference was then made to the large area over which the rock and water garden extends, to the diversity of its attractions, and to the fact that it was planned and constructed by Mr. R. Hosier, the gardener, under the direction of Mr. Drummond, who takes a keen interest in the gardens which form so delightful a setting to the stately mansion.

There are two water areas in association with the rockeries and the rock-loving plants, and the largest of these forms a long, rather narrow lake, which skirts the lower side. This is separated from the rock masses by a breadth of turf and a broad gravel walk, and is fringed with plants suitable for such a position. The other area of water is on the eastern side, and partly enclosed by bold masses of rock in the manner shown in the accompanying illustration. This forms a large circular rock-girt pool. It will be seen that the outer margin is formed with large pieces of rock, and that ferns and flowering plants of various kinds have been planted in the crevices, and form an elegant fringe. The water is kept within the desired bounds by an inner wall, which rises a few inches above the usual level, and between the two walls is a terrace several feet wide, affording accommodation for a considerable number of flowering and other plants. On the breadth of turf between the margin of the pool and the walk are bamboos, grasses, irises, etc., etc., and these produce a distinct and pleasing effect, and add much to the enjoyment of this sheltered and otherwise pleasant walk.



A ROCK-MARGINED POOL.
In the gardens of Swaylands House, the residence of G. J. Drummond, Esq.

---

An edition of "SWEET PEAS AND THEIR CULTIVATION," by C. H. Curtis, has been issued for 1912, and consequently this is an up-to-date work on the subject. The price, by post, is 1s. 2d. (cloth, 1s. 9d.) from the Publishers, 148-9, Aldersgate Street, London, E.C.

## HERBACEOUS CHRYSANTHEMUMS.

The use of chrysanthemums as herbaceous plants for the mixed border can be made very effective, though one often sees it quite the reverse. It is the later varieties of the early-flowering section—those flowering from mid-September onwards—which are best adapted for this purpose, most of us agreeing with the dictum in Mr. William Robinson's "English Flower Garden" that, "getting chrysanthemums much before their natural season is a practice of doubtful value." We do not want to be reminded of autumn in July and August, nor do we want a subject in bloom at that season, even though it is the queen of the autumn, which we shall be seeing through September, October, and November.

As regards

### Soil and Situation,

in the sense that people sometimes say that Shirley poppies will grow on a dust heap, it may be said that the chrysanthemum will grow anywhere, but if it is to look presentable during the summer months, with strong, dark, healthy foliage, to be followed by fine clusters of flowers, the soil must not be of too dry a character, for in that case the leaves along the main stems will become dried up, while, unless the soil is pretty deeply cultivated, though not necessarily rich, the plants will be weedy and generally unsatisfactory. Where space permits, it is a good plan to prepare the ground by digging it to a depth of a couple of feet, and mixing with it a moderate amount of both animal and mineral manures.

**Planting** is better done in the spring than in the autumn, as the plants are then less liable to suffer injury from slugs, frost, and dampness. Where one has old clumps these should be broken up in early March if they have a nice lot of new growth by that time, and the youngest and best rooted pieces put in the places prepared for them. When the ground has been well prepared, the plants may be allowed to go for two, or even three, years without moving if they survive; but, looking to results, it is better in a general way to treat them like the more rampant Michaelmas daisies, and transplant them every spring. Good groups of plants look better, and grow better, than single plants dotted about in gaps among the perennials—some of them very greedy—but it is, perhaps, a matter of taste whether such groups should be of one colour only or otherwise.

The **Uses** to which chrysanthemums can be put is only limited by the imagination of the grower. Apart from their use as a component part of the mixed border, to be treated in the main like its other occupants, they have a very important use as reserves for beds and borders when their earlier-flowering summer occupants are over, for, if grown at a fair distance apart on a spare piece of ground in the vegetable quarters, they may be taken up in damp weather with a good mass of earth and roots attached at any time of the summer without suffering much damage, and used to fill up gaps or even whole beds. Beds, too, may be planted with chrysanthemums and other plants in mixture so designed that when the latter go off flower they may be pulled up and the whole bed given up to the chrysanthemums.

The matter of **Varieties** is an important one, for, however different the uses to which these plants may be put, varieties differ no less widely, and must be chosen accordingly. Where they are to be treated as herbaceous perennials, it is essential to select those varieties which make good strong tufts of growth from the base in the autumn, many of the newer and improved varieties being very shy in this respect; and where the plant only makes one or two shoots, not only does a little damage by slugs mean the possible loss of the plant, but it is difficult to get those masses of blossom which we look for in border chrysanthemums. On the other hand, where it is intended to raise plants in pots every year, this point is not of much importance. But there is another difference of habit which has obvious results in a damp autumn. Many of the older varieties which are condemned now by experts have not sufficient stiffness in the flowering stems to keep the blooms erect, especially when they are wet, and, defect though this may be, it results in keeping the rain out of the centres of the flowers, and so lessening their liability to rot or mildew in a wet autumn. Some of those with sturdy, upright flowering stems, such as that beautiful Champ d'Or, are of little use in the open in wet, or even foggy, weather. The fine varieties in this early-flowering section which are now being brought out, however attractive they look on the exhibition table, are many of them better adapted for growing in pots than in the borders. As regards standing the winter, it is commonly observed that the yellow varieties, which are the most appreciated in the autumn garden, readily succumb during the winter.

Alger Petts.

## THE VINE AND FERN WEEVIL.

A note from a correspondent induces me to give a few particulars regarding this insidious and destructive fern pest (Otiorhynchus sulcatus). In the first place, its ravages are not by any means confined to ferns, as its general name is the vine weevil, but it is probable that, once it obtains a firm foothold in a fern collection, it is more absolutely destructive of the plants than it can be in the case of vines. Curiously enough, it appears to be somewhat sporadic in fern collections, so much so that when I published "Choice British Ferns," in 1888 (now out of print), I was taken to task for omitting any mention of it in the chapter on "Fern Foes, and How to Fight Them," an omission due to the fact that although I had been accumulating a fine collection of ferns for some years, the pest had never put in an appearance, nor had I heard of it from my fern-loving friends. Eventually, however, it introduced itself, probably in conjunction with some well-intended, and certainly more welcome, gifts and acquisitions, and ever since I have had to wage unceasing war against it to preserve my pets from annihilation.

For the past three years I have kept a record of the mature beetles found in my glass fernery, and the numbers average three to four hundred per annum, constant search reducing the number by one hundred last season, while this season, so far, a great reduction seems to be promised. No record has been kept of the even more destructive fat white maggots or grubs which effect their insidious underground work during the winter and in the spring, until they assume the beetle form and emerge to attack the foliage above ground, and, if not detected and destroyed, lay their eggs, in the late summer, and so secure a fresh generation. The beetles, happily, do not survive the winter, and hence, if all the grubs can be found and destroyed, there is no new generation. This, however, is not so easily accomplished. The presence of the grubs in the soil of moderately-sized pots and pans containing ferns is clearly evidenced by the plants flagging and becoming discoloured, while in the case of hartstongues, which are their favoured prey, the fronds, when pulled, come freely away from the caudex, having been gnawed through at the base. In pans of seedlings the young plants will be found lying quite loose on the surface, the roots and crowns being devoured and undermined. With deciduous ferns, whose fronds die down in any case, the presence of the depredators is only indicated by late and imperfect growth, or no growth at all.

All this time there is nothing visible above the soil except the signs of ill-health indicated; all the grubs are beneath it, and the beetles are non-existent. Hence, in the winter and spring, it is essential to look out for such signs, and wherever they appear, to turn out the plant and shake out the soil, when quite possibly a dozen or a score of fat white maggots, about half an inch long, and half as thick, curved into a semicircle, will be found among the mostly dead roots, and burrowing into the caudex. To make sure that all are found, the remaining roots and caudices must be washed quite clean, or some of the grubs may escape by having burrowed into the caudex itself, in which, however, they are always perceptible owing to their whiteness. All dead matter should then be cut away, and the fern, or its fragments, then may safely be repotted with a fair chance of survival if any centre of growth has been left intact.

These grubs are so tenacious of life that we have submerged infested plants, which we have been reluctant to destroy, for fourteen days in a bath without drowning them, and though a few were found lying apparently dead on the surface, we found they revived when allowed to get dry, and exposed to the air. The difficulty of entire extermination in the grub stage lies in the fact that with large, old-established specimens of ferns, in big pots, the plants are too robust to show any evidence of their presence in small numbers, and hence such specimens form refuges for a sufficient number of future beetles to survive and carry on the pestilent race. Obviously, therefore, equal attention must be paid during the growing season to the capture of the beetles.

In a cold conservatory the beetles commence to emerge from the soil about the beginning of May, first as soft, dark-coloured beetles, but speedily hardening into very tough-coated ones, nearly black, with an oval body about half an inch long, and a peculiar small head, with two short antennæ. They at once crawl up the stalks of the ferns, and gnaw the edges of the rising fronds, thus doing great damage to those of the hartstongues, as subsequent growth enlarges the gaps considerably, and quite spoil their appearance. Immediately such damage is observed search should be made for the depredator, which, very likely, may be found snugly ensconced in one of the frills or tassels, when it is easily extracted by the finger and thumb. If not so seen, it is practically certain to be found somewhere on the soil or in the caudex, since it rarely travels from one plant to another unless disturbed. If search still fails, immerse pot and plant in a pail of water, so as quite to cover the soil. The beetle cannot stand immersion at all, and will at once crawl out from its hiding place, and creep up one of the frond stems, where he is easily secured.

On large specimen ferns the black body of the beetle is easily distinguishable against the light, but here diplomacy is required, since directly it suspects an enemy, or is startled, it drops to the ground, and lies as if dead, its dark colour then rendering it almost impossible to detect. My diplomacy takes the form of a metal dessert spoon attached to a stick, and when a weevil is observed I cautiously bring the spoon beneath it, into which it incontinently drops when the frond is slightly tapped. The weevil's presence is sometimes only indicated by small blobs or drops of brownish liquid on the fronds, and also by a distinct paleness of the normal green colour which is reassumed speedily when the beetle is removed. This fact is difficult to account for, but admits of no doubt. All this, of course, involves considerable trouble, but is unavoidable if once the pest has, by ignorance of its habits or neglect, been allowed to establish itself, as it is quite immune in both stages from vaporisation, or any insecticide I know.

C. T. Druery, V.M.H., F.L.S.

---

**Tree Pæonies.**—These look their best when planted in the forefront of shrubberies, but they are sometimes grown in the ordinary herbaceous borders or in beds by themselves. Flowers of the Mountain Pæony exhibit a great variety of colours, and their large blooms are invariably much admired. They are greatly benefited by a mulching of well-rotted manure, as this not only checks evaporation, but helps to feed the plants. Remove any suckers from the root-stocks as they may appear.—J. Gardner.

# EDUCATION OF GARDENERS.

The following is the text of the paper on "The Education of Gardeners" read by Mr. W. Hales, A.L.S., Curator, Physic Garden, Chelsea, at the conference on "Horticultural Education" held in conjunction with the Royal International Horticultural Exhibition:—

When one considers the methods for the education of a gardener in this country, it may be said with a great deal of truth to be more or less a system of "drift."

That such a system—or rather, want of system—has produced many excellent gardeners is freely acknowledged, and is clearly shown in the magnificent exhibition which has just been opened; and when one ponders over the training these men have had, the thought naturally arises, how are we to improve upon the methods employed?

Since gardening is a progressive art which does not admit of finality, all true gardeners must ever feel that their education is *never* complete, and that they must always be alert to adapt themselves to new methods and ideas if they are to hold their own in the competition of life.

During recent years rapid strides have been made in educational methods generally, and one finds that the number of elementary schools which teach gardening as a purely educational subject have increased very considerably; but so far as the actual training of the real gardener is concerned, these schools play very little or no part.

There are, however, a certain number of institutions which teach gardening as a whole, or as one of the subjects in their courses, with the object of training gardeners; but after careful consideration one is forced to the conclusion that many of these institutions fall short of filling the position in the training of a gardener which they should occupy. What one feels to be most needed is that the work of these various establishments should be arranged and coordinated so that any boy who intends to make gardening his profession may be able to pass through such an organised course of training as will ensure him receiving the proper blending of practice with science, which, in this competitive age, is essentially necessary for the man who desires to reach the top of his profession.

## The Gardener's Work.

The work of a gardener covers such a number of different branches of the great tree of horticulture, that the education a gardener should receive must of necessity be a subject upon which there are many diverse opinions. There can, however, be no two opinions but that the boy who wishes to make gardening his life's work should have received whilst at school as full a general education as the circumstances will allow; and if it were possible for him to continue his studies up to the age of sixteen or seventeen years at a good secondary school, where he will receive an additional training in those sciences which will ultimately have a direct bearing upon his profession, such as geology, botany, chemistry, and land-surveying, he will be possessed of an asset which will undoubtedly be of value to him in his future work.

Gardening to-day makes demands upon the skill and intelligence of the individual such as was undreamt of in bygone years.

This is partly explained when one considers the enormous wealth of exotics from all climes with which quick transit and the work of collectors and travellers have enriched our gardens—to say nothing of the work of the hybridist—all of which the gardener is expected to grow and make flourish under conditions far removed from those in which they grow naturally. Therefore, the better the education a boy has received at school the more fitted will he be for dealing in an intelligent manner with the difficulties—and they will be many—of his future work.

## Learning Elementary Details.

We will assume, then, that a boy who intends to make gardening his profession has had the best education afforded by the elementary schools of the country. The next step in our policy of "drift" is for him to obtain employment in a garden as a garden boy, where he should be initiated into all the elementary details of the usual routine work of a garden. The size of the garden will matter little, providing that it is of a more or less representative character, and has at its head a thoroughly practical man, who is also prepared to take an interest in moulding the boy's character, and generally interesting him in his work.

This last is most important, as it has to be remembered that since the old system of indentured apprenticeship has become almost extinct, no head-gardener in our present system is under any definite obligation to instruct a beginner. Fortunately, however, there are numbers of head-gardeners who consider they have a moral obligation in this respect, and there is not, as a rule, any great difficulty in getting a boy well placed.

Personally, I am a great believer in a boy beginning on the bottom rung of the ladder, and gradually working his way up. It is, however, particularly necessary at this period of his career that he should be properly taught the elementary details of his work, and the correct reasons for their performance, or he will never become a good gardener.

Two years spent in acquiring the sound elementary details of his work will be ample to fit an intelligent and capable boy for the more important duties of a journeyman, and he must now realise that the future success or failure of his life as a gardener will largely depend upon himself, in the use he makes of the many and varied opportunities of acquiring knowledge which occur in his daily work. Neither must he forget to use every endeavour to further improve his general knowledge of those subjects which have a direct bearing upon his profession, since it is at this period of his life that his mind is most receptive to new facts and ideas, and his memory more retentive.

## Influence of Environment.

At this stage of a young gardener's life one fears that the environment in which he finds himself often plays a very large part in making or marring his future. Should circumstances be fortunate, and he falls in with studious companions, he will most likely endeavour to emulate their example. Conversely, if his fellow-workmen have no interest in striving to garner educational knowledge after their working hours, he will most probably follow the line of least resistance and do likewise. One feels that this is particularly true in the case of those gardeners who, from the very nature of their calling, are often isolated in country places far removed from the educational influences to be found in the neighbourhood of large towns and cities. Most of us realise the difficulties of getting classes together for these men, but one feels that the county educational authorities might very well step in here and supply the great need of assistance which these men require in the way of providing lectures upon subjects connected with their work. The young journeyman, however, should never forget that the cardinal point in his early training must be centred upon making himself proficient in the actual manual part of his work. Other subjects should be studied more in the way of "intellectual amusements," rather than as things which must be acquired at this stage. Deeper pursuance of these subjects should be reserved for the later stages of his training, when he will be more likely to have a clearer idea of what he ultimately desires to attain.

It has been well said that "Everyone has, or should have, two educations: namely, the one he receives from others, and the other he acquires for himself, and the latter is, as a rule, by far the most valuable to him." The man who does not earnestly strive to educate himself can never hope to be a success in his profession, neither can he hope to get the full enjoyment out of his life.

Let me, however, make it clear that I do not desire my young journeyman to always have his "nose on the grindstone." He should make time for the healthy physical recreations of life, such as cricket, cycling, etc., as I am a firm believer that a healthy body makes a healthy, active mind; and that taken in moderation, recreations are essentially necessary for the full development of both mind and body.

## Practice and Science.

When discussing the education of a gardener one is often met with the remark that there are many excellent gardeners who know nothing whatever of the sciences; and whilst this may be true to a certain extent, the very fact of their being successful cultivators of plants shows that they unconsciously follow their practice upon scientific principles, although they may not be able to describe their reasons for the performance of any particular practice in a systematized manner; which, after all, *is* science, pure and simple.

I believe it was Huxley who once described science as "organised common-sense," and if we were to keep this definition in mind, one would never hear of people trying to divorce good practice from science, since they are inseparable.

The young gardener should very early acquire the habit of using his powers of observation upon the objects of his daily work; and having observed, he must try and discover for himself the reasons for what he has seen, and then act upon his conclusions.

The success of his work will largely depend upon the use he has made of his powers of observation, since no work is more exacting in this respect than gardening. His watchword must always be, "Keep your eyes open to things which want attention," and never do things in a mechanical manner. I labour this point a little because, having had a fairly wide experience of men, I know only too well how common it is for them to get into a mechanical way of doing work. They will go through a house of plants for watering, and never see *the* plant which needs watering most; or they fail to notice the first sign of distress from insect pests, such as thrips and red spider, until a great deal of damage has been done.

It is, of course, only to be expected that at times no satisfactory solution of an observed phenomenon may be forthcoming; but with accumulated knowledge the right solution may present itself. As bearing upon this, I may be pardoned if I cite a case which happened in my own early gardening days; when I well remember being soundly rated by my chief—who was a man of far more than average erudition—because in a mixed house of plants of which I then had charge a particular plant during a spell of very bright sunny weather lost its leaves. I was told that I had neglected to give this particular plant sufficient water; but I on my part was equally certain that I had not been remiss in this respect. There the matter ended; until several years afterwards, when reading about the vegetation of the Catinga region of Brazil, I found that many of the plants of this region during spells of hot, dry weather, cast off their leaves, so as to prevent transpiration, and thus enable them to live through these dry periods. Upon looking it up I found to my surprise that the particular plant to which I have referred was a native of this region, and was doing under cultivation exactly what it would have done in nature. This is just one case in which a knowledge of botany might help the gardener to solve problems which occur in his daily work; but I wish to make it clear that I do not think a deep knowledge of any of the sciences is at all necessary to anyone in the early stages of their gardening career, proficiency in the performance of the manual work being far more desirable. They should, however, be sufficiently versed in the subject of botany to be able to describe in clear, concise language, the various parts of a plant, and understand its structure well enough to know what the particular functions are of each part, then the work of nutrition, food elaboration, and reproduction will add an increased interest to their work.

### Advantage of Moving About.

The young journeyman who has been properly advised will be alive to the advantages to be obtained from moving about to gardens in different parts of the country, where he will see the various methods practised under varying conditions of soil, climate, etc., and he ought not to stay much longer than two years in any one place. This moving about to different localities and gardens will tend to broaden his ideas, and teach him many lessons which it would be impossible to learn in any one garden, and to this end he should make it his business to get into as varied gardens as possible.

It is, perhaps, hardly necessary to mention any particular gardens in this respect, as in this country there are so many which are noted for their special features, and it can well be left to the choice, or the varying circumstances of the individual.

I may, however, call attention to the great value to be obtained from spending part of one's training in a good market or general nursery, where the methods of work are usually conducted with the greatest economy and profit, factors which are indispensable in the successful management of any garden.

If the journeyman could spend part of his training in a good Continental nursery or public garden he will be still further equipped, as here, besides his purely horticultural training, he will also have the advantage of acquiring a knowledge of the language of the country, which would probably be of much value to him in after years.

I venture to suggest that this is a subject this Conference might well consider, and see if some sort of organised exchange system between young gardeners of this country and Continental countries could not be instituted, on somewhat similar lines to those which at present exist for elementary school teachers between this country and France.

The journeyman desirous of making the best use of his early training will endeavour to spend two years in our great national botanic garden at Kew; or, failing Kew, either Edinburgh or Glasnevin, in either of which places he will find gardening of the very highest order carried on. It is true that at neither Kew nor Edinburgh are fruit and vegetables grown, but knowledge of these important subjects will have been acquired in the previous training. The great value of these gardens lies in their great wealth of collections of plants, such as are not found elsewhere. Further—and this is equally as important—in the association with men who are anxious to become the best men in their profession: in these associations with men of ambitious inclinations the best is brought out of any young man, and he soon shows by his work, and in the lecture-room, of what sort of stuff he is made.

It is just possible that when a young man sets out upon his career he may have some definite ideas of the class of gardening he wishes to follow; but whether this be private work, service under public bodies in parks, market and nursery work, or the teaching of horticulture, he will find that if he has gone through such a course of training as I have indicated, he will be much better equipped for specialising in any particular branch.

One cannot leave this part of the subject without acknowledging the great value of the horticultural Press in helping forward the educational work of a gardener. The man who wants to keep himself posted in what is going on in the horticultural world cannot afford to ignore the weekly Press, which fills a far more important part in a gardener's training than many people like to admit.

Mutual Improvement Societies, especially in the neighbourhood of some of our large towns, are also doing good work; but with reference to these one feels that if they could work in connection with local educational authorities, and have some definite courses of instruction given through a *competent* teacher, their work would be of much more value. This need not interfere with the "mutual" character of their work, but should be regarded as an amplification of it.

Flower shows also play their part in our educational work; especially is this true of those of the Royal Horticultural Society, and many of the larger provincial societies, several of the latter having special features for which they are noted.

So far we have dealt with our system of education more or less as one who sets out to become a gardener finds it.

### Educational Establishments.

From the mass of information, however, which this Science and Education Committee have collected together, it is evident that there is an enormous amount of teaching of gardening provided by the various educational authorities of the country; but, after carefully considering the whole of it, one is reluctantly forced to the conclusion that very little of it is designed for the man who is making gardening his profession. More especially does this seem to be the case with the higher college courses, which appear to be designed more for schoolmasters, who, it is hoped, will then be able to teach gardening in the schools.

This is certainly not quite as it should be, and what many of us would like to see grow out of this Conference is some definite coordinated system of educational teaching designed for the man who is making gardening his profession. This system should insure that the young gardener would finally be able to pass through a period of training in the higher branches of his profession, so as to be able to compete more successfully with the purely college-trained theory men, who, it has to be admitted, are often preferred for positions before the purely practical men because of their supposed superior scientific equipment.

Organise some system of training so as to make it possible that a thorough blending of the two types of men are the result, and horticulture will stand to gain untold advantages.

The pure scientist often has to lament his non-acquaintance with practice, as was the case with Darwin, who said that every botanist should have spent part of his training as a gardener.

Personally I am more than satisfied that, given the necessary training in research methods, the intelligent young gardener would often be a greater success than are many of the purely class-room men.

If, then, it were possible for the best men in gardening to spend two years or so at institutions which would make it their business to specially cater for them with teaching of the *right* kind, a race of workers would result who would be highly qualified to deal with unsolved problems in horticulture, in a thoroughly intelligent manner, and with great and lasting good to the community.

Very careful selection of the men who would be most likely to profit by this specialised training would be an essential part in the success of this scheme, and I would venture to suggest that one way by which they might be discovered would be by means of the examination for the National Diploma in Horticulture which it is proposed to establish.

Since horticulture is of such vast importance to the people of this country, is it too much to ask that the Government should render financial assistance, in the way of bursaries and scholarships, to help forward this scheme for the better education of gardeners? Surely not! And one ventures to hope that something of a definite nature in this respect may be the outcome of this great gathering.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

MILTONIAS.—In many collections Miltonia vexillaria will have passed its flowering stage, and in others will be in full beauty. After flowering the plants should have a short rest, and nothing should be done that will induce growth, for the longer period of rest this species enjoys the stronger will be the new growths, when the season of activity commences. For the next eight or nine weeks it will only be necessary to keep the compost moist, but on no account must the plant be allowed to suffer from excessive dryness at the roots or in the atmosphere. The pseudo-bulbs must be kept plump and healthy until new growths appear. In strong, healthy plants this will occur before the plants have finished flowering. Whilst at rest, M. vexillaria in dry localities enjoys a cool atmosphere, and is best accommodated in the cool house, and will enjoy as much fresh air as any subject grown therein. In a damp and cold locality I find the cool intermediate house the best place for this orchid when at rest. I do not advise repotting until the new growths are of some considerable length, and are about to push forth new roots; the middle or end of August is quite early enough. Should hot, dry weather prevail, I find Miltonias do not appreciate being disturbed. With the different varieties of this most useful orchid, it is possible to maintain a supply of flowers during the whole of the summer months. After the early-flowering varieties are over, the succession is maintained by M. v. splendens, M. v. Lambeauiana, M. v. Queen Alexandra, M. v. superba, M. v. Leopoldi, and M. v. rubella. These late-flowering varieties should be kept in the intermediate house until they bloom, after which they may also, should everything be favourable, be removed to the cool house.

M. BLEUANA.—The hybrids, M. Bleuana and M. Hyeana, and their many varieties, should always be given a position in the intermediate house. These plants make their growth after the same manner as M. vexillaria, and should be treated much in the same manner, with the only exception of temperature. I find these hybrid Miltonias commence to grow a little in advance of the species mentioned, therefore they may be repotted earlier. Being purely surface-rooting, they are best grown in what is known as half-pots, which must be well drained. For compost, I recommend equal portions of peat, polypodium fibre, osmunda fibre, sphagnum moss, and pure oak leaves, from which all the fine particles have been taken.

MILTONIA PHALÆNOPSIS is another species which may be treated after the same manner, but care must be taken that the plant is not over-potted, as it has not the power to push through a great thickness of compost.

CULTURE.—When potting Miltonias, care must be taken not to pack the compost too tightly, but it should be moderately firm around the whole plant. One of the greatest errors made is an excess of water after repotting; only just sufficient should be given until the roots have freely entered the new compost. Small yellow thrips often attack the foliage of Miltonias, and, when found, the plants should at once be dipped in some safe insecticide, the leaves carefully sponged, and subsequently cleaned in tepid rain water. After an attack of this pest, the plants may be vaporised from time to time with some safe compound. Woodlice do much damage to the young roots of Miltonias, and should be diligently searched for at all times, and destroyed. Baits of apple and potato should be laid for them, and every means taken to entrap them, until they are exterminated.—J. T. Barker, The West Hill Gardens.

"A Storehouse of Practical Information in the most concise form . . . ."

THE ENCYCLOPÆDIA OF GARDENING

14th (Revised) Edition.

By T. W. SANDERS, F.L.S.

A Book of 466 pages, which shows at a glance How any Flower, Vegetable, Fruit, Plant, Tree, or Shrub can be grown with ease and success.

"A valuable book of reference in a handy form, conveying in a nutshell all that the Amateur Gardener needs to know about Plants and Flowers of every description."—
THE QUEEN.

148-9, ALDERSGATE STREET,
E.C.

*SPECIMEN PAGE.*

*ENCYCLOPÆDIA OF GARDENING.*

flora (Syn. Achimenes amabilis), white, Aug., 2 ft., Mexico; zebrina, yellow and scarlet, Oct., 2 ft., Mexico.

**Nail-wort.**—See Paronychia.

**Naked-flowered Azalea** (Rhododendron nudiflora).—See Rhododendron.

**Naked-flowered Crocus** (Crocus nudiflorus).—See Crocus.

**Nandina** (Heavenly Bamboo).—Ord. Berberidaceæ. Half-hardy evergreen flowering shrubs.

CULTURE: Soil, peat & loam. Position, sheltered beds or borders in mild districts only. Plant in May or Sept. Propagate by cuttings inserted in sandy peat in a warm greenhouse in spring or summer.

SPECIES CULTIVATED: N. domestica, white, summer, 4 to 5 ft., leaves assume reddish tint in autumn, Japan.

**Nankeen Lily** (Lilium testaceum).—See Lilium.

**Nanodes.**—See Epidendrum.

**Narbonne Flax** (Linum narbonense).—See Linum.

**Narcissus** (Daffodil; Jonquil; Chinese Sacred Lily; Chalice Flower; Lent Lily).—Ord. Amaryllidaceæ. Hardy bulbous perennials.

CLASSIFICATION: Narcissi are divided into three main sections or groups, viz.: I. Magni-Coronati (Trumpet Daffodils). II. Medio-Coronati (Chalice-cupped Daffodils or Star Narcissi). III. Parvi-Coronati (Dolly-cup or Poet's Narcissi). Group I. have large trumpets; II., short trumpets or cups; III., very short cups or trumpets. To first group belong the following types: Yellow, white & yellow (Bicolor), & cream trumpet kinds, Johnstonii, cyclamineus, bulbocodium, Humei, Backhousei, & tridymus; to second group, incomparabilis, Barrii, Leedsii, montanus, Bernardi, Machai Nelsoni, triandrus, juncifolius, & odorus; to third group, Burbidgei, Engleheartii, poeticus, poetaz, tazetta or polyanthus, biflorus, and jonquilla. The name Daffodil usually applies to kinds with long trumpets.

OUTDOOR CULTURE: Soil, ordinary for common kinds; sandy loam for N. bulbocodium & vars.; peaty soil for N. cyclamineus. No manure must be applied. Position, partially or quite shady beds or borders facing N. or N.E. for robust kinds; rockeries sheltered from N. or N.E. winds for choice or dwarf kinds. Plant, June to Oct. Depth for planting, 3 to 4 in. on heavy soils; 6 in. on light soils. Distance apart, 2 to 6 in. Lift N. bulbocodium in July & replant in Oct.; other kinds every three or four years in July. Do not remove foliage until quite dead. Manures: 4 oz. of basic slag or 4 oz. of bonemeal for heavy soils; ½ oz. of sulphate of potash for sandy soils. Apply above quantities per square yard before planting.

CULTURE IN TURF: Make holes 2 to 3 in. wide, 3 in. deep. Place one bulb in each & cover with soil & turf. Plant, July to Oct. Grass must not be cut until leaves turn yellow.

INDOOR CULTURE: Compost, two parts fibrous loam, one part well-decayed manure or leaf-mould, one part sand. Pot, Aug. to Nov., placing 3 large, 6 medium-sized, or 12 small bulbs in a 5-in. pot. Depth for planting: Allow apex to just appear above surface of soil. Position, under cinder ashes outdoors or in frame until growth begins, then remove to greenhouse or window. Water only when growth commences; moderately afterwards. Apply weak stimulants when flowers appear. Temp. for forcing, 55° to 65°. After flowering, plant bulbs, except those of N. bulbocodium & N. cyclamineus, outdoors. Keep soil of the latter dry after flowering.

## STOVE PLANTS.

HIBISCUS COOPERI VARIEGATA. — This is a stove species well worth growing for its compact habit and beautifully marked leafage; but, as far as my experience goes, the plant is seldom met with in private collections at the present day. To bring out the rich colouration of the foliage, which is its real beauty, the roots should be restricted in rather small pots. Being of a shrubby character the plant is very accommodating, as it may be pruned hard back in winter to whatever shape is desired. The compost most suitable is three parts good friable loam to one part each of peat and leaf-soil, with plenty of sand and mortar-rubble added. Propagation is readily effected by cuttings of the young shoots in spring, and essential points to bear in mind are firm potting, avoidance of over-potting and feeding, and removal of flowers.

GARDENIAS.—Established plants will now be flowering, or approaching that stage, if started into growth as advised. With proper management gardenias will provide a wealth of their fragrant flowers successionally over a long period, and especially will this be ensured if two or three batches are grown. High feeding is necessary directly the flower buds are formed, and all weak lateral growths should be removed in order to concentrate the whole energies of the plant upon the blooms. When these are all cut give every encouragement to the plants to again break by maintaining a stronger heat than was desirable whilst in flower, and syringe freely twice or thrice daily. Provided the plants were given a liberal shift early in spring, no further potting will be necessary, except in the case of young plants being grown on. A top-dressing of good maiden soil, to which should be added a sprinkling of bone-meal, soot, and artificial manure, should be given immediately after flowering. The blooms should be cut before fully expanded, and placed in water in a temperate room; if allowed to open fully on the plant they quickly turn yellow.

FOLIAGE PLANTS FOR TABLE DECORATION.—Well-grown specimens, in small pots, of crotons, dracænas, pandanus, and aralia of the elegantissima type, are of immense value during the dull winter months, when flowering plants suitable for table decoration are scarce. Among the first-named the narrow and twisted leaved varieties are best, such as Chelsoni, Countess, Warreni, Johannis, and others of like habit. Assiduous attention should be given to the propagation of sufficient numbers of these from now onwards. Cleanliness, both of the structure in which the plants are grown, and the plants themselves, with plenty of light and a humid atmosphere, with top-ventilation on fine days, are important factors in success. Where much table decoration is carried out, a goodly number of plants in small 60-sized pots may be grown and utilised, as well as those in larger pots; for, if turned out and neatly massed up they can be artistically disposed in a variety of ways about the table and sideboards. Some growers dibble small pieces of the close-growing Selaginellas, such as denticulata, apeda, etc., on the surface of the soil some time before the plants are needed for use, where they quickly root and form a pleasing set-off to the plants; small pots of these subjects may be grown separately, and then placed on the surface when the plants are taken indoors. —H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

EARLY PEACHES AND NECTARINES.—The crop of fruits will have been gathered from these trees, and immediate steps should be taken to cleanse the foliage from insect pests. Where red spider has been troublesome, the trees should be dusted several times with flowers of sulphur when the foliage is wet. Thoroughly syringe the trees regularly with the help of the garden engine for several weeks. It is absolutely necessary to apply the water forcibly to eradicate red spider and thrips, but, at the same time, sufficient care should be exercised, so that no damage is done to the leaves in any way. Give the roots several good soakings with clean water, and allow the ventilators to remain fully open night and day. Examine the trees, and remove all surplus growths that are not required for next season.

MID-SEASON AND LATE TREES.—Continue to tie in the young growths as required, and admit plenty of air, both at night and in the daytime. At this season of the year copious supplies of water should be administered to the roots; syringe the trees thoroughly every morning and afternoon to keep the foliage in a clean, healthy condition; trees that are carrying heavy crops of fruit will require frequent applications of both liquid farmyard and chemical manure. Pull aside the foliage to expose the fruit to the sunlight and air, and maintain a moderately dry atmosphere in the house during the ripening stage.

PINE APPLES.—Where the successional plants have filled their pots with roots, they should be shifted into fruiting pots, exercising great care not to break the ball of soil during this operation. Spray the plants over lightly on bright afternoons, and close the house early. Supply liquid manure twice a week to plants that are swelling their fruits, but as soon as they commence to ripen stimulants of all kinds, as well as syringing, must be discontinued.

CUCUMBERS.—These will require constant attention to regulate and tie in the growths. Remove any leaves that have performed their functions, and show signs of decay. Frequently damp down the houses to maintain a humid atmosphere, and thoroughly syringe the foliage once a day to ward off the attacks of red spider. This pest has been a great source of trouble to many large growers in this locality. Give copious supplies of clean tepid water, and stimulants as required; top-dress the roots with a good rich compost when necessary. It is a good plan to damp down the paths and walls, late in the evening, with weak liquid farmyard manure; this will not only promote a healthy foliage, and the production of finer fruits, but it will also assist to keep red spider in check.

TOMATOES.—The earliest plants have produced heavy crops, and will still be in a good fruitful condition where the cultural details have been carefully followed out. Dryness at the roots should not be allowed at any time. When applying water see that sufficient quantities are given to well soak the whole bulk of soil. Stimulating manure can be used more freely now, and soot water, liquid manure, and chemicals should be used occasionally to assist plants that are bearing heavy crops. Top-dress the plants with a rich loam and a sprinkling of bone-meal when necessary. Later plants will require to be carefully tied in; remove all side laterals as soon as they appear; admit plenty of air night and day, and pollinate the flowers daily.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

ORNAMENTAL VINES.—Many of these are very beautiful and effective climbers, and, owing to their quick growth, they very soon create a decorative appearance. They are especially suitable for planting against arches and pergolas, and when the more vigorous kinds are allowed to ramble freely over forest trees in the wild garden, they are seen in all their natural beauty. Owing to their brilliantly-coloured foliage in autumn they are particularly effective at that season of the year. They succeed in any good garden soil, but copious waterings are necessary during dry weather if they are to make luxuriant growth, while they derive considerable benefit by being damped over with the syringe after a hot, sunny day. Vitis vinifera purpurea, V. Coignetiæ, V. Thunbergi, are vigorous growers; white V. armata, V. flexuosa, V. Wilsoni, and V. hedracea are all lovely kinds.

THE WATER GARDEN.—This feature is now becoming attractive, and some of the nymphæas are expanding their flowers. The foliage is so far very free from aphis, but should this appear the leaves must be sprayed with insecticide in the evening, when the flowers are closed. When the plants are in full bloom they present a really charming sight. Any growing at the water's edge and becoming too large can be carefully reduced at the present time. The masses of spiræas, Japanese and other irises, growing on the banks are commencing to make a gorgeous display. The showery weather has suited these admirably, and also the gunneras, which are fast developing their huge leaves. These are assisted in their growth by having some artificial fertiliser well washed into their roots, and a mulching of decayed manure is of material assistance to them. The flower spikes should be removed as they rob the plants of nutriment very considerably.

THE WILD GARDEN.—This is at all times attractive, more especially at present, while the rich and varied colouring of the trees is fresh and brilliant. Japanese maples add not a little to the beauty of this portion of the grounds. These are very effective in beds, or planted singly. The ground around them should be kept carefully cleaned and free from weeds during the summer. This is also essential treatment for the various colonies and beds of plants in the wild garden. It is necessary to mow the long grass now, and gather it up carefully to avoid injury to any of the shrubs and plants. Everything should be kept as natural and informal in appearance as possible, and groups of plants should always be of irregular outline. The wild garden is a place where self-sown seedlings are to be encouraged. For instance, masses of foxgloves, evening primroses, pæonies, poppies, and other subjects are extremely charming growing in natural masses as they do here.—J. Gardner, Batsford Park Gardens.

---

**Double-flowered Lilacs.** — Complaints are sometimes made that these do not flower with the same freedom as the single-flowered kinds, and in the case of small specimens this frequently holds good. When large this same feature cannot be urged against them, as they then bloom profusely. I have had under my observation a veritable tree of the white-flowered variety Madame Lemoine, which has been a mass of flowers and admired by everyone.—K.

**Hippeastrums.**—These are, in most gardens, referred to as amaryllis, it being an exceedingly difficult matter to change a once thoroughly-established name. While differences of opinion may exist on this point, and also as to the best season in which the bulbs should be repotted, there can be no question as to the high ornamental qualities of the different garden forms, and their value for decorative purposes during the spring months. Various species have played a part in the production of the hippeastrums of to-day, but that Veitchian publication, "Hortus Veitchii," gives to Hippeastrum Leopoldi the credit of having exercised the greatest amount of influence on the present-day race. That beautiful and distinct species, H. pardinum, whose flowers have a cream-coloured ground dotted more or less with crimson, though so attractive in itself, has not proved of great value to the hybridist, while the distinct Hippeastrum procerum (known popularly as the blue amaryllis) has not up to the present proved fertile, either as a seed bearer or pollen parent when crossed with the garden forms. Considerable changes have of late years taken place among the hippeastrums, there being a great improvement in the shape of the flower, while the green centre is now almost eliminated. Added to this are the decided breaks in colour which are now to be found among the newer forms, of which the variety Rose du Barri, which was given an Award of Merit by the Royal Horticultural Society on March 19, may be quoted as an example.—K.

# EXHIBITIONS AND MEETINGS.

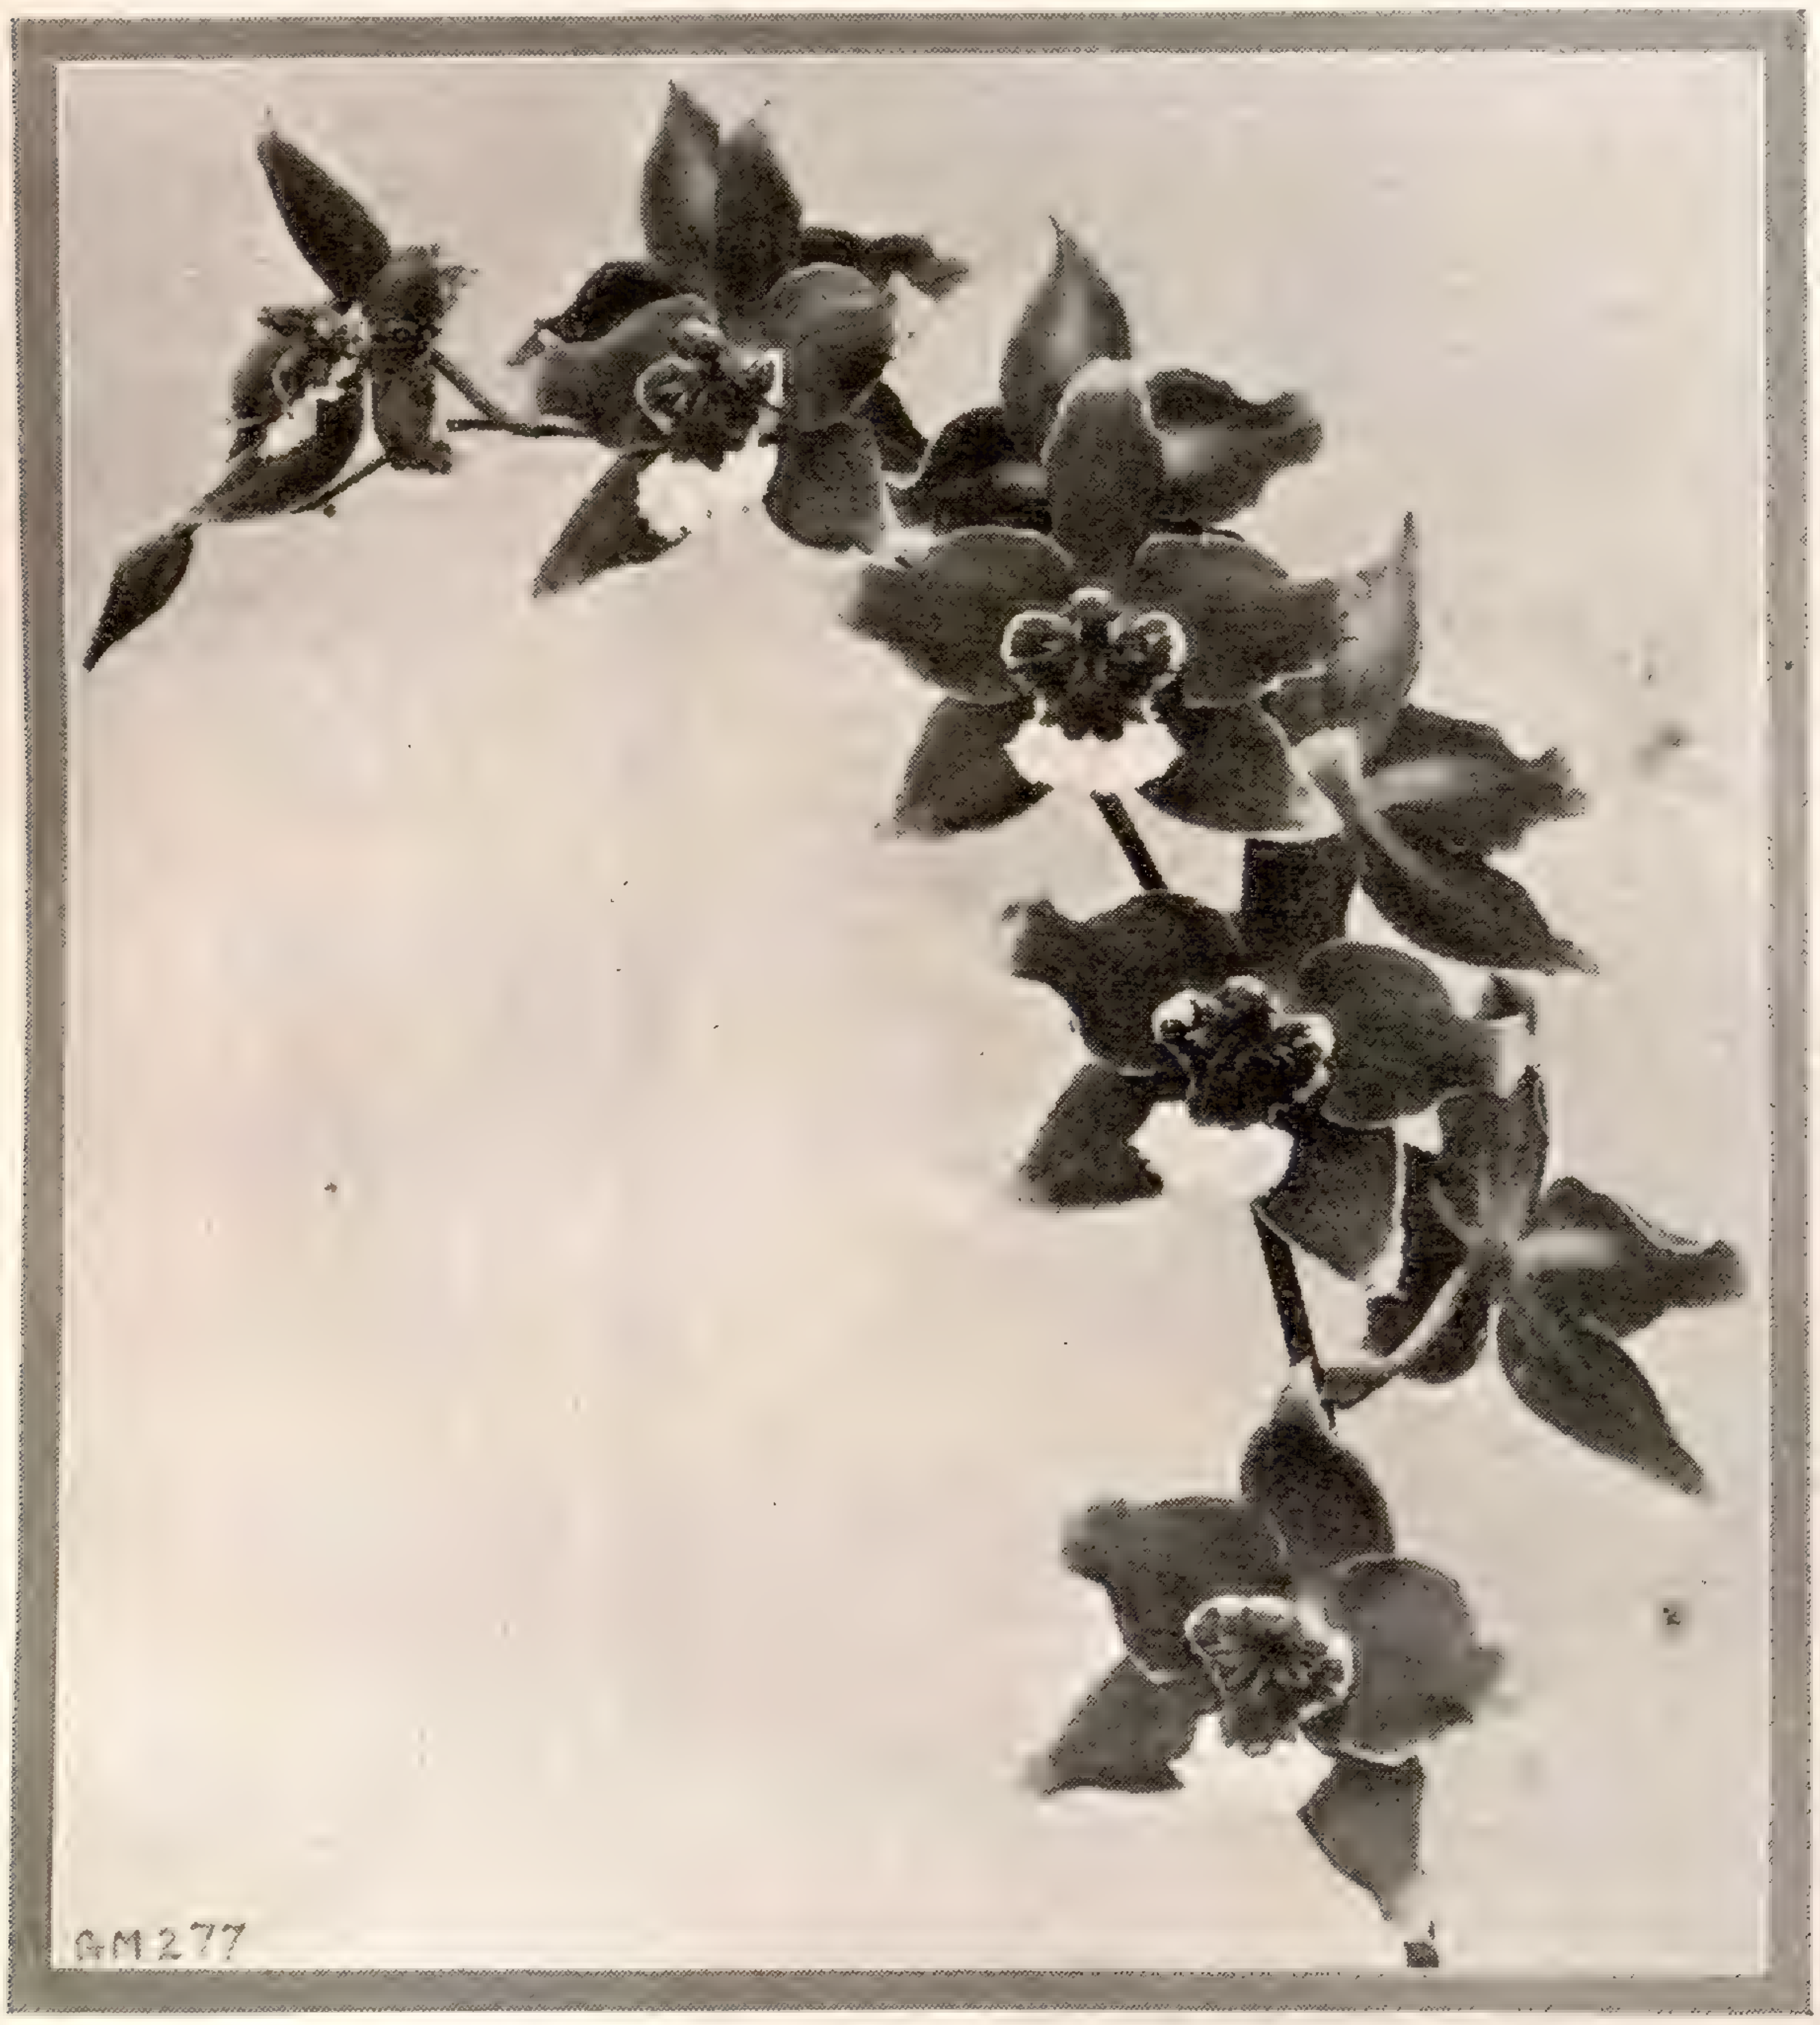
## Royal Horticultural Society.

JUNE 18.

A beautiful exhibition was held at the Royal Horticultural Hall, Westminster, on Tuesday last, and, though there was a good attendance, the crush was not nearly so great as usual. Orchids filled comparatively little space. Delphiniums, pæonies, roses, and sweet peas were very much in evidence, while alpines and greenhouse subjects were well represented.

### FLORAL COMMITTEE.

Right across the end of the hall Messrs. Sutton and Sons, Reading, put up a beautiful exhibit of sweet peas. The background was formed of ten arches, but only the pillars were filled with sweet peas, the arching portion being clothed with smilax and asparagus. Beneath each arch bunches were grouped (in one variety) to form wedge-shaped masses. Below these, again, were vases of flowers set over black velvet. The whole arrangement was excellent, and overcrowding had been carefully avoided. A few of the leading varieties were Sky Blue, Imperial Blue Spencer, Doris Usher, Chas. Foster, Audrey Crier, R. F. Felton, Prince George, Thos. Stevenson, Southcote Blue, Mrs. Cuthbertson, Clara Curtis, and Edrom Beauty.



ODONTIODA COOKSONIÆ FOWLER'S VARIETY.

A splendid new hybrid. Flowers large, crimson-scarlet, with rosy tips to the sepals and petals, and a white apex to the yellow-crested lip. F.C.C., R.H.S., June 18. Messrs. Charlesworth and Co., Haywards Heath.

A large group from Messrs. J. Kelway and Son, Langport, once more demonstrated the beauty and usefulness of pæonies and delphiniums. The deep blue, white-centred Delphinium Huish Beauty, was very fine, and the Dusky Monarch and the lighter Star of Langport were other superb varieties; while the single pæonies Heart's Desire, White Knight, Eileen Kelway, Elf, Queen Alexandra, and Admiral were all exquisitely beautiful. Messrs. Barr and Sons, Covent Garden, filled a long table with a bright exhibit of hardy flowers. Their chief subjects were delphiniums, Anchusa italica Dropmore, and A. Opal, the lovely Dimorphotheca aurantiaca, nemesias, lupins in variety, phloxes and Spanish and English irises in a wide range of colouring.

The delphiniums from Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath, were charming. There were grand spikes of Rev. E. Lascelles, the large velvet-purple Henri Moissan, Robert Cox, King of Delphiniums, Eva, Walter T. Ware, and the long-spiked Novelty. Messrs. W. and J. Brown, Stamford, showed a goodly group of Lilium Sovitzianum, with Gaillardias Lady Rolleston and The King, both very fine. Messrs. William Bull and Sons, Chelsea, sent a wide selection of Spanish irises. Mr. R. Prichard, of West Moors, Wimborne, a new exhibitor, showed a small group of alpines.

A large and handsome group of hardy flowers from Messrs. Wm. Cutbush and Son, Highgate, had a little pool of water-lilies in the foreground, a background of spikes of Eremurus robustus and sheaves of E. Bungei. In front were groups of English irises, Romneya Coulteri, Lilium Humboldti magnificum, Sidalcea candida, and Gladiolus America, a lovely pink form. Messrs. G. Bunyard and Co., Maidstone, presented a bold exhibit of the finer varieties of delphiniums, with bunches of Pentstemon tubiflorus, Centaurea macrocephala, Iris Monnieri (fine), English irises, pæonies, and Oriental poppies.

A little rock garden from Messrs. J. Cheal and Sons, Crawley, was daintily filled with dwarf campanulas, mimuluses, sedums, primulas, violas, Genista shipkaensis, etc., backed by Japanese maples. Messrs. Carter Page, and Co., London Wall, put up cactus and pæony-flowered dahlias, and a collection of fragrant and pretty violas, staged in low pans.

A handsome collection of hardy flowers from Mr. Maurice Prichard, Christchurch, included pæonies and delphiniums, Campanula grandis pallida, Watsonia Ardernei alba, Kniphopia Goldelse, and the showy Lavatera Olbia (A.M.), with large silvery-rose flowers. Messrs. Pulhams, Elsenham, were represented by a small collection of herbaceous and alpine flowers and plants.

Messrs. G. and A. Clark, Dover, filled a corner with a most effective group of hardy flowers. Iris Monnieri, I. Monspur, delphiniums, pyrethrums, Geum Mrs. Bradshaw, alstremerias, and Gilia coronopifolia were all finely represented. Mr. G. Reuthe, Keston, put up a collection of alpine flowers and shrubs, the Edelweiss attracting a good deal of attention.

Messrs. A. A. Walters and Son, Bath, put up a group of delphinium spikes, the most conspicuous variety being the handsome Rev. E. Lascelles. Canterbury bells of enormous size, notably the big cup-and-saucer varieties, ranging from purest white to deepest blue, were shown finely by Mr. W. J. Godfrey, Exmouth.

In the group of hardy flowers staged by Messrs. R. Wallace and Co., Colchester, we noticed such good things as Lilium myriophyllum, Incarvillea Delavayi, Eremurus Warei, Iris Monnieri, Campanula macrantha, and Iris spuria lilacina. Messrs. George Jackman and Son, Woking, showed Delphinium Rev. E. Lascelles in grand style, Gaillardia Meteor, a selection of pinks, Clematis recta, Crambe maritima, etc., in their group of hardy flowers.

A pretty exhibit of sweet peas from Messrs. E. W. King and Co., Coggeshall, included Anglian Lavender, Mrs. C. W. Breadmore, Gladys Burt, Rosabelle, Mrs. W. King, and Constance Oliver.

Mr. Jas. Box, Lindfield, filled a corner with a beautiful lot of delphiniums, pæonies, Spanish irises poppies, Helenium Bigelovi, Canterbury bells, and a fine set of heucheras. Mr. Box also set up a large exhibit of sweet peas, his best varieties being Audrey Crier, Chas. Foster, Mrs. H. Dickson, Mrs. W. J. Unwin, Orange Perfection, and Bertha Massey. Messrs. R. H. Bath, Wisbech, put up a splendid lot of delphiniums, Spanish irises, and herbaceous pæonies; among the latter Mons. Chas. Leveque, carnea elegans, Mandarin, Her Grace, Victor Lemoine, and Marie Lemoine were fine.

Messrs. T. S. Ware, Feltham, showed delphiniums, pæonies, and gaillardias largely, and set up a collection of very dainty little dwarf alpine campanulas. Iris ochroleuca was well represented. Delphinium Lamartine, D. Moerheimi, Viola cornuta purpurea, the pretty Mimulus Bennetti, Clianthus Allioni, and Oriental poppies were shown by Messrs. Baker's, Wolverhampton.

Mr. Vincent Slade, Taunton, showed some excellent zonal pelargoniums and a set of plants of the pretty Polypodium vulgare cambricum. Messrs. W. Wells and Co., Merstham, had a little exhibit of Oriental poppies, delphiniums, etc., and Messrs. Hobbies. Lim., Dereham, sent a good new crimson semi-double climbing rose named Effective (A.M.), a fine form. Charles Blick (A.M.) is a fine new white Malmaison carnation, shown by Mr. C. Blick, Hayes, with lovely bunches of King Arthur. Scarlet Gem. Elizabeth Shiffner. John Ruskin, Dora Blick, and other good border varieties.

Mr. P. Ladds, Swanley, showed the new pink pelargonium Champion, finely flowered. Messrs. Gunn and Sons, Olton, opened their season of phloxes with a bright exhibit of the finest varieties, the white E. van

MESSRS. SUTTON AND SONS' GOLD MEDAL DISPLAY OF SWEET PEAS.
At the Royal Horticultural Society's meeting, June 18.

Lassberg being conspicuously good; Viola cornuta purpurea was also beautifully shown by the Messrs. Gunn. Mr. L. Greening, Richmond, staged a pleasing little alpine and water garden. Graceful ferns in great variety were brought up by Messrs. H. B. May and Sons, Edmonton; Nephrolepis Roosevelti, Adiantum Farleyense gloriosum, and Nephrolepis Marshalli compacta were particularly good.

Mr. Amos Perry, Enfield, banked up delphiniums at either end of a fern-margined lily pond, wherein lovely flowers of Nymphæas Jas. Brydon, Marliacea carnea, M. rubra, and M. alba were very beautiful. Eremurus Warei, Ostrowskia magnifica, Lilium Krameri, and the fine dianthus Mrs. Perry, also formed part of the display.

Messrs H. Cannell and Sons, Swanley, put up an interesting lot of begonias, the drooping pink B. Fleur de Chrysanthème being particularly graceful, and suitable for baskets. Some good fuchsias were also included. A bright bank of Salvia splendens Pride of Zurich contrasted with the bank of the new Marguerite Mrs. Sander, from Mr. L. R. Russell, Richmond.

Messrs. Jas. Veitch and Sons, Chelsea, made a brave show of perpetual and Malmaison carnations growing in pots, and gorgeous cannas, all arranged under fine weeping standard fuchsias. The same firm put up a charming lot of Spanish irises, the varieties Cajanus, Louise, Solfaterre, and Lemon Queen being especially good. They also had a very fine group of such yellow or yellowish eremuri as E. Bungei magnificus, E. Warei, and E. Bungei superbus; they were grand spikes set over Thalictrum japonicum, with an edging of funkias. Philadelphus Vio Lactée (A.M.), and P. Bouquet Blanc (A.M.), the latter with semi-double white flowers closely set on the branches, were also exhibited by the Messrs. Veitch.

Messrs. Frank Cant and Co., Colchester, filled a length of tabling with splendidly developed roses tastefully arranged in stands, vases, and boxes. A particularly wide range of varieties was presented, and among the many we made special note of Mdme. Jules Gravereaux, Mdme. Ravary, Lady White, Una, Prince de Bulgarie, Corallina, Mdme. Melanie Soupert, Juliet, Irish Glory, Lady Waterlow, Lady Hillingdon, Mrs. Alfred Tate, Comtesse du Cayla, Peace, and Irish Elegance.

Messrs. Paul and Son, Cheshunt, were represented by a large bank of handsome herbaceous pæonies, spiræas, irises, and a collection of roses, the latter including Butterfly, Sweet Lavender, Will Scarlett, Eccentric, and other free-flowering varieties. They had also a vase of sprays of Philadelphus Vio Lactée (A.M.).

Messrs. William Paul and Sons, Waltham Cross, presented roses in baskets, and also set up pillar specimens in pots. Juliet, Ophelia, Warrior, Mdme. Segond-Weber, and the new Bianca were varieties especially well shown, and proved highly attractive.

Messrs. B. Cant and Sons, Colchester, filled one length of tabling with beautiful roses. Rambling roses made a background to the stands of Mdme. Melanie Soupert, Mdme. Segond-Weber, Irish Glory, Mdme. Ravary, Mrs. Alfred Tate, Le Progrés, Sunburst, Betty, Lady Ashtown, Peter Blair, and other lovely varieties.

Some excellent blooms of roses from Messrs. Stuart Low and Co., Enfield, represented the varieties Betty, La France, Chateau de Clos Vougeot, Duchess of Wellington, Rayon d'Or, Mildred Grant, Lyon, and Juliet. The Messrs. Low in another group, presented a selection of perpetual carnations and flowering plants of Maggie Nettlefield, Sir E. Wood, Maggie Hodgson, and other Malmaison varieties. Some first-rate perpetual carnations from Mr. H. Burnett, Guernsey, included fine bunches of Marmion, R. F. Felton, Bonfire, Mikado, Orpheus, White Perfection, and Mrs. Tatton.

## ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, displayed a bank of orchids set in ferns. Cattleya gigas Sanderiana was grandly shown, and so were Miltonia vexillaria Lambeauiana, Dendrobium superbiens, Anguloa Ruckeri, Cœlogyne asperata alba, very pretty; Dendrobium Sanderæ, L.-c. Fascinator, white forms of Cattleya Mossiæ, and the beautiful C. Mrs. Myra Peters. Mr. Black, gardener to R. Thwaites, Esq., Streatham, contributed a large selection of odontiodas, mostly small plants, representing a large number of crosses. Conspicuous in this group were nine plants of Cattleya Mossiæ Wagneri.

The Liverpool Orchid Nursery Company, Liverpool, contributed a small group of hybrids, chiefly Lælio-cattleya Cowani and L.-c. Canhamiana. Cypripedium bellatulum was also included. Mr. E. H. Davidson, Borlases, Twyford, put up a very pretty set of orchids, showing Cattleya gigas, C. Mendeli, C. Mossiæ, L.-c. Aphrodite, a fine form of Odontoglossum hibernicum, O. eximium, and O. Airworth. Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, exhibited Odontoglossum percultum Clarksoni, O. crispum-Wiganianum, and the quaint, striped Cattleya Mossiæ Mrs. Goodson.

Messrs. Charlesworth and Co., Haywards Heath, presented a few interesting orchids, notably Cattleya Mossiæ Wagneri, Dendrobium Sanderæ, D. Dearei, Trichopilia tortilis, Odontoglossum citrosmum roseum, and Cleisostoma crassifolia. Odontioda Cooksoniæ Fowler's var. (F.C.C.), shown by Messrs. Charlesworth and Co., was superb. It had ten splendid flowers two and a-half inches across, rich deep crimson-scarlet, with rosy tips to the sepals and petals, and a white lip, with yellow crest and a large crimson-scarlet area over the centre. We believe this plant has passed into Mr. Gurney Fowler's collection.

Oncidiums and Renanthera Imschootiana formed a pleasing background to a group of orchids staged by Mesrs. Stuart Low and Co., Enfield. Here was a beautiful plant of Lælio-cattleya Haroldeana carrying five handsome rosy-carmine flowers; Odontoglossun grande, Dendrobium formosum giganteum and Miltonias were also displayed. Mr. E. V. Low, Vale Bridge, Haywards Heath, showed the curious Brasso-cattleya Corona, a good plant of Cœlogyne Burfordiense (the hybrid between C. pandurata and C. asperata), and the lovely Cattleya Harrisonæ alba.

Mr. D. Shill, gardener to Baron Bruno

BATH GRAND ROSE SHOW
and
GENERAL SUMMER EXHIBITION,
WEDNESDAY and THURSDAY, JULY 10th and 11th.

Classes for Roses (Nurserymen and Amateurs), Bouquets, Cut Flowers. Sweet Peas, Strawberries, Plants, and Tuberous Begonias.
Entries close Friday, July 5th.
For Prize Schedules, etc., apply,
B. R. F. PEARSON, Secretary.
Office: 17, Argyle Street, Bath.

BIRMINGHAM, THE NEW CENTRE OF HORTICULTURAL ACTIVITY.
Space should be booked without delay at this
GREAT SHOW OF THE MIDLANDS
The Opening Ceremony will be performed by The Right Honorable the Countess of Warwick, on Friday, July 19th. at 12 o'clock mid-day.
Schedules (post free) from Secretary:
William G. Carradine, F.R.H.S., Hamstead Road, Birmingham.

BLETCHLEY AND FENNY STRATFORD HORTICULTURAL SOCIETY.
BLETCHLEY PARK, BUCKS.
Magnificent grounds, adjoining Bletchley Junction, L. and N.W. Rly.

THIRD ANNUAL SHOW,
AUGUST 5th, 1912, BANK HOLIDAY.
The leading Show in the Midlands.
Prizes amounting to £18 offered for Carnations, £16 for Roses, in open classes, Special Prizes for Table Decorations, etc., etc.
Schedules on application to Secretary,
THOS. BEST.
Bletchley. June 17th, 1912.

Cardiff & County Horticultural Society.
24th GRAND ANNUAL SHOW
SOPHIA GARDENS, CARDIFF,
Wednesday & Thursday, July 17 & 18, 1912.
Specially good prizes in every Section, amounting in Money and Plate to nearly £500.
Tents lighted by electricity by Messrs. Fred Price and Co., Ltd.
POPULAR PRICES.
Schedules from the Secretary,
Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff

HANLEY PARK, STAFFORDSHIRE.
JULY 3rd and 4th, 1912.
SIXTEENTH
GREAT ANNUAL FLORAL FETE.

£500 in Prizes, Silver Cups, Gold and Silver Medals, Silver Challenge Cup, value £10 10s., offered for "Trade Exhibit" (for particulars see page 7 in Schedule).
Valuable Special Prizes offered by the Principal Firms in England.
Schedules post free on application to
WM, POULSON, Secretary.
Town Hall, Hanley.

SALTAIRE, SHIPLEY, AND DISTRICT ROSE SOCIETY.

TENTH ANNUAL EXHIBITION will be held in SALTAIRE PARK, on WEDNESDAY, JULY 17th, 1912. (Postponed from July 9th.)
Entries close July 12th.
Schedule and further particulars from the Hon. Secretary, E. WRIGHT, Rosedene, The Glen, Saltaire, Yorks.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

Schroder, The Dell, Egham, exhibited the glorious Lælio-cattleya Baroness Emma (C. Hardyana × L.-c. eximia) with grand purple lip (F.C.C.); and Miltonia Bleuana Rising Sun (A.M.), white with orange-yellow disk. Cattleya gigas Mandaiana came from Mr. W. A. Manda, St. Albans; and Messrs. Sander and Sons secured an A.M. for Odontonia St. Albans (Miltonia fuscatum × Odontoglossum Pescatorei).

### FRUIT AND VEGETABLE COMMITTEE.

Mr. A. E. Bourse, Hope Vitw, Biggleswade, gained a Silver Medal and Cultural Commendation for three bunches of wonderfully fine asparagus. Messrs. Whitelegg and Page showed the Newberry, a strong rambling grower, and very free fruiting, the berries even larger than those of the loganberry.

### CERTIFICATES AND AWARDS.

First-class Certificate.—To Lælio-cattleya Baroness Emma, from Baron Bruno Schroder (gardener, Mr. Shill), The Dell, Egham; to Odontioda Cooksoniæ, Fowler's var., from Messrs. Charlesworth and Co., Haywards Heath.

Award of Merit.—To Odontonia St. Albans from Messrs. Sander and Sons, St. Albans; to Miltonia Bleuana Rising Sun, from Baron Bruno Schroder, The Dell, Egham; to Carnation Mrs. Husan Morris, from S. Morris, Esq., Thetford; to Begonias James Braid, F. W. Walker, and Golden Shower, from Messrs. Blackmore and Langdon, Twerton, Bath; to Delphinium Harry Smeatham, from Messrs. Blackmore and Langdon, Bath; to Delphiniums Drake, Tagalie, and Lovely, from Messrs. J. Kelway and Son, Langport; to Eremurus Lemon Queen, from Messrs. Jas. Veitch and Sons, Chelsea; to Philadelphus Bouquet Blanc, from Messrs. Jas. Veitch and Sons; to Philadelphus Vio Lactée, from Messrs. Jas. Veitch and Sons, and Messrs. Paul and Sons, Cheshunt; to Lavatera Olbia, from Mr. M. Pricsard, Christchurch; to Delphinium Lavender, from G. Ferguson, Esq. (gardener, Mr. F. W. Smith), Weybridge; to border Carnation Cyclops, from Mr. Charles Blick, Hayes; to Malmaison Carnation Charles Blick, from Mr. Charles Blick, Hayes; to roses Pink Pearl and Effective (pillar variety), from Messrs. Hobbies, Lim., Dereham.

After trial at Wisley the following delphiniums have been granted an Award of Merit: To Darius, Cymbeline, Jessica, and Lorenzo, from Messrs. G. Bunyard and Co., Maidstone; to Mrs. James Kelway, Smoke of War, Dr. Lodwidge, and Royal Standard, from Messrs. J. Kelway and Son, Langport; to Mdme. E. Geny, J. S. Sargent, Colonel Crabbe, and Dr. Bergman, from Messrs. J. Forbes, Lim., Hawick; to J. S. Brunton, from Mr. B. Ruys, Dedemsvaart, Holland; and to Lizzie Van Veem, from Mr. J. Box, Lindfield.

### MEDALS.

Gold.—To Messrs. Sutton and Sons, Reading, for sweet peas.

Silver-gilt Flora.—To Messrs. Frank Cant and Co., Colchester, for roses; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. Sander and Sons, St. Albans, for orchids; and to Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse plants and hardy flowers.

Silver-gilt Banksian.—To Mr. Jas. Box, Lindfield, for hardy flowers and sweet peas.

Silver Flora.—To Messrs. Blackmore and Langdon, Twerton, Bath, for delphiniums; to Mr. H. Burnett, Guernsey, for carnations; to Messrs. G. and A. Clark, Dover, for hardy flowers; to Messrs. Wm. Cutbush and Son, Highgate, for hardy flowers; to Messrs. Gunn and Son, Olton, for phloxes and violas; to Messrs. G. Jackman and Son, Woking, for hardy flowers; to Messrs. Carter Page and Co., London Wall, for dahlias, etc.; to Messrs. Wm. Paul and Son, Waltham Cross, for roses; to Mr. Amos Perry, Enfield, for hardy flowers; to Messrs. R. Wallace and Co., Colchester, for hardy flowers; to Messrs. Stuart Low and Co., Enfield, for orchids; to Mr. Black, gardener to R. Thwaites, Esq., Streatham, for orchids; to Mr. H. Davidson, Borlases, Twyford, for orchids.

Silver Banksian.—To Messrs. Barr and Sons, Covent Garden, for hardy flowers; to Messrs. R. H. Bath, Lim., Wisbech, for pæonies and delphiniums; to Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; to Messrs. H. Cannell and Sons, Swanley, for begonias, etc.; to Mr. W. J. Godfrey, Exmouth, for Canterbury bells; to Mr. L. Greening, Richmond, for rock garden; to Messrs. J. Kelway and Son, Langport, for pæonies and delphiniums; to Messrs. Stuart Low and Co., Enfield, for carnations; to Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; to Messrs. Paul and Son, Cheshunt, for roses; to Mr. Maurice Prichard, Christchurch, for hardy flowers; to Mr. A. E. Bourse, Biggleswade, for asparagus; to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Bronze Flora.—To Messrs. Bakers, Wolverhampton, for hardy flowers; to Mr. R. L. Russell, Richmond, for salvias, etc.; to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers.

Bronze Banksian.—To the Misses Hopkins, Shepperton, for hardy flowers; to Messrs. E. W. King and Co., Coggeshall, for sweet peas; to Mr. G. Reuthe, Keston, for hardy flowers; to Messrs. A. A. Walters and Son, Bristol, for delphiniums; and to the Liverpool Orchid Nursery Company, Liverpool, for orchids.

## National Hardy Plant Society.

JUNE 19.

The first show of this latest aspirant to national honours was held in the Royal Horticultural Hall, Vincent Square, Westminster. The competitive section hardly came up to expectations, but the trade exhibits made up for any deficiency in the other classes, for the result was a fine show. The arrangement of the hall might have been better from a spectacular point of view, but this was partly owing to its following so closely on the heels of the fortnightly show, and partly to some of the exhibitors cancelling their entries on the morning of the show.

The premier class in the show was for a collection of hardy flowers to occupy a space fifteen feet long by five wide. Here there were four very fine entries, the first prize being awarded Messrs. Fred. Smith and Co., Suffolk Seed Stores, Woodbridge, who staged a splendid exhibit, lightly arranged. The chief subjects employed were delphiniums, papavers, alstremerias, campanulas, Potentilla Louise Van Houtte, heucheras, and Inula glandulosa. If a fault could be found it was with the long sticks supporting the labels. The second prize falling to Mr. Frank Bouskell, Market Bosworth, Nuneaton, who had a more richly coloured group, the papavers with delphiniums, gaillardias, irises, pæonies, and pinks were nicely blended, and there was a lightness about the group that must have made the exhibit a very close second; while Messrs. Bees, Lim., were third. Messrs. F. Smith and Co. were awarded for their collection the gold medal offered by the GARDENERS' MAGAZINE for the best exhibit in the show.

Class 2 was for a collection of hardy herbaceous perennials grouped on the floor in a space twenty feet by nine. The first prize was well won by Messrs. G. and A. Clark, Lim., Dover, who had a really fine display, arranged in a most artistic fashion. The irises were beautifully grouped, with fine clumps of Betonica grandiflora, Artemesia tinctoria, Pyrethrum Mrs. Alfrey, Pentstemon tubiflorus, and campanulas. The group was well finished off with grasses and turf.

Messrs. Whitelegg and Page, Chislehurst, were second with a rather loose but highly effective group. The chief features were the delphiniums, anchusas, campanulas, and gaillardias, the front being formed with alpine pinks and violas.

For a collection of irises, Mr. F. Bouskell was awarded second prize for a collection that were unnamed, and consequently of little educational value.

For a collection of delphiniums there were only two competitors, Messrs. Blackmore and Langdon being placed first with splendid examples of Harry Smetham, Lord Curzon (very

MESSRS. F. SMITH AND CO.'S COLLECTION OF HARDY HERBACEOUS PLANTS.

Awarded the first prize in its class, and the GARDENERS' MAGAZINE Gold Medal for the best exhibit in the competitive classes at the Hardy Plant Society's Show, June 19.

fine), Queen Wilhelmina, Fred Miles, Perfection, Mrs. W. Shirley, Rev. E. Lascelles, Era, and Ampere. Messrs. R. H. Bath, Lim., were second with a beautiful display, but they lacked the weight of the first prize collection.

There was but one entry for twelve vases of laced pinks, and the second prize was awarded to Mr. R. Morton, Grange Dene, Woodside Park, whose best vases were A. Brown, Lufra, Jean Douglas, Chantilly, Prince Christian, and Fred Hooper.

The class for four vases of hardy flowers appeared most popular, there being five entries. Brodie Henderson, Esq., Little Berkhampstead (gardener, Mr. H. Smith), was placed first with Campanula persicifolia alba, Pæony Summer Day, Spiræa aruncus, and a seedling delphinium. Mr. R. Morton was second with five vases of King of Delphiniums, Eremurus Bungei, and Iris Black Prince; while Mr. F. H. Norman was third. Mr. F. H. Norman was the only exhibitor for a collection of hardy perennials to occupy a space four feet by three, and he was awarded the first prize.

For a collection of violas, Mr. J. Bastock, 75, Springfield Road, Birmingham, won first prize with a fine display, the best varieties being Mother Bastock, Moseley Perfection, George Dunn, A. J. Bastock, Moseley Purple, and Ajax; while Mr. A. M. Sharratt, Shenley, was second, having good specimens of Countess of Eglinton, Adie Elsdon, Kathleen, and Willie Farmer.

### NON-COMPETITIVE EXHIBITS.

Mr. G. W. Miller, Clarkson Nurseries, Wisbech, had an arrangement of pyrethrums, Iceland poppies, pæonies, and Viola cornuta purpurea. Messrs. H. B. May and Sons, Upper Edmonton arranged a splendid group of hardy ferns, comprising some sixty species and varieties. The plants were in splendid condition, and looked beautifully cool and refreshing beside the other groups. Athyriums, lastreas, polystichums, scolopendriums were in variety, with blechnums in fine condition. Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath, had a splendid exhibit of Delphiniums, which were mostly fresh flowers. Robert Cox was magnificent with spikes two to three feet long. The Rev. E. Lascelles, Elsie, and Checla were also amongst the best.

Messrs. Barr and Sons, Covent Garden, rearranged their fine group, and added some new features, which included a fine collection of gladioli, including Queen Mary and Chas. Smith.

Messrs. Kelway, Langport, also refurnished their group with pæonies and delphiniums, making a bold display. While the magnificent group of delphiniums, pinks, and nymphæas from Mr. Amos Perry, Hardy Plant Farm, Enfield, were greatly admired. Messrs. R. H. Bath, Lim., Wisbech, also added to their fine group of pæonies, delphiniums and Spanish irises, the whole forming an attractive feature. Mr. Vincent Slade, Staplegrove Nursery, Taunton, also staged some nice specimens of Polypodium cambricum.

Mr. James Box, Lindfield, Sussex, had his fine exhibit of hardy flowers still on view, as did also Mr. G. Reuthe, Hardy Plant Nursery, Keston, Kent. Mr. W. J. Godfrey, Exmouth, rearranged his famous group of Campanula calycanthema; while Messrs. G. Bunyard and Co. Lim., Maidstone, presented their fine table of hardy flowers. The delphiniums and irises were beautifully bright and fresh.

Messrs. Pulham, Elsenham, also displayed some nice alpines. Messrs. Paul and Son, Cheshunt, also had their exhibit in fine condition, staging about fifty varieties of pæonies, with a fine collection of heucheras. Messrs. Wm. Cutbush and Son, Highgate, had altered their group considerably, adding some fine English irises, also a number of gladioli.

Mr. R. Prichard, West Moors, Wimborne, also left his fine collection of alpines on view.

The naturally arranged exhibit of Messrs. J. Cheal and Sons, Lim., Crawley, displayed their hardy flowers to perfection. It was a really charming display.

Mr. Maurice Prichard, Christchurch, had the same exhibit as on Tuesday, but it was as fresh and bright as on the previous day, the campanulas and delphiniums being excellent.

Messrs. Carter Page and Co., 52, London Wall, London, E.C., exhibited a large collection of violas, in pans, the most conspicuous being Bute Yellow, Royal Scot, James Pilling, Mrs. J. H. Rowlands, and Mauve Queen.

Messrs. Pipers, Bayswater, W., contributed an artistic group of hardy flowers, arranged with stone. The eremuri were excellent, as were also the liliums, irises, primulas, and alpines at the foot.

Messrs. J. Gibson and Co., Leeming Bar, also staged some fine hardy flowers, in which were noted Gaillardia Meteor, Eremurus robustus, pæonies in variety, liliums, and centaurias.

Messrs. W. and J. Brown, Stamford, also contributed a fine display of hardy flowers, the liliums and gaillardias being especially fine.

The Misses Hopkins, Shepperton-on-Thames, had a tasteful display of hardy flowers.

Mr F. Bouskell, Market Bosworth, exhibited a large collection of verbascums, which were somewhat marred by a lack of greenery. The best were V. Pannosum, A. M. Burnie, V. Chaxi, and Ivanhoe.

### AWARDS.

Gold Medal to Messrs. Blackmore and Langdon, Messrs. Wm. Cutbush and Son, Mr. Maurice Prichard, Messrs. Barr and Son, Mr. Amos Perry, and Messrs. J. Piper and Son.

Silver-gilt Medals to Messrs. W. and J. Brown, Messrs. H. B. May and Sons, Mr. G. Reuthe, Messrs. T. S. Ware, Lim., and Mr. J. Box.

Silver Medals to Messrs. R. H. Bath, Lim., Messrs. G. Gibson and Co., Messrs. G. Bunyard and Co., Messrs. Carter Page and Co., Messrs. Bakers, Messrs. Kelway and Son, Messrs. W. J. Godfrey and Son, Mr. F. Bouskell, and Messrs. J. Cheal and Son.

Messrs. F. Smith and Co. were awarded the Gardeners' Magazine Gold Medal for the best exhibit in the show

F.C.C. to Wahlenbergia gentianoides, from Mr. R. Prichard, Lithospermum Froebelli, from the same exhibitor; to Delphinium Dusky Monarch, from Messrs. J. Kelway and Son; to Gladiolus Queen Mary; to Delphinium Lavender, from Mr. G. Ferguson; to Lavatera Olbia, from Mr. M. Prichard; to Rodgersia tabularis, from Mr. Amos Perry.

## National Gladioli Society.

This society held its first summer show of early flowering gladioli in the Royal Horticultural Hall, Vincent Square, Westminster, in conjunction with the usual fortnightly meeting. Although it was not a great effort, it will suffice to draw attention to this beautiful section of the gladioli. For twelve varieties, six blooms each, Messrs. E. H. Wheadon and Sons, Guernsey, won the premier award with beautiful vases of Sarnia's Glory, Dawn, Orient (a very beautiful vase), Peach Blossom, Dauntless, Beauty, The Queen, and Dictator. Mr. C. Blamfield, Guernsey, was second. For six varieties, Mr. F. Lilley, Guernsey, led off with some fine spikes, King Edward VII., Dewdrop, Princess Victoria, Pink Perfection, Salmon King, and Queen Alexandra. For a small group, three feet by six feet, Mr. Lilley was again successful, staging fine vases of Princess Victoria, King Edward, Queen Alexandra, King of Spain, and Dewdrop.

Mr. K. Velthuys, Hillegom, had a nice representative collection in which were noted the distinct Baron Jules Hulot, Augusta, America, etc. Mr. F. Lilley also contributed a gay group, though he had rather an unfortunate position for staging.

## East Anglian Horticultural Club.

At the June meeting of this club Mr. Hy. Goude, the Norfolk County Council Lecturer, gave a discourse upon "Pests" (Insect and Fungoid) that he has met with in the course of his work as horticultural instructor in the large county of Norfolk. As there are on the western side large tracts of land which each year are devoted to potato culture, it was only to be expected that they came first for comment. The leaf-curl disease is generally in error attached to "the disease" of which everyone dreads. Both the American and the old form of mildew are often met, and are proving disastrous to gooseberry growers. The mite has entirely prevented growers in some of the districts growing black currants, whilst in others the strawberry beetle has carried on its ravages to an injurious extent. Caterpillars and aphis, apple suckers and scale, appeared more in some places than in others; the bright side of it, however, was that one noted nowadays more active and stringent steps were taken to check and eradicate these enemies, by spraying and clean culture. The matter brought out a very animated general discussion.

There was a capital display of flowers, fruits, and vegetables upon the tables, the thanks of the meeting going to Mr. F. Wilby, gardener to F. A. Bainbridge, Esq., for sweet peas; to Messrs. A. J. and C. Allen, for their group of new roses; and to Mr. Frank Neave, for a display of pansies and columbines. The summer excursion of the club is this year fixed for July 11, to the notable gardens of Westwick House, by kind permission of Colonel B. J. Petre.

⁂ Mr. H. N. Ellison, West Bromwich, was awarded a Silver-gilt Medal for the fine collection of plants he exhibited at the Royal Counties Show, Guildford.

## Yorkshire Floral Fete and Gala.

(Continued from page 464.)

Mr. Barnes secured 20½ points, making a total of 109 points. Second prize fell to Mr. J. Edmonds, gardener to the Duke of St. Albans, Bestwood Park, Arnold, Notts, who had good dishes of Royal Sovereign strawberries, Lord Napier nectarines, and Black Hamburgh grapes; for this exhibit the judges awarded 95 points. Carnations and gypsophila were used for decoration. Third prize fell to Messrs. C. E. Simpson.

In the class for a collection of ten kinds of fruits there were four entries. Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, was a capital first with Black Hamburgh and Foster's Seedling grapes, Early River's cherries, Lady Sudeley apples, Brown Turkey figs, Royal George peaches, Royal Sovereign strawberries, Royal Jubilee melon, Early Transparent Gage plums, and Lord Napier nectarines. Mr. J. Edmonds came second with good strawberries and Dymond peaches; Mr. J. E. Hathaway, gardener to J. Brennand, Esq., Baldersby Park, Thirsk, third.

Mr. Edmonds led for six kinds of fruit, and he had a very nice Queen pineapple in his set; Mr. S. Barker second, and Mr. J. Hathaway third. For four dishes of fruits the prizes fell in due order to Mr. W. N. Hague, gardener to W. D. Cliff, Esq., Meanwood Towers, Leeds; Mr. Edmonds, and Mr. J. Hathaway.

Mr. Edmonds scored for a pair of bunches of Black Hamburgh grapes, with finely-berried and deeply-coloured clusters; Mr. H. E. Bray, gardener to Lady Hawke, Tadcaster, second. Mr. Edmonds also led for a pair of bunches of white grapes with neat examples of Muscat of Alexandria; Mr. Hague second, and Mr. N. F. Barnes third.

### NON-COMPETITIVE.

Messrs. Sutton and Sons, Reading, occupied their usual position, and made up an elaborate exhibit of flowers, fruits, and vegetables, the whole arrangement being good; the firm's specialities in peas, cucumbers, tomatoes, melons, and beans were pleasingly associated with sweet peas, stocks, gloxinias, poppies, delphiniums, and other charming summer flowers. Messrs. J. Kelway and Sons, Langport, exhibited stately and beautiful delphiniums in association with such charming single pæonies as Queen of Roses, Heart's Desire, Scilla, and Purple Cup, the latter rich crimson-purple, and a real beauty. Messrs. Dickson's, Chester, filled a goodly length of tabling with sheaves of pæonies, delphiniums, and irises, fronted with a wide selection of pæonies, poppies, campanulas, liliums, and spiræas

The delphiniums from Messrs. R. H. Bath, Lim., Wisbech, were particularly good, notably the varieties Mrs. K. F. Caron, Rev. E. Lascelles, Hampton, and Duke of Buccleuch; pæonies and Spanish iris were also good. Messrs. Wm. Cutbush and Son, Highgate, showed a capital lot of perpetual carnations, Alma Ward and Mrs. L. Mackinnon being very fine; the new pink named Princess Christian, very free, was splendid, and the new hydrangeas, araucarias, coleus, etc., all added to the effectiveness of a good display.

Messrs. Dobbie and Co. Edinburgh, showed a glorious group of bunches of sweet peas, in which May Campbell, Thos. Stevenson, Inspector, Melba, Decorator, Dobbie's Scarlet, and other of their specialities were conspicuously beautiful. Early dahlias, chrysanthemums, and antirrhinums were also staged. Messrs. Aldersey and Marsden Jones, Tilston, contributed a few sweet peas and hardy flowers. Mr. C. F. Waters, Balcombe, contributed a collection of perpetual carnations. Messrs. Young and Co., Hatherley, Cheltenham, exhibited carnations finely, putting up splendid bunches of good blooms of Duchess of Devonshire, Robert Craig, Mikado, Cecilia, Mrs. Greswolde Williams, Britannia, and White Enchantress. Mr. W. J. Godfrey, Exmouth, sent his new Canterbury bells and poppies. Miss Hemus, Upton-on-Severn, had an exhibit of dainty Iceland poppies and sweet peas.

Mr. Clarence Elliott, Six Hills, Stevenage, put up a most interesting rock garden, planted with colonies of Wahlenbergia saxicola, Nepeta Musseni, Campanula pulla, Oxalis enneaphylla, Orchis maculata, and other pretty plants. Messrs. E. J. Batchelor and Sons, Harrogate, massed fine varieties of useful ferns, and made free use of Nephrolepis Batchelori, a lovely mossy-fronded form of great beauty; N. Schouleri, N. Whitmani, and N. todeaoides were other fine things staged in a goodly group. Messrs. Seagrave and Co., Sheffield, were represented by a fragrant display of violas flanked by ivy-leaved pelargoniums.

Messrs. Hogg and Robertson, Dublin, showed ixias grandly—indeed, they made an unusually fine display of these beautiful flowers, in association with Spanish irises. Messrs. S. Broadhead and Son, Huddersfield, put up a little rock garden, and Mr. J. E. Sadler, Newbury, showed hybrid orchids, liliums, and hardy flowers. Mr. A. F. Dutton, Iver, Bucks, contributed one of his fine exhibits of beautiful carnations, and if any were better than the rest they were Mikado, Enchantress, Mrs. A. F. Dutton, White Lawson, and Winsor. Mr. C. W. Breadmore, Winchester, put up a beautiful lot of sweet peas, and the colouring of his Scarlet Emperor, Marjory Linzie, Stirling Stent, Princess Mary, Dazzler, and Aggie Elder was lovely.

Messrs. Webb and Sons, Wordsley, Stourbridge, displayed their fine gloxinias in front of a bank of sweet peas, liliums, spiræas, etc. In front of all this beauty they arranged first-rate cauliflowers, peas, marrows, potatoes, melons, tomatoes, etc. Messrs. H. B. May and Sons, Edmonton, submitted a large, beautiful, interesting, and educational exhibit of useful ferns. Messrs. Jarman and Co., Chard, sent pelargoniums and their charming varieties of sweet sultans. Mr. Chas. Warner, Abbey Nurseries, Leicester, put up a most interesting exhibit of hardy fuchsias,

Messrs. Bide and Sons, Farnham, contri-

THE
VERY LATEST
AND BEST IN
HAND PNEUMATIC SPRAYERS.

**The "Four Oaks,"** acknowledged by all users to be far and away the best on the market.

**No separate pump.** Self contained. A great advance over those kinds with separate pump. Cannot get out of order. The easiest, handiest, and most economical sprayer for greenhouse and garden work and disinfecting.

**The "FOUR OAKS" Streetley Pattern.**

Capacity, 2 Quarts.
Working capacity, 6 Pints.

Prices:
In Copper - **25/-**
In Steel - **17/6**

The copper machine is recommended where price is not a great consideration. Is **lighter, cleaner, and will not rust.**

Sole manufacturers:—
THE FOUR OAKS SPRAYING MACHINE Co.,
Four Oaks Works,
SUTTON COLDFIELD, BIRMINGHAM

buted a nice set of sweet peas; Mr. W. A. Manda, St. Albans, sent new ferns, etc. Mr. H. N. Ellison, West Bromwich, interested hosts of people with a collection of curious cacti (set up by him for Messrs. F. A. Haage, jun., Erfurt), and choice ferns. Mr. W. J. Unwin, Histon, showed Mrs. W. J. Unwin, Clara Curtis, Nora Unwin, Gladys Burt, and Arthur Unwin, and other sweet peas of his raising. Messrs. G. Massey and Sons, Spalding, sent a lovely lot of herbaceous pæonies. Messrs. A. W. King and Co., Coggeshall, put up an artistic display of sweet peas, arranging their flowers in stands of varying height rising well above the usual bunches of bloom; Mrs. W. King, Anglian Lavender, Anglian Orange, and Anglian Crimson were foremost varieties. Mr. G. W. Millar, Wisbech, again showed his fine new pyrethrum Queen Mary.

Messrs. Charlesworth and Co., Haywards Heath, put up a pretty group of orchids, wherein the leading plants were Odontioda Bradshawiæ, Odontoglossum Aireworth, L.-c. Canhamiana alba, Cattleya Mossiæ Wagneri, and C. M. Reineckiana. Messrs. Mansell and Hatcher, Rawdon, Leeds, had also an attractive exhibit of orchids, and here Cypripedium Curtisi, C. Smithi, Lælio-cattleya Martineti, L.-c. Eudora, and Lælia purpurata were conspicuous. Messrs. Sander and Sons, St. Albans, presented a goodly group of orchids, and they had fine examples of Lælio-cattleya Martineti, Cattleya gigas Sanderiana, L.-c. Fascinator, and Miltonia vexillaria Lambeauiana, with lovely white flowers.

Mr. George Yeld, Burton Lane, York, submitted a small but very beautiful collection of hybrid and cross-bred hemerocallis and irises; among the latter Asia, Purity, Sea Nymph, Nero, and Geraldine were particularly pretty. Mr. Yeld's excellent work is becoming more and more important and useful. Mr. E. J. Hicks, Twyford, displayed roses finely, and his stands of Mdme. Abel Chatenay, Richmond, Mdme. Jules Grolez, and Frau Karl Druschki were first-rate.

Mr. George Prince, Longworth, was a large exhibitor of roses, and put up charming lots of Le Progrés, Lady Hillingdon, the new Rayon d'Or, Lady Pirrie, Juliet, and other bright varieties. Mr. Henry Drew, Longworth, displayed a nice collection of rambling, decorative, and garden roses. Mr. R. Sydenham, Tenby Street, Birmingham, staged a set of sweet peas in rustic ware.

### MEDALS, ETC.

Premier Prize.—The Archbishop of York's prize for the most meritorious exhibit in the show went to Mr. J. Donoghue, gardener to J. Pickersgill, Esq., Weetwood, for his group.

Special Gold Medal.—For best collection of orchids, to Messrs. Sander and Sons, St. Albans. For the best collection of decorative plants and cut flowers, arranged for effect, to Messrs. Wm. Cutbush and Son, Highgate.

Large Gold.—To Messrs. Webb and Sons, Wordsley, Stourbridge; to Messrs. E. W. King and Co., Coggeshall; to Mr. E. J. Hicks, Twyford; to Messrs. Dobbie and Co., Edinburgh; and to Messrs. Sutton and Sons, Reading.

Gold.—To Messrs. Sander and Sons, St. Albans; to Messrs. W. Cutbush and Son, Highgate; and to Messrs. Young and Co., Hatherley, Cheltenham.

Large Silver-Gilt.—To Messrs. Hogg and Robertson, Dublin; Mr. G. Yeld, York; and Messrs. Charlesworth and Co., Haywards Heath.

Silver-Gilt.—To Mr. C. Elliott, Stevenage; to Messrs. R. H. Bath, Wisbech; to Messrs. Mansell and Hatcher, Rawdon, Leeds; to Messrs. J. Kelway and Son, Langport; to Messrs. H. B. May and Sons, Edmonton; to Messrs. W. and J. Brown, Stamford; to Mr. C. F. Waters, Balcombe; and to Mr. C. W. Breadmore, Winchester.

Large Silver.—To Mr. G. Prince, Longworth; and to Messrs. Batchelor and Son, Harrogate.

Silver.—To Messrs. Aldersy and Marsden Jones, Tilston; to Messrs. Seagrave and Co., Sheffield; to Mr. H. Drew, Longworth; to Miss Hemus, Upton-on-Severn; to Messrs. W. J. Godfrey and Son, Exmouth; to Mr. J. E. Sadler, Newbury; to Mr. F. A. Haage, jun., Erfurt; to Mr. W. J. Unwin, Histon, Cambs; to Messrs. Massey and Sons, Spalding; to Mr. C. Warner, Leicester; and to Messrs. Jarman and Co., Chard.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

---

RUST ON FERNS.—C. C. W., Clapham: I should be glad of information, cause, and cure, if any, regarding the rust as on specimens of fern fronds enclosed. Rust of this character appears to be a local trouble here, and some gardeners will not attempt to grow pteris in this district because of the trouble. At present I have a fernery where plants are growing freely in rockwork, and there are no signs of rust on these, but a batch of pteris in another house is badly affected.—We have on several occasions pointed out that the "rust" that appears all too frequently on ferns, is similar to, if not identical with, the Begonia rust. One of the mites, a species of Tarsonymus, is the cause of the trouble, and it is encouraged by a dry atmosphere. Infested plants should be dusted freely and frequently with tobacco dust, and the atmosphere of the house must be kept moist. Another method of dealing with the pest is that of dipping the infested plants in a soft soap and sulphur mixture. Take four ounces of soft soap and knead into it as much flowers of sulphur as it will comfortably hold; add hot water and stir vigorously till the soap and sulphur are dissolved, and then add sufficient tepid soft water to make up a gallon and a-half of solution. Into this dip the plants at intervals of a week; one dipping will kill the mites but not the eggs, hence a second, and probably a third dipping will be necessary. See that the surroundings are clean, or the pest may re-infest the ferns from other plants.

THINNING PEACHES AND NECTARINES.—F. R., Chatham: Kindly tell me what would be a fair crop of peaches and nectarines for trees covering a wall space about ten feet high and twelve feet wide.—Where the conditions are satisfactory, and the trees are in good health, peaches should average one fruit to every square foot of space occupied of the tree, and nectarines about one fruit to every nine-inch square. Thus your peach trees filling a space 10ft. by 12ft. should carry 120 fruits; rather more if the tree is very robust; somewhat fewer if it is not growing freely. A nectarine occupying a similar space might carry 212 fruits, or thereabouts. When there is a good set of fruit the aim should be to so thin them that they are as evenly distributed as possible all over the tree. Some consideration must also be given to the size of the variety; the smallest nectarines may well be left a little closer together on a vigorous and well-fed tree, while the largest peaches should be thinned rather more severely than the medium ones.

ASPARAGUS BEDS.—M. G. E., Pinner: What is the best method of dealing with asparagus beds at this season of the year?—Cutting should cease by the end of the month, and the beds be then carefully weeded and given a dressing of nitrate of soda at the rate of one ounce to the square yard. If the weather is dry, water the nitrate in. A similar dressing a fortnight later will prove beneficial, and if you have liquid farmyard manure at disposal give the beds a good soaking with it between the nitrate dressing, and then once a week for a month after. The aim should be to encourage strong growth, as it is only by so doing that fine crowns are built up for next season's crop. Such encouragement is altogether better than piling wet manure on the beds in the late autumn after the growths have been removed. Put stakes at the corners of the beds and some at intervals along the sides, and attach cords thereto, running the cords across and also round the beds, at about three feet from the ground; this will prevent damage to the growths by wind and heavy rain.

Canary Guano
"THE BEST IN THE WORLD."
There is no Fertilizer that gives such good all-round results as Canary Guano. It is used by the leading Amateur and Trade Growers all over the country. A postcard to the Manufacturers will ensure full particulars. . . . . .
Sold by practically all Seedsmen in Tins, 6d., 1s., and 2s. 6d., and in Bags (14lb.) 3s. 6d.; (28lb.), 6s.; (56lb.), 11s., and 1 cwt., 20s. each.
Manufactured by:
The Chemical Union, Ltd.
IPSWICH.

SPECIMENS OF DRACÆNA SANDERIANA.—E. D., St. Neots: Can you tell me how some growers manage to get such useful, tall specimens of Dracæna Sanderiana in 32-sized pots, and sometimes even in 48's.? Do they cut back old plants for the purpose?—The useful examples of Dracæna Sanderiana so often seen where plants are freely used for decorating, are produced by placing three, four, or five young, newly-rooted plants together, the tallest in the centre, and growing these in brisk heat and a moist atmosphere. One stake is used, and the growths are "slung'" to it. When a fair size has been obtained, a hardening-off process is carried out, and the specimens are soon fit to stand rough usage and exposure. We have seen Dracæna Sanderiana used freely out of doors during the summer in sub-tropical gardening.

THE SOURCE OF SAFFRON.—P. B., Newquay: No doubt you know that many Cornish people have a liking for Saffron cake; I believe saffron is the product of a crocus, but am not at all sure how it is produced. A few words of enlightenment will greatly oblige.—Saffron is obtained from Crocus sativus, an autumn-flowering species that was once cultivated extensively around Hinton, in Cambridgeshire, and especially round Saffron Walden, in Essex. At the present time Spain provides most of the saffron in commerce. Saffron is a drug as well as a dye, and is obtained by picking the stigmas and part of the style; these are picked in early morning, made up into a mass two or three inches thick, pressed with a heavy weight, "sweated" in considerable heat, and then dried in a lower temperature. The cake thus produced is commercial saffron. Some idea of the expensiveness of the drug may be gathered from the fact that about 4,300 stigmas are needed to make an ounce of saffron. It is said that one grain of saffron will suffice to give a distinctly yellow tint to ten gallons of water.

SEA HOLLIES.—B. S., Southampton: Having quite fallen in love with Eryngium alpinum, I wish to add other good sea hollies to my collection of hardy perennials, and shall be glad if you will name those that are worthy of cultivation, so that I may make their acquaintance before purchasing. —Besides Eryngium alpinum, good sea hollies include E. maritimum, 1½ft.; E. amethystinum, 1½ft.; E. Oliverianum, 3½ft.; E. Bourgati, 2ft.; E. giganteum, 4ft.; and E. planum, 1ft.

### NAMES OF PLANTS.

A. J. G., Calne.—Thalictrum aquilegifolium.

W. C. B., Doncaster.—Appears to be a form of Mertensia dahurica.

L. P., Grasmere.—1, Oncidium Marshallianum; 2, Cattleya gigas—a capital form.

F. T. R., Rye.—1, Anchusa italica; 2, Isatis glauca; 3, Campanula persicifolia; 4, Thalictrum flavum 5, Polygonum Baldschuanicum; 6, Lathyrus rotundifolius.

N. E. H., Chirk.—1, Lychnis viscaria fl.-pl. 2, Viburnum Lantana; 3, Sonerilla margaritacea; 4, Lælia purpurata; 5, Pyrus Aria; 6, Dianthus alpinus.

**Fabiana imbricata.** — Though a member of the order Solanaceæ, this Chilian shrub bears a good deal of resemblance to a heath, the leaves being small and scale-like, while the pure white flowers are tubular in shape. In the South and West of England it is a delightful out-door shrub, but even where it will not stand the winter in the open ground it is well worth culture as a decorative plant for the greenhouse.—T.

## MARKETS.

## CATALOGUES RECEIVED.

VILMORIN, ANDRIEUX, AND CO., PARIS.—The plant catalogue from Paris is of encyclopædic character, extending to 112 closely-printed pages. New plants and their descriptions fill eight pages.

W. SANFORD AND CO., LIM., HALL GREEN NURSERIES, BIRMINGHAM.—A neat list of bedding plants, dahlias, carnations, etc.

M. V. SEALE, SEVENOAKS.—Although bedding plants are included in this handy catalogue the major part of the space is devoted to descriptive lists of the various kinds of dahlias.

C. ENGELMANN, SAFFRON WALDEN.—This freely illustrated list of perpetual carnations gives portraits of Mr. Engelmann's novelties and recent introductions are given, with an excellent description of each.

KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.
Mr. ——, Castle Gardens, Rosneath, Dumbartonshire. (H.R.H. Princess ——.)
"I take the liberty to write you and to let you know that the herbaceous plants you sent have done exceedingly well—Gladioli, Hollyhocks, Delphiniums especially good. I have not lost a dozen of the plants. The Princess was also very pleased with them when here, and all that saw them said they never saw any better." (Planted April, 1911.)

FOR "HEART'S DESIRE" PÆONY, as pictured in this issue, and for other beautiful new varieties, apply to the raisers, Kelway and Son. The majority of the new Delphiniums certificated by the R.H.S. in 1912 were raised and introduced originally by KELWAY and SON, The Royal Horticulturists, Langport.

PERPETUAL - FLOWERING CARNATIONS.—Large strong bushy plants, in 4-inch pots, 6s. 6d. doz. Smaller, in small pots, 20s. 100. Illustrated catalogue, 75 varieties, post free. C. F. A. VAN DER SLUYS, F.R.H.S., Ramee, Guernsey.

ROCK GARDENS and ALPINE PLANTS. —A new work and a complete guide to the Formation and Management of Rockeries, by E. H. Jenkins, F.R.H.S. Many Illustrations. Cloth, 2s. 10d., post free, from Publisher, 148, Aldersgate Street, London.

DAFFODILS. — Surplus Bulbs, choice varieties. White Queen, 5s. 6d. each; Maggie May, 3s. 6d.; Lord Roberts, 3s. 6d.; Weardale Perfection, 2s.; King Alfred, 2s.; Monarch, 1s. 9d.; Pilgrim, 3s. 6d.; and numerous other varieties. Good exhibition bulbs sent. Address, HEAD GARDENER, Chaddlewood, Plympton, Devon.

HAMMOCKS, very strong, white Navy canvas; Hammocks, lovely for gardens or camping out, 5s. 6d. each; list Fancy Tents free; Blue Serge Gardeners' Aprons, 2s.; Useful Stools, 18 stamps.—H. J. GASSON, Government Contractor, Rye.

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.
XL ALL NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake.
XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.
XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are XL All WEED KILLER, XL ALL FERTILISER, XL ALL ROSE MANURE, RICHARDS' GREEN SUNSHADE, finest powder shading on the market, 1s. packet does 100 feet of glass. Don't forget to ask your Nurseryman or Seedsman for my small pink list.
G. H. RICHARDS, Manufacturer,
231, Borough High Street, London, S.E.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Thinning.

Chief among the multifarious details to which both the amateur and professional gardeners have to give their attention is the one commonly known as thinning, and, as will be readily conceded by those who have had the advantage of efficient training that upon the manner in which this detail is dealt with, depends in a large measure, the success achieved in garden management. The thinning may be rendered necessary by the prodigality of Nature in her endeavour to clothe the ground or other space with verdure; or by the too lavish use of seeds or plants by the cultivator in the initial steps that have to be taken both in the production of displays of flowers and of useful crops. There is no occasion to dwell at any length upon the causes of such crowding as have an injurious effect upon the development of the plants, but an endeavour should be made to obtain a clear view with regard to them for the purpose of being in a position to deal more effectively with crowding at an early stage of development than is otherwise possible. To obtain the best results from thinning, the work must be done at an early stage, and, as a rule, be proceeded with in a gradual manner. The cultivator has not only to remove sufficient plants to allow the roots and leaves of those remaining room enough to perform their allotted functions, but to guard against the risk of blank spaces due to snails and other marauders. A careful study of the habit of the various classes of plants raised from seeds sown in the open is the keystone to success, in the thinning of large numbers that in many instances suffer much from overcrowding. No difficulties that are insuperable are associated with this study, and those who devote the attention to it that is so well merited, usually make rapid progress. When for example, it is found as the result of observation that an annual when free from overcrowding will fill an area with a diameter of fifteen inches, it is obvious that twelve or more plants cannot attain their full size in a square foot. By some this may be regarded as self-evident, even to the tyro in gardening, but were it so, we should not be constantly seeing annuals springing from the ground so thickly as to suggest a sowing of small salading. We have another proof in the fact that for a long series of years annual flowers were regarded as ephemeral and unsatisfactory, simply because they were invariably so crowded that they could not do more than produce attenuated growths surmounted by a few flowers at the apex. An immense improvement has been effected within recent years in the culture of annual flowers, but much has yet to be accomplished before they will contribute to the attractions of the garden in proportion to their capabilities. Another form of thinning in the flower garden is not less necessary than the rooting up of superfluous annuals, and that is the removal of the weak and redundant growths of Michaelmas daisies, herbaceous phloxes, and other plants of a similar habit. In not a few instances, the whole of the growths are allowed to remain, and produce dense masses of foliage relieved by a few flowers at the top. Within a few weeks the herbaceous phloxes will be yielding their attractively coloured and fragrant flowers, and those who attach but little importance to the thinning of these and similar plants will do well to compare the examples in their gardens with those in the gardens of friends who consider the removal of all but three or four of the strongest growths an essential part of successful cultivation. Such a comparison as is here suggested, provided it is made with an open mind, will do more to bring about a much-needed reform in the hardy flower border than the strongest arguments that can well be urged in print. Again what delightful plants are Helianthuses Miss Mellish and rigidus, when the growths are thinned to a distance of fifteen and twelve inches respectively, while they are quite indifferent when, as so often happens, the whole of the plants are allowed to remain. They are most generally seen in a crowded state in small gardens, but masses so dense that the plants cannot attain their full development may sometimes be met with in big public gardens that are under skilful management. We might refer to the many indifferent crops of vegetables that are annually met with, more particularly in the gardens of the smaller amateurs, because of a failure to recognise the fact that none of the vegetables, in general cultivation can attain to a high state of development when much crowded. It may indeed be stated as a general proposition that a satisfactory root crop is an impossibility unless the plants are allowed a moderate space, this being determined by the dimensions to which they attain when grown with but little, if any, restriction. If it be necessary to pay increased attention to the thinning of the occupants of the flower and kitchen garden it is certainly essential the growth of fruit trees should not be allowed to suffer from over-crowding. In the case of peach and nectarine trees there is little of which complaint, so far as the number of growths allowed to remain is concerned, but it would be an immense advantage were the number of shoots produced by pears and plums considerably

[Photo: Russell and Sons.

PROFESSOR J. B. FARMER, D.Sc., F.R.S.

reduced. The practice which is sometimes adopted of allowing all the shoots to remain and then cut them back when summer pruning is in progress is not one that can be recommended. The best method of procedure is to thin the shoots where crowded at a quite early stage by rubbing off those which are weakly and ill-placed. If this was not done when the surplus shoots could be removed with the finger and thumb, it should be done now with the aid of a sharp knife, the removal being effected by cutting them off close to the base. This reduction will more fully expose the base of the remaining shoots and the short spurs to the beneficial influence of light and air, and thereby assist in fruit production.

---

**Professor J. B. Farmer, D.Sc., F.R.S.,** who has for some years past occupied the important position of professor of botany at the Royal College of Science, London, evinced quite early in life a strong taste for botanical pursuits and natural science. He had a distinguished career at Magdalen College, Oxford, and was First Class Final Honour School Natural Science in 1887. He was demonstrator of botany at Oxford University from 1887 to 1892, elected a Fellow of his college in 1889, and was assistant professor of biology at Oxford from 1892 to 1895, when he was appointed to the position he now occupies. Professor Farmer was a member of the Science and Education Committee of the Royal International Horticultural Exhibition, and contributed in no small degree to the success of the exhibition of scientific objects. He is a member of the R.H.S. Scientific Committee, and with a taste for gardening, he appreciates the importance of a close association of practice with science.

**A Minister for Horticulture** has yet to come, but we must be thankful for small mercies, and for Mr. Runciman's assurance that under the Board of Agriculture and Fisheries there will be a distinct Horticultural Branch. In answer to a question put in the House of Commons last week, Mr. Runciman stated that this new horticultural branch would embrace all sections of horticultural industry, and would have as its head Mr. A. G. L. Rogers, who would be assisted by nine experts and an adequate clerical staff.

**Gold Medal Sweet Peas.**—We understand that Mr. C. W. Breadmore, of Winchester, obtained a gold medal for his exhibit of sweet peas at the York Gala, whereas, owing to a clerical error, we credited him with a silver-gilt one.

**The Ontario Fruit Crop.**—According to the official report on the fruit crop that we have just received from the Ontario Department of Agriculture, the severity of the winter told upon some orchards in a very marked manner, while many others were practically unscathed. In the more western counties of the Lake Erie group, and in Lambton, a number of peach trees were more or less frozen in the bud, and many were at first thought to be destroyed; but later examination showed that the damage was not so bad as had been feared, as the deep snow had in most cases prevented root-killing. On the other hand, in what is known as the Niagara district—the leading commercial fruit section of the Province—peaches came through the winter with but little harm, and the frost of May was not heavy enough to injure the fruit buds. Plums and cherries give promise of good yields, and apples are also likely to give a good crop. Complaints are made of injury to various classes of fruit trees from the San José scale, more especially in the Lake Erie counties, and of the caterpillar threatening apples in some of the Lake Ontario counties east of Toronto; but spraying operations have been more active than ever this season. Raspberries, blackberries, and other bush fruits were considerably broken down or frozen back as a result of the deep snow and the severe cold, but, as a rule, they have been merely checked and not killed. Strawberries also suffered, but more from the drought of last summer than from the winter. However, taking fruit prospects generally, the outlook is encouraging, considering the unusual severity of the past season.

**Rainfall at Cardiff.**—The Cardiff Naturalists' Society have issued a report of the meteorological observations made in that district for 1911. From this we learn that the total rainfall for the year was 50.95in., for July 0.39in., and December 12.35in. The highest mean during the past ten years was 67.9in. in 1903, and lowest 39.98in. in 1905. With readings above 80 deg. on seventeen days, and above 90 deg. on two days, the residents of the district had good cause for thankfulness that so large a proportion of the rainfall was registered in December, and that the period of torrid heat was accompanied, as in July, by a light fall of rain, for, while a high temperature and heavy rainfall may have a stimulative effect upon plant life, it is not particularly pleasant to the ordinary individual.

**Cuscuta Gronowi.**—The biology and physiology of this species of dodder, which is parasitic on willows, has been investigated by Dr. K. Spisar, and the report thereon has been published in a recent bulletin issued by the International Academy of Science, Prague. It was found in the course of the investigations that seedlings would wind round organic or inorganic supports of varying thickness, the contact stimulus being so strong that contact with a thread was sufficient to bring about a reaction. During the formation of haustoria, which is not dependent either on light or the want of food, growth ceases, and the circumnutation movements are lost, but reappear after a few days. The tissues in the haustorial zone when the rest of the dodder has been torn off, give rise to adventitious buds, and thus regenerate the parasite, which is not very fastidious about its host, and may be parasitic on itself.

**Horticultural Science and Education.**—At the Conference on Legislation in connection with Plant Diseases, held recently at Chelsea, a resolution was passed asking the Science and Education Committee of the Royal International Horticultural Exhibition to continue its work with the object of furthering international action if possible. The need for combined international action appeared to be the keynote of the conference. In view of the fact that this committee virtually came to an end on the completion of the conference proceedings the Royal Horticultural Society has agreed to appoint a committee to carry on the work suggested above.

**Synthetic Rubber.**—Remembering what a large amount of capital has been expended, and how much labour employed in the production of Para and other forms of rubber, and that planting is still being vigorously conducted in many tropical countries, it is something of a shock to know that Professor W. H. Perkin has discovered a means of making rubber from fusel oil produced from starch. It is said that synthetic rubber can be produced cheaply and abundantly from such bases as cereals, maize, potatoes, etc. Two points of interest have arisen in connection with this discovery; the German chemists have made a similar discovery, but along diff lines, and at a later date than the Bri one; and during the process a wa producing acetone cheaply has been f and this is important because of the p acetone plays in the manufacture of a munition. In future, therefore, our po toes, for instance, may serve for food, or i the chemists' hands become peaceful rubbe or death-dealing ammunition.

**Postponement of Saltaire Rose Show.**—In consequence of th National Rose and National Sweet Pe Societies having fixed the date of thei respective exhibitions for July 9, the Sal taire Rose Society have altered the date o their exhibition from July 9 to Wedn day, July 17

**The National Chrysanthemum Society's Outing** will take place on Monday, July 15. A visit will be paid to the gardens of F. G. Gledstanes, Esq., at Berry Hill, Taplow. The train will leave Paddington at 9.15 a.m., and arrive at Staines at 10.13. From Staines the party will proceed by steam-launch to Maidenhead, lunch at the Dumb Bell Hotel, visit Berry Hill gardens, and return to the hotel for tea. At 5.30 p.m. the party will go by the steam launch to Marlow, returning in time to catch the 8.35 p.m. train from Taplow to Paddington. This trip will include six hours on the most lovely part of the river Thames, and, given fine weather, the outing should be a most enjoyable one. Tickets may be obtained from Mr. R. A. Witty, not later than July 8.

**Gardeners' Visit to Hillingdon Court.**—A party of about thirty members of the Hanwell and Greenford Horticultural Society visited Lord Hillingdon's beautiful gardens at Hillingdon Court, Uxbridge, a few days ago. The visit proved most interesting and instructive under the guidance of Mr. A. R Allan, the head gardener. The blue walk, with its borders of delphiniums and anchusas, and the red walk, with its abundance of roses, attracted special attention, while the choice conifers, flower garden, and fruits indoors and out were all greatly admired.

**Protection of Flowers in Bavaria.**—In a contribution to "Nature" on the protection of plants in South Bavaria, Mr. C. C. Hosseus gives some interesting particulars of what is being done in the district of which the health resort of Berchtesgaden in the Bavarian Alps, with a view to protect a large number of wild flowers and a few trees and shrubs from the vandals. From this communication we learn that the Government has ordered that all wild plants of commerce, as well as rare specimens, are to be protected. Without special permission nobody may remove the following plants: Leontopodium alpinum, Rhododendron hirsutum, R. intermedium, R. ferrugineum, Rhodothamnus chamæcistus, Loiseleuria procumbens, Helleborus niger, Cypripedium calceolus, Primula auricula, Gentiana pannonica, G. purpurea, Nigritella suaveolens, Orchis ustulata, Chamæorchis alpina, Ophrys muscifera, Gentiana acaulis, Lilium martagon, Platanthera bifolia, Scolopendrium vulgare, Cyclamen europæum, Achillea clavennæ, Imperatoria ostruthium, Nymphæa alba, Ilex aquifolium, Taxus baccata, Pinus cembra, etc. When the names of these plants are examined, it is seen that many of them are remarkable for a limestone flora. Tables with coloured flowers show the exact form of specimen under consideration, and the waiting-rooms in railway stations, as well as the foyers in the big hotels, have excellently painted illustrations of the protected plants. This system, however, is not sufficient alone; large mountain areas are also protected, and are called "Pflanzen-Schonbezirk." This applies to nearly all the great mountains which border the Königsee near Berchtesgaden, the pearl of the German lakes. No one has the right to collect here any plant, except a few men of science with special permission of the Government.

**Holland House Show.** — The Royal Horticultural Society's summer show at Holland House, Kensington, for July 2, 3, and 4, promises to be an unusually important function. Last year the summer show was held at Olympia, but the Council have now come to an arrangement which promises to retain Holland Park as a permanent site for the summer show for some years to come. New spacious tents, with a special patent ventilation, are to be erected for the exhibits, and so an improvement will be effected on past crowded and stuffy conditions. High Street, Kensington, is the nearest railway station but Addison Road is also quite near.

**The Rose Harvest in the Balkans.**—The valley of Kezanlik, in Southern Bulgaria, is yielding its annual harvest of rose blooms. For mile after mile the plantations of roses, chiefly Damask varieties, extend, the bushes being about 7ft. apart. About fifteen tons of half-opened flowers go to produce a pound of rose-oil or attar, and this amount of fragrant essence is worth from £14 to £20. Some idea of the extent of the rose harvest will be gathered from the statement that the Kezanlik Valley produces annually about fifteen tons of rose attar.

**The Devon Daffodil Society** has, notwithstanding a decline of £22 15s. 6d. in subscriptions, slightly increased its credit balance as a result of the past year's working. We regret to learn that Captain Parlby is resigning the secretaryship, owing to his anticipated absence from Plymouth during the coming season. Captain Parlby has been an enthusiastic and capable secretary, and Mr. Coryndon Matthews is to be his successor in that office. At the recent annual meeting it was agreed that the society's spring show of 1913 should be held at Barnstaple, in North Devon.

**Soil Fertility.**—In the course of his lecture on "The Fertility of the Soil," before the Royal Institution, Mr. A. D. Hall stated that experiments at Rothamsted had shown that the addition of carbonaceous matter in the form of sugar to a Rothamsted plot poor in nitrogen had greatly increased the yield in barley. It was possible, he went on to show, that a production of over four quarters per acre of wheat could be maintained indefinitely by natural agencies alone, provided that the small annual losses of phosphoric acid and potash were replaced. The prospect of reducing the waste of highly intensive culture was not entirely hopeless. The losses were due to bacteria, which attacked nitrogen compounds and liberated nitrogen, but the researches of Drs. Russell and Hutchinson had shown that by putting the soil through various processes of partial sterilisation, such as heating or treatment with antiseptics like chloroform or toluene, certain organisms which checked the useful bacteria of the soil could be eliminated. Heating the soil to the temperature of boiling water for ten hours would double its productivity, and the process had been found commercially profitable in the case of greenhouse soils. The market growers of cucumbers and tomatoes made up an exceptionally rich soil of virgin loam and stable manure, but in a few years such a soil, while still enormously rich on analysis, became incapable of growing a profitable crop. Partial sterilisation enhanced the fertility of this soil by eliminating the injurious organisms. At present these processes had not been extended to the open field, but progress was being made in that direction, and gave some promise of a method by which ultimately the unseen fauna and flora of the soil would be domesticated, the useful races encouraged, and the noxious repressed, just as the larger flora and fauna had been reduced to the service of man since primitive man first turned from hunting to the cultivation of useful crops.

**Manurial Requirements of Carrots.**—During the year 1911 the Midland Agricultural College, Kingston-on-Soar, carried out some experiments in the manuring of carrots that were of much interest. According to the report, the carrots were less affected by the drought than swedes and turnips, and the yield varied from 10 to 16 tons per acre. Farmyard manure was found the best foundation dressing for land to be cropped with carrots, and the best return was obtained when the animal manure was applied to the previous crop. Supplementary applications of chemical fertilisers usually give a profitable increase—salt, potash, and phosphates being the most effective materials. The advantage of salt is that it mitigates the influences of drought by retaining the moisture in the land, while probably it also aids the liberation of potash from its compounds in the soil. A potash manure should, it is stated, always be included and is necessary when dung is not used in large quantity and phosphates are more effective than a nitrogenous substance. The manurial treatment recommended is 3cwt. of salt worked into land before sowing or planting, 5cwt. superphosphate, and 1¼cwt. sulphate of potash mixed together, and applied at the time of cropping, and 1cwt. sulphate of ammonia as a top dressing when the plants are about 4in. high. When no farmyard manure is used the quantities of artificials should be slightly increased.

**Growth of Douglas Fir.**—The West of Scotland Agricultural College, Glasgow, has published a report on an investigation into the current annual increment in girth of a Douglas fir plantation on the Ben More Estate, Kilmun, during 1911. The trees were planted in 1879, and in order to ascertain the rate of growth they were measured five feet from the ground on May 1, 1911, and on February 17 this year. The 93 trees under observation showed an average girth increment of 0.86in. each, while 40 of the stronger trees gave an average of 1.09in. The details showing the height growth are not considered so trustworthy, but the few trees measured gave an average rate of about 3ft. a year.

**Fugosia hakeæfolia.**—This is a very uncommon member of the mallow family, and as regards the foliage a most distinct one. It forms a rather upright-growing shrub, clothed with long, narrow, fleshy, almost cylindrical-shaped leaves, bearing in this respect a certain amount of resemblance to some of the Hakeas, an Australian genus of proteaceous plants. The flowers of the fugosia are hibiscus-like, being from three to four inches across, and in colour purplish-lilac, with a central cluster of darker-coloured stamens. Though now uncommon, it is quite an old plant in gardens, having been introduced from South Australia by Messrs. Lucombe and Pince, of Exeter, in 1846. Its propagation and culture presents no difficulties; that is, if it is given ordinary greenhouse treatment.

## THE R.H.S. AND THE ROYAL INTERNATIONAL EXHIBITION.

The following correspondence has taken place between Sir Trevor Lawrence, President of the Royal Horticultural Society, and Mr. J. Gurney Fowler, Chairman of the Board of Directors of the International Exhibition:—

Royal Horticultural Society,
Vincent Square, Westminster, S.W.,
June 5, 1912.

Dear Mr. Gurney Fowler,—The Council of this Society, at their meeting yesterday, requested me to convey to you and your colleagues on the direction of the Royal International Horticultural Exhibition their hearty congratulations on the signal success with which the exhibition has been carried out. The Council's own experience makes them fully aware of the long-continued and unremitting labours attending exhibitions on even a much smaller scale; and the success which has crowned your efforts cannot fail to be most gratifying to all concerned, and to reflect great credit on them. It is the universal opinion that a more complete and comprehensive, a better-arranged, and more beautiful and instructive exhibition has never been seen in any country. No wonder, then, that it has received the fullest and most unstinted praise and admiration from their Majesties the King and Queen downwards.

The Council, moreover, are glad to understand that the financial results will probably show a satisfactory surplus, and relieve the guarantors from all liability.—I am, yours very truly,

TREVOR LAWRENCE, President.

J. Gurney Fowler, Esq.

Glebelands, S. Woodford, Essex,
June 7, 1912.

Dear Sir Trevor Lawrence,—Your letter of the 5th inst. has been received by me with the very greatest pleasure, and this pleasure will also, I am sure, be felt by all my colleagues on the board when I communicate its contents to them.

For some two years now we have been, as you know, preparing for this exhibition, and it has caused to many of us much work, trouble, and, above all, anxiety. Now that it is a thing of the past, a great load of responsibility, both financial and otherwise, has been lifted from us, and we are able to return to our ordinary work with the satisfactory feeling that our efforts have met with your Society's appreciation, also with that of their Majesties the King and Queen, and of the general public, and have resulted also, as you say, in a signal success.

This fact is an all-sufficient recompense for our many labours, and I hope most sincerely that the exhibition will result in the advancement of horticulture in all its branches. This has been, and is, my constant endeavour.

It is early yet to talk about the financial results, but, so far as we can see, there is little likelihood of any call upon the guarantors, by whose generous support we were so greatly encouraged and assisted. We look forward to having eventually a considerable sum in hand to distribute to gardening charities or otherwise, as we may be advised.

Thanking you for your letter, believe me to remain, yours most sincerely,

J. GURNEY FOWLER, Chairman.

Sir Trevor Lawrence, Bart.

---

**Cytisus elegans.**—For greenhouse decoration this cytisus affords a pleasing variation to Cytisus racemosus—the genista of the market grower. From this last, elegans differs in its looser habit, more silky foliage, and lighter yellow flowers. According to the "Kew Handlist," it is but a variety of Cytisus fragrans, which is regarded as the correct name of Cytisus racemosus of gardens.—W.

# NATIONAL ROSE SOCIETY.

This being the Jubilee year of the Southampton Horticultural Society, the National Rose Society decided to hold an early provincial show in the famous Southern seaport. This exhibition filled the pavilion and two tents on the Royal Pier on June 26. The weather was gloriously fine, and breezy, and the roses were plentiful, splendid in size and colour, and the competition was very keen.

## OPEN CLASSES.

For four dozen blooms, distinct, the premier award in the open class was secured by Messrs. D. Prior and Son, Colchester, with a goodly set, in which a few of the best were Victor Hugo, Bessie Brown, Mdme. Jules Gravereaux, Mamie, Mdme. Constant Soupert, Horace Vernet, Mildred Grant, Florence Pemberton, His Majesty, Dean Hole, White Lady, Caroline Testout, Juliet, Boadicea, Her Majesty, and Lady Helen Vincent. There were seven competitors and second award fell to Messrs. B. R. Cant and Sons, for a bright set that included Souv. de Pierre Notting, Victor Hugo, Horace Vernet, Mabel Drew, W. R. Smith, Mdme. Jules Gravereaux, and Mdme. Hoste; Messrs. Alex. Dickson and Sons came third.

The class for a dozen trebles brought out six competitors, and here Messrs. D. Prior and Son led with His Majesty Mrs. Myles Kennedy, Rosamane Gravereaux, J. B. Clark, Mdme. Jules Gravereaux, Mildred Grant, etc.; Messrs. B. R. Cant and Sons were placed second, and Messrs. A. Dickson and Sons third, the latter showing a fine set rather over-dressed, as it seemed to us.

The Southampton Cup for a dozen tea or noisette roses was secured by Messrs. D. Prior and Son, Colchester, with exquisite examples of Molly Sharman Crawford, White Maman Cochet, Mdme. Vermorel, W. R. Smith, Souv. de Pierre Notting; Mrs. Foley Hobbs, Mdme. Constant Soupert, Mrs. Myles Kennedy, Mdme. Jules Gravereaux, Boadicea, Nita Weldon, and Mrs. E. Mawley; eight entries. Messrs. B. R. Cant and Sons second.

## NURSERYMEN.

Messrs. J. Burnett and Co., Howe House Nurseries, Cambridge, led for twenty-four blooms, distinct, with a clean set of fair-sized flowers; Mr. G. Prince, Longworth, came second; and Messrs. Perkins and Son, Coventry, third. Fifteen entries. The finest set of eighteen tea or noisette roses came from Mr. George Prince, Longworth, who displayed charming flowers of W. R. Smith, Mrs. Foley Hobbs, and Comtesse de Nadaillac; Mr. Henry Drew, Longworth, second; Messrs. J. Burrell and Co., third; eight entries.

There were eight competitors in the class for eight roses, distinct, three blooms of each, and first prize was won by Messrs. J. Burrell and Co., Cambridge, with very clean blooms of Bessie Brown, William Shean, G. C. Waud, Dean Hole, Hugh Dickson, Lady Barham, Mildred Grant, and Mdme. Jules Gravereaux; Mr. George Prince second; and Mr. Henry Drew third. Messrs. D. Prior and Son scored for a dozen new roses with Mrs. Arthur Coxhead, Nita Weldon, Mrs. Foley Hobbs, Margaret, George Arends, Cynthia, etc.; Mr. G. Prince second, and Messrs. A. Dickson and Sons third; nine entries.

Gloire de Chedane Guinoisseau, finely shown, won first prize for twelve blooms of an H.P., for Messrs. D. Prior and Son, Colchester; there were eight entries, and Messrs. S. Bide and Sons, Farnham, came second with Frau Karl Druschki; a similar variety won third place, but the class card was not in position. There were fifteen entries in the class for a dozen blooms of any H.T. rose, and here Messrs. Alex. Dickson and Sons, Newtownards, came to the front with a beautiful set of Mrs. Cornwallis West; Messrs. Perkins and Sons, Coventry, second with Dean Hole; equal third prizes were given, and Mrs. Stewart Clark won one of these for an unknown competitor, and Messrs. B. R. Cant and Sons, Colchester, secured the other with Mildred Grant.

Messrs. Frank Cant and Co., led for a dozen blooms of any tea or noisette rose with delightful flowers of Mrs. Foley Hobbs; Messrs. D. Prior and Son, second, with Mdme. Jules Gravereaux, and The King's Acre Nurseries, Lim., Hereford, third with Mrs. Edward Mawley; ten competitors.

The best representative group of cut roses, filling a space of 60 square feet, was a fine one, well staged by Mr. Elish J. Hicks, Hurst, Twyford, whose columns of Pharisaer, American Pillar, Mdme. Abel Chatenay, Lady Hillingdon, Richmond, and Blush Rambler were especially good; Mr. Henry Drew, Longworth, second. Premier award for a collection of two dozen roses, distinct, in bunches of not more than twelve trusses each, was nobly won by Mr. J. Mattock, Headington, Oxford, who had lovely flowers of Richmond, Lady Pirrie, Gen. McArthur, Marquise de Sinety, Mrs. Stevens, and Lady Curzon. There were six competitors, and these made a grand show; other prizes fell, in order, to Messrs. Frank Cant and Co., Braiswick, Colchester; Messrs. W. Spooner and Son, Woking; and Messrs. Paul and Son, Cheshunt.

In the class for seven baskets of roses, distinct, Mr. E. J. Hicks, Hurst, Berks, was awarded first prize for a grand set of flowers of Rayon d'Or, Countess of Gosford, Gen. McArthur, Duchess of Wellington, Mdme. Jules Grolez, Comtesse du Cayla, and Lady Hillingdon; Mr. John Mattock second, and Messrs. S. Bide and Sons third among four competitors. Messrs. W. Spooner and Son led for three baskets of roses, and made a beautiful show with Marquise de Sinety, Lady Pirrie, and Mdme. Melanie Soupert; Mr. G. Prince second, and Messrs. G. and W. H. Burch, Peterborough, third.

## AMATEURS.

The Munt Cup and first prize in the amateurs' section for eighteen blooms distinct was won by Dr. C. Lamplough, Kirkstall, Alverstoke, with a choice set of Mdme. Jules Gravereaux, Gloire de Chedane Guinnoisseau, A. K. Williams, Queen of Spain, Bessie Brown, Florence Pemberton, etc.; Mr. G. N. Hammond, Burgess Hill, second; and Mr. E. M. Eversfield, Denne Park, Horsham, third; twelve entries.

Mr. H. L. Wettern, Waratah, Sanderstead, Surrey, led for six blooms of any H.P., with the inevitable Frau Karl Druschki; Dr. Lamplough second with the same variety, and Mr. F. Slaughter, third, also with the Frau.

Mr. E. F. Brown, Lynton, Slough, scored for six blooms of an H.T. rose with lovely examples of Dean Hole; Dr. Lamplough second with Mildred Grant, and Mr. Wettern third with Avoca. Dr. Lamplough had also the best half dozen blooms of any tea rose.

Mr. Alexander Hill Gray, Beaulieu, Bath, was a capital first for a dozen tea or noisette roses with finely-coloured Harry Kirk, Mdme. Constant Soupert, White Maman Cochet, Mrs. E. Mawley, and Dr. F. Guyon; Rev. R. Powley, Upton Scudamore, second, and Mr. Eversfield third; six entries.

Among the growers of fewer than 2,000 plants of exhibition roses, Mrs. E. Croft Murray, Perivale, Ryde, led for a dozen blooms distinct, and Mr. F. G. Slaughter was second. Mr. J. Hart, Potters Bar, and Mr. C. C. Williamson, Canterbury, were first and second respectively for six trebles, while Rev. R. Powley, Upton Scudamore, beat Mr. Slaughter in this section for nine teas and noisettes.

In the division for growers of fewer than 1,000 plants, Dr. Lamplough, Mr. R. Escofet, and Mr. H. L. Wettern annexed the chief awards. Growers of fewer than 500 plants turned up in fine force, and the principal prize-winners were Mr. Raymond Escofet, Kingsley Dene, Dulwich; Mr. T. H. Gillett, Elven House, Andover, who had a fine Mrs. Roosevelt in his set of twelve blooms; Mr. E. W. Morris, Uckfield; and Mr. E. L. Brown.

Mr. Alan Searle, Bassett, scored in a lower division, and was successful in the local classes.

The Rev. J. H. Pemberton, Havering, Romford, won the first prize for twelve bunches of garden roses, and, among others, showed The Garland, Seagull, Claire Jacquier; Mrs. A. M. Wightman, Bengeo, second; and Mr. Conway Jones, Hucclecote, Gloucester, third.

## LADIES' CLASSES.

Mrs. Colston Hale, Virginia Lodge, Warminster, led in the class for table decoration with a pretty arrangement of Irish Elegance; Mrs. G. A. Hammond, Cambrian Road, Burgess Hill, second; and Miss K. Vokes, Birch Lawn, Sholing, third.

Mrs. Colston Hale led for a bowl of roses with Mdme. Abel Chatenay, Mr. Charles Williamson, Canterbury, coming second with Lady Hillingdon. Mrs. Hammond scored for a vase of roses, and Mrs. Colston Hale came second. First prize for a basket of roses fell to Mrs. E. M. Burnett, Westwood Road, Southampton, who used Irish Elegance, and Gottfried Keller; Messrs. C. Hale second.

## SILVER MEDAL ROSES.

As usual, silver medals were awarded to the best blooms. In the trade division the best H.P. rose was Victor Hugo, shown by Messrs. D. Prior and Son, Colchester; the best H.T. was St. Helena, shown by Messrs. B. R. Cant and Sons, Colchester; and the best T. rose was Mrs. Foley Hobbs, from Mr. G. Prince.

In the amateur classes the best H.P. rose was A. K. Williams, exhibited by the Rev. J. H. Pemberton; the best H.T. was Mrs. Theodore Roosevelt, staged by Mr. E. L. Brown, Slough; and the best T. rose was W. R. Smith, shown by Mr. E. W. Morris, Uckfield.

## GOLD MEDAL ROSES.

A number of new roses were staged, and Messrs. Alex. Dickson and Sons, Newtownards, were awarded a gold medal for a lovely single rose named Irish Flame, which is a deeper yellow than Irish Elegance, with a ruddy bronze flushing on the outside of the petals. A gold medal was awarded to Messrs. B. R. Cant and Sons, Colchester, for St. Helena, a lovely large, shapely, deep cream-coloured H.T. rose of great substance, and one that should prove fine for exhibition.

## OTHER EXHIBITS.

Messrs. B. Ladhams, Shirley, Southampton, displayed hardy flowers finely, and made a splendid show with gaillardias, pinks, and the new Salvia Ladhamsi, the latter a hybrid between S. turkestanica and S. sclarea. Messrs. W. H. Rogers and Son, Bassett, contributed cut roses and roses in pots; Messrs. Toogood and Sons displayed sweet peas well, and so did Mr. Longster, Southampton, while Mr. Wootten exhibited carnations.

There were two classes for sweet peas, each for six bunches; in one of these Mr. F. G. Bealing was first; Mr. H. H. Lees, Havant, second; and Mr. A. E. Usher, Ranston Gardens, Blandford, third. In the other class Mr. F. Green, The Beeches, Southampton, was first, Mr. Lees second; and Mr. H. J. Hood, Thornaby Avenue, Southampton, third.

---

**Alexandra Day.** — On Wednesday last some ten thousand ladies in white were busily engaged in selling wild roses in London, in honour of Queen Alexandra, and for the benefit of the hospitals and charitable institutions in which her Majesty is specially interested. It was an excellent idea to honour Queen Alexandra, who for many years has been the patroness of the National Rose Society, in this manner, and it made so strong an appeal to the sympathies of all classes of the community that its success was at once assured. From within a very short time of the scheme being made known promises of support were forthcoming, and the arrangements were so quickly completed that everything was in readiness for the great army of flower-sellers to commence operations on Wednesday morning. Favoured by fine weather, the sale of the roses proceeded so briskly that before the day had far advanced there were but few members of the community who were not wearing the English emblem, and before the day closed the sales must have amounted to several millions of blossoms, need it be said the blooms had not been plucked from the English hedgerows, but were the product of the deft fingers of crippled children, who had been taught the art of flower-making.

# NOTES FROM KEW.

### Greenhouse Flowers.

While the greenhouse is remarkably gay with blossoms, the bulk of the occupants of that structure are such as are usually employed for decorative purposes at this season of the year. Still, there are a few uncommon subjects or combinations and one such is furnished by a number of the distinct red-flowered Alonsoa incisifolia, in the shape of dwarf bushy plants in full bloom, and dotted over with Canna Van der Schoot, a variety whose golden-yellow flowers are marked with red. Another group is made up of dwarf plants of Jacobinia magnifica, carrying good heads of bloom, and overtopped by finely-flowered examples of the double-flowered Marguerite Mrs. F. Sander. This marguerite is the finest of those forms in which the centre of the flower is filled up with a large anemone-like disc, while in foliage and general appearance, it bears a greater resemblance to the typical Chrysanthemum frutescens than to the other garden varieties. Another pleasing combination is a number of the white-flowered Begonia nitida and the scarlet Clerodendron fallax, mixed. A double white feverfew is also very pretty, while that annual species of statice from Turkestan, which bears the awkward name of Statice Suworowi, is so pleasing when in a mass that it might with advantage be more often grown for conservatory and greenhouse decoration than it is. A group of Rehmannia angulata, and another of the new Rehmannia kewensis, to which I referred in the GARDENERS' MAGAZINE of May 11 (see p. 382), are also very attractive.

### Flowering Cannas.

These are so extensively grown for greenhouse decoration or for bedding out during the summer months that their culture in any other manner is seldom considered. The way, however, that they thrive under more tropical conditions in the old Lily House is an eye opener; for, grown in large pots and stood in the lily tank in such a manner that the base of the pot just touches the warm water, they attain a development to which we are quite unaccustomed. In this way both foliage and flowers are magnificent, and, taken altogether, anyone with such a structure at command might do worse than try a few of these cannas therein. A good light position is, of course, necessary to their well-doing.

### Hibiscuses.

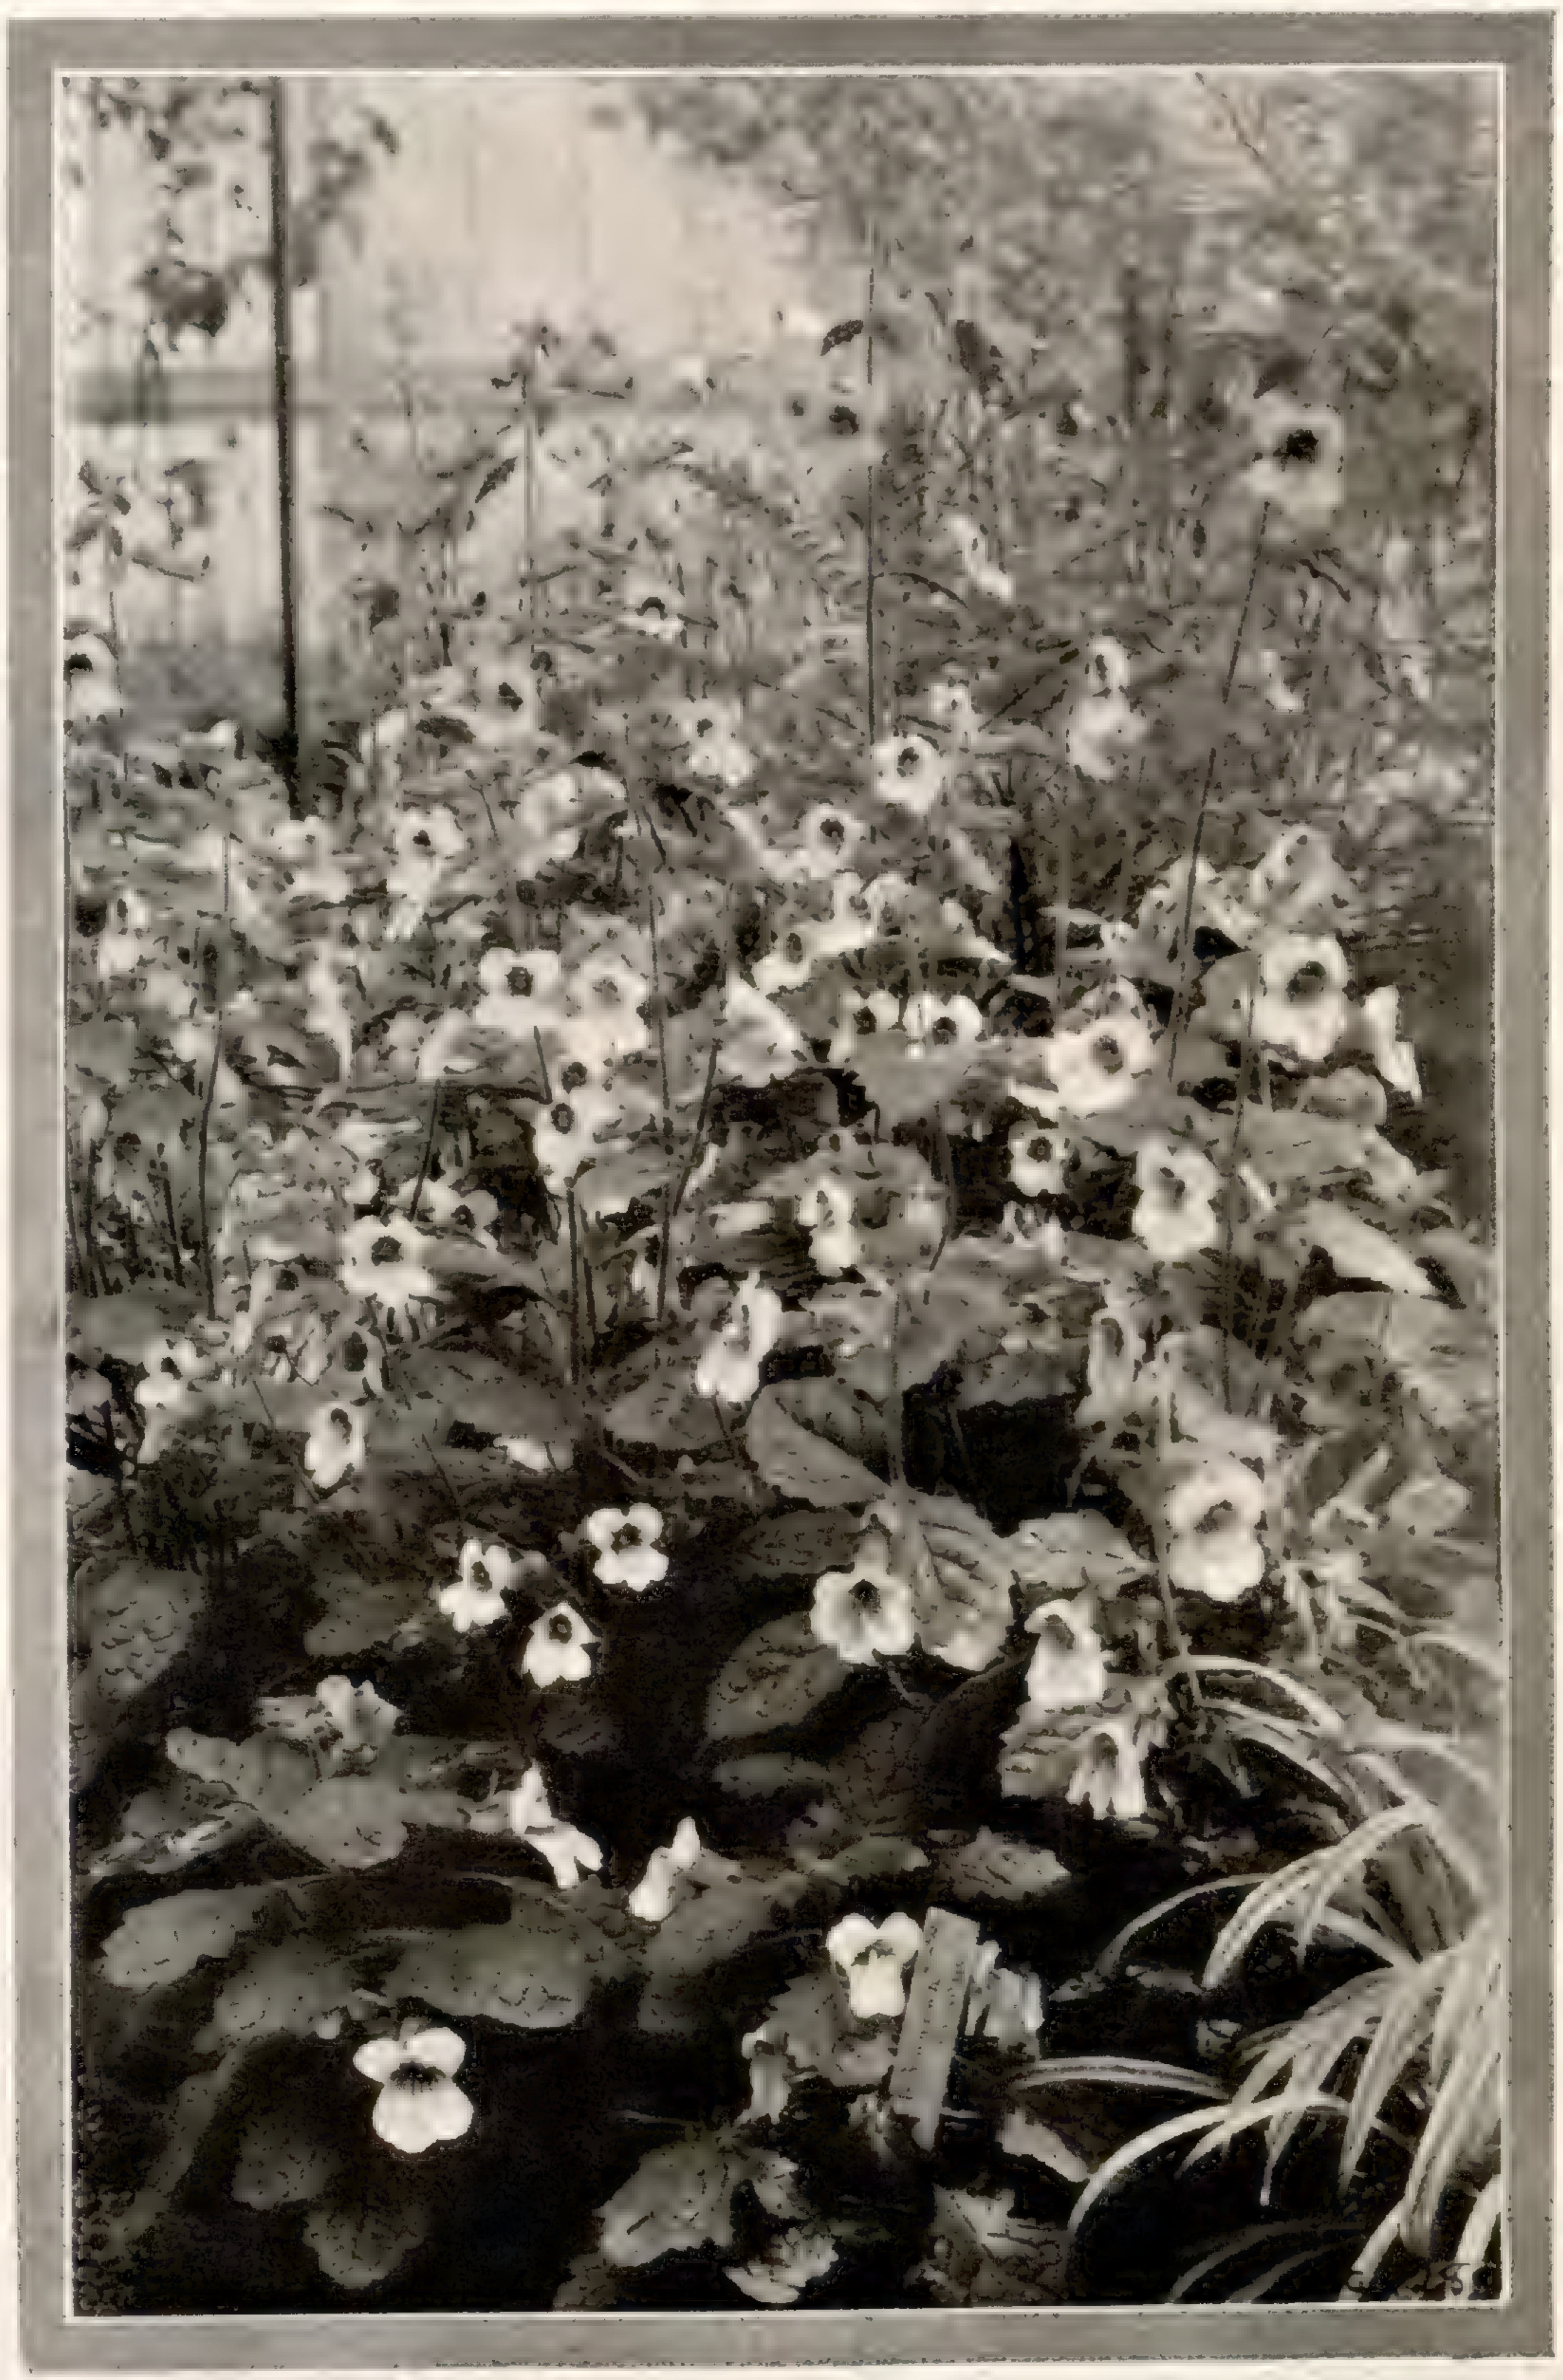
Planted out in the bed situated in the porch of the old Lily House are some very striking forms of the shrubby members of the hibiscus family, with large and showy blossoms. Notable among them are Hibiscus Cameroni, a native of Madagascar, with large single blooms of a bright carmine-red colour, and a single form of Hibiscus rosa-sinensis, with flowers of a more rosy tint. This last-named species is widely spread throughout the tropics, and there are now a great many forms in cultivation, some with double and others with single flowers, while in one variety, namely, Cooperi, the leaves are marked with a pretty tricolor variegation. As Hibiscus rosa-sinensis both grows and flowers freely, it is useful for good-sized structures where showy flowers are welcomed.

### Juanulloa aurantiaca.

A specimen of this uncommon Peruvian shrub is now flowering freely in the Succulent House. It belongs to the order Solanaceæ, and is nearly related to the daturas or brugmansias; indeed, it is sometimes known as Brugmansia floribunda and Brugmansia parviflora, as well as Juanulloa parasitica. The flowers, which are of a deep orange colour, protrude from a large calyx of the same tint. Compared with the Brugmansias, the flowers are small, being only about three inches in length.

### Ixora congesta.

There are a great number of garden varieties of ixora in bloom in the intermediate portion of the T range, but, although some of them may be more floriferous in a small state than this species, there are none with more attractive blossoms, which are of a brilliant reddish-orange colour. It is said to have been introduced in 1845, but at the present day it is rarely met with in gardens.



REHMANNIA KEWENSIS.
A fine greenhouse plant produced by crossing R. Henryi with R. chinensis. Flowers yellowish with a large crimson blotch on the upper segments. Raised at Kew.

### Clerodendron speciosum.

This very showy climbing clerodendron which is flowering with great freedom on the roof of the T range, is of hybrid origin, the parents being the tropical African Clerodendron splendens, which is rather more particular in its cultural requirements than most of the others; and C. Thomsonæ, which is more usually met with as Clerodendron Balfouri, a garden name. The flowers of C. speciosum, which are borne in large, spreading panicles are of a rich crimson colour, and afford a pleasing contrast to the lighter-tinted ones of C. Thomsonæ. Both are of easy culture, and quickly attain an effective size.

### Aristolochia elegans.

Though this was introduced over a quarter of a century ago, and has proved to be a very desirable plant in many ways, its merits are even now too often overlooked. Over most of the tender species of aristolochia it possesses several advantages, as in the first place it is of less rampant growth than most of them, which feature renders it of use for comparatively small structures, under which conditions, being brought near the eye, the pretty cream-coloured flowers, with their intricate markings of purplish-chocolate, can be fully appreciated. They are also without the unpleasant odour common to some of the aristolochias. The species is now flowering freely in the T range.

K.

# NEW PLANTS, ETC.

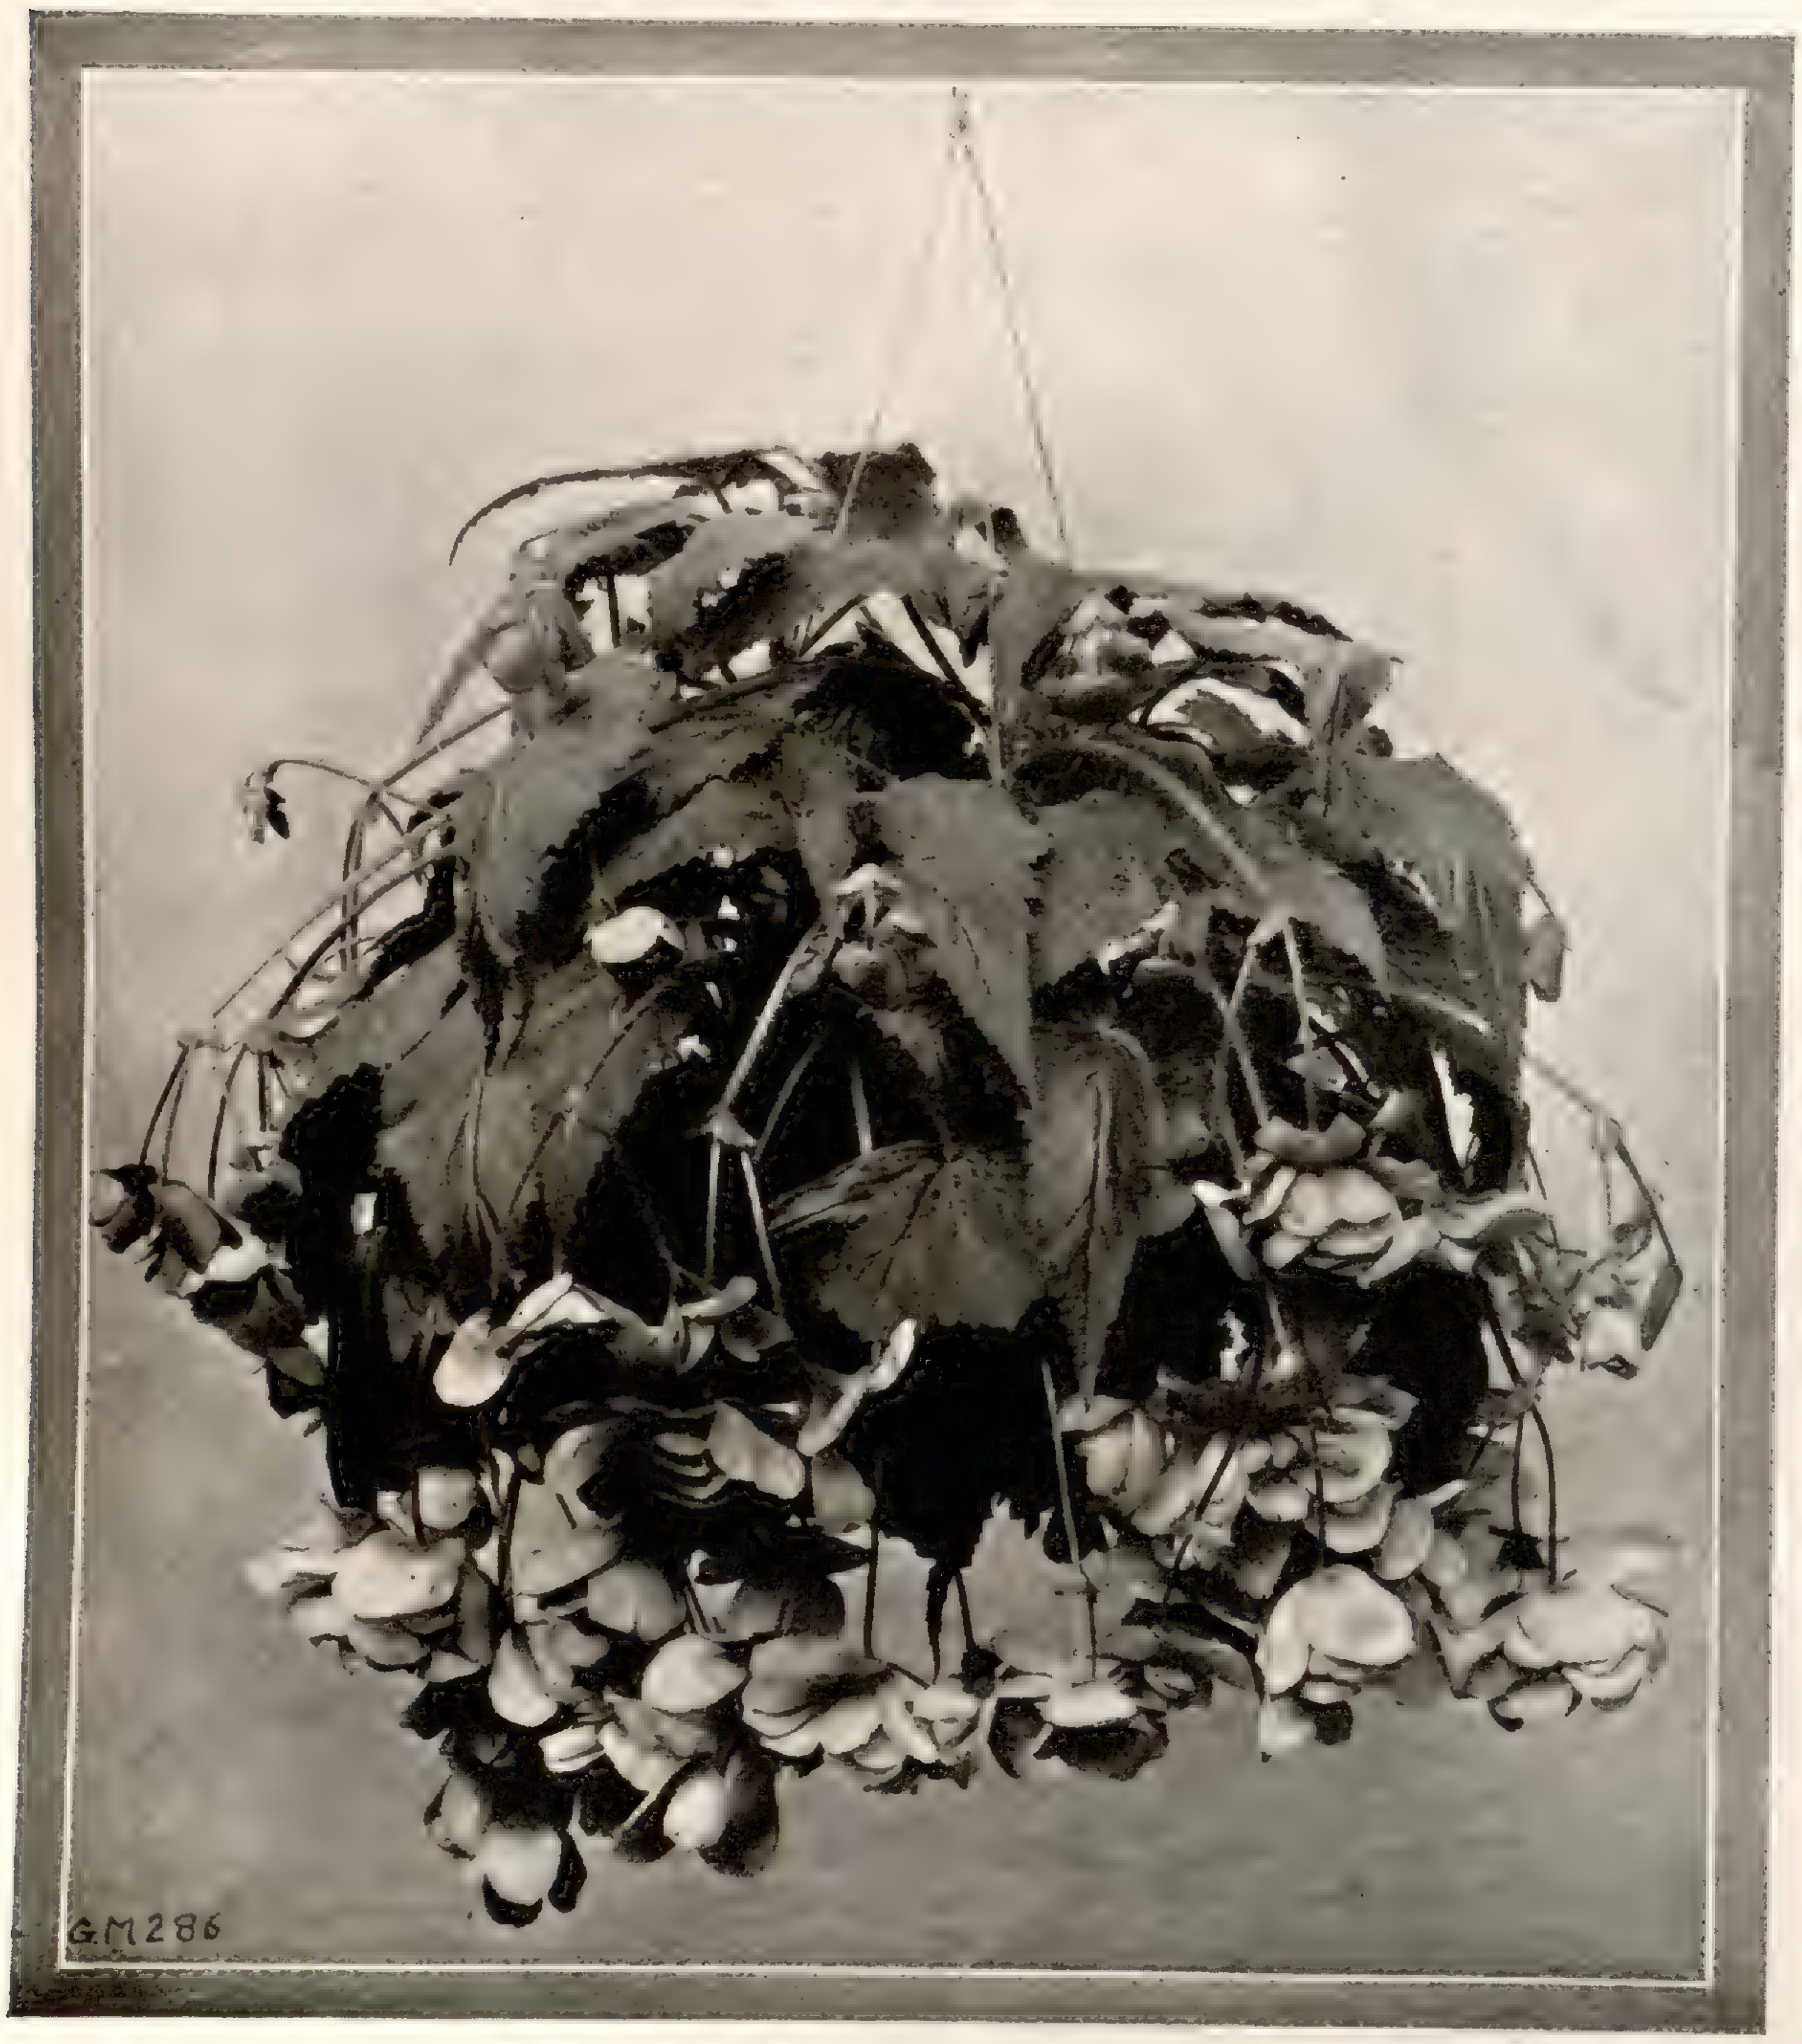
◆

### ODONTIODA COOKSONIÆ FOWLER'S VAR.

An exceedingly beautiful hybrid (Odontoglossum ardentissimum × Cochlioda Noezliana), and one that stands right in the front rank of odontiodas. The large, shapely flowers are deep crimson-scarlet with rosy tips of the sepals and petals. The lip is white, with a yellow crest, and has a central deep crimson-scarlet blotch. F.C.C., R.H.S., June 18. Messrs. Charlesworth and Co., Haywards Heath.

### LÆLIO-CATTLEYA BARONESS EMMA.

A gloriously handsome hybrid between Lælio-cattleya eximia and Cattleya Hardyana. The flowers are large, well-formed, and stand up finely. Sepals and petals are rosy blush, while the large and wide lip is white at the base, with a yellow dark-veined throat, and a spreading crimson-purple apex. F.C.C., R.H.S., June 18. Baron Bruno Schroder (grower, Mr. Shill), The Dell, Egham.



BEGONIA GOLDEN SHOWER.

A pendulous, tuberous-rooted begonia with yellow, darker centred, flowers. A.M., R.H.S., June 18. Messrs. Blackmore and Langdon, Bath.

### MILTONIA BLEUANA RISING SUN.

A charming miltonia with large white flowers, each having a bright orange-tinted disk with radiating brown lines. A.M., R.H.S., June 18. Baron Bruno Schroder, The Dell, Egham.

### ODONTONIA ST. ALBAN.

A pretty and distinct hybrid obtained by crossing Miltonia Warscewiczi with Odontoglossum Pescatorei. Evidence of the latter parent was seen distinctly in the branching spike and the shape of the flowers, while the red shading on the white lip was a sure indication of the miltonia parent. The white sepals and petals are marked with red purple. A.M., R.H.S., June 18. Messrs. Sander and Sons, St. Albans.

### LÆLIO-CATTLEYA GANYMEDE SOUTHFIELD'S VAR.

A small but very pretty hybrid derived from Lælia Latona and Cattleya Schroderæ. The sepals and petals are yellow, and the lip is yellow at the base, but bright ruby-crimson over the wavy apex. A.M., R.H.S., June 18. W. Walters Butler, Esq. (gardener, Mr. Jones), Southfields, Edgbaston, Birmingham.

### LAVATERA OLBIA.

An old plant that has somehow or other missed general recognition. It is a shrubby species hailing from Provence, and, as it has become naturalised in some parts of the British Isles, there is no doubt about its hardiness. The soft downy leaves are deeply three or five-lobed, though the highest ones may sometimes be entire. The short-stalked axillary flowers are about two inches across, and a very pretty shade of silvery rose or pale silvery-purple. The plant flowers freely, grows from 3ft. to 6ft. high, and is an elegant subject for a sunny position. A.M., R.H.S., June 18. Mr. Maurice Prichard, Christchurch.

### CARNATIONS.

Mrs. Husan Morris. A large variety with waved petals, and coloured deep pink on a paler pink ground. A.M., R.H.S., June 18. S. Morris, Esq. (gardener, Mr. G. Henley), Wretham Hall, Thetford.

Charles Blick.—A noble pure white Malmaison carnation; a seedling from Nell Gwynne. A.M., R.H.S., June 18. Mr. Chas. Blick, Hayes, Kent.

Cyclops.—A showy border variety with rich crimson markings on a deep orange-yellow ground. A.M., R.H.S., June 18. Mr. Chas. Blick, Hayes, Kent.

### EREMURUS LEMON QUEEN.

A bright and sturdy variety, raised by crossing E. Warei with E. Bungei. The stately spikes rise about 4ft. high, and carry a very large number of lemon-yellow flowers that are made the more attractive by the deep orange-coloured anthers. A.M., R.H.S., June 18. Messrs. Jas. Veitch and Sons, Chelsea.

### BEGONIAS.

Golden Shower. — A very free-flowering pendulous variety, with bright yellow, darker-centred, blooms. As a basket plant, this is a capital begonia. A.M., R.H.S., June 18. Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath.

James Braid.—A large, very double and shapely begonia of brightest crimson hue. A.M., R.H.S., June 18. Messrs. Blackmore and Langdon, Bath.

F. W. Walker.— A rich scarlet double begonia, of fine size and shape. A.M., R.H.S., June 18. Messrs. Blackmore and Langdon, Bath.

### ROSES.

Effective.—An aptly named pillar rose of great beauty. It has very large flowers, each with two or three rows of broad carmine-crimson petals. We understand that General McArthur and Carmine Pillar are the parents. A.M., R.H.S., June 18. Messrs. Hobbies, Lim., Dereham.

Pink Pearl.—A very beautiful, large, and substantial single rose of the most delightful shade of pink, with a central cluster of golden stamens and anthers. The parents are Una and Irish Elegance. A.M., R.H.S., June 18. Messrs. Hobbies, Lim., Dereham.

### DELPHINIUMS.

Harry Smeatham.—The rounded flowers of this sturdy variety are very effective. The colour is a pleasing shade of blue, with a deep purple line down the centre of each segment. A.M., R.H.S., June 18. Messrs. Blackmore and Langdon, Bath.

Lavanda.—A very distinct and beautiful variety, with large shapely flowers of a pretty mauve shade. A.M., R.H.S., June 18; A.M., N.H.P.S., June 19. G. Ferguson, Esq. (gardener, Mr. F. W. Smith), Weybridge.

Drake.—This is an effective light blue variety, with a white centre to each bloom. A.M., R.H.S., June 18. Messrs. J. Kelway and Son, Langport, Somerset.

Tagalie.—In this fine blue variety the white centre almost disappears as the semi-double blooms advance in age. A.M., R.H.S., June 18. Messrs. J. Kelway and Son, Langport.

Dusky Monarch.—Already described and figured in these columns. A.M., N.H.P.S., June 19. Messrs. J. Kelway and Son, Langport.

Lovely.—The colouring in this fine form is a combination of deep blue and purple. The spike is particularly sturdy and shapely. A.M., R.H.S., June 18. Messrs. J. Kelway and Son, Langport.

### PHILADELPHUS.

Bouquet Blanc.—This semi-double white variety is especially free-flowering, the branches being thickly studded with blooms. A.M., R.H.S., June 18. Messrs. James Veitch and Sons, Chelsea.

Voie Lactée.—An elegant single-flowered variety, the blooms flatter than in many kinds, and of milky whiteness. A.M., R.H.S., June 18. Messrs. Paul and Son, Cheshunt, and Messrs. James Veitch and Sons, Chelsea.

### GLADIOLI.

Innocence.—This fine pure white early-flowering gladiolus surpasses the well-known form of Colvillei named The Bride, and it should soon become a favourite. A.M., National Gladiolus Society, June 18. Mr. T. W. Le Page, Guernsey.

Cardinal.—Another fine early variety, with large, salmon-red flowers, marked with white. The buds are quite red. A.M., National Gladiolus Society, June 18. Messrs. E. H. Wheadon and Sons, Le Couture, Guernsey.

Queen Mary.—A large-flowered early gladiolus, with rich pink, white-blotched flowers of great beauty. A.M., N.H.P.S., June 19. Messrs. Barr and Sons, Covent Garden.

### WAHLENBERGIA VINCÆFLORA.

A low-growing hardy perennial, suitable for the rock garden. It bears its campanulate flowers very freely, on slender stems; the colour is bright cœrulean blue. F.C.C., N.H.P.S., June 19. Mr. Reg. Prichard, West Moors, Wimborne.

### LITHOSPERMUM FROEBELLI.

A compact little plant, less than a foot high, clothed with neat leaves and furnished with deep blue blossoms. A.M., N.H.P.S., June 19. Mr. Reg. Prichard, Wimborne.

### RODGERSIA TABULARIS.

This Chinese plant has large peltate leaves and heads of rather small whitish flowers that are fragrant. A.M., N.H.P.S. June 19. Mr. Amos Perry, Enfield.

## SOME UNCOMMON RHODODENDRONS.

The rhododendrons have surpassed themselves in freedom of flowering this season, and never do I remember having noted a more glorious display.

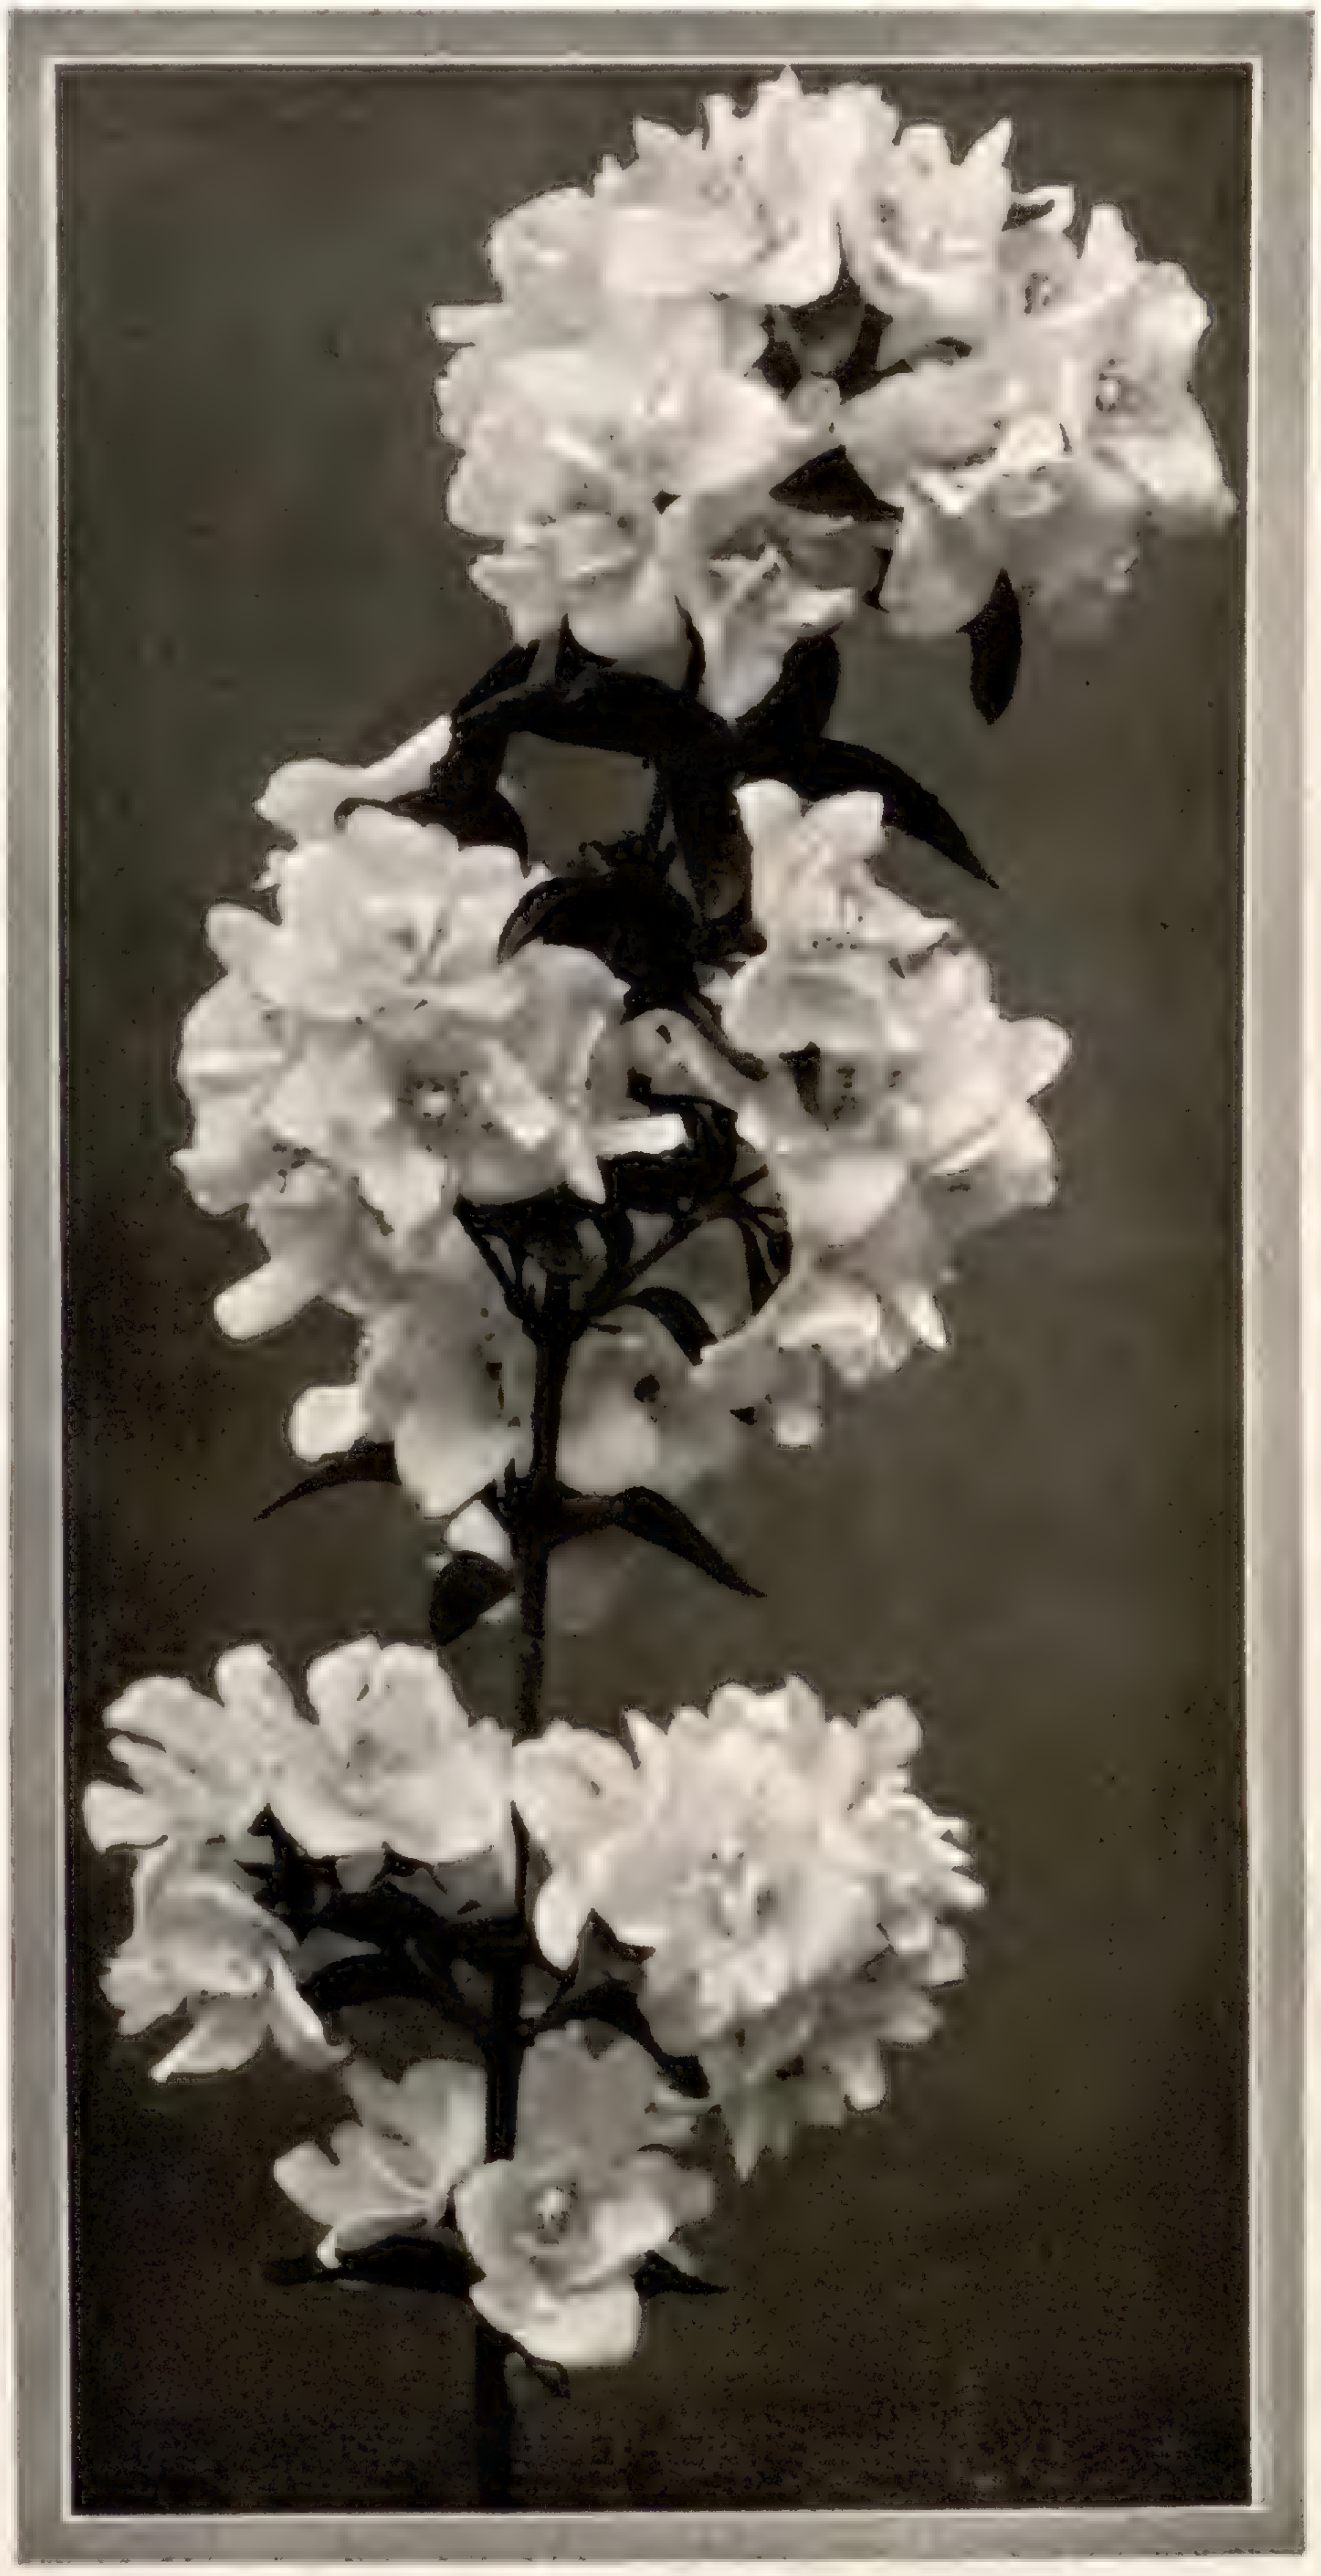
It is true that their season of beauty was cut short by the prolonged drought, at least where artificial watering was not resorted to, and, incidentally, it should have received attention. Happily, the big rainfall we have experienced will bring about strong and vigorous growth, which will be responsible for another season's display.

The object of this note is to call attention to a few uncommon rhododendrons that are apt to be lost sight of amidst the galaxy of beauty included in the aggressively handsome garden varieties which have resulted from the intercrossing of R. arboreum, R. caucasicum, R. ponticum, R. catawbiense, etc. From the Himalayas we have R. lepidotum, which produces its small and flat flowers in the latter part of April. I am told by a Kew colleague that this species affords a sprinkling of flowers at intervals throughout the summer in a western garden, but, as far as my experience and observation goes, the flowers produced after the normal flowering period are scarcely worth speaking about. With the advent of June, R. Broughtoni aureum*, a hybrid created by intercrossing Azalea mollis and an evergreen rhododendron, displays its charms, the flowers being of yellow colouring, as the name indicates. Then there is also R. Smithi aureum, of similar hue. R. Kæmpferi hails from Japan, and makes a brave show in late spring, more especially when a dozen plants are brought together in a group, bed, or colony.

Then we have a number of quite petite species, several of which cannot boast a stature exceeding two inches, but, notwithstanding, are veritable gems of this great family of plants.

R. serpyllifolium bears flowers of a purple hue, the leaves being very small, while R. racemosum is a very desirable species, with rose and white blooms. R. punctatum, R. Wilsoni, R. yunnanese, R. afgleanicum, and R. myrtifolium extend the list, not forgetting R. kamtchaticum, which luxuriates in a very damp or boggy situation, and speedily resolves itself into a wide-spreading mass. R. Roglei, which, I believe, is synonymous with R. cinnabarinum, is a great beauty, and so are the alpine species, R. hirsutum and R. ferrugineum, which create a blaze of colour in their season.

There is much to recommend in a fully representative collection of these uncommon forms, and certainly it would constitute one of the most interesting features in the garden. WALTER H. AGGETT.



PHILADELPHUS BOUQUET BLANC.

A beautiful hardy shrub with an abundance of semi-double white flowers. A.M., R.H.S., June 18. Messrs. Jas. Veitch and Sons, Chelsea.

**The Bottle Brush Flower.**—Few hard-wooded plants have made the same amount of headway in popular favour within the last few years as this, and at recent Temple Shows it has been well represented. All previous displays were, however, left behind at the International Show, for both as standards and as bush plants magnificent examples were shown. In the competitive classes prizes were awarded for the best specimens, while in several non-competitive groups very fine examples were shown. It is known generally as Metrosideros floribunda, but by botanists it is referred to as Callistemon salignus.—S. W.

---

[* This yellow-flowered rhododendron is no way related to R. Broughtoni illustrated in our issue of June 15.—ED., "G.M."]

## ROSE NOTES.

The present June has been more a month of roses than usual, and wherever the plants have been persistently syringed they are clean and promising. The great difference between roses receiving this attention and those neglected is very evident this season. While we had considerable young growth upon our plants late in April and early in May, we were visited by dry winds, and oftentimes very cold nights. Such conditions naturally caused distress to young growth; in addition to which they were more than usually affected by insect pests. Indeed, I think most of us have noticed how much worse and prevalent insects are during weather of the character mentioned, especially at a time when the plants are unable to advance freely.

SINGLE ROSE PINK PEARL.

A large, thick-petalled single variety; rich pink with golden stamens. A.M., R.H.S., June 18. Messrs. Hobbies, Lim., Dereham.

I have seldom seen our old-fashioned climbers and climbing polyanthas more beautiful than this June, where the syringe has been freely used. On the other hand, plants both in cold and sheltered aspects have been almost denuded of foliage from attacks of aphides and red spider during the spell of dry and uncongenial weather. This is almost invariably the case where syringing was neglected. Even clear water alone would have done much good, and there can be little excuse for this when one considers the great benefits from a judicious use of the syringe and a weak insecticide.

Since the welcome showers early in June our maiden plants are coming on rapidly, and will soon be well in flower should the same conditions continue. At the middle of the month we have a good display upon maidens of Lady Battersea, Madame Ravary, Viscountess Folkestone, and Gustave Regis. Some maidens of Sunburst are looking well, but this is evidently a somewhat changeable rose, more particularly as regards its first blossoms. We have quite a number of roses that vary considerably during the changeable days of early summer and late autumn. Mrs. Aaron Ward and Prince de Bulgarie are notable examples; in fact, one can often cut quite distinct blooms from the same plant. We find the same in Lady Roberts and William Allen Richardson. So much is this the case that I have more than once been asked to name a variety because the grower was convinced his plants were not true, the misconception occurring from this variableness.

It is long since a climbing or pillar rose has pleased me so much as Sarah Bernhardt, a hybrid tea from Dubreuil in 1907. This is a most brilliant scarlet-crimson, with velvety purple shadings, and quite an acquisition among our pillar roses. It is described by some as semi-double, but I have it much in advance of that form, almost as full as Prince Camille de Rohan. It is also very fragrant, and an exceptionally free and early bloomer. An old introduction from Ducher in 1870, named Tour Bertrand, has surpassed itself also. This is seldom met with or even catalogued; yet it is fuller and a freer grower than either Safrano or Madame Falcot, being between those two varieties in colour. Good for any purpose, but especially as standards, and fairly high walls. It is a reputed seedling from Gloire de Dijon, but has no resemblance whatever to that variety, either in shape of flower or habit of growth. It is very sweet-scented, flowering in terminal trusses upon all growths, but never producing the long shoots associated with climbers of the Dijon race. This and Madame de Tartas are sadly overlooked, and by some means they escaped public notice at the first. Yet if Tour Bertrand was introduced now it would be in favour as a deep saffron and yellow pillar rose, while its perfume is surpassed by very few.

The budding season is near at hand, and soon the budding of briers and other stocks will be the most important work to be done in the rose garden, except the constant attention to keeping the foliage clean and the application of suitable fertilisers and stirring the surface at every favourable opportunity. Budding needs much care in selecting the most suitable condition of both stock and bud. The choosing of rose buds is another matter that does not receive enough consideration. The healthier the plant and the more typical the flowers from it, the better chance have we of perpetuating these desirable qualities in the future rose.

You cannot bud too closely upon the base of roots in the case of dwarf stocks, nor too near the stem of standards. Almost all the future trouble from stock suckers can be avoided by careful insertion of the buds. In many cases the buds are not tied in firmly enough. This must be done, and the tie slightly released as the stock swells in the process of growth. Let there be no hesitation or bungling in the work, and have everything ready so that delay does not cause drying of opened stock or prepared bud. Any suspicion of bruising must also be avoided, and in both stock and bud the flow of sap should be sufficiently active to allow of easy preparation.

Plenty of water will be needed for most strong-growing roses against buildings and walls; and weak liquid manures should be applied freely. Water that barely percolates more than a foot or nine inches is almost useless. Indeed, I often consider it harmful, by reason of its exciting top roots that so soon fail when the soil is allowed to become dry once more.

ROSARIAN.

---

**Dracæna Deremensis Bausei.**—Last summer, at the Olympia Show, an Award of Merit was given to a very distinct dracæna, under the name of Dracæna Deremensis variegata. A drawback in this variety is that the white variegation is not very clearly defined, in which respect it is surpassed by the variety Bausei, which has white markings that are much clearer than those of the other, while it also extends to the leaf-stalks. —T.

# GARDENS OF UNCOMMON PLANTS.

Certain plants are unfamiliar in different localities, or perhaps it is more correct to say that a plant which is uncommon in six counties may be a household favourite throughout a seventh, in which its merits have become lauded by first one grower, then another. To make a garden of rare plants is far more simple than it seems, just by reason of the prevalence of certain plants in a neighbourhood to the exclusion of others of equal, possibly superior value.

The sites are most important. One bed should be filled with Tunica Saxifraga, a profuse blooming, dainty, peach-pink trailer, with foliage so similar to grass that it is often weeded up from a border. An excellent plant to associate with it is the one-foot-tall Salvia porphyrantha, which has crimson flowers. Another bed may have rings of Pyrethrum Tchihatchewi in it, a foot apart, the inner spaces being filled with the yellow and the vermilion Flora's Paintbrush, respectively Cacalia coccinea and Cacalia aurea, both annuals that grow rapidly from seed.

A bed of mixed Primula obconica proves exceedingly beautiful; a sunny position is essential, and a good deal of sand and crushed brick rubble should be mixed with the soil. The best effect is gained from a bed that slopes gently to the middle, as the plants then can be set only seven inches from row to row, and the vivid green foliage will meet and overlap, leaving no vestige of ground by the end of summer. The lavender, crimson, nearly white, or rose varieties can be used separately if preferred, but all shades harmonise.

Then a bed of the yellow dwarf variety of the biennial Sweet Scabious makes a charming novelty. If an accompanying plant is desired, crimson or bronze foliage, either for carpet or centrepiece, will be found most satisfactory. Calceolaria rugosa Queen of the North delighted every grower last year. The habit is dwarf, the foliage a rich dark green, which especially well contrasts with the yellow blossom. The Spider Plant, Cleome gigantea, proved another favourite, suitable for fine beds or borders. It is a three-foot grower with immense leaves and branching habit.

A simple plant, just a hardy annual, capable of filling a lawn bed excellently, is Chrysanthemum carinatum Silver Queen. The odd feature of the flower is that the disk is silvery, set among white petals with pale yellow ring. In one most successful bed it was given a centre mass of Streptosolon Jamesoni. There are several kinds of hibiscus that are exceedingly valuable as rare bedding plants, but probably the most suitable and attractive is Hibiscus Sabdariffa, which seldom exceeds fifteen inches in height, is yellow with deep maroon eye, a half-hardy annual that only requires plenty of sunshine and a fairly light soil.

White Plumbago can be put out during summer against southern house walls, its long branches securely tied up to trelliswork or nails. The blue variety is, perhaps, more charming. Another good scheme is to locate these a foot or two away from Ampelopsis Veitchi, and tie the one climber to the other, or associate them with a background of the orange and red Tropæolum tuberosum.

Eccremocarpus scaber, the Chilian Glory Flower, will thrive out during summer. One original way to use it is a plant to each bamboo cane, set half a yard apart at the back of some prominent border. For a remarkable colour show Lobelia Royal Purple may form the ground-work, or the deep blue variety of Convolvulus minor. A remarkable climbing convolvulus is C. althæoides, which has rosy blossom among silver-marked leaves.

For rockery adornment profuse sowings should be made of the Blue Woodruff, Asperula setosa azurea; Argemone mexicana, a one-foot, silvery, thistle-like plant, with poppy-shaped cream blooms; Platystemon californicum, a low trailer, with grey leaves and primrose-coloured flowers, shaped like Celandines; Collomia coccinea, coral-red, 1ft.; and the brilliant magenta, star-shaped, little Kaulfussia kermesina.

LAVATERA OLBIA.

A hardy, shrubby perennial with elegant leafage and large, silvery-rose flowers.
A.M., R.H.S., June 18. Mr. Maurice Prichard, Christchurch.

There are many places where the beauty of the coloured-leaved kales are unknown. The biennial cerise-crimson Gilia coronopifolia invariably attracts attention, while Gypsophila elegans carminea is a delight when alternated with cream begonias.

Arbours, pergolas, or porches should be clothed with the pinky-white Polygonum Baldschuanicum; the curious-shaped Scyphanthus elegans, a half-hardy annual; and double Convolvulus major.

M. H.

# ENGLISH LEGISLATION AND PLANT DISEASES.

Chief among the most important of the papers read at the conference held in conjunction with the Royal International Horticultural Exhibition was that by Mr. A. G. L. Rogers, of the Intelligence Division, Board of Agriculture and Fisheries, who dealt with the aim of English legislation in connection with plant diseases. He said:

Although the importance of extirpating contagious diseases of animals has long been recognised in England, and the State has taken an active part in preserving the health of English cattle for many years past, legislation on the subject of diseases of plants is of comparatively recent date. Many other countries have been earlier in the field, and have perhaps advanced further than it has been found possible to do here. Greater powers have been given to the Government, the service of inspectors is larger, and the regulations more drastic and sweeping. But this need cause no surprise, nor lead anyone to suppose that the interests of horticulture have been overlooked or neglected.

Those countries which have led the way in legislating on the subject of the pests and diseases of plants have generally had public attention roused to the necessity of taking action by some sudden and almost dramatic disaster. Some new pest, whose life history has been unknown, has appeared in their midst and swept like an epidemic across the country, destroying the crops and ruining the cultivators of the soil. In England, with one notable exception, we have have been spared that experience.

### Freedom from Serious Pests.

This freedom from serious pests that we have so long enjoyed is due not to any accidental good fortune, but in a great measure to the geographical position and climatic conditions of these islands. The destructive insects, which have spread across the Continent of Europe, without regard for national boundaries, have been checked by the sea from invading England. The prevailing south-west wind reaches this country from the Atlantic, where there are no insect pests that attack crops. It is true that, owing to the large quantities of fruit and agricultural produce imported every year some foreign pests may be, and are, introduced, but most of them are parasites on tropical or semi-tropical plants which can with difficulty survive a year of English weather. In other countries whose area is larger their acclimatisation and subsequent spread is rendered easier by the gradual transition of the climate from semi-tropical to temperate conditions without any natural barriers to check their progress.

The small size of England, and the fact that the climate varies but little from one end of the island to the other makes such a risk improbable. And even if any such pest were introduced and established itself it would not find the conditions favourable for rapid breeding during the summer, so that a second winter would find only a slight increase. But there are other circumstances which have contributed to keep England free from any overwhelming incursion of insect pests.

Agriculture has been practised here for many centuries, and the crops that are now raised differ very little from those that were raised a hundred years ago. Farmers and fruit-growers are therefore not likely to be exposed to the risks which beset pioneers in a new country, where the insects that formerly lived on native weeds attack their cultivated crops, or to which pests may be imported from abroad without the parasites that keep them down in the country from which they were brought. It is true that the foregoing remarks apply chiefly to insect pests, and are not equally applicable to those more insidious diseases caused by microscopic fungi, to which the constant rainfall and the muggy weather that so often prevail during the growing season render the crops particularly liable. But with the one exception of the potato disease, caused by Phytophthora infestans, already referred to, the fungus diseases that have been introduced into this country have not spread with great rapidity, or caused serious loss in the first few years after they have made their first appearance. Even the American Gooseberry Mildew (Sphaerotheca mors-uvae) which was first detected in 1906, and had certainly been in the country for some years previously, did not reach certain important fruit-growing districts for some years, in spite of the favourable seasons for the spread of such diseases that prevailed, and has not yet established itself in the south-western counties.

### Danger of the Introduction of New Pests.

The real danger to be feared in this country is of a very different order from that which besets more extensive countries, especially those which are still thinly populated, where farms are large, and means of communication still imperfect. In an old and densely-populated country there are few localities which are not under cultivation of some kind. The area classed as mountain and heath in England is very small, and though the districts covered by towns are large and numerous, there are gardens attached to the houses among the mountains and in the towns, where fruit and vegetables are grown which might harbour diseases and pests, and render the task of extermination correspondingly difficult. Even in the districts that can properly be described as agricultural there are no natural boundaries which would check the spread of disease, while the means of communication by human as well as natural agencies are rapid and easy. The maps that have been hung in the Exhibition show how few fruit-growing areas there are which are at all isolated.

The danger, therefore, which lies before the fruit-growers of this country is the introduction, as it were by stealth, of some new pest, its gradual spread until it is firmly established before it is discovered and identified, and the difficulty of exterminating the pest to which such circumstances give rise. In order to meet this danger it is essential that a constant watch should be kept not merely among English fields and gardens to discover and control any new dangerous pest that may be reported as attacking English crops, but also through foreign publications, whether official, scientific, or popular, on the appearance of such pests in the countries that lie on the other side of the Channel, or with which we have constant intercourse by trade. It is for this reason that the plant diseases service of the Board of Agriculture and Fisheries has arisen in the Intelligence Division, and it is this circumstance which has influenced and moulded the whole character of English legislation and administration on the subject of diseases of plants.

### Legislative Enactments.

The Destructive Insects and Pests Acts of 1877 and 1907 by virtue of which the phytopathalogical service of this country is conducted, had their origin in the agitation created by the introduction of the Colorado Beetle (Doryphora decemlineata) in 1877, and their completion in the alarm due to the discovery in an English fruit garden of the American Gooseberry Mildew (Spaerotheca mors-uvae), both of them pests from the New World. The Acts contemplate the issue by the Board of Orders to prevent the introduction of destructive insects and pests from abroad, and their control and, if possible, their eradication after they have been introduced. The duty of administrating these Orders is placed on the Local Authorities, though a large part of the work is carried out by the Board's officers, so that there is a double system of inspectors, those appointed by the Local Authorities, who have a special knowledge of local conditions, and those appointed by the Board, whose object is to secure uniformity of administration throughout the country. But both classes of inspectors send in their reports to the Board, so that the Central Authority is in constant communication with all the districts in which disease prevails or where inspectors are at work.

Before describing the method by which the reports are prepared and submitted, it will be necessary to give some account of the principles on which the Orders of the Board are drawn up, and the procedure which they require to be carried out. This had to be settled while the Act of 1907 was being drafted, and a memorandum was prepared in which attenion was drawn to the fact that all destructive insects and pests with which agriculturists in England are likely to be troubled may be classified under three heads. First, there are those pests which are indigenous or have at least been prevalent so long in this country that they are distributed more or less evenly throughout the land. These pests, though they frequently cause serious injury, seldom, if ever, take the form of an epidemic. Their virulence is scarcely affected by any abnormally wet or dry season. They often yield to simple treatment, and at any rate there is not the slightest hope that they can be exterminated by any State or municipal interference. The number of such pests is large, and their names will readily occur to any farmer or fruit-grower. They include the Winter Moth (Cheimatobia brumata), the Wireworms (Elateridae), the Woolly Aphis (Schizoneura lanigera), Apple Canker (Nectria ditissima), and Potato Disease (Phytophthora infestans). These pests are described in the Board's leaflets, thousands of which are distributed every year free of cost, or at a nominal charge, and they must be left to the individual growers to contend with. Those who cannot identify them are invited to send specimens to the Board for determination and advice as to treatment.

The second class includes those pests which have only recently been introduced, or which are only to be found in certain counties. These pests, if likely to prove dangerous to to spread to districts hitherto unaffected, can be made the subject of a special Order, if there is any prospect that they can be controlled by such means. The two diseases that have been treated in this way are American Gooseberry Mildew (Sphaerotheca mors-uvae) and Wart Disease of Potatoes (Synchytrium endobioticum), but others might be mentioned. It is these pests, of course, which claim the chief attention of the Board and the Local Authorities.

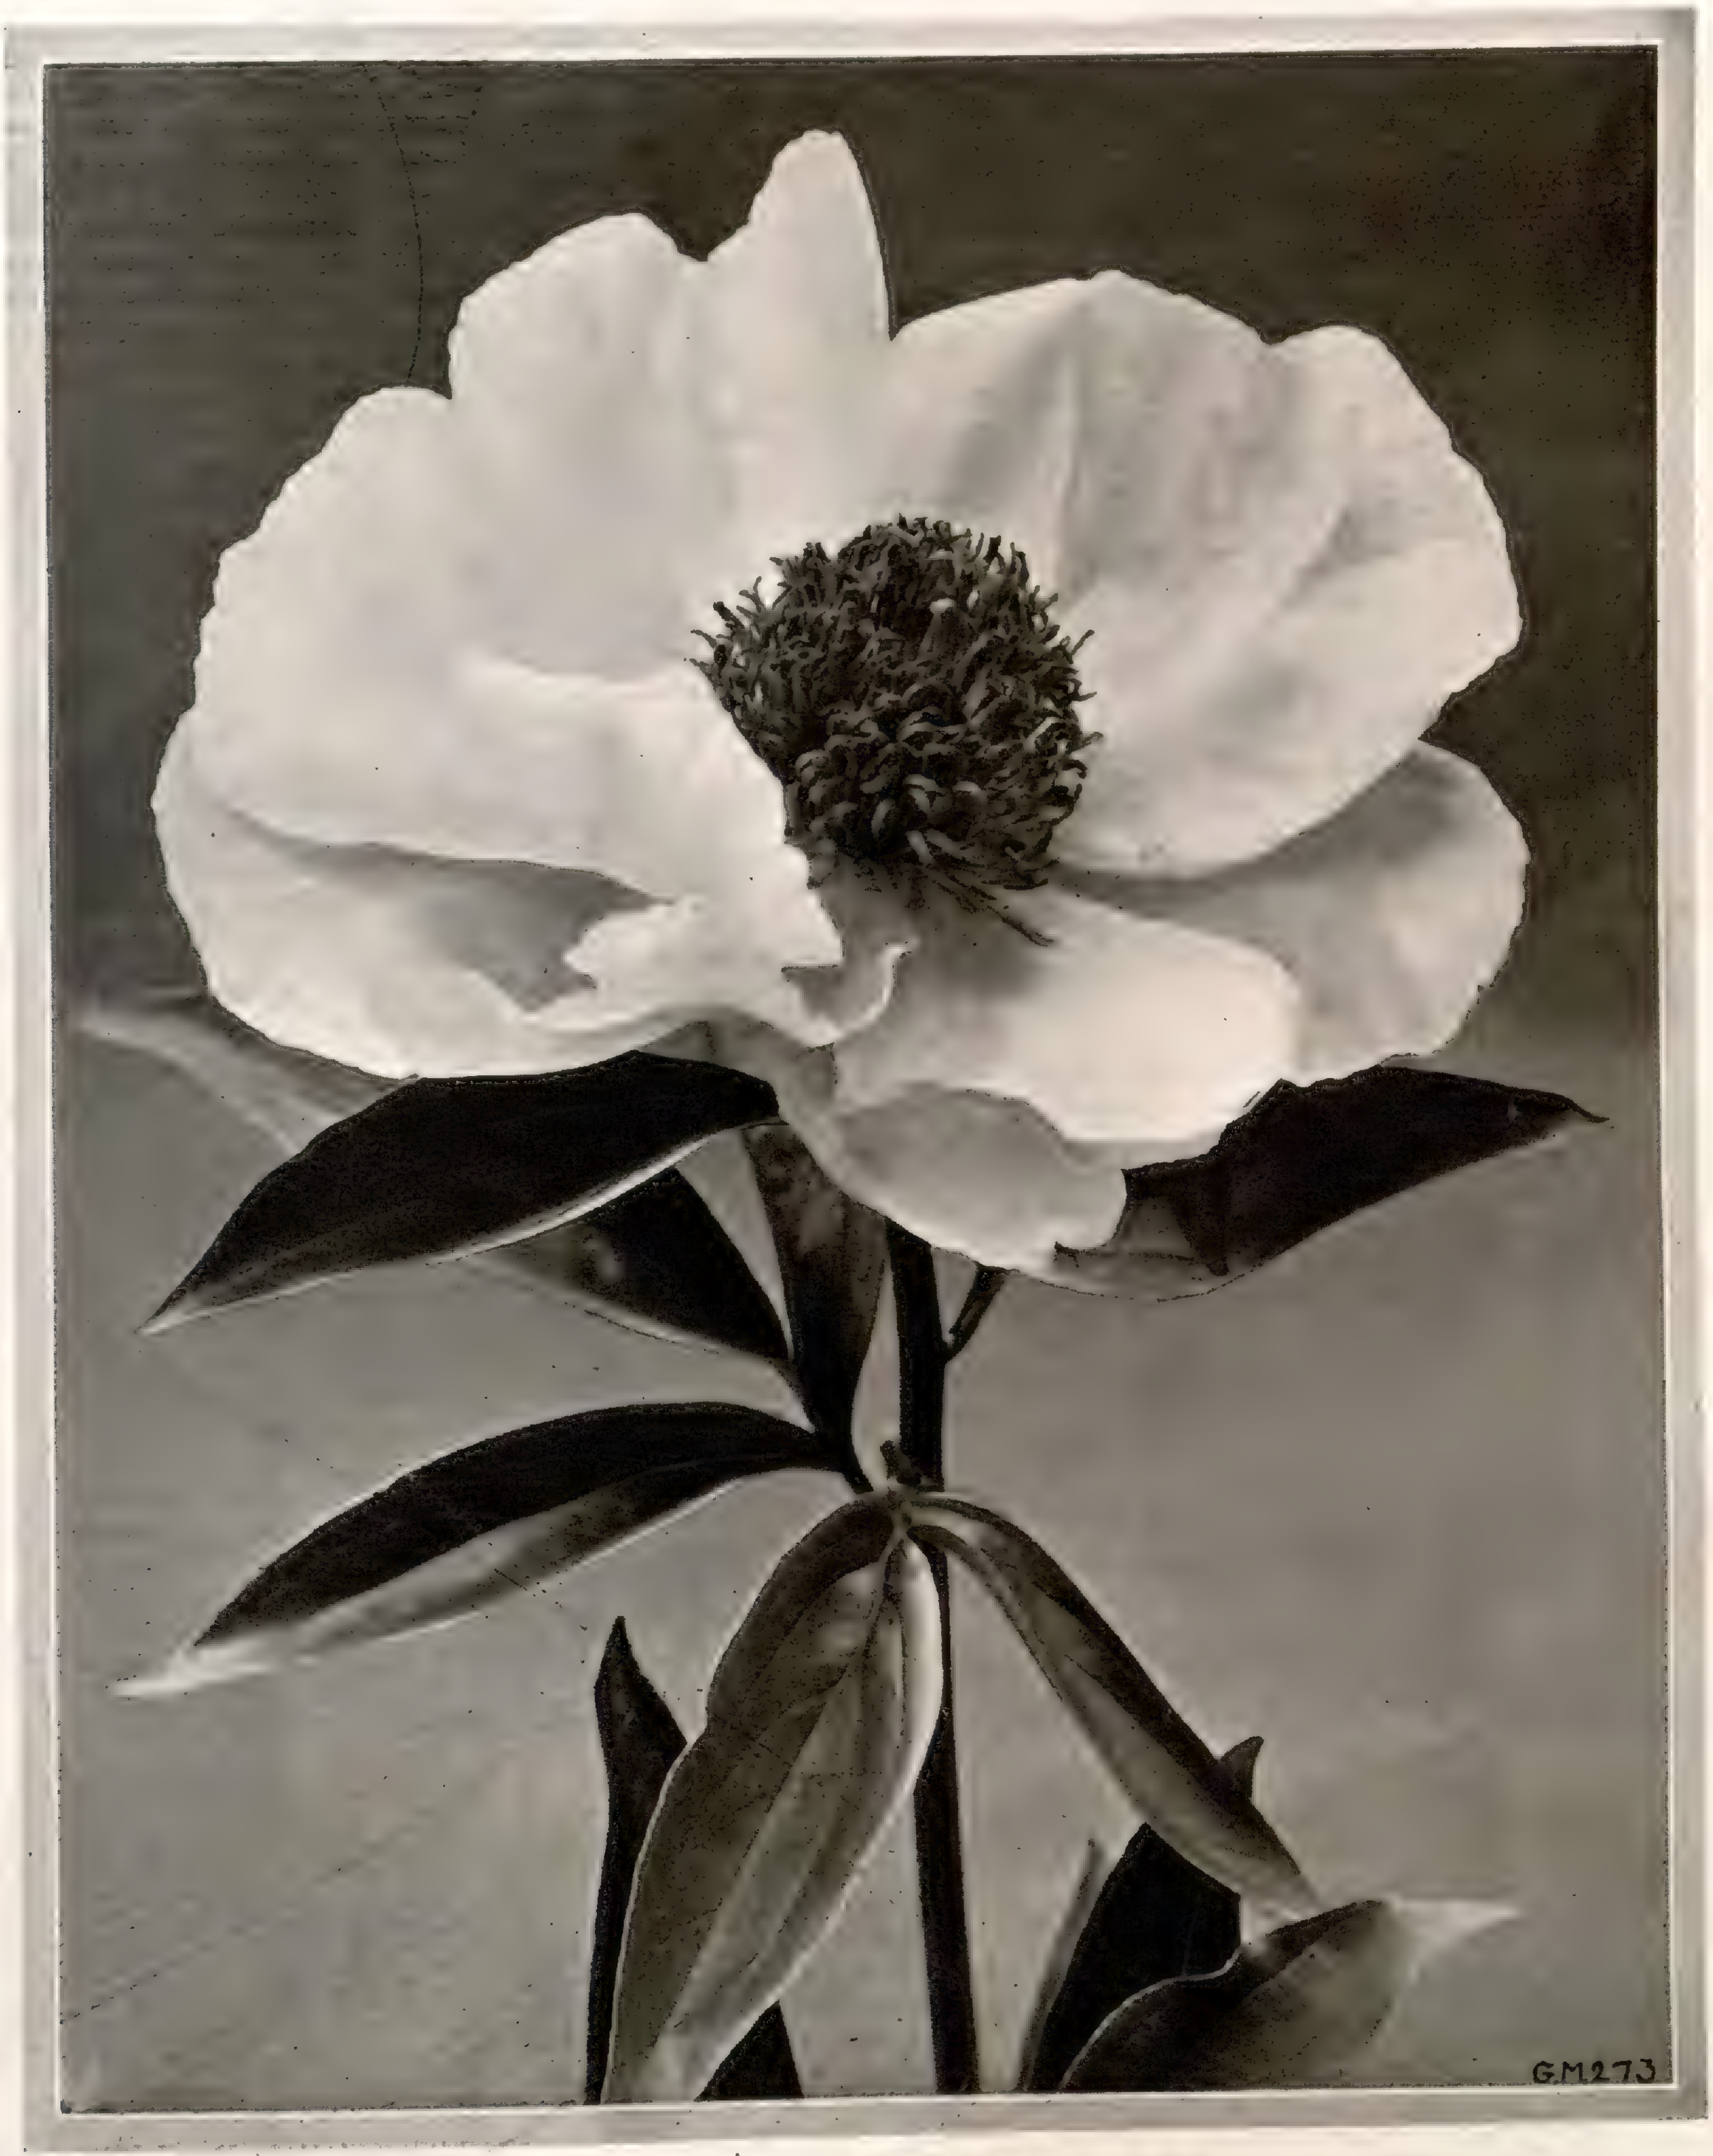
The third class includes those pests which have not yet been found in England, but whose introduction is to be feared, and those which have been reported sporadically for which no adequate treatment has yet been found. Among these are to be numbered the San José Scale (Aspidiotus perniciosus), the Potato Moth (Phthorimaea operculella), the Japanese Fruit Scale (Diaspis pentagona), or the Large Larch Sawfly (Nematus erichsoni), which, however, has perhaps been longer in this country than was at one time supposed, and the Tomato Canker (Mycosphaerella citrullina). Though it is of the utmost importance that these should be kept out of the country, or dealt with adequately, where they are found nothing can be done in advance. Preparations can be made for dealing with them promptly when they appear, or investigations carried out as to the best and most effective treatment of those already with us. As they assume more dangerous proportions or a suitable method of control is found, they should be removed from the third category to the second. A fourth class was subsequently added to which reference will be made later on.

The lines laid down in this memorandum have generally been followed in the preparation of the Board's Orders in connection with Destructive Insects and Pests. Certain other distinctions have also been drawn between the pests in the second and third classes which have led to a variation in the procedure for dealing with each. Thus although it is considered a cardinal principle that the occupier of any premises on which any scheduled pest may exist or have recently existed is bound under a penalty to report the fact to the proper authority, the pests in the second class are considered to be so well known that the plea of ignorance of the pest is not considered a good defence. Those in the third class might easily fail to be detected, and in this case a fine can only be imposed if the occupier can be convicted of "knowingly" failing to report. Again, when one of the pests on the second list is discovered a notice is served on the occupier declaring his premises "infected premises," and prohibiting the movement from them of any plant which might convey the disease to other premises, except by licence. Those parts of the plant which are used for human food are exempt from this rule if they are fit for consumption. The pests of the third class are treated differently, and no attempt is made to define the infected place. The reports refer merely to the parish in which the premises lie.

(To be continued.)

## PÆONY HEART'S DESIRE.

The beautiful single-flowered pæony that we have the pleasure of illustrating herewith is of special interest to both cultivators and raisers of pæonies, and should receive the attention it so well merits. To the cultivator it is of value for the production of bold masses of flowers and foliage in the hardy flower border, and to the raiser it should prove of a high degree of utility as an exceptionally fine type of the single-flowered race. One of its marked characteristics is its freedom from looseness of habit or roughness in the development of the flowers, and its consequent effectiveness in the garden. The flowers, as will be seen from the accompanying illustration, while distinctly regular in outline, have broad, gracefully curved petals that are so arranged as to remove any trace of formality. Not less noteworthy is the variety for the excellence of its habit, the growth being erect, the foliage light and elegant, and the flowers are borne on rigid stems that carry them well above the foliage when upon the plants, and also admit of their being readily arranged to produce bold and distinct effects when in a cut state. In colour the flowers are brilliant rose, and their charm is greatly enhanced by the central mass of rich golden anthers. Heart's Desire is one of the many beautiful single pæonies that have been raised by Messrs. Kelway and Son, of Langport, who, as so well known to cultivators of hardy flowers, have done so much to improve both double and single-flowered pæonies.



SINGLE-FLOWERED PÆONY HEART'S DESIRE.
A beautiful variety with rose-coloured flowers, introduced by Messrs. Kelway and Son, Langport.

**Pyrus floribunda atrosanguinea.**—The typical Pyrus floribunda, which is also known frequently by the name of Malus floribunda, is from its limited size and exceedingly graceful habit, a general favourite, especially for small gardens. To its many admirers who may be acquainted with the variety atrosanguinea this can be thoroughly recommended, for the flowers are very much richer in colour than those of the typical kind.—S. W.

## PEARS.

From what can be seen at present, this promises to be one of the most fruitful pear years we have had for a considerable period. True, there are some varieties that are not carrying full crops of fruit, but this is not difficult to account for, seeing that all kinds do not bloom at the same time, and under the same conditions. As there were several degrees of frost, with cold winds prevailing, when some of the trees were in bloom, failure of these to fruit can in a measure be accounted for. Many of the more choice kinds are doing well, particularly where the trees received due attention in the way of spraying, so as to rid them of insect and other pests, and protection from frost.

Cordons, whether on walls or in the open, look very promising, and there can be no doubt where only a small quantity of each variety is required, this is the most economical way of growing pears, as a greater number of the choicest kinds can be grown than is the case where trees of larger dimensions occupy the limited space at command.

I notice, however, with some of the more tender varieties growing in exposed places, especially those having tough, hard skins, that the fruits are affected more or less by the late spring frosts, so much so with some kinds that it has caused many of them to present quite a rusty appearance. Some would, no doubt, attribute this to the ravages of insects, but as there could be no red spider, thrips, and the like in cold weather, when the plants are in bloom, one may dismiss that idea without comment; others would have us believe that a parasite of some kind has been at work, and could be got rid of by the application of some wash, but from very close observations, I have come to the conclusion that this contraction of the skin is caused by frost and cold winds when the fruits are very small, and in some instances when the trees were in bloom, and there was no foliage to give protection. On many occasions I have looked over the trees in an evening and noticed the fruit quite clear and free from these specks, but, on examining them the following morning, after a frost, they have been affected. Where there are many fruits of this class, it is well not to commence thinning too early, as in all probability many of them will fail to swell.

While on this subject of thinning, due consideration should be given to the condition of the trees, the variety under cultivation, and the kind of stock on which the tree is grafted. Some varieties of pears grow very large, but when the trees are in a vigorous condition, such should be allowed to carry more fruit than those in indifferent health. Pears do not need much support until they commence to form their pips, therefore it is not advisable to commence thinning too soon, and when this operation is performed, reduce the number in the first instance, if the fruit be overcrowded, to one on each truss; if it be found afterwards that a further reduction is needed, go over the trees again, and remove the small ill-placed fruits.

Now, as to the number of fruit a tree should carry. Much depends on the variety. If the tree is vigorous, then three fruit of the largest varieties may be allowed to each foot of stem—that is, supposing a cordon to be twelve feet in length, it should be capable of carrying three dozen fruits of the largest size, averaging, say, a pound each, or four dozen of a smaller size, while at least five dozen may be allowed to remain of such kinds as Winter Nelis and others of a like class. As the later varieties swell more rapidly when the days become shorter, and there is more moisture, both in the soil and in the atmosphere, trees do not become so exhausted in maturing their crops as is the case of such varieties as Clapp's Favourite and others that ripen at that period; therefore, the crop should be regulated according to the variety and the season of ripening.

There are other things to be taken into consideration in addition to thinning and regulating the fruit, if we are desirous of obtaining the finest results, for not only must the specimens be of large size, but they must possess good colour, and be of the finest flavour. As neither of these things can be obtained unless during growth the fruit is exposed to all the light and air possible, it is evident that the young shoots overshadowing them must be removed early in the summer. It should be the aim of the cultivator to keep his trees in a healthy flourishing condition, and at the same time produce the finest specimens possible. As this cannot be accomplished unless constant attention be paid to the tree's requirements, and one has a knowledge of essential conditions, it is necessary to observe closely the difference in the habit of each separate variety, as no general rule can be laid down to show how every kind should be treated. Some varieties make strong, rampant growth, which bloom but sparingly unless checked, while others are of a more slender habit and flower most profusely each season. Now to treat all alike would simply be courting failure, whereas by paying close attention and observing how the numerous varieties respond to different treatment, one is able to judge the best and most suitable time to perform the various operations necessary to attain the desired end. Slender growing varieties may be summer pruned much earlier than the strong growing ones without fear of their permanent buds bursting; therefore, it is well to take this into consideration at the time of summer pruning.

As pears ripen at different seasons, their fruit is of considerable value to those in private establishments, both for dessert and culinary use, and as many of the varieties are in season when other kinds of fruit are scarce, it is well worth considering, not only how good crops can be secured, but how they can be preserved to the best advantage. In large gardens where ample room is at command, there is no reason why a good quantity of the best late-keeping varieties should not be grown. It is seldom now that we see large well-trained trees carrying two or three bushels of fruit each, neither is it desirable to have such a large quantity of those kinds that only remain in condition for a short period. It would be far preferable to grow more of some of the best late varieties that come into use from December onwards than to have so many of one kind that ripens in October and are so soon spoiled.

Many of the finest flavoured mid-season pears do not remain in good condition more than a day or two, especially if placed in a warm room. There is an inclination nowadays to go in for size in preference to flavour. I know from experience that appearance goes a long way in commanding favour, but good looks are not everything. Some of our finest flavoured pears have not the most showy appearance, and are discarded on that account, and, though it is possible to improve the flavour of many things by superior cultivation, it would be better to discard inferior varieties and grow only those of proved sterling merit, especially as trees can now be made to produce fruit in the course of a few years.

H. C. Prinsep.

## DELPHINIUMS.

Delphiniums have always enjoyed a position of prominence in decorative gardening, and their many sterling qualities undoubtedly account for this, for unlike some other flowers, they have maintained their position chiefly on account of that great diversity of habit that admits their inclusion in gardens of any size, while the colour range is a positive safeguard against the evil of changeful fashion, that at times so adversely affects flowers upon which the florist has expended much time and expense.

Few hardy border flowers are distinguished by greater natural grace, elegance, and a certain stateliness of character, consequently there are few positions in a garden wherein delphiniums may not be employed to advantage; in borders the extreme range of height and colour is readily shown, and when the latter is displayed in distinct shades, they are particularly impressive provided the varieties are arranged in rather bold groups and the growth is vigorous.

Wherever space permits, most telling effects are produced by planting whole beds in masses or groups of distinct shades, an arrangement that scarcely admits of improvement, as in this way the variety in modern delphiniums is disclosed in all its wondrous beauty.

The cultivation of delphiniums is by no means difficult, as they succeed in any ordinary garden soil that has been deeply trenched and liberally manured previous to planting. The best results are obtained on deep, friable loam, while on heavy soils some material to lighten and render them warmer should be added at time of planting. On light soils the necessity of liberal supplies of manure is very evident, as otherwise the plants soon deteriorate; this stimulus may be applied to the plants in spring, digging, or better, forking, it in among the roots, to be followed by a heavy mulching of short manure in April, while during periods of drought, the application of some liquid manure will greatly assist perfect development.

The varieties that have originated in gardens are most popular at the present time, as they surpass the species in general vigour, and, being more refined in colour, they appeal to a much wider circle of plant lovers. The varieties of these are innumerable, and it is only possible here to name a few that are generally recognised as of standard merit:

King of Delphiniums, gentian blue and purple, with white centre, spike narrow, flowers double; Francis F. Fox, deep blue, flushed purple, and eye white; Persimmon, bright azure-blue, sulphur centre, large flowers on branching spikes; True Blue, intense blue, with black eye, a very telling border flower; Rev. E. Lascelles, dark blue, white centre, narrow spike; Mrs. J. S. Brunton, bright blue, white eye, spike loose; Bandolero, violet-mauve and blue, with white eye, double; Moerheimi, the best of the white varieties; Rev W. Wilks, rich purple-plum colour, black eye; M. Porion, sky-blue flowers of ranunculus form; Mrs. Creighton, semi-double, deep blue, with rose-violet centre; and Queen Wilhelmina, the colour a charming combination of soft blue and rose, with white centre.

Of dwarf varieties all the forms of grandiflorum are admirable border plants, their low stature and continuous flowering properties rendering them particularly valuable in all planting of a composite nature, while in some instances the shades of blue are almost unique. The type grandiflorum

## FOR GARDEN AND FARM CROPS

*By* W. DYKE.

*Edited by T. W. SANDERS, F.L.S., Editor of "AMATEUR GARDENING."*

A book for which Gardeners—amateur and professional—have been waiting, and one which will fill a gap in many a garden lover's library. Mr. Dyke is an authority and treats his subject in a lucid and simple style that will without doubt convince the reader of its great importance. What he has to say on manures and fertilisers is the outcome of profound study, and long and practical experience. From this work you may learn why manures are needed, and obtain practical information in regard to the food of plants, the constituents and properties of natural and artificial manures and their application, with the object of increasing the quantity and quality of plants, flowers, and all garden and farm crops.

by post, for which I enclose remittance of ..................

*Name* ..........................................................

*Address* ......................................................

(chinense) is a slender branched border species, with gentian blue flowers on stems that attain a height of 2½ to 3ft.; album is somewhat similar with white flowers. Belladonna, with lovely sky-blue flowers, on 3ft. stems, is indispensable in the border, and fortunately it comes true from seed; the colour is perfect. Belladonna semiplena, a form of the last-named, has flowers similar in colour, with the addition of a rose-lavender flush. Lamartine, one of the finest of all dwarf delphiniums, flowers rich turquoise blue, with snow-white centre, on branching stems, some 3ft. high, a beautiful flower in itself and effective in contrast with Belladonna.

Delphiniums are readily propagated by seeds, which should always be selected from the best flowers. Sowing may be performed in the open during May, the seedlings being subsequently transplanted to nursery beds, and planted permanently the following spring. Seeds may also be sown under glass in January or February, and if grown on rapidly and transplanted to a prepared bed in May or June, flowering plants will be obtained the same season. Delphiniums vary greatly from seeds, particularly those having double flowers; hence, in order to propagate a particular variety, resource must be had to cuttings and division of the crowns. Where the latter method is adopted, the plants are cut over immediately the flowers fade, when fresh growth is produced, and if carefully lifted and divided at this time, they readily produce roots on replanting and become well-established before winter. Single shoots taken in spring or autumn, and formed into cuttings, root readily if inserted in sandy soil, and placed in a close frame; this latter method is generally practised to perpetuate new or rare varieties of merit, and indeed is the one that can be the most strongly recommended. Thomas Smith.

Coombe Court Gardens.

A DOUBLE BORDER OF DELPHINIUMS AT COOMBE COURT, KINGSTON HILL, SURREY.

## ECHEVERIAS.

These plants are extensively used in carpet beds and to form edgings to borders generally. They should, however, only be employed thus where they will be in keeping with the plants with which they are associated. Where it is necessary to plant them so as to form a face-edging, many persons find it a difficult matter to place them so that they will retain their positions throughout the summer months, as ordinary soil will crumble away.

Use one part of cow-manure and two parts of ordinary soil; add water, and mix the ingredients in a wheelbarrow or on some boards, until they are of the consistency of stiff mortar. Then place a board of the required depth, or two if needed, which have been soaked with water, to the edge of the bed. With a trowel press the mixture of cow-manure and soil to the moist boards, leaving a level surface at the top, and then slide away the board from the edge. The echeverias must be at once planted, their stiff stems and roots being pressed into the soft mixture. One, two, or more rows of plants may be soon put in. If the edge is one to a round bed, then use three damp boards on end, and 9in. wide, thus making a neat curve as the boards are moved forward as required. The plants do well so treated.

Geo. Garner.

---

**Hydrangea arborescens grandiflora.**—This hydrangea, which came to us across the Atlantic a few years ago, is now extensively grown, and it begins to figure in the principal florists' shops of London. It is a form of the North American Hydrangea arborescens, in which the rounded head consists almost entirely of large, white, sterile flowers, whereas in the typical form, these are limited to a scattered few.—T.

# WORK FOR THE WEEK.

### THE ORCHID HOUSES.

TRICHOPILIAS.—Some of the trichopilias are now in bloom, and others are over, such as the lovely T. suavis and its white variety alba. The white-flowering forms of this interesting family of plants comprise some of the most chaste, and beautiful of flowers, and deserve to be grown wherever white flowers are appreciated. In the intermediate or cattleya house T. suavis will now be forming new growths, and when these are two to three inches long, and about to push new roots, is the best time to repot them, should it be necessary. They are best grown in pans suspended from the roof, where the flowers, being short-stemmed and drooping, are seen to great advantage hanging just over the sides of the pans. They will succeed in a compost similar to that used for cattleyas. Excess of moisture must be avoided for over-supplies at the roots, or in the atmosphere, will often cause the pseudo-bulbs to become spotted, and entail the loss of the plant. T. Backhousiana, T. tortilis, T. marginata, T. lepida, and T. crispa are all good and worth growing. T. (Pilumna) fragrans and T. nobilis are both lovely plants, similar in habit to the above, and require exactly the same treatment. The plants whilst in full growth should be grown in a fairly moist position, but when at rest drier conditions and only sufficient water to keep the bulbs and leaves plump should be given them. Many of these inexpensive orchids would be much more sought after, and be very much more grown if they were not so easily obtainable.

PLATYCLINIS FILIFORMIS, the Golden Chain orchid, will now be in flower, the spikes springing up from the half-made growths, and the plants must not be allowed to suffer for want of water. This species, and P. glumacea, should be grown in a well-shaded part of the intermediate or cattleya house and placed in a position where the foliage can be conveniently sprayed over several times a day. Repotting is best performed immediately after the flowers are faded, using a compost as for cattleyas, and the plants should not be potted too firmly.

EPIDENDRUM PRISMATOCARPUM.—This useful and handsome species succeeds under the same conditions as the preceding, and is therefore best accommodated in the intermediate or cattleya house. The flowers possess lasting properties, in addition to their beauty, and is therefore a suitable subject for exhibition purposes. This also is in flower at this season, and when the flowers are over, should it be advisable to disturb the plant from any reason, the work should be taken in hand. The pots, or pans, in which the plants are to be grown should at first be filled two-thirds full of clean crocks for drainage, as it is most essential that the drainage should be perfect, and the water pass readily away from the roots. During the early stages of the growth water must be sparingly given, sufficient only to keep the rooting material nicely moist being necessary. This dry treatment must be continued until the new pseudo-bulbs commence to form, and new roots are freely moving through the compost, after which an abundant supply of water may be given until the growths are fully developed. This plant also succeeds in a similar compost as that advised for cattleyas, and should be given a position where it may enjoy plenty of light, but must be shaded from direct sunshine; it also appreciates an abundant supply of fresh air on all favourable occasions.—J. T. **Barker**, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

AMARYLLIS OR HIPPEASTRUMS.—By this time the flowering of these fine subjects is practically over, and the plants are in full growth. They should be placed in a position where they will have a fair amount of light, but must be shaded from direct sunshine. Where it is possible to give up a house to their culture, a low span-roofed structure is the best. It should be provided with an efficient heating apparatus, so that a brisk heat may be maintained when forcing is necessary. If this is not required, the plants will come on naturally with very little heat. They should be removed from the conservatory directly they have finished flowering, and if a house cannot be given up to them, a good position for the plants will be on the back stages of late vineries, where they are slightly shaded by the leaves of the vines. They then have plenty of moisture, and a certain amount of heat. Amaryllis are gross feeders, and the better they are treated whilst making their growth the better will be the quality and strength of the flower spikes. They should be given water whenever required with liquid manure alternately. Sheep droppings placed in a tub makes a capital liquid manure for them. Grow them on in this way until about the first week in August—the exact time can be determined when the centre leaves have attained the same length as the older ones. The plants should then be moved outside and stood on an ashbed, and allowed to go to rest. Water will only be needed if the weather is very dry and hot. As the bulbs ripen, the foliage will gradually die off. At the end of October the plants should be placed on a shelf, where they will not be subjected to frost, and kept perfectly dry until the flower spikes begin to appear in spring. I am perfectly sure the reason so many gardeners fail to grow and flower amaryllis satisfactorily is because the bulbs are not ripened and rested properly.

CHRYSANTHEMUMS.—These will need plenty of attention now. All plants required for big blooms have become established in their flowering pots, and are growing freely. Stakes should be placed to the growths selected, and all other growths should be rubbed out, three to four to each plant being quite sufficient according to their strength. The plants should be stood in their summer quarters at once. Where there is plenty of room in the frame ground chrysanthemums are best stood in single rows 4ft. apart on an ash base. A stout pole should be fixed firmly in the ground at each end of the row, and two wires strained one above the other, to secure the plants, to prevent the wind blowing them about. Often for lack of space the plants have to be stood each side of the kitchen garden paths, and they do quite well there providing the walk is a wide one and not overhung with trees. Plants intended for bushes should be pinched frequently. Chrysanthemums when growing freely should not be allowed to suffer from dryness at the root.

SALVIAS.—Salvia splendens, S. Pitcheri, and S. rutilans all need attention now, and if shifted on into 10in. pots and treated precisely as chrysanthemums, and in company with them they will be found to do well. Red spider is often very troublesome in hot weather, and if not checked will cause all the leaves to drop off. If the plants are watered overhead every evening this will easily prevent it.

EUPATORIUMS.—These are very useful greenhouse plants for the winter, and if attended to now will make fine plants by then. Young plants which were rooted in April will now be ready for their shift into 5in. pots. The compost best suited to their needs is fibrous loam two parts, decayed manure one part, with coarse silver sand. When potted the plants should be stood outside on an ash bed. The strong-growing varieties, Purpusi and Petiolaire, will need a further shift into 10in. pots directly they are ready for it. Eupatoriums are gross feeders; they like plenty of liquid manure when well established.—**Lewis Smith**, Shotesham Park Gardens.

## HARDY FRUITS.

SUMMER PRUNING.—Pyramids, bushes, and espaliers of apples, pears, and plums may now be summer pruned; probably in the late and colder portions of the country, where growth is more backward, it may be advisable to defer the operation for another fortnight. The summer pruning of established trees consists in cutting back to five or six leaves all young side shoots, leaving those at the end of the branch from one-third to nearly full length, according to the space available. Where a dense growth proceeds from the spurs the weaker ones should be removed. There are certain varieties of apples which form their principal fruit buds on the tips of the young growths, and in this case an exception to the above treatment should be made. These growths should be left intact until they have borne fruit, when they may be shortened back. On young trees a sufficient number of shoots to form the main branches should be retained, extra vigorous growths, after attaining the desired length of growth, should be stopped by pinching out the tips of the shoot. Summer pruning when carried out on common-sense principles has a beneficial effect, both on the tree and the crop of fruit; each individual tree has its own particular characteristics, and should be treated accordingly. Unfruitful trees making a quantity of gross growth will receive no benefit by hard pruning; on the contrary, the harder they are pruned the more will they persist in making new shoots. Such trees must be treated to drastic root-pruning during the early autumn, and to small use of the knife during the growing season.

WALL TREES.—Pears, apples, and plums growing on walls should have similar treatment to that afforded bushes, etc. The training of young trees should receive careful consideration; sufficient young growths should be laid in to build up a shapely and well-balanced tree. If the trees are fan-trained build up the wings first, and there will be no difficulty in filling up the centre in a satisfactory manner. The principal trouble in horizontal training is to secure growths at the required distance apart. If the leader fails to break satisfactorily it must be stopped to bring about the desired growths.

GRAFTED FRUIT TREES.—Trees grafted this spring will by this time have formed a perfect union. The clay and ligatures should be removed before injury occurs to the expanding union. Where the grafts have failed to join, a well placed growth may be detained for summer budding, or for grafting in due season. Well established and vigorous trees headed back for grafting form a considerable amount of spray growth. This should be removed to throw the whole energy of the tree into the desired channel. The new grafts should each have a stake and tie as a safeguard against strong winds. Where a considerable number of large trees have been grafted and it is not possible to afford the time for applying the stakes, the risk of loss by wind may be largely diminished by stopping the leading shoots. Every effort, however, should be made to give the necessary support to the new growth.—W. **Messenger**, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

CARROTS.—It is very advisable to make another sowing now of the Shorthorn forms of carrots, to maintain a regular supply of nice small tender roots, appreciated so much on the dining-room table. Take special care with the drills, drawing them rather deeper than usual, to receive a good supply of old potting soil previous to sowing the seeds. Cover the seeds with similar material, making it nice and firm if at all dry. This little care will contribute much to the success, particularly in dry weather.

RUNNER BEANS.—Where a good demand has to be met, a sowing should now be made. Sow in a shallow trench similar to a miniature celery trench. Where pickling this delicious vegetable is practised this sowing will be found to yield young, succulent pods in profusion at the right time. Gather them quite young and dry. Cut them up as for immediate cooking, place in layers in earthenware jars, and cover each layer with ordinary salt. Repeat this practice till the jar is full; tie down, and store in a cool place.

PEAS.—There is still good time to sow these if care is taken in the preparation of the ground. Sow early varieties, as well as late ones, the former often being fit to gather from seven to eight weeks hence. We have found Sutton's Early Giant excellent for a quick late crop. Peas will, of course, need mulching and spraying during dry autumn weather. Sow also Sturdy, Gladstone, and Autocrat.

SPINACH.—Sow the ordinary summer spinach every ten days in various parts of the garden. Sow also the spinach beet if a sure and plentiful supply is required. This variety raised from seed sown now will not run to seed till late spring next year. It bears transplanting with impunity when thinning out.

LETTUCE.—Make regular sowing of both cos and cabbage varieties, and guard against slugs when the plants are quite small. A sowing of new lime, broadcast, deters these pests.

ENDIVE.—Good breadths of this should now be sown, as from this sowing fine, fully-developed plants will be ready for blanching when good lettuce are becoming scarce during the late autumn. Sow both Batavian and curled varieties. Draw drills one foot apart and an inch in depth. Keep a sharp look out for slugs when germination is taking place. When large enough to handle plant out on good ground, fifteen inches apart. Ground previously occupied by potatoes forms an excellent site.

CELERY.—The earliest batch will now need a little soil drawn up to commence the blanching process. Previous to this carefully pull off all small leaves and side shoots from around the base. Give a dressing of soot, and water in if dry; then proceed to mould up after the stems have dried.—**Geo. Ellwood**, Swanmore Park Gardens.

## GARDENERS AND THE NATIONAL INSURANCE ACT.

The United Horticultural Benefit and Provident Society, in the institution of which Mr. William Marshall, V.M.H., and the late Mr. Shirley Hibberd, took a prominent part, has carried on its good work under the Friendly Societies Act, for a long number of years, and has been repeatedly referred to as one of the most successful societies in the United Kingdom. The wonder is that so few (comparatively) gardeners have joined the U.H.B.P.S. Probably the chief reason is that so many join the juvenile branches of such societies as the Oddfellows and the Foresters, and eventually join the adult lodges. With £41,000 invested and a membership of about 1,400, the Society is in a financial position of unusual strength. These funds will not be affected at all by the National Insurance Act, but it may be at once stated that individual balances (some old members have over £100 to their credit) are not likely to accumulate so rapidly under the new regime as they have done in the past.

At a special general meeting of members, held at the Royal Horticultural Hall on Monday, June 17, it was decided by a majority of 81 to 2, that the Society should seek the approval of the Commissioners, and be thus enabled to do business under the National Insurance Act, which comes into force on July 15. Previous to the meeting, a copy of the old rules, slightly revised, and a copy of the new rules for the working of the Insurance Act, were sent to every member. These rules were approved, and the Committee of Management was empowered to make the few necessary additions required by the Commissioners.

Gardeners who are exempt from the provisions of the Act may still join under the old rules, as the business of the Society will be conducted under two sections. Every employed gardener whose income does not exceed £160 a year must pay 4d. a week under the Government scheme of national health insurance, and his employer must pay 3d. a week, after the Act comes into force. To this total of 7d. a week, the Government does not pay 2d., but it will contribute 2d. towards every 9d. worth of benefits administered under the Act. No one is compelled to join a friendly society, but the advantages of joining an approved society, as against becoming a deposit member through the medium of the Post Office, are so obvious that even the National Health Commission urges attachment to an approved society.

Considering that gardeners have, on the whole, excellent health, and the profession occupies a very high position on the Actuarial Tables, it surely does not need much argument to show that if gardeners band together for the purposes of the new Act they are likely to get far greater benefits for the amounts contributed than would be the case if they joined other societies to which varied trades are admitted. Under the old rules a member of the United Horticultural Benefit and Provident Society received 18s. per week for 26 weeks if ill, and 9s. per week for a further 26 weeks in case of continued illness, while if the illness proved chronic he then received 6s. per week as long as illness lasted. And all this for 3s. per month, plus 3s. per annum to the Benevolent Fund, and 2s. 6d. per annum to the Management Fund. Supposing such a member now comes under the provisions of the National Health Insurance Act. In the past he has paid, roundly, 10d. per week. In the future he must pay 4d. a week, and for that sum, plus his employer's and the State contribution, he will obtain all the benefits the State scheme provides. He prefers to secure these benefits through the medium of the U.H.B.P.S., and it is anticipated that this society will be able to increase the benefits as a result of good management and the good health of its members. So far, this member pays 4d. a week, but he may see no good reason why, for benefits receivable, he should not still pay 10d. a week, as aforetime. He may do one of three things: Pay 2s. per month, plus 3s. and 2s. 6d. per annum to the Benevolent and Management Funds, and receive 12s. per week for six months, 6s. per week for a further six months in case of illness, and 4s. per week if chronically ill. This would mean 10s. in cash per week under the Insurance Act, and 12s. per week under the Society's own business, thus making 22s. per week, in addition to the other benefits of the Act, during six months of illness. Secondly, pay 1s. 4d. per month in addition to the State requirements, plus 3s. and 1s. 3d. per annum respectively to Benevolent and Management Funds, and receive 8s. per week during the first six months' illness; 4s. per week for a further six months, and afterwards 2s. 8d. per week if chronically sick; this making 18s. per week for the first six months of illness. Thirdly, he may pay his 4d. to the State scheme, and 8d. per month, plus 3s. and 1s. 3d. per annum, under the old rules, and receive during the first six months of illness 10s. per week and other benefits under the Act, and 4s. per week under the Society's old rules.

The Society will only admit as members those belonging to the gardening profession. New members must conform to the old rules as to age, etc., if they contribute to that part of the Society's business outside the Act, but age alone will not disqualify a gardener who desires to join and obtain the benefits of the Act through the medium of the U.H.B.P.S.

Head gardeners, nurserymen, and seedsmen, and market gardeners would be doing their men a kindness by securing and placing before them the Society's rules, etc.

C. H. CURTIS.

## ROYAL GARDENERS' BENEVOLENT INSTITUTION.

This fine, old, and useful charity held its annual festival dinner at the beautiful hall of the Grocers' Company on Tuesday evening, June 25, under the presidency of Sir Jeremiah Colman, Bart., V.M.H. There were about 230 ladies and gentlemen present, and the hall was beautifully decorated.

After an excellent dinner, in a few charming words Sir Jeremiah gave "The King," and followed with "Her Majesty the Queen, Queen Alexandra, the Prince of Wales, and other Members of the Royal Family," and he took advantage of this opportunity of pointing out how the institution had been honoured for long years with Royal patronage.

In proposing "Continued Prosperity to the Gardeners' Royal Benevolent Fund," the Chairman said that the love of gardening was either hereditary or instinctive in himself; in his childhood, when his pocket money was 1d. per week, he set aside a fair sum for seeds for his garden, but little thought he would have the honour of presiding in later years over such a representative gathering of gardeners as was present. Horticulture was progressing, and he was glad to say that the Royal International Horticultural Exhibition had proved a huge success. The recent honours list showed that horticulture was receiving due recognition, while the Minister of Agriculture had already signified his intention of making horticulture a distinct branch of his board. Lastly, the honour conferred upon Sir Harry J. Veitch recently had met with universal approval and pleasure (the meeting enthusiastically endorsed the chairman's remarks). Gardening was the most elevating of pursuits, and the purest of human pleasures. To be orthodox he should string out a long list of figures and facts relative to the working of the institution they had all met to assist. But he would not do so, and simply refer to the annuities granted to 253 beneficiaries, the Victorian Era Fund, assiting 49 poor gardeners awaiting election; and the Good Samaritan Fund to help the extremely necessitous. The institution has distributed £140,000 in assistance to gardeners, and needed £5,000 a year to meet its liabilities, only £1,000 a year being assured. Sir Jeremiah concluded with a reference to the distinguished company present, and his gratitude to those who had come to assist the charity; in a stately hall of an ancient and honourable company—to whom he tendered thanks—and surrounded by portraits of kings, queens, and nobles, and with tables ornamented by wonderful plate, and decorated with charming flowers by Mr. Leopold de Rothschild's able gardeners, Mr. Hudson and Mr. Bedford, and with the lady friends of horticulture present, he felt that everything was conducive to benevolence and practical sympathy. Contrast, said he, these surroundings with those of a disabled breadwinner, or of a gardener's widow, and before the picture fades, please fill up your forms with the amounts you feel able to afford for a deserving cause. With the toast and his appeal, the Chairman coupled the name of the treasurer, Sir Harry J. Veitch, and asked that the result of the evening might prove a record.

Sir Harry J. Veitch, who was enthusiastically received, said he found it difficult to say anything different to what he had said during the five-and-twenty years he had had to respond to the toast. First he thanked the chairman for his presence and advocacy of the claim of the charity, and tendered thanks to the Grocers' Company for the use of the hall. Sir Harry said the oldest pensioner was a widow of 98 years of age, and her husband enjoyed the pension for eight years after contributing £25 6s.; the couple had received over £400. One widow had received £450 from the Institution, and her husband had contributed £10 to the funds. Seven pensioners were over 90 years of age. After a word of praise to Mr. G. J. Ingram, the capable secretary of the Institution, Sir Harry read several pathetically thankful letters from pensioners. Although need was the only qualification for candidature, those candidates who had subscribed received some advantage because they were credited with votes in accordance with their contributions. Sir Harry concluded with a strong and feeling appeal for funds, and thanks for the reception given him; he felt that the honour he had received was an honour to horticulture in general, and not merely a personal manner.

Colonel the Hon. Mark Lockwood, M.P., proposed "The Ladies and Visitors" in a delightful and humorous speech that was much appreciated. Lord Southwark responded to this toast in a very pleasant fashion.

"Our Chairman," ably given by Mr. N. N. Sherwood, V.M.H., was accorded full musical honours, and Sir Jeremiah Colman and Lady Colman were heartily cheered. Sir Jeremiah responded in a few simple and feeling words, and with pleasing reference to the generosity of Sir Harry J. Veitch and Mr. N. N. Sherwood.

The subscription list for the evening, read by Mr. Ingram, amounted to £3.250: a splendid sum. This sum included £500 from the Chairman, 100 guineas from Messrs. Sutton and Sons; Messrs. de Rothschild, 100 guineas; Mr. J. Gurney Fowler, 50 guineas; Mr. L. Salomon, 30 guineas; Mr. A. W. Sutton, £20; Messrs. J. Veitch and Sons, 25 guineas; Thames Bank Iron Company, 25 guineas; and Sir H. Waechter, £50. The Covent Garden table (per Mr. J. Rochford), £188 10s., and the second Covent Garden table (per Mr. D. Ingamells), 50 guineas; Mr. N. N. Sherwood, to celebrate his jubilee with Messrs. Hurst and Sons, contributed the munificent sum of £500; and in acknowledgement of the great honour conferred upon horticulture through them, Sir Harry and Lady Veitch gave £300, and it need hardly be said that the notification of these magnificent donations were cheered to the echo. With the exception of the year when there was a special collection, this was a record subscription at a festival dinner. At the Chairman's request, Mr. G. J. Ingram was accorded hearty thanks for his untiring and successful work as secretary of the Institution.

An edition of "SWEET PEAS AND THEIR CULTIVATION," by C. H. Curtis, has been issued for 1912, and consequently this is an up-to-date work on the subject. The price, by post, is 1s. 2d. (cloth, 1s. 9d.) from the Publishers, 148-9, Aldersgate Street, London, E.C.

ROYAL SHOW

PRACTICE WITH SCIENCE

DONCASTER,
July 2nd to 6th, 1912.

£10,900 in PRIZES.

LIVE STOCK, POULTRY, MACHINERY, JUMPING, RIDING, DRIVING, PIT PONIES, FORESTRY, DAIRYING, HORSE SHOEING, SHEEP DOG TRIALS, DOG SHOW, FLOWER SHOW.
*For particulars SEE DAILY PROGRAMME.*

Band of The Queen's Own Yorkshire Dragoons.

**Prices of Admission:** Tuesday, July 2nd, 5/-; Wednesday and Thursday, July 3rd and 4th, 2/6; Friday and Saturday, July 5th and 6th, 1/-.
THOMAS McROW, Secretary.
Royal Agricultural Society of England,
16, Bedford Square, London, W.C.

NATIONAL SWEET PEA SOCIETY.—Great Exhibition at Royal Horticultural Hall, Westminster, July 9 and 10. Entries close July 3. Minimum annual subscription, 5s. Schedules on application. "Sweet Pea Annual" free to members; 2s., post free, to non-members. List of Sweet Pea names free to new members. CHARLES H. CURTIS, Hon. Sec., Adelaide Road, Brentford, Middlesex.

---

WOLVERHAMPTON GREAT FLORAL FETE,
JULY 9th, 10th, and 11th, 1912.
£900 in Prizes.
Entries close July 1st.
Schedules on application to the Secretary.

---

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## York Floral Fete and Gala.

The following notes of York Show were unavoidably held over from our issue of June 22:

### GROUPS AND PLANTS.

For the best collection of flowering and foliage plants, arranged for effect on a table space 12ft. by 6ft., and 2ft. from the ground, Messrs. J. Cypher and Sons, Cheltenham, scored with a very bright display of ferns, bright crotons, carnations, liliums, cattleyas, odontoglossums, and lælio-cattleyas; Mr. W. A. Holmes, Chesterfield, was a good second, and he made carnations and liliums a feature. Mr. G. W. Richardson, gardener to Mrs. Whitehead, Deighton Grove, Yorks, third, and Mr. T. M. Ward fourth. This was an especially good class, and the competition was very keen.

The class for a group of carnations was a good one. The space allowed was 12ft. by 6ft., and here Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, led with a grand lot of Souv. de la Malmaison, finely grown, with a backing of scarlet flowers, and crimsons in front. Mr. J. Donoghue was a very close second with Malmaisons backed and flanked by tree and border varieties, Cecilia being prominent; Mr. W. Langstaffe third.

At York a considerable number of classes are provided for greenhouse plants, and the competition is usually keen, this year especially so. Mr. H. W. Clark, gardener to Captain Walker, Mill Mount House, York, led for gloxinias with a handsome exhibit of well-grown plants; Mr. F. Dean, gardener to J. Rowntree, Esq., Clifton Lodge, second. Mr. T. Winn, Burton Lane, led in the open class for gloxinias, and was also a capital first-prize winner for a group of begonias with fine double varieties. Mr. F. Dean scored in the strong class for a group of calceolarias, and was followed by Captain Walker. Messrs. W. Seagrave and Co.; Mr. Skill, gardener to H. E. Leetham, Esq., Elm Bank, York; and Messrs. W. J. Godfrey and Son, Exmouth, won prizes as placed, for a group of show pelargoniums.

Mr. Wm. Todd, Vyner Street, York, gained first prize for a group of roses in pots. Standards, arches, and pillars of Dorothy Perkins and Hiawatha were freely used, with dwarfs of Frau Karl Druschki, Capt. Hayward, etc., beneath. Mr. W. Langstaffe, Garth Terrace, York, second, with a good lot of roses, but not well displayed. In another class for a group of roses, decorative plants admissable, Mr. Langstaffe was the leading prize winner, and his centrepiece was a standard of Philadelphia Rambler; Mr. W. H. Todd second.

There were but two entries in the class for a table of roses, 6ft. by 4ft., and here Mr. E. J. Hicks won first place with an excellent exhibit containing masses of Richmond, Frau Karl Druschki, Lady Hillingdon, Mdme. Abel Chatenay, and Mdme. Ravary; Mr. Henry Drew, Longworth, was a good second.

For a specimen greenhouse plant in flower Messrs. J. Cypher and Sons set up a very large and freely-flowered Erica ventricosa magnifica, and this won them the leading award; Mr. W. Vause second. The Messrs. Cypher scored easily for six specimen foliage plants with large examples of kentias and crotons; Mr. Vause and Messrs. R. Simpson and Sons followed in order. The latter firm staged the three best crotons.

Mr. Barker scored for six orchids in the amateur section, and in the same division led for three orchids and for a single specimen, the latter being a lovely Cattleya Mossiæ alba. Mr. A. Sunley, South Milford, was also a prize winner in the orchid classes, and Mrs. Whitehead scored with a fine Vanda suavis.

### PELARGONIUMS.

Specimen pelargoniums do not occupy the large position they once did at York, but nevertheless they make a fine show. For six specimens, zonal or nosegay varieties, Mr. Henry Pybus, Monkton Moor, won first prize with Mrs. W. Paul, Lady Reid, Mrs. Kelly, Doris Clark, Dr. Kotch, and Mrs. Newdigate; Mr. Jas. Sunley second, and Mr. J. W. Clarke, third. For a dozen specimens Mr H. Pybus scored, but we have seen him show in better form; Doris Clark, Mary Pelton, H. Jacoby, and Mrs. Kelly were his best specimens; Mr. J. W. Clarke, Clifton, York, came a capital second with smaller but finely-flowered specimens, and Mr. J. Sunley came third.

Mr. J. W. Clarke scored for half a dozen specimens of double varieties with good examples of Ernest Louth, R. W. Sayers, Royal Star, Mdme. Thibaut, F. V. Raspail, and King of Denmark; Mr. H. Pybus second, and Mr. R. Madgett, Clifton, York, third. Mr. H. Pybus led for three zonal varieties, and here his selection was Lady Reid, Mrs. Turner, and Mrs. D'Ombrain; Mr. Sunley second, and Mr. J. W. Clarke third.

### FLORAL DESIGNS.

In the classes for floral decorations there was a goodly display. Messrs. J. Backhouse and Son led for two bridal bouquets, and these were composed chiefly of white odontoglossums; Mr. A. A. Gatley second. The Messrs. Backhouse also came first for a pair of ball bouquets, with designs in gorgeous orchids; Mr. A. A. Gatley second. The Messrs. Backhouse also led for a pair of hand bouquets, and here they used golden oncidiums and cypripediums advantageously. In other classes the York firm scored for a basket of cut flowers and for a basket of roses, the latter being a fine exhibit of Mdme. Abel Chatenay.

### HARDY FLOWERS.

A very interesting class was one for twenty alpine and herbaceous plants in pots. There were three exhibits, all staged outside, and first prize was awarded to Mr. Walter Pybus, Monkton Moor, Leeds, whose leading specimens, all in excellent form, were Nepeta Musseni, Saxifraga pyramidalis, Mimulus Tillingi, Delphinium nudicaule, Achillea The Pearl, and Pyrethrum Nero. Mr. S. Pickering came second with Geranium sanguineum, Cerastium tomentosum, Phlox canadensis, funkias, sedums, and sempervivums Mr. G. W. Pinkney, Stockton, third.

### FRUITS AND VEGETABLES.

Mr. N. F. Barnes scored for a dish of peaches with large examples of Royal George; Mr. Thomas, gardener to the Marquis of Ripon, Studley Royal, second, with Hale's Early. In the nectarine class Mr. C. Lawton, gardener to Colonel Harrison Broadley, M.P., Welton House, E. Yorks, scored well with Lord Napier, and was followed by

Mr. Edmonds with the same variety. In the well-contested melon classes, Mr. S. Barker led for a green-fleshed variety with Lord Derby; Mr. A. Nicholson, gardener to A. S. Lawson, Esq., Aldborough Manor, Boroughbridge, scored for a scarlet-fleshed variety with Emerald Gem, and Mr. H. Drew, gardener to Lieut.-Gen. Pakenham, Langford Lodge, Crumlin, co. Antrim, led for a white-fleshed variety with an unnamed specimen. Mr. Edmonds scored for a pineapple with a Queen. Mr. Searle, gardener to the Marquis of Northampton, Castle Ashby, led for figs and also for strawberries.

Mr. Searle, Castle Ashby, won first prize in Messrs. Sutton and Sons' class for a collection of six kinds of vegetables, and a similar award in Messrs. E. Webb and Sons' class for six kinds. In these classes Mr. W. N. Hague, Leeds, took second place.

### Horticultural Club.

On Tuesday, the 18th instant, after the usual monthly dinner of this club, at the Hotel Windsor, Mr. G. Bunyard, V.M.H., in the chair, a very interesting lecture, under the title of "Pictures from a London Garden," was delivered by Mr. Horace J. Wright, illustrated by a number of lantern slides in natural colours. The lecture derived much of its interest from the fact that a very small suburban garden, about forty by thirty feet, and surrounded by the most commonplace conditions, was alone concerned, and yet by intelligent and painstaking arrangements and culture, was proved capable of yielding an abundance of beautiful effect. The slides themselves were from photos taken and coloured by the owner of the garden, Mr. Morton, of Harringay, and the lecturer dilated in each case on the best modes of selection, arrangement, and cultivation. The various plants which formed the chief attraction of the numerous slides were made the means of considerable instruction for those whose restricted conditions as regards space and environment might otherwise lead to the belief that a "garden beautiful" was altogether out of the question.

It was shown how the scope of a small area could be enlarged by means of arches, suspended baskets, and even by commonplace butter tubs which, when painted, raised on supports and filled with bulbs, trailing and other plants, on judicious lines; and, above all, carefully attended to as regards watering, became really things of beauty and replete with interest. Monotony was avoided also by the shifting from time to time of the materials employed, and careful selection of suitable plants. A corner, for instance, which, backed by the high wall of a neighbour's house, and limited by an ordinary wooden fence, must at the outset have appeared a hopeless case, formed the basis of one of the most beautiful slides of all, being over-arched by a splendid specimen of the Dorothy Perkins rose, beneath which was a tall, robust group of Lilium candidum, both in full flower. The lecturer pointed out that even a paved and cemented backyard could, by similar care and attention, be made a source of inexhaustible interest, and that under the most adverse conditions "where there is a will there is a way."

After the lecture an animated discussion took place, in which Messrs. C. Pearson, W. Bilney, A. Worsley, C. T. Druery, W. Hales, and G. Bunyard participated, Mr. Wright eventually responding. The close planting of bulbs for better effect was advocated, and approved all round, little or even no space being left between them, the result being a far finer massed effect of blossom without any detriment but the contrary, to their individual health and robustness. Mr. Druery suggested for such confined conditions the publication of a black list of ineligibles, owing to their monopolising tendencies, instancing the Harpaliums, Michaelmas daisies, and others which tended to become absolute pests if once granted a foothold. Another point elicited was the terribly absorptive power of bricks, which so robbed the soil of its water that plants trained against walls were frequently starved to death in consequence of this drain, despite apparently copious supplies to the surface. A very hearty vote of thanks was accorded to Mr. Wright.

## CIMICIFUGAS.

The genera Cimicifuga embraces some of the most distinct of hardy border flowers. For the most part natives of North America, they succeed in any good loamy soil, but they attain to their greatest luxuriance when given a moist position, such as may readily be found in the bog, and when the growth is so developed the floral display is also correspondingly great. Cimicifugas do not reach their full development until they have been planted several seasons; for this reason it is a good policy to recognise them as permanent occupants, and to select their position accordingly. The flowers are usually white or cream-coloured, and are produced well above the leaves in the form of slender panicles. The leaves are large, but are generally broken up into smaller leaflets or lobes, which mostly incline to be cordate in shape.

The decorative effect of cimicifugas, particularly when in flower, is, in substance, what some of the larger spiræas give earlier in the season; for, as a rule, they follow these in flowering, so that they may readily be given full play when arranging beds or borders where a display is required to extend well into autumn. Cimicifugas vary in height from three to six feet according to the conditions under which they are grown. The best species are C. americana, having thrice pinnate leaves and pure white panicled racemes; C. cordifolia, with twice ternate leaves, the leaflets cordate in shape, and the panicles cream-coloured; japonica has ternate, many-lobed, cordate leaflets and graceful panicles of white flowers; C. racemosa has three ternate leaves and deep-cut leaflets, and the flowers are white in compound racemes. Thomas Smith.

**Melon Barnet Hill Favourite.**—This is an excellent melon of good flavour, constitution, and free-setting qualities, and a variety which is gaining in favour, as it becomes better known. It was shown in Mr. C. Beckett's collection of melons at the International Show. It is grown well and is much in request at Sherfield, where its good qualities are highly esteemed.—Paul T. More.

**Petunia Queen of Roses.**—This petunia, which is one of the specialities of Messrs. James Carter and Co., Raynes Park, is a delightful variety for summer bedding, the flowers being of an exceedingly beautiful shade of rose. They are single, for it has been conclusively proved that the double flowers, striking though they be when protected, are not seen at their best out of doors.

**Ivy-leaved Pelargonium Vicar of Shirley.**—This variety, now being distributed by Messrs. H. Cannell and Sons, is a well-marked sport from Souvenir de Charles Turner, a guarantee that it is a very useful plant. In this new variety the flowers are of a deep cerise-scarlet, with prominent maroon markings in the upper petals. It promises in time to become as popular as its parent, which is grown in such large numbers.

**Specimen Fuchsias.** — Though large specimen fuchsias have long been grown and exhibited in the West of England, they rarely figure at a Metropolitan show. From their uncommon appearance half a dozen plants shown by Mr. Jules Friedlander, White Knights Park, Reading, at the International Exhibition, attracted a very large share of attention. The rarity of the exhibit was not its only claim to recognition, as the plants composing it were magnificent specimens, eight or nine feet in height, and profusely laden with blossoms. Three light-flowered kinds, namely, Jubilee Queen, Amy Lye, and Mrs. Bright; with three dark, Elegance, Brilliant, and Mrs. Jules Friedlander, were shown.—W.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

REVERSION IN SCARLET THORN.—J. C. and S., Aberdeen: We send you a small twig cut from the single scarlet thorn in which you will see a portion has reverted to the original. We have not seen this happen before, but possibly such reversion has come under your notice.—So far as our experience goes it is rarely that the single scarlet thorn reverts to the original white-flowered form, but in double thorns reversion of this character is much more frequent.

ORDER OF FREE GARDENERS.—E. S., Taunton: Can you tell me who is the secretary of the National Order of Free Gardeners?—We do not know. The Registrar of Friendly Societies would probably give you the information. If you are considering the question of joining a friendly society, we commend to your notice the United Horticultural Benefit and Provident Society; the secretary is Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

ROSE FELICITE ET PERPETUE. — H. A. H., Bournemouth: Would you kindly tell me the right version of the name of the rose, which all the publications of the National Rose Society, two or three recent rose books of authority, and several rose catalogues, unite in calling Félicité et Perpétue? In spite of this frequent agreement in error, I prefer Dean Hole's rendering of "Felicite Perpetrelle." I wrote to one of the officials of the N.R.S. on this subject, but so far have received no answer.—When doctors differ, who shall agree? Félicité Perpétue was the name in common use for many years. The trouble is that no one seems to know the origin or reason for the name, but it is now assumed that Jacques named the variety after two persons, named respectively Félicité and Perpétue. If the title of Félicité was given to the rose as indicating its joyful, or blissful, character, then Dean Hole's rendering would seem to be the correct one, as it signifies perpetual bliss.

FRUIT FARMING IN ONTARIO. — M. E. G., Warwick: Can you give me any information concerning the prospects of fruit farming in Ontario? Is there land still available?—The Chief Agent for the Ontario Government informs us that cheap fruit lands consisting of loams and sands can be had in many districts in Ontario at reasonable prices. These farms, when planted, will increase many times in value, besides giving reasonable returns during the growth of the trees from inter-cropping. Apples, pears, berries, cherries, and plums are staple crops in every section. Peaches and grapes are suitable to particular sections. Early vegetables and tobacco can be grown in the south-western sections, returning from £20 to £220 per acre. Small farms are to be found which are very suitable for incoming settlers with limited capital. The growing season lasts for 200 to 210 days, and the proximity of the Great Lakes make them immune from damaging frosts in spring and fall. The last winter was very severe. The trees are all growing very well; the apples were not affected at all, nor were the smaller fruits. The peaches in the peach districts have shown remarkable endurance. It must be remembered that the last was the severest winter experienced for fifty years. Under such circumstances the future of Ontario as a fruit-growing section is assured.

ROSES NOT EXPANDING.—W. S., Lutterworth: Heavy rains often prevent the proper opening of rose buds. The outer petals becomes so tightly packed that they do not readily separate, and so the growing inner petals either burst the outer ones and so produce a damaged flower, or they force the whole mass of petals from the base or hip. Defective root action is also responsible for buds decaying instead of opening, and this is the trouble in your case, as evidenced by the poor leaves and yellowy flower stems. There is something radically wrong with the plant, and it should be given a better position in the autumn. The soil is probably wet and cold a foot or so below the surface.

GARDENERS AND HEALTH INSURANCE.—M. M., Lincoln: Can you enlighten me as to the manner in which a friendly society, approved by the National Health Insurance Commissioners, will obtain the money paid by an insured person, seeing, as I understand it, the member's contribution is, so to speak, paid into the Post Office for an equivalent in stamps?—The money is paid in the first place into the local post office in exchange for insurance stamps (not postage and revenue stamps) to be placed on the cards of the insured persons. The stamped cards are lodged with the societies at the end of the period of their currency, and the society then forwards them to the Insurance Commissioners and is credited with the amount of the stamps, less a deduction which will be explained later. The money received by the post offices from the sale of stamps has in the meantime been accumulating in the "National Health Insurance Fund" in the same way that money is accumulated in a bank. As the societies are called upon to pay out benefits they draw upon this central fund, as from a bank, for the amounts paid out and for the expenses of administration. The deduction referred to above is a deduction of one penny and five-ninths from every sevenpenny contribution collected and credited to the societies, and it is made for the purpose of providing the money for the reserve values. It is not retained permanently by the Commissioners, but has to be used by them in payment of interest upon the reserve values and in paying off the reserve values themselves. In other words, it is redistributed among the societies in accordance with the ages of the members, and it is itself part of the money upon which societies can draw, as explained in the previous paragraph.

### NAMES OF PLANTS.

J. C., Goodmayes.—Geranium albanium.

C. P., Wolverton.—1, Phacelia campanularia; 2, Erica ciliaris; 3, Taxus baccata glauca.

F. W., Coventry.—Probably a variety of Anthemis tinctoria; send a plant, or some basal growth with a few more flowers.

J. L. S., Bramber.—Alyssum alpestre; 2, Achillea alpina; 3, Dianthus deltoides; 4, poor specimen, probably Artemesia argentea.

M. C., Chippenham.—1, Ginkgo biloba; 2, Prunus Pissardi; 3, Philadelphus Gordonianus; 4, Lonicera sempervirens; 5, Solanum Seaforthianum.

**Coleworts.**—Perhaps the most estimable of all autumn and winter vegetables, and the least grown. Too much value is attached to the old cabbage beds sprouting for a supply at this time, whereas if two sowings of coleworts were made, one at the end of May, and another at the end of June, much worry would be saved, besides having a plentiful supply of delicious cabbage throughout the winter. The last season proved this, where grown in quantity, other winter vegetables being cut badly, and the later coleworts came through the ordeal almost unscathed. Plant one foot apart each way as ground becomes cleared of early peas, potatoes, etc.—G. ELLWOOD.

## OBITUARY.

### MR. WILLIAM FYFE.

With much regret we have to record the death of Mr. William Fyfe, which occurred at Lockinge Park, Wantage, on June 24.

Mr. Fyfe, who had been in rather indifferent health, was appointed to the charge of Lockinge Park gardens by the late Lord Wantage about twenty years ago, and during this period he succeeded, by means of administrative ability and cultural skill of a high order, in greatly enhancing the high reputation these great gardens so long enjoyed, and of obtaining for himself a foremost position among practical horticulturists. It is interesting to recall the fact that Mr. Fyfe occupied a prominent position in the gardens of Lockinge before he assumed charge of them, for previous to his doing excellent work at Ditton and Overstone Park, he was general foreman, and in that position afforded ample evidence of his commanding ability. The fact that Mr. Fyfe was appointed to the position of head of the gardening staff at Lockinge some years after his leaving to fill responsible positions elsewhere, is an unquestionable proof that in the discharge of his duties he favourably impressed his employers during the first period of his being in the gardens of their historic Berkshire estate. During the time Mr. Fyfe was in charge of the gardening establishment the several departments were so well maintained that it would be difficult to mention one as of exceptional excellence in comparison with the others. He was generally regarded, and properly so, as one of the most successful fruit growers of the day, and throughout the time he was in charge of the Lockinge Park gardens the vineries were regarded by those specially interested in fruit culture under glass as one of their chief attractions. Mr. Fyfe was not less successful as an exhibitor than as a cultivator, and many were the prizes that he was successful in winning at the leading exhibitions. Mr. Fyfe was remarkably successful as an exhibitor of vegetables, and took a leading part in the development of the modern methods of presenting vegetables to public notice at the exhibitions. This is not the time to deal at length with his successes as a winner of prizes for vegetables, but it should be mentioned that during the period in which he exhibited them he was a formidable competitor, and obtained the premier position in many a hard-fought contest. It is even more important to place on record the fact that by the tasteful manner in which he staged his collections, he did much to bring about a great and highly beneficial reform in the exhibition of the products of the kitchen garden. Mr. Fyfe also achieved distinction as a cultivator of both hard and soft-wooded plants, and, as a cultivator of Fortune's Yellow rose, had probably no equal. For some years Mr. Fyfe was a regular contributor to the GARDENERS' MAGAZINE, and he was long a member of the Royal Horticultural Society's Fruit Committee, and enjoyed to the full the esteem of those who were associated with him in the work of that body.

THE LATE MR. WILLIAM FYFE.

**Ada Aurantiaca** is another species which is worthy of cultivation on account of its peculiar yoke-of-egg coloured flowers, which, when mixed with the long spikes of odontoglossums and the other inmates of this house, prove most effective. The plants have just passed out of bloom, and, like Trichomosa suavis, the half-formed growths will quickly produce new roots, therefore any plants that require potting should be now attended to. After repotting give but little water for some time, as should the compost be overcharged with moisture there is great danger of the young growths damping off, and the plants receiving a severe check thereby. When thoroughly established and well rooted the plants may receive copious supplies of moisture at the roots. Both this and the preceding are easy plants to cultivate, and should be grown by those who cultivate a few orchids for the love of them, but who do not indulge in an orchid house proper, as these two species may be cultivated amongst ordinary greenhouse plants, provided they are shaded from the sun.—J. T. B.

## NOTES OF OBSERVATION.

◆

**Cineraria Matador.**—This cineraria, which has been before the public for two or three years, has gained many admirers during the present season, the distinguishing feature being its beautiful colour. It is of sturdy habit, with large flowers; that is to say, it belongs to what are usually termed florists' cinerarias. The colour is difficult to define, but it is of a somewhat light velvety crimson-scarlet.—S. W.

**Propagating the Double Gorse.** — The double-flowered gorse is a very beautiful shrub, and well worthy of a place in the borders of a garden. It will succeed in almost any kind of soil, but especially in one that is light, sandy, or gravelly. In some parts of the New Forest, and in gardens of that part of the county of Hampshire, the double gorse may be seen thriving in very shallow and poor soil. Propagation is easy if the tips of the shoots are inserted in a sandy bed on the north side of a wall at the end of the summer. Plants so raised make pretty little standards about 30in. high.—G. B.

**Scutellaria indica var. japonica.**—Among the choice alpines which have been displayed this spring in the alpine house at Kew is a Japanese variety of the Indian Skull Cap. Its full botanical name is Scutellaria indica var. japonica, and this lengthy appellation is certainly against its popularity. On the other hand, it is a beautiful little plant with neat greyish-green foliage, both pleasing in form and in hue, and giving a good supply of purple flowers. At Kew it was only a few inches in height, and it is evidently a rock plant of no little merit. It is understood to be hardy, and a comparison of notes regarding it would lead to the belief that it is so. It should be cultivated in a dryish and sunny position, and, although not showy, it will be a neat and pretty little plant for the rock garden. Propagation is effected by division or by seed.—S. A.

**The Whitethorn, or Quick, for Hedges.**—Mr. Day, in dealing with this subject a short time ago, advocated double lines as preferable to single ones, but he did not say why. I have had much to do with this form of hedge plant, and think none other is equal to quick where cattle are concerned, and I have always held to the idea that a single row of plants is preferable, as I have many instances here supporting that view; but I am willing to learn, and would be glad to hear the reason that prompted Mr. Day to urge the contrary. We have single-row hedges of quicks that are one hundred years old, not more than 4ft. 6in. high, and perfect cattle fences. My experience of double rows is that, though a hedge can thus be grown quicker than when in single rows, the bottom is less thick. The common fault with the management is that of allowing the hedges to get up too quickly. —E. M.

**Pyrethrums.**—At this season of the year there are no more useful flowers to be found in the garden than pyrethrums. They are excellent subjects for table and room decoration, standing a long time when cut. When planted in the herbaceous borders they brighten them up considerably. To see them at their best, however, they require to be planted in their separate colours. They will succeed in nearly any good garden soil, but they are bad drought resisters, and need liberal waterings in dry weather. Ground intended for pyrethrums should be well manured and trenched in the autumn. There are many excellent varieties on the market, but the following dozen are about the best: Doubles—Duchess of Edinburgh, mauve; Leonard Kelway, rose; Bonamic, sulphur; H. Murger, purple; Dulcina, white; and Eximea, pink. Singles—Albion, white; Emblem, lilac; James Kelway, crimson; A. Kelway, rose; General Gaselee, scarlet; Kimberley, crimson.—D. S. A.

**Turnips** are the better if frequent sowings are made at this season. Choose a site, if possible, on a border facing north. Treat as advised for carrots. If a northern border cannot be spared sow on the shady side of peas and beans. Red Globe is an excellent variety for sowing at this time of the year, and indeed at all times.—G. E.

**Kerria japonica flore plena.**—This is certainly entitled to a place among the most beautiful of our hardy shrubs, for with its charming double rose-like blossoms of a rich golden-yellow colour, there is nothing to which it can be compared. Owing to its early season of blooming, it is seen as a rule to the best advantage when trained to a wall, and thereby protected from spring frosts and cutting winds. Though deciduous the bright green bark renders it during the winter season almost as effective as an evergreen. Apart from its value out of doors, it also readily lends itself to gentle forcing, and, brought on in this way, the flowers are much appreciated in early spring.—K.

**Pelargonium ardens.**—This belongs to the old-fashioned race of pelargoniums; in fact, it is often looked upon as a true species, but the "Dictionary of Gardendening" states it is a hybrid between Pelargonium fulgidum and P. lobatum. It is of a free branching habit of growth, with neat, dark green leafage, and bears its umbels of bright coloured flowers in great profusion. These blossoms are deep scarlet, with an almost black blotch in the centre. There is a tendency in favour of these old-fashioned pelargoniums, many of which have such fragrant leaves that in the nosegays of bygone days were always much appreciated. The nomenclature of these is terribly confusing, but as a collection is to be grown at Wisley this year, that trouble may be, to a certain extent, overcome.—S. W.

**Centropogon Lucyanus.**—This pretty flowering plant, which is seen at its best at the cool end of the stove, or in the intermediate house, at all events during the winter, has a season of blooming which extends over a lengthened period. It is fairly well-known as a rather loose-growing plant, that bears towards the points of the shoots clusters of peculiarly curved bright rosy-carmine coloured flowers. As a pot specimen, from its loose, partially drooping habit, it needs to be secured to a stake, but it may be also grown in a suspended basket, under which conditions the drooping clusters of flowers are seen to considerable advantage. It is readily struck from cuttings of the young growing shoots, taken in the spring, inserted in pots of sandy soil, and placed in a close propagating case with a gentle bottom heat. In the potting compost a liberal supply of good leaf-mould should be mixed.—W. T.

**Streptocarpuses.**—Comparisons between the International Exhibition just past and the one held forty-six years previously, are very generally met with. Among the subjects at that time unrepresented, and one may truthfully say undreamt of as popular garden plants, are the different forms of streptocarpus, which now occupy a foremost position among decorative flowering subjects. It is about twenty-five years since the first hybrid streptocarpuses made their appearance, but it was some time after that before they were generally cultivated. The collection of these beautiful flowers at the International well served to show not only their high decorative value, but also the good habit of the plants, their shapely blooms, and particularly the wide range of colour that now exists among them. Added to this, they are of comparatively easy culture, and can be readily raised from seed. From a purely decorative standpoint, they must be considered to be the equal of the gloxinia, as though the flowers are less in size, they are wonderfully effective, and good flowering examples of these streptocarpuses can be grown in quite small pots, and in this way they are very useful for dropping into the small jardinieres and other receptacles now so much in vogue. W.

## TOMATO-LEAF RUST.

The destructive disease known as tomato-leaf rust, due to the parasitic fungus Cladosporium fulvum (Cooke), was first described by Dr. M. C. Cooke, from specimens received from North Carolina in 1883.

Its occurrence in this country was recorded by Plowright in 1887, when it proved very destructive to tomatoes grown under glass, in two different districts. Curiously enough, the fungus was not observed as a source of injury to tomatoes in the United States until the year 1888. It is now a well-known pest, attacking tomatoes in France and Italy also.

### Description.

The leaves, stem, and occasionally the fruit, are attacked. The fungus usually first appears on the leaves, in the form of small scattered spots, which gradually increase in size and encroach on each other, until almost the entire under surface of the leaf becomes covered with a minutely velvety, dull rust-coloured layer, consisting of the spore-bearing portion of the fungus, the spawn or mycelium being imbedded in the tissues of the leaf. The presence of the fungus is first indicated by the appearance of pale yellowish patches on the upper surface of the leaf, corresponding in position to infected areas on the under surface. These yellowish patches increase in size, in proportion to the spread of the fungus on the under surface, and gradually change through brown to almost black, often with a tinge of purple. The fungus forms long, rust-coloured, afterwards blackish streaks on the stem, and more or less circular, scattered patches on the fruit. When the fungus shows a rusty tinge, the leaves wilt and soon die, and, as a rule, the disease spreads very quickly. This, to a very great extent, is due to the usual method of spraying horizontally, so that the spores are forcibly driven from one plant to another. If by any means the water could be allowed to fall from above, after the manner of a steady rain, numerous spores would be washed on to the soil, where they would germinate and perish, instead of being lodged on the leaves of healthy plants, where they set up new centres of disease.

### Preventive and Remedial Measures.

Spraying with fungicides is, according to a recent leaflet issued by the Board of Agriculture, of very little avail, unless commenced the moment the disease first shows on the foliage. The reason for this is that no fungicide is a curative agent; neither will it kill fungus spores. All that a fungicide can do is to form a film of some substance on healthy leaves, and act as a poison to any germinating fungus spores that happen to alight on the leaf. Success in this direction depends entirely on the method in which spraying is conducted, the object being to cover the entire surface of every plant with the fungicide. To accomplish this object even approximately, repeated sprayings are absolutely necessary.

If the plants are young, half-strength Bordeaux mixture may be employed. When flowers and young fruit are present, a solution of liver of sulphur, 1oz. in four gallons of water, should be used.

→ Spraying ←
The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested "FOUR OAKS"

which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-.** No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 C, SUTTON COLDFIELD.**

ALPHA SPRAYERS

Whenever you want a sprayer, for no matter what purpose, always order an "ALPHA" SPRAYER—the king of sprayers, judged from every standpoint.

It is simple in construction but powerful in operation. Easy to work, yet answers every purpose. Carries further and fuller than any other sprayer. Ideal for garden use (especially on fruit trees and bushes); the standard sprayer for all disinfecting and lime-washing work. Used by the biggest firms, railway companies, agriculturists, sanitary authorities, and gardeners.

"Alpha" Sprayers have won 18 GOLD AND SILVER MEDALS AND DIPLOMAS within the last two years.
Supplied by all leading Seedsmen and Nurserymen.

Messrs. ROBINSON BROS., Ltd., West Bromwich, Staffs.

TO HEAD GARDENERS.

**THE BECKENHAM URBAN DISTRICT COUNCIL** require the SERVICES of an experienced and thoroughly efficient GARDENER, to take charge of and assist in the laying out of their recently acquired Kelsey Park (20 acres), to generally superintend the management of 3 other Recreation Grounds belonging to the Council, and to take control of trees and shrubs on the public highways.

Salary, £2 per week, with house and light.

Only applications from skilled gardeners used to the management and laying out of large Parks or Recreation Grounds and to the control of workmen will be considered.

Forms of application may be obtained from Mr. John A. Angell, Surveyor to the Council. Applications on the prescribed form, accompanied by copies of 3 testimonials of recent date, to be addressed to the undersigned at the Council Offices, Beckenham, and delivered before 4 p.m. on Monday, July 15th. Canvassing any member of the Council, directly or indirectly, will be a disqualification.

By Order,
F. STEVENS,
Clerk of the Council.

**THE POPULARITY OF XL ALL SPECIALITIES** increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are XL All WEED KILLER, XL ALL FERTILISER, XL ALL ROSE MANURE, RICHARDS' GREEN SUNSHADE, finest powder shading on the market, 1s. packet does 100 feet of glass. Don't forget to ask your Nurseryman or Seedsman for my small pink list.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Science and Horticultural Education.

With regard to the recent pronouncement of Mr. Runciman that a grant would be made by the Government for the purposes of horticultural education, there exists some difference of opinion. On inquiry, it would appear that this difference in some cases is based on a doubt as to the really practical application of the money. The professional gardener, who has acquired his knowledge by many years of practical experience, finds himself severely handicapped in the struggle for a comfortable existence by the fact that his profession is not recognised as it merits; his position, too often, being merely that of a sort of outdoor servant, with wages more or less on the scale of a superior labourer. Outside his actual working sphere little or no opportunity is afforded him of education on wider lines, while his sons, if he have any, can only follow him in the same profession with an equal handicap. When, therefore, grants or bequests of the nature cited come into question, experience shows him that instead of him or his deriving any direct benefit therefrom, there is, in his opinion, too great a tendency to appoint as trustees or distributors of such funds, men of purely scientific standing, so that eventually the bulk, or all, of the funds are devoted to scientific research, and the actual working horticulturist or gardener is left out in the cold, and his eminently practical services ignored. Even those who recognise the great value of scientific research as a foundation for its practical application cannot but feel, and recognise also, that we owe the great mass of our horticultural and floricultural acquisitions directly to the practical gardener, rather than to the scientist. The scientist is practically bound to restrict his labours to more or less abstruse research into the inner phenomena of plant life, and in the vast majority of cases is quite unacquainted with those qualities of beauty, colour, make, flavour, etc., etc., which distinguish the flowers and fruit with which the gardener is familiar, and by virtue of which special knowledge he is enabled by selection to improve them more and more. If we take such representative bodies as the judging committees of the Royal Horticultural Society, the Floral, Fruit, Orchid, and allied Committees, formed of men who not only judge, but are themselves largely the originators, so to speak, of the improved products concerned, we shall find that although many, probably most of them, admit the value of science as an ally to horticulture proper, few or none will admit the justice of all grants in aid being absorbed in the scientific direction, or placed in scientific hands alone for distribution. We are quite willing to grant that it is not an easy matter to determine how they may be justly and judiciously apportioned, but it is quite easy to conceive that without such apportionment, the practical gardener is by no means "enthused" when he hears of such pecuniary assistance, ostensibly to horticultural education, but really only to one phase of it, and that, in his mind, by far the least important. On the other hand, it is only fair to consider the immense benefit which the gardener derives from research in the form of chemical manures, experiments in etherization, electricity, and other stimulative factors, insecticides, in the elucidation of bacterial influences in the soil; and last, but by no means least, is the discovery of the Mendelian laws of hybridisation. A knowledge of these first factors certainly enables him to stimulate growth, and to hasten inflorescence, while the last gives him such an insight into the mysteries of complex reproduction, that instead of regarding the apparent identity of the first family raised as a failure, and consigning it to the dust heap, he now knows that on it he may have all the elements of success lying latent, and ready to appear in the next generation in the forms he desires. He also knows that by subsequent crossing on Mendel's lines, he can fix a variety definitely. To these and many other benefits every intelligent gardener should know his indebtedness, but it is quite another matter when the indebtedness to his own particular branch of knowledge and practical experience is ignored, and science given altogether the lion's share of any spoils which may be going. We have ventured to voice these sentiments, as we know that they are very much in the air, but in the absence of any definite organisation of gardeners, fail, perhaps, to find that expression which can reach the powers that be, and so rectify matters.

MR. J. F. McLEOD.

**Mr. J. F. McLeod** has for about a quarter of a century had charge of the gardens of Dover House, Roehampton, the residence of J. Pierpont Morgan, Esq., and throughout that period he has maintained them in such splendid condition that they have come to be regarded by those well versed in garden management as a model of their class, which, it may be said, is a high one. Mr. McLeod has obtained considerable fame as a cultivator of Malmaison and other carnations, of choice fruits that are usually grown under glass, and some other of the subjects that come under the gardener's care, but he is in no sense a specialist. At Dover House every department is maintained in a manner that proves to demonstration that Mr. McLeod is a master of it, and in a walk through the pleasure grounds, the kitchen garden, and the plant and fruit houses those who appreciate high-class cultivation do not trouble about determining whether one is better than the others, but admire all that comes under their notice. Mr. McLeod has duties to perform other than those connected with the gardens, and among these is the management of the live stock, which includes one of the finest herds of Jersey cattle in the kingdom, and serves to show that the training in agriculture, as well as horticulture, which he had early in life has stood him in good stead. As a member of the committee of the Royal Gardeners' Fund Mr. McLeod has done good service in the cause of gardening charity, and in the position he occupies on the Royal Horticultural Society's Floral Committee, he has shown a thorough acquaintance with the various classes of subjects that come before that body, and gained the esteem of his fellow members of that body.

**New Knights.**—On Monday morning, the 1st inst., the King held an investiture at Buckingham Palace. With the other gentlemen who had been selected for similar distinction, Mr. Harry J. Veitch and Lieut.-Colonel Prain were introduced into the King's presence, when His Majesty conferred upon them the honour of knighthood.

**N.R.S. Metropolitan Exhibition.**—With reference to the metropolitan exhibition of the National Rose Society to be held on Tuesday next, Mr. E. Mawley, V.M.H., the hon. secretary, reminds us that "as the present season is the most favourable for roses known for many years, an unusually large and varied display of all types of roses may be anticipated at the society's exhibition in the gardens of the Royal Botanic Society on Tuesday next. Years ago rose shows consisted of long lines of boxes containing 'exhibition' roses and little else, whereas now these long lines of matchless specimen blooms are relieved by tastefully arranged displays of decorative roses—roses which depend for their popularity more on their wealth of colour and elegant habit than on the size, fulness, and regularity of form of the individual bloom. This year these roses will be more freely in evidence than ever before, and, among other ways, staged in round baskets, which allow them to be seen to the greatest advantage. Another special feature will be the number of roses to be seen of that new type, the Pernetianas, with their entrancing shades of mingled yellow, pale rose, fawn, orange, and pink. It is at this exhibition that the finest new seedling roses of the year are generally to be seen, as the award of the gold medal of the society, the highest honour obtainable anywhere, is eagerly sought after by the raisers."

**Bedding Roses at Kew.**—During the past fortnight the roses in the numerous beds around the palm house at Kew have been aglow with colour, and have afforded an object-lesson of much value to those who are interested in the varieties specially adapted to the maintenance of a continuous display of flowers during the summer months. A considerable proportion of the beds have been recently replanted, and many of the newer varieties that are used as bedding varieties are represented. A more comprehensive trial of bedding roses could not well be desired, and certainly no trial could be held amid more pleasant or interesting surroundings. Those who are concerned with the method of utilising strong-growing roses for filling beds by the practice of pegging down the growths made the previous season should not miss the beds of Clio, Frau Karl Druschki, and Gloire de Dijon by the palm house, and the beds of Frau Karl Druschki and William Allen Richardson on the main walk

**Roses and Sweet Peas.**—Two important exhibitions will be held in London next week, and in one sense it is unfortunate that both occur on the same day, though, perchance, some enthusiasts will go to both on Tuesday, July 9. The National Rose Society holds its great exhibition at the Royal Botanic Gardens, Regent's Park, and we understand it could not fix a date other than that already fixed by the National Sweet Pea Society, which holds its London exhibition at the Royal Horticultural Hall, Westminster. The latter society, however, holds a two-days' show, whereas the rose show lasts one day only.

**Manchester and North of England Orchid Society.** — The Rev. J. Crombleholme has been reappointed chairman of this society for the ensuing year, and was presented with a special gold medal, on the occasion of the annual meeting, for his exhibits during 1911-12. Mr. Z. A. Ward is the vice-chairman; Mr. R. Ashworth, treasurer; and Mr. H. Arthur, secretary. The medals and trophies won during the season now ended were distributed at this meeting, and the principal recipients were: Colonel Rutherford and Messrs. W. R. Lee, Z. A. Ward, J. McCartney, G. H. Peace, A. Warburton, W. J. Hargreaves, F. A. Hindley, and H. Arthur. The society's next meeting will take place in the Coal Exchange, Manchester, on July 11.

**Severe Hailstorm in Northumberland.**—The gardens in some parts of Northumberland have suffered considerable damage from a hailstorm that passed over the county on June 25. With reference to the storm, Mr. C. L. Cawkill, Angerton Gardens, Morpeth, writes: "On June 25 we had a severe hailstorm between 4.30 and 5.30 p.m., and considerable damage was done to crops, both in garden and field. Fruit on both garden and orchard trees was badly bruised, while kitchen garden crops are completely spoilt, onions, spinach, Brussels sprouts, and cauliflowers being torn and battered to the ground. Annual flowers, which were promising well, will be of little use, the hardy plants in herbaceous borders are broken down, and the anchusas, verbascums, and delphiniums are torn to shreds. Japanese chrysanthemums are stripped of nearly all their foliage, and a goodly number have their stems broken, and will have to be thrown away. The bush plants of the various varieties of chrysanthemums may break again if we have favourable weather. The storm came from the south, and missed the gardens a mile to the east and west of Angerton. The hailstones were as large as nuts, and on the north side of the buildings they laid until noon of the day following the storm.

**Royal International Horticultural Exhibition.**—On the opening day of the Holland Park Show, Mr. Gurney Fowler, chairman of the Royal International Horticultural Exhibition, presented, on behalf of the exhibitors at Chelsea, a large silver cup of the exhibition with a purse to Mr. Edward White, hon. managing director, Mr. T. G. Henslow, secretary, and Mr. S. T. Wright, superintendent of the ground arrangements of the International Exhibition. The directors have issued a brochure containing a list of the exhibitors and of the prizes awarded, with the members of the jury arranged in the several sections in which they served. The brochure is illustrated with portraits of the directors, and a portrait group of the committee of the International Horticultural Exhibition of 1866.

**York Gala and Floral Fete.**—We are pleased to record the fact that the York Gala was a greater financial success than the gathering of the previous year. The attendance on the first day established a record, the number of visitors being 11,794, and the amount taken at the gate £661 8s. On the second day the visitors numbered 27,455, and the amount received for admission was £844 6s. 6d. These figures represent an increase for the two days of 3,040 visitors, and of £98 4s. 9d. in cash, as compared with 1911.

**Sawdust Manure.** — It is very generally believed by both gardeners and farmers in this country that farmyard or stable manure made with sawdust as litter is not so valuable as that made with straw. The same opinion is held by both classes of cultivators in the United States, and in order to ascertain if there is any real foundation for the belief so general some experiments were begun at the Maryland Experimental Station in 1908, and continued on a large scale for three years with flowering plants grown under glass-houses. Comparisons were made between (1) cow manure made with sawdust as litter; (2) cow manure made with straw or chopped maize stalks as litter; (3) cow manure free from litter of any kind, the cows being kept on a cement floor without bedding. The manure was collected and left in a heap until some fermentation had taken place. This broke down the strawy litter considerably, but the sawdust had quite a fresh appearance when it was applied. The same amounts of the different manures were used, and they were all thoroughly worked into the soil. The plants tested were roses, carnations, chrysanthemums, and sweet peas. In no case could any harmful effect of the sawdust be detected, and, in fact, taking the average of the three years, the manure containing it gave slightly the largest number of blooms. For other reasons, however, it was concluded that for the particular circumstances manure without litter of any kind was the best.

**Memorial to an Apple Tree.**—A ceremony unique in the history of fruit-growing took place at Dundela, near Morrisburg, Ontario, a short time since. A monument was unveiled to an apple tree. The farmers of Dundas County by popular subscription have placed a marble stone close to the spot where stood the original McIntosh red apple tree that succumbed only recently after braving the storms and its enemies for over 100 years. About 115 years ago, John McIntosh, who went to Canada with the United Empire Loyalists and settled in Matilda township, found a number of apple trees while clearing a place for a home. One of them produced fruit of such superior colour and quality that he named it the McIntosh Red. It soon attracted attention, and his son Allan propagated it and commenced to disseminate the variety. In recent years it has been widely circulated, and now is planted in all parts of the American continent where apples flourish. In 1896 the old tree was partly injured by fire, but continued to bear on one side until 1908, when it failed altogether.

# THE CHARM OF THE ROCK GARDEN.

A deep interest pervades all that pertains to the rock garden of to-day. No phase of gardening is more popular with garden lovers, and the high standard of excellence attained in the art of rock garden making is illustrative of the progress made in natural gardening. The idea of growing mountain and moorland plants in a free manner, amid a natural setting of rocks, and treated as nearly as possible according to their requirements, has been so enlarged upon, and so popularised that few gardens of any size are without a rock garden, or a place where rock plants are grown and treated in a natural way.

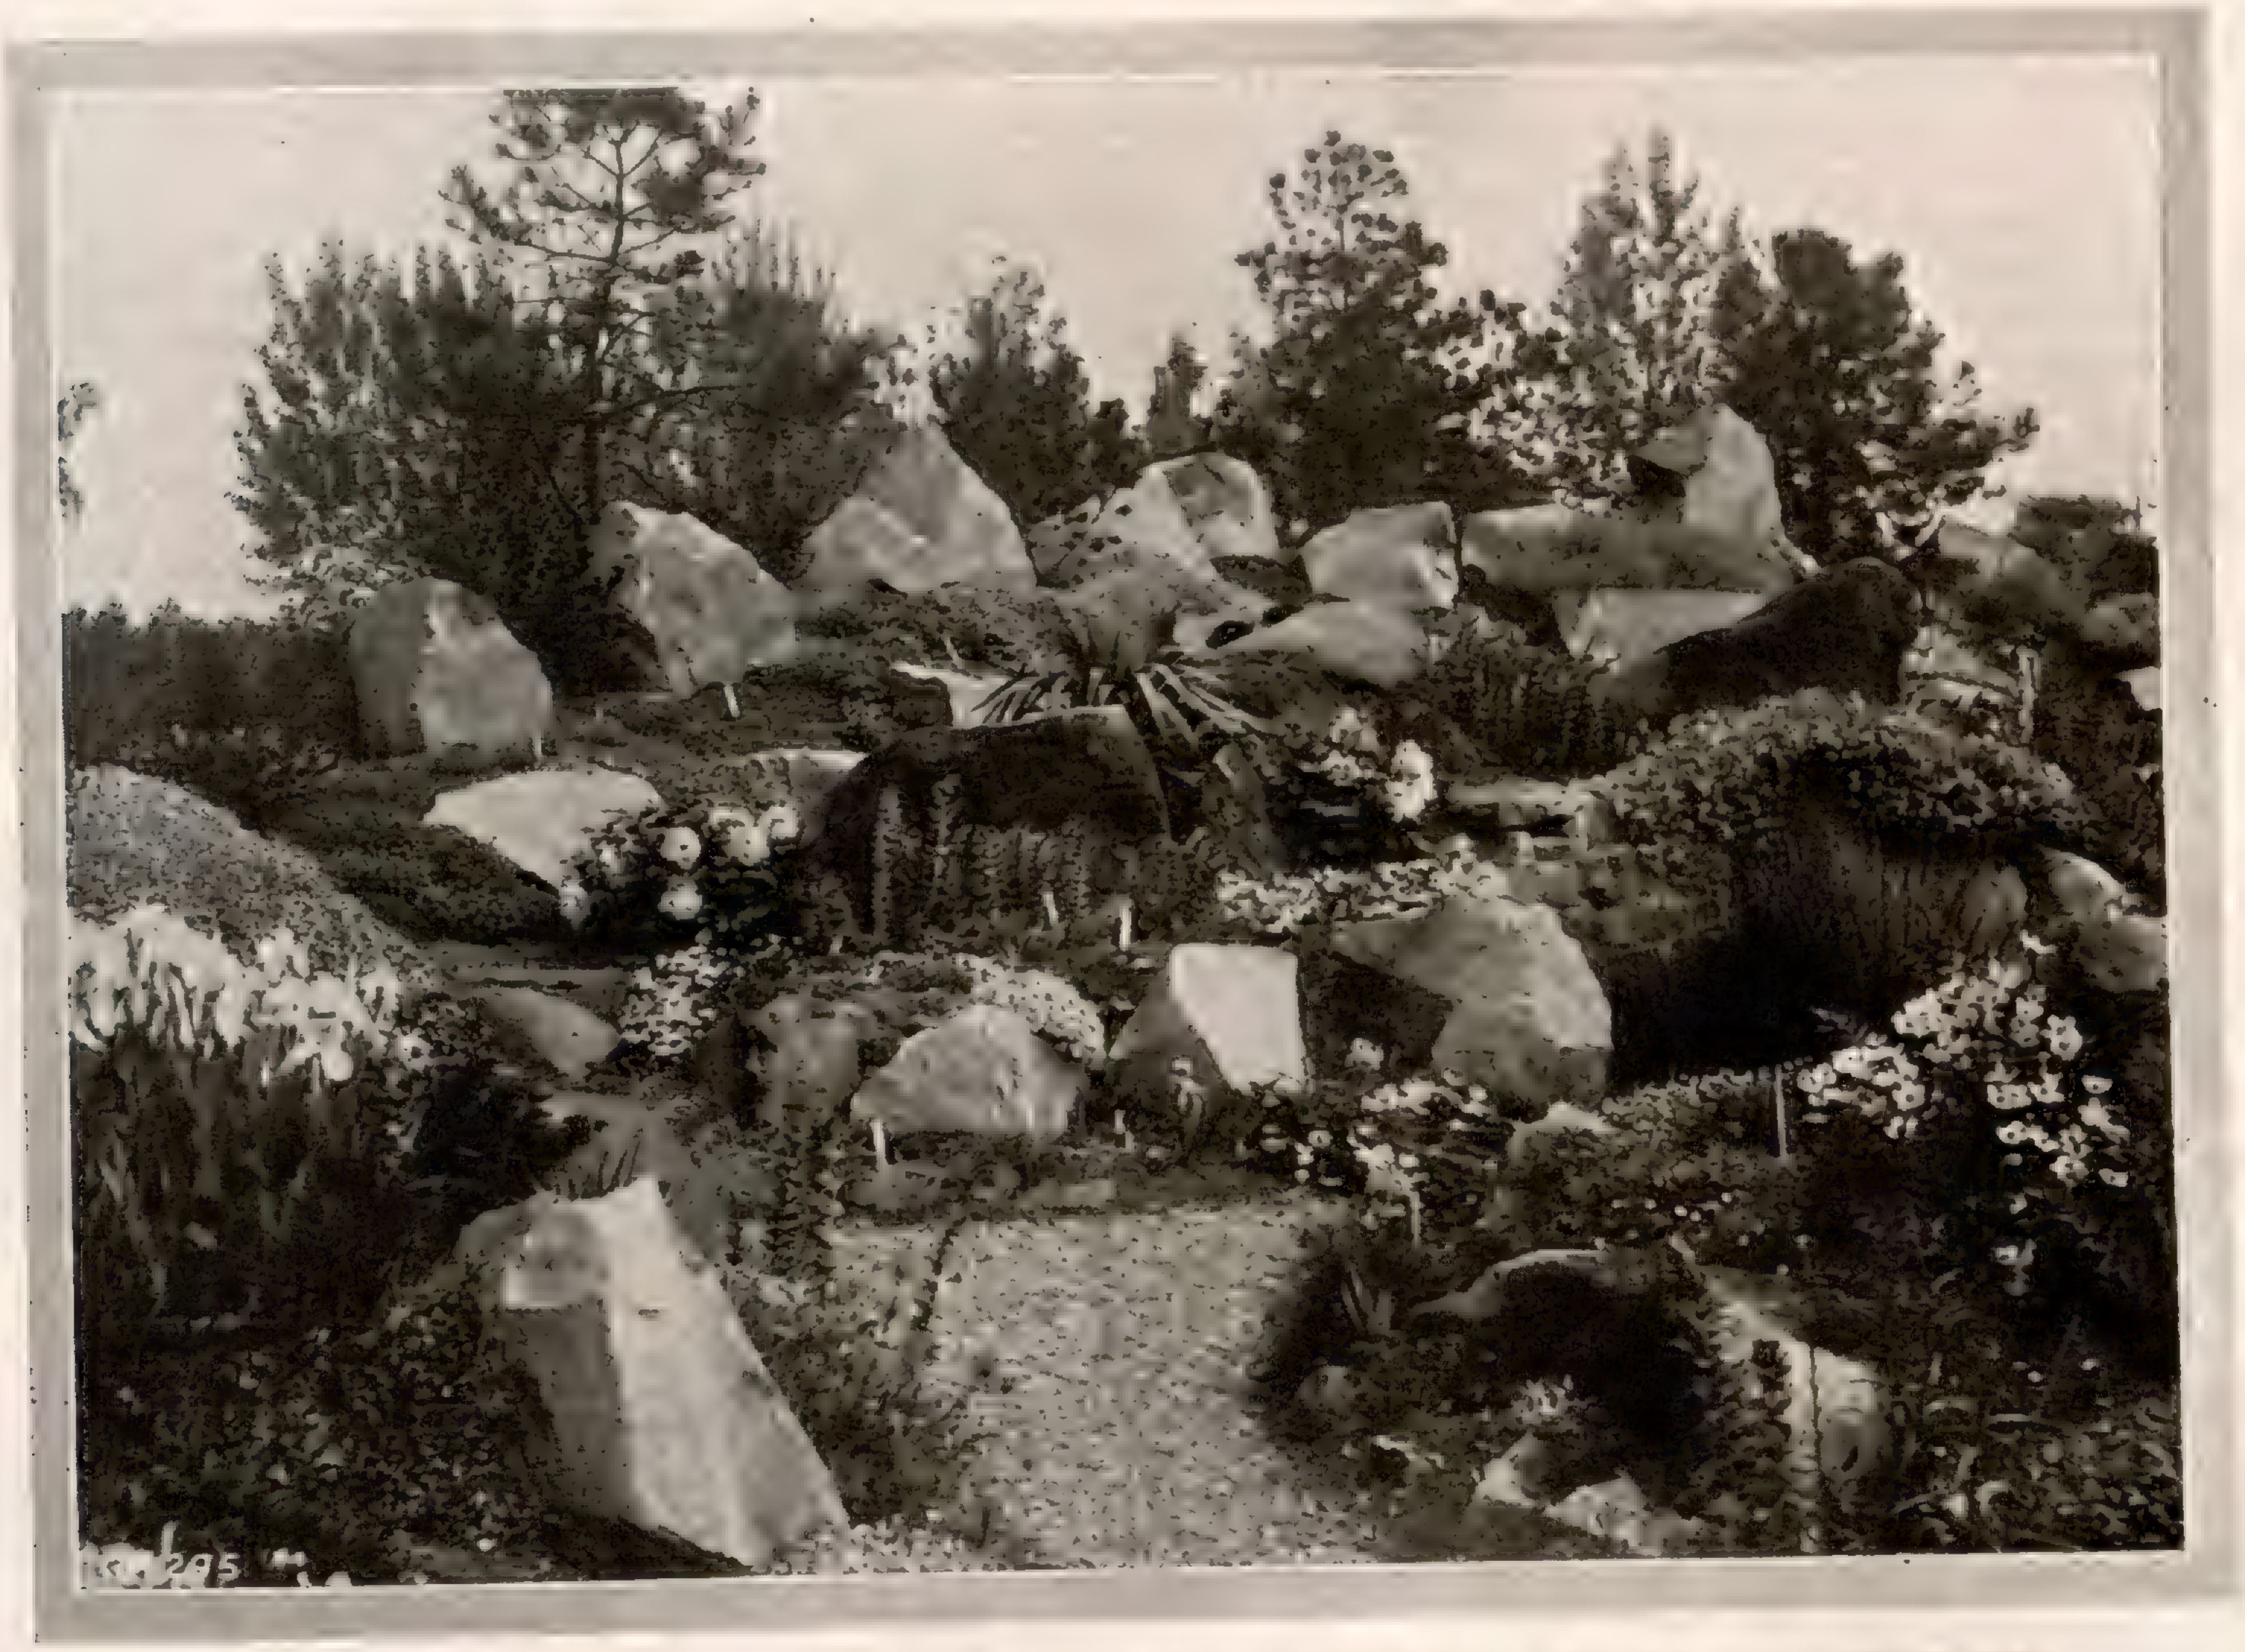
The pioneer work connected with the rock garden has long since been accomplished, and now we are reaping the harvest of good ideas, which were largely promulgated some forty years ago, by those who were engaged in combating the formalism and incongruities largely found in the gardens of that period. The majority of my readers will have had ample opportunity of noting for themselves the possibilities of the rock garden. It is capable of the greatest diversity. No two rock gardens need be alike, there being ample scope for the formation of a landscape which shall differ from every other landscape.

I do not wish to infer that it is always an unwise thing to copy some idea, or to elaborate some detail; on the contrary, some of the most delightful garden features are but the outcome of an idea arising in another garden. Apart from this consideration, there is no reason why every rock garden should not be distinctive, and quite different from its fellows.

The matter of the construction of a rock garden is full of interest. The question of the contour of mounds and slopes, the making of valleys and drifts, the formation of streamlets, pools, rock pathways, stepping stones, and rock groupings, all provide matter for the closest attention, and the keenest interest and thought. Geometry is out of place here. Instead you let your mind wander back to scenes green in the memory. A memory picture of a rocky gorge o'erhung with ferns and light tree growth, with a streamlet tossed from rock to rock in a shower of white spray; another of a winding track between huge boulders, and along the cliff face in a mountain region; a hillside broken by outcrops of grey rock, o'erclad with wild thymes, helianthemums, sedums, etc., with its silence broken only by the song of the lark or the droning of humble-bees among the scented thyme blossoms; or a delightful valley of gentle slopes, with a silent stream-fed pool at the base, a vale of flowers, of luxuriant shrubby growth, of decorative reeds, and sub-aquatics nodding to every movement of the breeze. These memory pictures give inspiration.

The gentle stream, the rocky gorge, the calm sweet valley, must live again in the rock garden you are making. You may not copy them, as a Japanese landscape artist would. You add something here, delete something there, as fancy dictates, but your memory picture is not erased. It gives the main idea, the keynote, and you play upon it, evolving from it a refreshing bit of garden scenery. Thus you go on. The charm of making the rock garden remains as long as the task lasts. Then comes the soiling up, and the planting. The selection of the plants which are to inhabit the new home. You range through crowds of subjects (popular, novelties, rarities), exercising a choice which is guided by a love of the rock dwellers and their beauties. Plants may be purchased or gathered from hillsides and mountain ranges at home and abroad, and carefully transferred to the new rock garden. Slopes are clothed; nooks, crannies, and drifts between the rocks are planted up. Time speeds on, and you add to the collection from time to time.

It may be said that the true rock garden is never twice alike. Every time you view it there is something fresh. Some new rarity is blossoming, or some hitherto unnoted feature presents itself to the eye. There is no monotony. Growth is practically continuous. From earliest spring to the autumn days you obtain an unparalleled profusion of blossom, and in the winter you have the charming range of foliage colourings rendered by plants and shrubs, mounds of grey-green, silver, and bronze. Dwarf pines and shrubs cluster over the rock-face. There is movement, life, and colour, always apparent. It is the one phase of the garden which does not disappoint in the shortest days.



A BEAUTIFUL ROCK GARDEN SCENE AT HOLLAND HOUSE, SOUTHCLIFF.

Illustrative of the diversity of the rock garden is appended a view of a corner of the rock garden at Holland House, Southcliff, in May. Just at this time irises, helianthemums, anemones, Pæony Moutan, pæonies, alpine phloxes, etc., are aiding violas, aubrietias, saxifrages, etc., in the making of many pictures.

Added to the general charm of the rock garden there is a rich mine of interest in the raising of seedling plants. The crossing of specific forms of saxifrages, and many other subjects, will give the greatest delight, for in batches of seedlings one hails new colours, new forms, new varieties. Something that will give new tones of colour among the rocks, or contrasts with existing varieties. Something that will charm your visitors, and prove a fount of interest to all who are versed in mountain plants.

One has only to witness the interest now taken in hybrid saxifrages to realise how it may just as readily be extended to other plants.

P. S. Hayward.

## ROSE LINA SCHMIDT MICHEL.

It is a curious fact that some good roses never become so well known as they deserve to be, while others that are in many respects inferior, are to be found in almost every rose garden. In most gardens whose owners are interested in pillar roses, the H. T. Dawn has been tried, and, although its bright pink semi-double flowers are very attractive and are freely produced, and its shoots are very vigorous, yet I think most growers would complain of its leggy habit—unless it is bent right down very early in the spring, the shoots are almost certain to get bare at the base, and there are few more unsightly objects in the garden than a pillar rose bare and leggy at the base with a bushy top-heavy bunch of leaves and flowers at the top.

We had almost decided to give up trying to grow Dawn until we are told by friends that this leggy habit could be overcome by taking down the long rods in early spring and leaving them for some weeks in a horizontal position, and so getting the buds to break all the way along before fastening them again to the pillar. This plan has been quite successful, but it is not always convenient to do this, as the plants take up a lot of room when tied down in this way, and I would advise all who admire the flowers of Dawn, and yet do not want to have to treat their pillars in the way described, to grow the H.T. Lina Schmidt Michel in its place. I saw this rose at the Temple Show about four years ago, and was very much taken with the lovely shades of pink in its large, loose blossoms. The big, shell-like petals are of a soft creamy-pink on the inside and very bright glowing rose-pink on the outside, while the buds are almost vermilion red; altogether it is a brighter and fuller plant than Dawn. The foliage is dark green, tinged with bronze, and rather leathery. The flowers are generally produced singly or at most two on a stem (at any rate, in the first blooming), and are on long stalks, so that it is a more useful rose for cutting than Dawn, which grows in rather tight, uncomfortable bunches of three or four blooms unless it is disbudded. The first summer we had Lina Schmidt Michel we were afraid we had discovered two reasons which might justify its absence from so many rose gardens; the first was that it seemed to be a shy flowerer, and the second that it was in no hurry to climb up its 10ft. pillar. However, last summer—its second in our garden—it overcame one of our fears, and reached the top of its pillar, and would evidently have liked to go higher still, while this—its third summer with us—it has entirely vindicated itself in the matter of freedom of flowering, and is a most shapely pillar plant, clothed from base to summit with it fine big foliage, and its glowing pink blossoms, which seem happy alike in sunshine or in rain. The flowers have a very pleasant scent, and it is not given to mildew. I have just been examining (June 18) our plants of Dawn and Lina Schmidt Michel to see which is the best in this respect, and find that Dawn has already a considerable amount of mildew on the flower-stems, while Lina has none. It is a good autumn bloomer, and the fact I have just noticed that its flowers are not spoilt by rain makes it specially useful at that time of year. I find, on referring to the N.R.S. catalogue, that this rose was only introduced by Mr. Peter Lambert in 1905, so possibly it has not yet had time to find its way into the many gardens which, I am sure, would be the brighter for its presence; perhaps, too, it suffers from its rather cumbersome name. Dawn is certainly much happier in this respect. Unfortunately, we cannot drop the surname, as we should be interfering with the rights of that charming little apricot Tea rose which goes by the name of Lena.

White Lady.

## THE POSSIBILITIES OF A SCHOOL GARDEN—I.

### Its Objects.

Some years have now passed since horticulture was added to the curriculum of elementary schools, and school gardens were established. To be quite correct about the commencement, however, I should have said many years, for long before school gardens were recognised by education authorities, certain far-seeing persons in villages here and there, saw the possibilities of school gardening, realised its usefulness, and introduced the subject on their own initiative and very often at their own expense. The introduction of gardening, as a recognised subject, however, was the result of a conviction that our education system was wrong inasmuch as it was not practical enough. Whereas the brain of the boy was utilised, his hands were mostly allowed to remain idle, and he left school with an idea at the back of his mind, and for which his school training was largely responsible, that it was infra dig to do manual work.

He acquired a certain amount of knowledge, but had no capacity for applying it; he knew something, but could do nothing, and the inborn intelligence which the average boy possesses was not appealed to by the mode of teaching. In other words, he was an institution for the reception of certain facts; the process was one of driving in, but the drawing out and development of latent intelligence is, after all, the keynote of successful teaching. In looking round for material in teaching with the object of altering the existing order of things, and making boys more handy, useful, skilful, intelligent, and self-reliant, the authorities found it at the very door of the school, in the workshop where the lad can make something, and in the garden where he can grow something and see, in the course of a few months, the result of his labour. This, after all, was only a matter of history repeating itself, and the hall-mark of official authority was given to ideas that solitary teachers and isolated educationists believed in long years ago, and were, to some extent, practised in the village dame's school in times gone by.

School gardening then was not a spontaneous growth, its beginning, as we know it, was only a continuation, in the form of an experiment, but, unlike some other experiments in education, it has grown and developed, and is still increasing. A good deal of the credit for this must be given to enterprising teachers, who saw the possibilities of a school garden as a means of education, and in face of criticism and a good deal of local scepticism, went ahead and showed the way, with the result that others have followed, and gardening is gradually becoming an essential part of every elementary school in rural Britain. A strong point about the movement is that it has been voluntary; gardening is a special subject, though, perhaps, this is one of the weaknesses about the system, and the majority of the teachers who have taken it up have done so of their own free will, believing that it would be useful to the children and invaluable for giving life and reality to lessons of a more literary type. As evidence of its helpfulness in the latter direction a teacher informed me recently that the gardening was the most "living" subject in his school.

In some quarters even now there seem to be hazy ideas as to the objects of school gardening, and apparently certain individuals still retain the impression that the object is to make professional gardeners of the boys. No idea than this could be so mistaken or so mischievous, and it only goes so far as this, that a teacher in his gardening class can detect the boys who have a taste and capacity for gardening, and he may be able to find a way for them to follow the craft after they leave school. This is quite as it should be, and I know of several promising youths who are making their way in horticulture whose capacity for gardening was discovered in the school garden. In my opinion, one of the greatest drawbacks in our system, or rather lack of system, in making gardeners to-day, is the want of discrimination in first finding out whether the individual is possessed of the natural taste and inclination that are essential to the making of a good gardener.

The object, then, of the school garden, is not primarily to make professional gardeners, but there is one phase of the teaching that I would emphasise. Scattered about over the face of this country there are thousands of men, and women, too, who make gardening a hobby. In the course of their daily occupation they toil on the land, down mines, in factories, workshops, offices, and elsewhere, and in their spare time they find pleasure, and sometimes profit, in the pursuit of gardening. That this hobby is healthy everybody will agree; that it is uplifting must also be admitted when it is realised that those who pursue it are, for the most part, respected members of the community to which they belong. In face of this evidence, it is very desirable that there should be an increase rather than a decline in this national taste for gardening, and it is the school garden that will help to bring it about. Hundreds of that section of gardeners whom we call amateurs have had no opportunity of learning, and what they know about gardening they have had to pick up as they went along. In the school garden, however, the boys have an opportunity of learning the principles of the thing, the foundation is laid, and they go from school with something upon which they can build, and in their young minds are placed ideas that can hardly be put there at a later age.

Another object of school gardening, and a highly important one, is that boys are taught to use their hands; in other words, to work, to be handy and inventive. The dignity of manual labour is a thing that this country must uphold, and surely the place to teach the boy that it is not infra dig to use his hands in honest labour, is the school. It has been urged in the past that our education system has failed in this particular, hence the desirability of introducing manual processes into the curriculum. It is not claimed for school gardening that it will solve the question of back to the land, but surely, by making use of local environment in teaching, boys in the country will be induced to take more interest in their surroundings, and in after life find pleasures there that life in the town can never offer them. Whether the objects of school gardening are ever fully accomplished or not, it is claimed for them that they are good, and in subsequent issues I propose to deal with different phases of the subject as they appear to me.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of those popular flowers is "Dahlias and their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

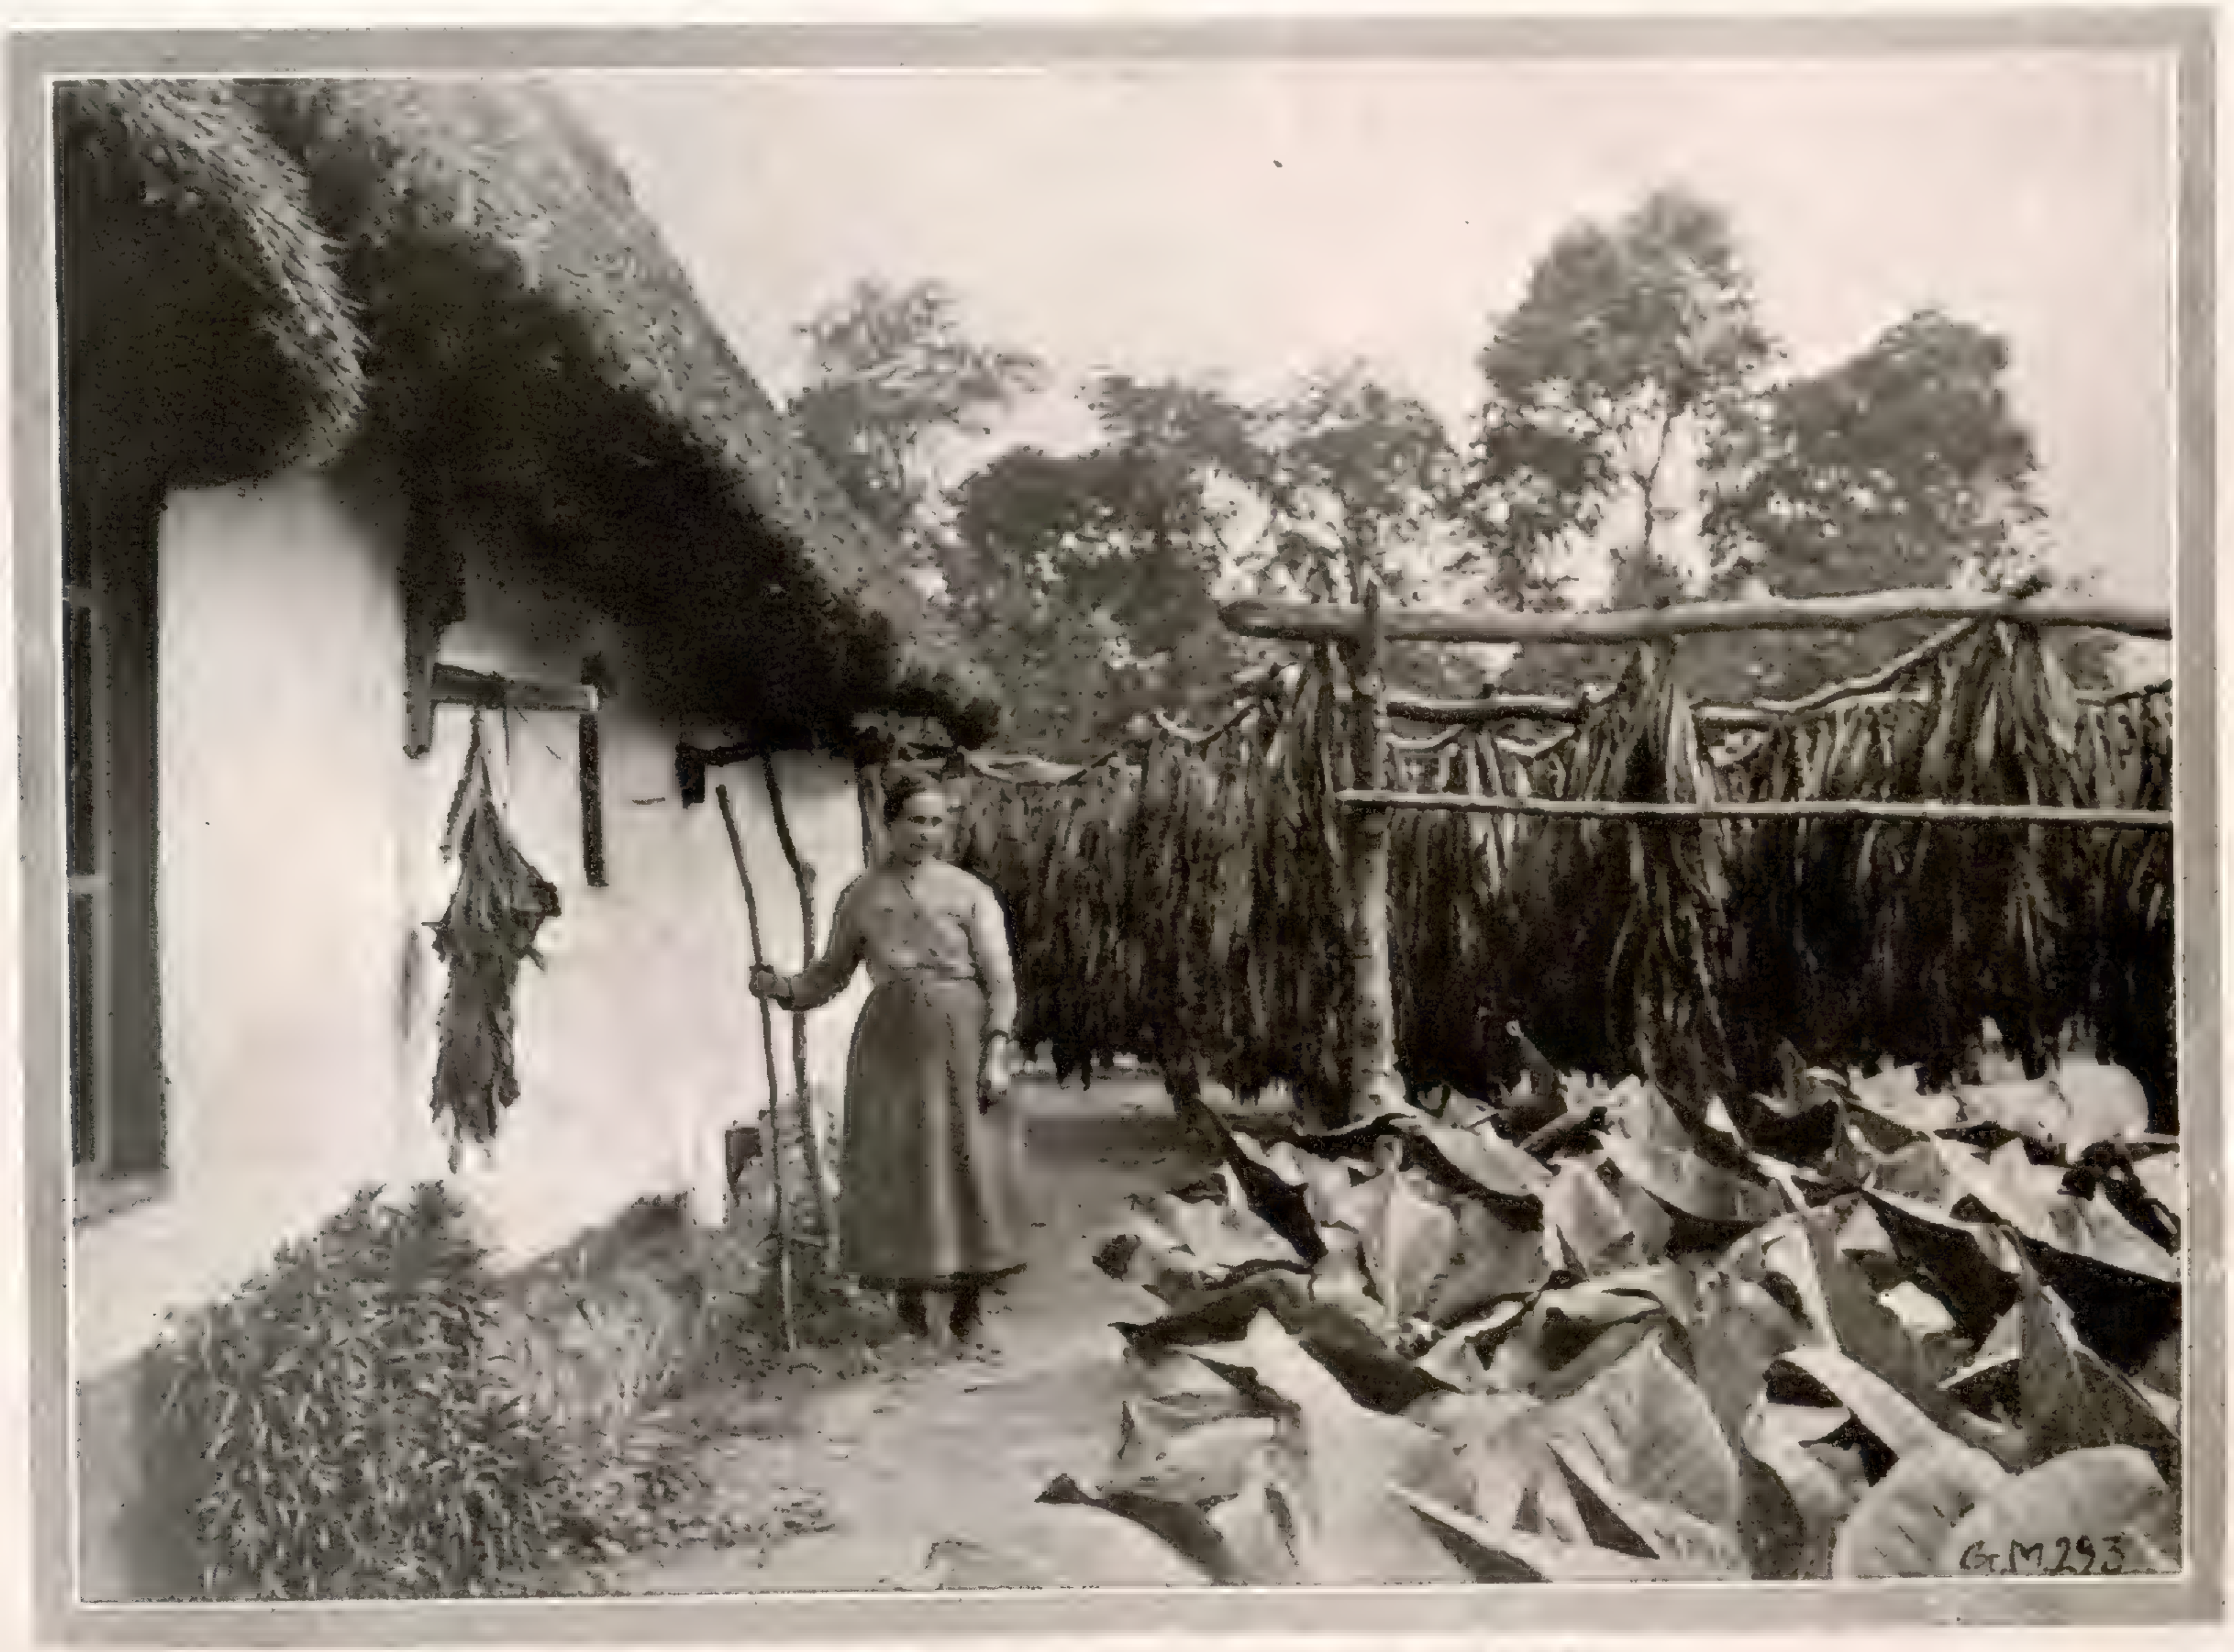
## TOBACCO CULTURE BY FRENCH PEASANTS.

In these days, when the cry, "Back to the land," comes from our over-populated towns and cities, any fresh incentive is a valuable asset, especially if applicable to small holdings and cottage gardens. We have learnt so much of systematic gardening from our French allies that we may go a step further, and enquire how they contrive to make the cultivation of tobacco in a quite small way, and under conditions almost precisely similar to our own, a success financially as well as regards the quality of the leaf

In the Pas de Calais, principally in the villages of Bréscent, La Calotérie, and Essocq, and the neighbourhood of Montreuil and Hesdin—the latter barely an hour from Boulogne—nearly every cottage garden has its plot of strong, healthy tobacco plants. No expensive apparatus is necessary, nor any very heavy work incurred, except what can be done by the man of the house in his off-hours, with the assistance of his wife and family. All the plant necessary is a frame of rough poles on which to suspend the ropes of leaves for drying, and this can be readily roofed in should the season be a wet one; also an outhouse or granary in which to continue the gradual drying process through the winter until delivered to the factory in the month of February.

The tobacco seed is sown in frames in March, and the young plants put out in May. After planting the earth should be kept well stirred and free from weeds and the flower-head cut out directly the flower buds are seen. At the end of August the leaves are cut close down to the crowns, and are threaded on to cords and hung up to dry on the wooden frames until the end of September when they are suspended under cover until the following February. Should the sun be excessively hot it is advisable to slightly shelter the drying leaves during the hottest hours of the day; otherwise they become brittle and powdery.

F. Mordaunt.



TOBACCO PATCH WITH DRYING FRAMES.

## SUMMER PRUNING.

The question of pruning fruit trees is one which is often confounded with that of training. The latter practice has for its sole object the regulation of the growth of the tree in any desired manner, so that it may develop along certain specified lines, and form a certain shape or conformation which appears most desirable to the cultivator. Pruning, on the other hand, achieves a much more important object. It produces, or tends to produce, a well-balanced growth; it represses undesirable or over-vigorous development in any part of the tree, and encourages growth that may be weak in another part. The main object is precisely the encouragement of the fruiting proclivities of the tree.

In the summer time the growing shoots of fruit trees are apt to develop more vigorously than is good for the tree as a whole. They therefore need some sort of artificial repression, and summer pruning is the practice we adopt in order to secure this restraint. Where trees are trained in some formal fashion, quite distinct from Nature's own habit, and also, in the case of dwarf fruit trees, summer pruning must not on any account be neglected; otherwise the flow of sap will be uneven, and generally at the expense of those parts which are provided for the elaboration of fruit. Therefore, it is clearly evident that if the stronger-growing shoots at the upper part of the tree are stopped at the proper stage, the flow of sap will be diverted and equalised, and there will be uniform action throughout. The purpose of the leaves, it may be remarked, is to elaborate the flow of sap which comes from the roots, afterwards returning it to the stem to form woody fibre. In this manner, the judicious stopping of the more vigorous growing shoots will assist in the formation of fruit buds.

Generally, the reason offered by most gardeners for summer pruning is that it induces the formation of fruit buds for another season. Others hold that it prevents the tree from becoming over-crowded in the centre, and so admits air and sunlight to the fruiting spurs. Both these reasons are sound ones, but it does not follow that the grower who summer prunes his fruit trees will always find the practical application of such theories of any use. Many have found it extremely disappointing, and, as there is no hard-and-fast rule to be observed in this connection, we can only fall back on the assumption that they summer pruned their fruit trees because it appeared to be the custom to do so, without paying any attention to seasonable conditions, habit of growth, soil conditions, or actual development of the trees.

One of the commonest mistakes is to commence the work too early. The lower buds, which ought to remain in a dormant state until the next season, are then excited into premature growth, which, of course, is the very opposite effect to that which it was intended to achieve. As a general rule—and a very general one, too, with many exceptions to prove it—summer pruning may be performed quite safely at the end of July or the beginning of August. The spring growth of a normally vigorous tree is usually completed about the middle of July, always providing the season is a normal one, of course, and it may then be noticed that subsequent growth is checked for a time. Meanwhile, the wood becomes firmer, and the buds assimilate nourishment. To summer prune the longest shoots at this stage is certainly apt to divert a great deal of sap energy to the assistance of these two processes.

In order to secure the most beneficial results from summer pruning, it is best to practise it "little and often." Small, undersized fruits are generally developed if a fruit tree is permitted to carry its whole natural free growth. Also, these small fruits are only borne on the outer extensions of the tree, and it will usually be noticed that the centre is crowded with a mass of useless light and air-resisting foliage, so that the main extensions of the branches carry few, if any, fruit buds. The gradual thinning out of these shoots, and their subsequent shortening to four or five leaves, is the proper method of summer pruning. Each day, a little of the work should be done, so as not to disturb the normal growth. Wholesale thinning at this stage is likely to have very injurious effects indeed. Bush, espalier, pyramidal, and wall trees all come under this category.

In the case of pears and apples, the chief object should be to encourage flower buds and restrict the development of side shoots. In the latter case, one must commence the work at the top of the tree, and continue about one-third of the way down. The middle of the tree will then require attention. Severe summer pruning cannot be recommended under any circumstances, for it is always the better plan to have too much wood rather than too little. Wall fruits, such as plums, cherries, and also apricots, should be pruned in such a manner as to leave an adequate number of shoots between the branches to fill the spaces without any over-crowding. Any excess of wood over and above this amount should be stopped at the third or fourth leaf, and laterals must also be immediately pinched beyond the first leaf. In the case of wall pears, all the strongest shoots must be reduced to five or six leaves, always excepting those required for the extension of the tree, of course.

Summer pruning is, to a large extent, simply a corollary to disbudding, and therefore it is obvious that if the tree is already bearing more buds than it is properly able to mature, the weaker and worst-placed buds, and even a whole spur in some cases, must be at once removed. This overloading of a fruit tree with spurs and potential fruit buds is of much more frequent occurrence than many growers would imagine, and it may safely be said to be the cause of a great deal of unfruitfulness amongst fruit trees.

Old Basing. J. C. NEWSHAM.

## ROSES UNDER GLASS.

How very unhappy many rose trees appear to be during the summer months when grown under glass. I have seen the plants half eaten up with red spider, and shedding their leaves daily, and the excresence from green aphides sadly disfiguring the pot plants grown under the climbing roses.

Few plants are more carefully attended to early in the year when they are yielding their first crop of blossoms, and few plants from under glass are more neglected in the summer time. When the autumn crop comes more attention is given, of course, but it is too late to do much good.

At the present time the small, wiry shoots should be entirely cut out, and others, which cause undue crowding, shortened considerably. Then the garden engine or hand syringe should be freely used to cleanse the branches retained. If air be freely admitted also, the cultivator will be well pleased with the crop of blossoms in the autumn. G. B.

## FLOWERING CANNAS.

Very few classes of plants have made so much headway in popular favour within the last few years as the cannas. Five-and-twenty years ago the present-day race was practically unknown. True, two or three years before that time a few of the then new section had been distributed, but it was not until the summer of 1888 that some of them were brought prominently forward. In that year no less than seven varieties were given first-class certificates by the Royal Horticultural Society, but in later times only awards of merit have been bestowed upon the new varieties. As an illustration of the rapid advance of the canna it may be mentioned that in the years from 1859 to 1888 only five varieties had been honoured by the R.H.S. Floral Committee, whereas since then 75 awards have been given.

Previous to the advent of these large-flowered forms, cannas were chiefly regarded as fine foliage plants for summer bedding, the floral features being considered of but minor account. For the commencement of the race of large-flowering cannas, which at first were called "gladiolus-flowered," we are indebted to M. Crozy, then of Lyons, and afterwards of Hyères. He devoted a good deal of time to the improvement of the canna, aiming at a dwarfer habit, greater freedom of flowering, and larger blossoms. As little was heard of his work until the new varieties were put into commerce their advent caused a considerable stir in the horticultural world. Since then numerous varieties have been obtained by different raisers, and the improvement in them has steadily continued, so that the best varieties of to-day are as far in advance of those of 1888 as these latter were superior to the old Canna indica. It may be as well to recall the names of the seven varieties which in 1888 gained such high honours, though they are now long since superseded. They are Amiral Courbet, Capricieuse, Francisque Morel, Geoffrey St. Hilaire, Madame Just, Paul Bert, and Ulrich Brunner.

The varieties popular at the present day can be, and are, put to a great variety of uses, though they are more generally grown in pots for greenhouse decoration than for any other purpose. For single stems pots from 6in. to 7in. in diameter are very suitable, and grand heads of bloom can be obtained, whereas if cramped in smaller pots the display of bloom is lessened. Plants grown in this way are not only of considerable value for the embellishment of the greenhouse, but they are also largely employed for grouping purposes at the various exhibitions held during the summer months. Owing to their handsome leafage they harmonise well with the various foliage plants which go to make up the major portion of the groups seen at many of the shows, and then, in addition, their gorgeously coloured blossoms serve to brighten up what might otherwise be a somewhat sombre display.

Again, they can be grown as bold masses in large pots or tubs, and so treated there are many places where they may with advantage be placed during the summer months. In this way, with an occasional supply of liquid manure, they will continue to grow and flower throughout the season.

Lastly, these cannas can be highly recommended for summer bedding, both foliage and flowers being very fine if they are liberally treated. This last item is most essential. It was brought home forcibly to me during the trying weather of last summer, when beds of cannas, and some of them in noted gardens, presented a most unhappy appearance. The main cause of the trouble was that the soil was heaped up in such an unnatural fashion that even when artificially watered the major portion of the liquid flowed on to the neighbouring grass, instead of moistening the soil around the roots of the cannas. After these examples of how not to do it, I was agreeably surprised to find some magnificent beds in an establishment of much lesser pretensions. The soil had been deeply dug and well manured, and the surface of the bed made saucer fashion, so that not a drop of water was wasted. Given a very wet summer, the results might not be so markedly superior to the others, but last year at least this mode of treatment paid.

Among other items in favour of these large-flowered cannas is the fact that they pass the winter in a dormant state, and consequently they may at that season be kept under the stage of the greenhouse, provided they are free from drip, or, in fact, anywhere safe from frost. On this point it is as well to bear in mind that the rhizomes of the yellow-flowered varieties are more delicate than those with red blossoms, so that the best place should in winter be assigned to the yellow forms. These cannas are all readily increased by division, as in spring the rhizomes may be cut up into as many pieces as there are buds, and if these are put into 5in. pots, and placed in a gentle heat, they will form good-sized plants by bedding-out time.

The list of varieties is at the present day very extensive, and, although the question of a selection is one on which there are sure to be differences of opinion, the following are all thoroughly good and reliable: A. Ortmann, dark purple; Baron de Richter, bright apricot, lighter edge; Black Prince, deep maroon; Bronze Poitevine, bright orange, rosy centre; Ernst H. Krelage, cherry-carmine; Evolution, golden-yellow, pink centre; Feuermeer, brilliant scarlet; Frau E. Kracht, rosy-salmon; Furst Weid, intense crimson; J. B. Van der Schoot, yellow, freely dotted red; J. Lochner, scarlet and orange; King Humbert, reddish-orange; Konigen Charlotte, deep scarlet, edged yellow, dwarf; Meteore, bright orange-red; Niagara, intense scarlet, gold margin; Oscar Dannecker, orange-yellow; Papa Crozy, vermilion; Rosea gigantea, rose; R. Wallace, canary-yellow; Schwabenland, cherry-crimson; Stuttgartia, scarlet and orange, light yellow edge; Venus, pink, yellow border; William Saunders, rosy-scarlet; and William Watson, deep salmon. S. W.

**Campanula pyramidalis** and its white variety, although quite hardy, is of immense value for the conservatory or greenhouse. It has to be treated as a biennial, and when well grown, the fine spikes of bloom reaching five to six feet in height, produce a fine effect. Seed should now be sown for next year's display in a pan filled with a sandy compost. Sow thinly and evenly over the surface, and just cover it with fine soil. Place the pan in an unheated frame, when the seed will soon germinate. When large enough for handling put the seedlings into 3in. pots, and shift them on as they require more root space until they reach 10in. pots. During the winter they should remain in the unheated frame, but be protected from frost. They will at this stage lose most of their leaves. In February they should be moved to a frame where they will have the assistance of a little heat, to which they will readily respond. Fresh leaves will appear, and the flower spikes may be seen developing from the centre; when this takes place the supply of stimulants should commence, first once a week, but after a few weeks every time they need water.—LEWIS SMITH, Shotesham Park Gardens.

# ENGLISH LEGISLATION AND PLANT DISEASES.

(Concluded from page 490.)

## Survey of Plant Diseases.

Now it is laid down in the American Gooseberry Mildew Order and in the Wart Disease of Potatoes Order, that in defining the limits of the infected premises only that part of any garden or other holding is to be included on which disease exists or has recently existed. The areas, therefore, are small, seldom exceeding three acres, and in most cases much less. One large fruit farmer, therefore, may have several infected premises in his occupation, and, as a matter of fact, there are sometimes ten or twelve such places registered under the name of one occupier. I have laid what may seem to some undue stress upon this point, which appears at first sight a trivial one, because it is here that the foundation-stone is laid of the whole structure of the Survey of Plant Diseases in England which the Board have been trying to build up. The system on which this survey has been planned has already been fully described in the annual reports of the Intelligence Division of the Board of Agriculture and Fisheries, Part II., but as it is intimately bound up with the subject of this paper, it may perhaps be outlined again. In the first place, it is obvious that the first step to be taken in making a study of any plant pest which it is proposed to eradicate is to ascertain the area over which the pest has spread. Without an adequate knowledge of the "extent" of the attack in every county, and in every garden, no progress can be made. But it is equally important to ascertain what is the "intensity" of the attack in each place, since this alone can give any true conception of the amount of injury done. Every report, therefore, that is sent in to the Board respecting an outbreak of American Gooseberry Mildew must contain a record of the extent of the infected premises that are affected by disease, and an expression measuring the intensity of the attack throughout the garden. But if this report is to be of any use it must be based upon an agreed scale of degrees, and must not be merely the personal impression of the inspector.

DRYING TOBACCO LEAVES AFTER GATHERING.

## Scheduling Diseases.

The measure of the extent of the disease is a comparatively simple affair. Given that the infected premises cover three acres or one acre of gooseberry bushes—and each report must in the first instance give the approximate area scheduled—the inspector has merely to ascertain the proportion affected. A scale of five degrees is taken, and the words "very many," "many," "common," "few," "very few," are used to signify the number of bushes attacked. Thus if less than 10 per cent. of the bushes are mildewed, the report says "very few"; if between 10 per cent. and 30 per cent., "few." "Common" implies between 30 per cent. and 60 per cent.; "many," 60 per cent. to 80 per cent.; "very many," 80 per cent. to 100 per cent.

The measure of the intensity of the disease is a much more difficult affair, and implies a study of the development of the disease from the moment when it first becomes apparent on the plant to the state when the bush is either dead or of so little economic value that it is uprooted and destroyed by the occupier. The number of degrees in the scale of intensity is, however, the same as in the scale of extent, the words selected being "very slight," "slight," "general," "bad," and "very bad." The symptoms which justify the inclusion of any case in each degree vary with the disease under consideration, and are, of course, selected in an arbitrary manner. They have been fully described in the annual reports already referred to, and need not be explained again, especially as a short explanation is attached to the Maps of Disease shown in the Exhibition. It is sufficient to point out that by collecting a series of reports, each of which records two dimensions of disease, viz., the extent and the intensity, it is possible to calculate with some accuracy the amount of disease present over any given area, from a parish to the kingdom, to compare one district with another, and one year with another. It is the best, if not the only, way of estimating the effect of widespread influences, such as the weather and the character of soil on the spread of disease, and it is a very useful method of studying the general effect of any remedial measures that may be adopted over large districts. Finally, it is the only accurate way of exhibiting to foreign Governments or private traders who wish to ascertain the sources from which nursery stock or other produce, for purposes of propagation, can be obtained with a reasonable assurance of escaping infection. The system is as yet only in its infancy, and it is anticipated that as it is applied to new diseases and continued for a longer period it will be found useful in drawing attention to facts that would otherwise be overlooked, and materially assist in drawing conclusions as to the progress of epidemics.

So far only those Orders of the Board have been described which deal with diseases that are more or less firmly established in this country, and that will require a long and patient course of treatment to stamp out, if indeed that can ever be accomplished. Such diseases are, of course, chiefly a matter of interest to the Government of the country concerned, and the farmers and fruit-growers that are affected.

## Insects to Guard Against.

Orders that relate to the third class of pests are of a wider interest, and affect not only the home grower but the foreign trader who wishes to place his goods on the English market, and to a certain extent the English nurseryman who wishes to dispose of his stock abroad. It has already been explained that the pests referred to are those which are either non-existent in England, or have only recently been introduced. But, as stated, it was quickly found that there is a fourth class of pests, namely, those which, though present in England, are of very slight economic importance here, but which are regarded as serious by other countries. It is considered that the Board should arm themselves with powers to deal with pests of this order for two reasons; first, that they may have power to act promptly should any of these pests assume undue proportions, and, secondly, that they may be in a position to give an official certificate of freedom from disease to those nurserymen who wish to trade abroad. These pests may, therefore, be classified under two heads, those which we wish to keep out of this country, and those which other Governments wish to keep out of their countries.

The pests which comes under the first heading include several which are well known to all horticulturists who have studied foreign and colonial writings, though they may possibly be unfamiliar with the appearance of the devastation they cause. They are, first, the San José Scale (Aspidiotus perniciosus), a dangerous parasite which attacks many kinds of deciduous trees, but is specially injurious to fruit trees. It is supposed to be a native of Eastern Asia, but it has caused untold damage in Western America, and has spread to the Eastern States, and Canada, through the introduction of nursery stock. It prevails in Australia, and has recently been discovered in South Africa, though it is supposed to have been present there for about six years. It is not infrequently found on imported fruit in the market, but as inquiry has failed to reveal any case of infestation from that source in any country where it has established itself, no real danger is apprehended from that quarter. Another pest is the Mediterranean Fruit Fly (Ceratitis capitata), possibly a native of Northern Africa, which now causes considerable injury on both shores of the Mediterranean, and has been reported as near to England as Paris. It is known in Australia and in South Africa, and might very well cause much damage in the South of England. A third is the Colorado Beetle (Dodyphora decemlineata), an American pest, which has twice been introduced into England, and was only stamped out with some difficulty and expense. As already stated, it was the discovery of this beetle in England that led to the passing of the Destructive Insects Act of 1877, but the danger of a fresh importation is less probable now since the United States have become a purchaser of potatoes in England instead of a seller. Another parasite of the potato, the Potato Moth (Phthorimaea operculella), is also scheduled. This pest, which rivals the Phylloxera and the pernicious scale in the amount of damage it can and does cause, is believed to have originated in Northern Africa. It has been recorded from Spain, Portugal, Italy, and more recently from France, where it appears to be spreading, and is known to have caused considerable loss in Algiers. It was introduced into India from Italy, and spread so fast that it became impossible to control it. It exists in South Africa, and throughout Australia from Victoria to Tasmania. It is well known in New Zealand. In America it attacks not only potatoes but tobacco plants, and, in view of the ease and rapidity with which it spreads, and the difficulty in combating it, it may be said to be the most dangerous foreign pest that we have to fear. A fourth pest is the Cherry Fly (Rhagoletis cerasi), which abounds in France and Germany, and probably elsewhere. The larval form is familiar to all purchasers of the first cherries that come on the English market, for it is imported in great numbers every year in foreign fruit. Careful inquiry however, has failed to detect a single case of infestation in English orchards, though it is impossible to say how long this immunity will last. One fungus disease has been included, viz., Black Knot, caused by Plowrightia morbosa, which is known to be a serious pest in America, and one bacterial disease, American pear blight. Both of these are pests of fruit trees, and are known to cause much damage.

## Other Insect Pests.

Two insect pests have been scheduled which are found in England occasionally, namely, the Vine Louse (Phylloxera vastatrix), and the Large Larch Sawfly (Nematus erichsoni). The former pest is known over the whole world wherever vines are grown, and is perhaps the most notorious of all destructive insects. The second is a parasite on larch trees, and has caused the death of thousands of trees in Cumberland and in Wales. Some years ago it nearly destroyed the larch forests in Denmark, and it is now devastating the woods of Canada. The importance of both of these pests is increased by the fact that they are regarded as serious by foreign countries, and in the case of the former stringest regulations have been passed to prevent its importation by the Government of every vine-growing State.

The remaining pests dealt with in the Order, viz., the Gipsy Moth, the Brown Tail Moth, the Nun Moth, and the Narcissus Fly, have all been scheduled for the same reason. As is well known, the first two insects have proved to be very destructive in the United States and in Canada. The third moth is occasionally very troublesome on the Continent of Europe, and the last has proved injurious in British Columbia, and is much feared in New Zealand, to which country large quantities of bulbs are sent from England. In no case do they cause any great injury in England. The Brown Tail Moth is rare, and is getting scarcer. The Gipsy Moth is almost extinct. Only two cases of injury from the former have been reported to the Board during the last six years, one of which was complicated by the presence of the Lackey Moth in large numbers, and no case of damage by the latter has been reported at all. The Nun Moth is not known as an injurious pest. The Narcissus Fly, though abundant, has not caused widespread injury. But the fact that all these pests are regarded as serious in countries with which English nurserymen trade is one which the Board are bound to take into consideration. In recent years British colonies and foreign countries have imposed regulations dealing with the importation of plants which rival in number and hardness the rules called the Pie, and it is to be feared that in some cases nurserymen have abandoned their overseas connections on the ground that the trade is not worth the trouble involved.

## Assistance from Government.

Now it will probably not be contended by anyone that it is the duty of the Government to push the business of any particular trader, or even the business of any class of traders, except in a general way. Those who make private profits must depend on their own exertions, and the reputation which the high quality of the goods they offer brings them. But it may reasonably be urged that it is the duty of every Government to smooth away the difficulties which other Governments lay in the path, and that the Board should help exporters to surmount the barriers imposed on importation when they can properly do so. With this object, therefore, the Board have been at same pains to collect, and publish as complete a collection as possible of all the regulations in force in other countries dealing with the importation of plants. A study of these regulations shows that they may roughly be divided under three heads, namely, those which require that the actual plants to be imported have been inspected by an officer of the Board and are certified to be healthy, those which require that the plant shall come from a nursery which has been inspected by an officer of the Board and declared to be free from disease; and those which require a certificate that no case of certain specified diseases has occurred within a certain distance of the place where the plants were grown. There are, of course, other cases where a quarantine or an inspection is imposed on arrival, but these affect the foreign purchaser rather than the English exporter.

The utmost the Board can do is to ascertain the nature of the regulations, and offer the nurserymen facilities for complying with those that require some inspection or report as regards the freedom from disease of that part of England from which they come. Arrangements have accordingly been made for such inspection, and the issue of such certificates and a memorandum setting out what the Board are prepared to undertake has been circulated to all the principal nurserymen in England. It is in order that the Board's inspectors may be in a position to enter on premises where disease may exist and search all places where it may be found that the pests recently referred to have been scheduled, for in some cases at any rate it is necessary to examine not only the premises or the plants in respect of which an application for a certificate has been made, but the adjoining premises as well. It is in this connection also that the system described above for obtaining a survey of diseases is of general benefit. Certain countries require a certificate with each consignment of potatoes which reaches their shores to the effect that no case of wart disease (Synchytrium endobioticum) has occurred in the neighbourhood where the potatoes were grown. Under the present organisation it is possible, except in a few cases, to issue the certificate or to report the Board's inability to do so on receipt of the application. By this means a very real security is given to the importing country against the introduction of disease, without imposing any undue delay or hindrance on trade. It is possible that the system might be extended with advantage. In England we do not believe in quarantine stations for imported plants. Such imports as do reach this country from abroad generally arrive at a season when nearly all insect and fungus pests are in a dormant condition. If the plants are to be examined at the port or at a quarantine station they would have to be unpacked, often to the great danger of the life of the plant, and examined under a microscope by a highly skilled expert, who would have to be familiar with the eggs and young stages of many foreign pests, and the appearance of the damage caused by many invisible fungi. He would have to identify in their immature state many diseases which many experts cannot always determine when mature, and he would be haunted by a constant fear of overlooking some dangerous pest.

If the Government of the importing country can only be satisfied by the reports based on such a system as has been described that the plants proceed from a district free from certain diseases, or from a nursery kept under constant supervision and declared to be clean, the plants could be taken direct to the premises where they are to be planted permanently and there examined by duly-qualified inspectors at a season when the pests that are feared resume their activity, and show by the injury to the plant or by their visible presence that they have been introduced. There are few, if any, pests that can be introduced from or into countries with a temperate climate that would breed or spread to neighbouring plants so rapidly that they could not be readily stamped out on such a system as has been described. In the case of the few pests to which this does not apply the introduction of the host plant should be prohibited altogether.

---

**Semi-double Pelargonium The Speaker.**—Since the advent of the sturdy growing semi-double, salmon-coloured variety King of Denmark in the middle of the 'nineties many members of this class have been brought forward. This comparatively old kind still maintains its place as one of the best in its colour, which is just now very popular. A variety recently shown by Messrs. Cannell and Sons, of Swanley, under the name of The Speaker promises, when better known, to be extensively grown. It is of stout growth, while the semi-double flowers, borne in bold erect trusses, are of a brilliant fiery salmon colour. With so many varieties it may by some be thought that we have enough, but there is always room for such as this, the new pink Ambrosia or the salmon form of Paul Crampel.—S. W.

## NEW PLANTS, ETC.

* * *

### ROSES.

St. Helena.—This is a very fine hybrid tea rose, large-petalled, shapely, full sized, and attractive. The colour is deep cream, with a suggestion of pink and a yellowish base to each petal. Should prove a useful rose for exhibition purposes. Gold Medal, N.R.S., Southampton, June 26. Messrs. B. R. Cant and Sons, Colchester.

Irish Flame.—Another of the strong-growing, elegant, single varieties, of which Irish Elegance may be taken as a type. It resembles the latter variety, but is wholly yellow, with deep ruddy-bronze shading on the outside of the petals. Dark stems and foliage. Gold Medal, N.R.S., Southampton, June 26. Messrs. Alex. Dickson and Sons, Newtownards, Co. Down.

### MAGNOLIA KOBUS.

A shapely, pyramidal, deciduous tree from Japan. It is perfectly hardy, and usually flowers in April. The flowers are about four inches across, and the six petals are white with a central purple line along the outside. Bot. Mag., t. 8,428.

### SCHOMBURGKIA LUEDDEMANI.

This Venezuelan orchid is a strong-growing species, allied to S. undulata. The spike is 1½ to 2ft. long, and carries a head of many flowers, each about three inches across, undulate, and brown, with a purple lip. Under cultivation this requires tropical treatment, and a distinct period of rest after completion of growth. Bot. Mag., t. 8,427.

### AGAVE PROTUBERANS.

This is a stemless, tuberous-rooted, Mexican species, with linear-lanceloate leaves about eight inches long, green, with numerous brown-purple blotches. The flowers are numerous, and borne at the head of a scape two feet high; they are shortly-tubed, with recurving greenish-red segments. Bot. Mag., t. 8,429.

### DAPHNE RETUSA.

A low-growing shrub that promises to be a useful one. It grows from 2ft. to 3ft. high, and comes from a high altitude in Western Szechuan. The neat, oblong leaves are deep green above, and pale green beneath; the flowers are white, tinted with rose or violet, especially on the outside, and they are borne in terminal umbellate clusters. To considerable beauty is added the charm of fragrance. Bot. Mag., t. 8,430.

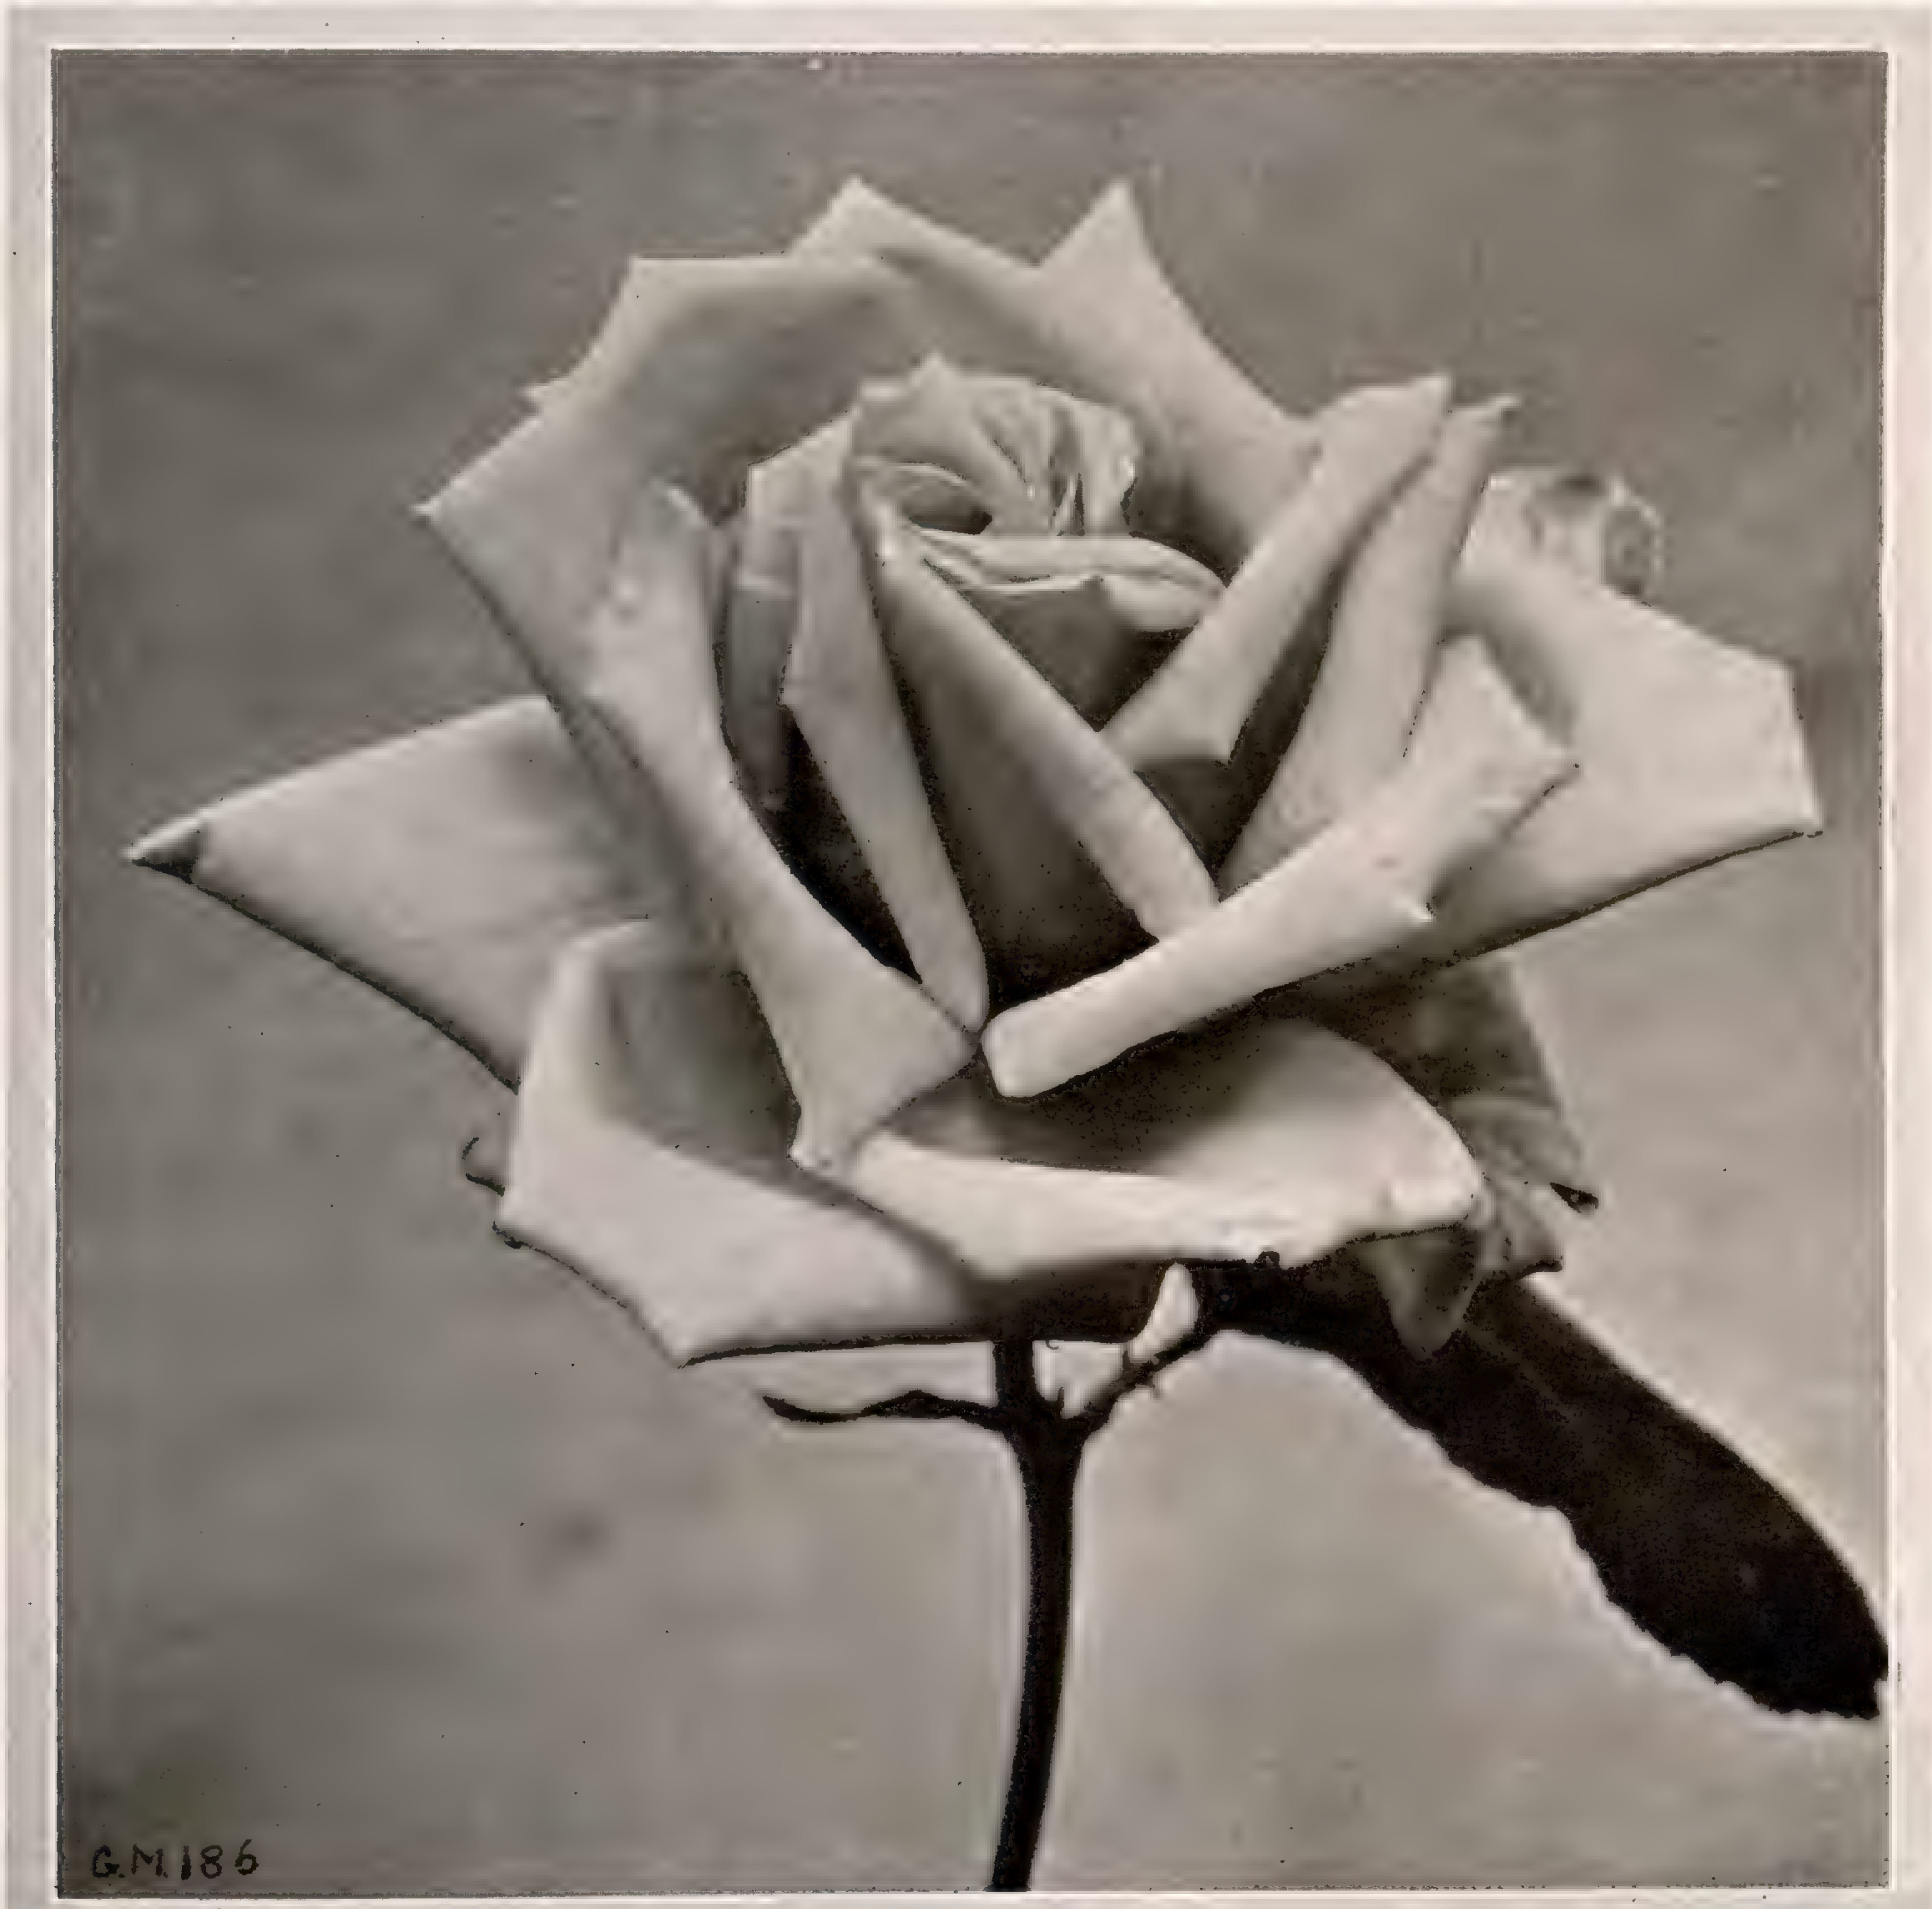
---

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## POTENTILLA DAVURICA.

The usefulness of the common Potentilla fruticosa is such that it warrants a good trial with any other hardy shrubby kinds which may be obtained. P. davurica, a native of China, resembles the commoner species in habit, but differs by bearing white flowers. Growing to a height of 1½ or 2ft., it forms a compact bush, with small three-parted leaves and showy flowers three-quarters of an inch across. Shrubby potentillas are excellent subjects for planting in large masses on moderately dry banks, where the soil is fairly good; they are, however, inferior to such plants as double-flowered gorse, cistuses, and helianthemums, for positions where the natural soil is poor and gravelly. They may be increased from seeds, which germinate well if sown soon after they are gathered. Young plants grow rather slowly for the first two or three years, without they have been planted under exceptionally favourable conditions. A second white-flowered species may be obtained in P. Salesoviana from Siberia. It is, however, rather more difficult to cultivate than the common kind.

W. DALLIMORE.



H.T. ROSE ST. HELENA.

A fine new variety, deep cream-coloured, with a yellow base to each broad petal. Gold Medal, N.R.S., at Southampton, June 26. Messrs. B. R. Cant and Sons, Colchester.

## AMONG THE ALPINE FLOWERS.

> "The lanes are full of roses,
> The fields are grassy deep;
> The leafiness and floweriness
> Make one abundant heap."
> —Leigh Hunt.

With the country full of delights, and the borders gay with summer flowers, the rock garden has a stiff task in its endeavour to attract us by its charms. As we roam through the country lanes or up and down some flowery glens, we see so much to entice us that the more modest beauties of the alpine flowers might well seem tame and insipid; while if we seek the paths which lead among the garden's borders we shall find beauties of the most glowing order, and visions of grace difficult to surpass.

Yet the alpine lover is not inclined to swerve from the objects of his affections, and will find among them many treasures dear to him, even when many others have veiled themselves in modest green garments and no longer shine in bright colouring or fascinate us with their charming blossoms. Let us look among those which welcome the summer sun, and see their graces and their points of beauty and discourse awhile upon their ways!

### Campanula Stansfieldi.

Of all the race of alpine flowers, we have none, I think, so valuable for summer bloom as the campanulas, a varied and beautiful race, indeed, and one we never seem to tire of. We look for their coming with eagerness; we delight in them while they are in bloom, and we mourn unfeignedly when their season is over, and our gardens are bereft of their graces for the season. To the keen cultivator, too, they present an almost Protean variety, both in their characters and their ways. The one who is content with "easy" plants will find among them many beauties which will not tax his skill too greatly. On the other hand, the one who takes a pride in conquering cultural difficulties will discover among these little harebells, or bell-flowers many rarities which will tax his skill to the utmost. The true lover of alpines comes in midway between the two. He likes an "easy plant," but he thinks that a good one of any class is worth some trouble, and so he seeks to cultivate the best of these charming flowers. Surely Campanula Stansfieldi appeals to the last-mentioned in the highest degree! As we gaze upon it now we must rejoice in its beauty, and seek to give to others an inspiration to add Stansfield's bellflower to their rock gardens.

Picture a little bush, only a few inches high, of yellowish, hairy-looking, small leaves, above which are borne many of the dainty soft lilac flowers, with their petals arranged like a tapering, shallow, and open bell. It is a picture of beauty, and is a little alpine which should rank among the indispensables. I suppose we owe it to that redoubtable alpinist of Southport whose name it bears, and we must consider him a happy man in having his patrynomic immortalised in this lovely plant. That it is easy to grow would appear from the somewhat conflicting advice respecting its cultural needs. We are advised to plant it in a cool, shady spot; we are also recommended to set it on a flat part of the rockery in sun. That it does in either sun or shade appears evident, and the writer has it in both, and each plant is doing equally well.

### Silene Saxifraga.

To the ardent enthusiasts in alpine plants there is always something wanting in the descriptions we receive of some of our pet plants. A botanical one must, of necessity, be deficient in anything but the baldest detail, and sometimes it is most unsatisfying indeed. Take, for example, Silene Saxifraga the Saxifrage Catchfly. Its colour is said to be "yellowish on the upper surface, reddish-brown beneath." This reminds one of the herbarium rather than the rock garden, and we feel that the human element is absent; yet how difficult is it to give a better account! As growing on the rock garden this alpine catchfly makes a charming carpet of nice little green leaves, almost grass-like in their tenuity. Above these are sightly raised some, but not a crowd of, pretty, nicely-formed, roundish, notched flowers, which it is somewhat of a libel to call "yellowish," so nearly pure or creamy-white are they. The underside of the petals is of a nice shade of almost pale red-brown. The whole plant is not more than about six inches high—in poor soil not more than three or four inches. An impressionist writer has spoken of this as a "spidery-looking plant, interesting but not brilliant, with creamy flowers, brownish on the outside." It is not easy to see where the term "spidery-looking" comes in, but otherwise the account of the flower is good, and the recital of these different views will assist the reader in considering whether to covet the plant or not. It gives little trouble on a level terrace, and seems to appreciate a part of the rock garden rather near the base.

### Dianthus sylvestris.

There are many lovely and dainty flowers among the alpine pinks, or dianthuses, and he is indeed happy who has a good collection of these charming flowers. The student of what to purchase could hardly do better than visit the rock garden at Kew, where he will see many beautiful species admirably grown if at all possible to do so. A lovely species, hardly ever seen in the rock garden of the time, is Dianthus sylvestris, now in bloom here on a sunny southwest ledge. There are alpine pinks with larger flowers, but that does not detract from the fact that this is a gem among the race, and a plant we should all attempt to grow well. But, alas! it has its own ways, and cultivators agree that it is by no means such an obliging plant as it looks. Even the most ardent and experienced growers evidently learn that it dies off without apparent cause, so that it is a comfort to be able to say that it is flourishing well here, and that it has had already a fair lease of life. From a good turf of narrow, deep, glaucous green, grass-like leaves it sends up lovely single flowers of a warm and charming rose. Why one of its synonyms seems to be Dianthus "frigidus" it is difficult to conceive, seeing that its colouring at least is by no means "cold." Nowhere has the writer seen it thriving so well as on an artificial moraine, save, perhaps, in his own garden, where it is on a south-west ledge in poor, hard soil, well mixed with grit and surfaced with whinstone chips, such as are used for surfacing tar-painted roads. These seem as a breath of life to many alpines, preserving them from decaying at the neck in rainy places, especially in winter.

### Silene maritima plena.

Yet our gardens should not only possess the newer flowers, but also the old favourites, and one of these which looks as if it might pass out of cultivation, so little is it seen now, is Silene maritima plena, the double variety of a common seaside plant which covers many gravelly sea beaches with thin carpets of glaucous leaves and single white flowers, and is occasionally represented in rock gardens by a rose-coloured form. This little wilding has long ago blossomed out into a double-flowered variety, with big white flowers almost like those of, say, Pink Mrs. Sinkins, quite double, nicely fringed, and altogether a desirable plant, when hanging over a stone, and a great success in stony and gravelly soil. I grew it years ago—more years than I care to tell of now—and lost it when family illnesses made plant growing a burden which could not be fully borne. It likes some top-dressing, and without this may die off at the neck. But it thrives in the poorest soil, and is a good old plant worth keeping in remembrance, though it has not the fragrance of the pink it so much resembles.

### Other Flowers.

There is the usual bewildering choice of other subjects, such as helianthemums, with their fugacious but brilliant flowers; dianthuses, or alpine pinks, in almost endless choice; gypsophilas, trailing over the stones with lace-like flowers; poppies, from the dainty little Papaver alpinum, in variety, to the Iceland and other taller flowers of Lethe; while anthemises and achilleas yet give some of their white or yellow flowers. There are, as usual, violas and violets in the utmost variety of colouring and markings, little and taller lychnises, silenes, or catchflies in other forms than S. Saxifraga; thrifts and acantholimons, yet full of flower; an almost endless choice of dwarf bellflowers; cerastiums, still in sheets of white; and a perfect galaxy of other flowers, telling us that though midsummer has come and gone, the alpine garden yet holds its beauties and its delights to all who love it and give it the needed care.

S. Arnott.

## THE PROPHET FLOWER.

This is one of the most delightful early-flowering subjects for the herbaceous border or rock garden, and, although it has been in cultivation for a great many years, it does not appear to have received the recognition that it deserves. The flowers, which are freely produced from early in April onwards, are a bright primrose-yellow, and when they first open have several dark brown spots on the corolla, but these marks gradually fade away and disappear. The plants do not exceed a foot in height, but when fully developed the flowers are so profuse that they almost entirely hide the foliage.

The species succeed in any good garden soil, either in the open or in partial shade, but a fairly light rooting medium that can be kept uniformly moist suits it the best. When planted in masses in contrast to Viola gracilis, it is very telling, and each helps to display the other to advantage. The Prophet Flower, which is known botanically as Arnebia echioides, is a native of the Caucasus and Northern Persia, and is perfectly hardy in our climate. It possesses narrow, veined leaves that die back in early winter, but the plant is quick to commence new growth with the first sign of spring. The Prophet Flower can be most readily propagated by division of the roots either in spring or autumn, but if this is done in September, and the young plants are kept in a cold frame during the winter neat specimens are obtained for flowering the following spring.

J. Gardner.

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## IN THE DEESIDE WOODS.

The 35th annual excursion, and what practically entailed a week's tour of the beautiful Valley of the Dee, Aberdeenshire, was commenced on Monday, June 24, by the members of the Royal Scottish Arboricultural Society. Headed by Sir John Stirling-Maxwell, president of the society, upwards of a hundred members assembled at Aberdeen Station, where motor cars were awaiting. Entering these, the party proceeded to Braemar, the extreme end of the area under inspection. From thence, day by day, they worked down the valley until Aberdeen was again reached on Friday, June 28. Twenty-five years have elapsed since the society last visited this district.

The suitability of the Deeside Valley for an arboricultural excursion is due to there being a happy combination of the old and the new, of the original irregular forests with those in which the intensive system of culture has been adopted, and of the woods where trees native to the soil have been allowed to flourish at will without much attention from either forester or gamekeeper. Here, also, are to be found extensive plantations where successful experiments have been made in introducing the trees of other lands. Striking examples of the latter are the Douglas firs on the Durris Estate, and the Japanese larches there, in which great interest was taken by Mr. John D. Crozier, for a number of years chief forester, and now holding an important appointment in the Government Forestry Department of Ireland. Moreover, great encouragement has been given by Royal owners of the Balmoral Estates, where Pinus nobilis, with its strikingly large cones, is a feature of special interest in the avenue to the Castle, and where numerous ornamental trees in the Royal demesne commemorate Royal family and national events of importance.

### ROYAL FOREST OF BALLOCHBINE.

Tuesday morning saw the arboriculturists early astir, and they commenced the serious work of the week by paying a visit to the Royal Forest of Ballochbine, on the Balmoral estates. Here they were met by Mr. John Michie, who personally conducted them round. The winding path along which Mr. Michie directed the party, enabled everyone to view to the best advantage and utmost ease the vast area of timber and the beautiful scenery. On every side were fine specimens of the Scots fir, which in themselves fully account for the eminent position which Balochbine has attained in regard to the quality of the timber grown on the estate. The trees are about 200 years old, and many of them contain timber up to the extent of one hundred and fifty cubic feet. The party proceeded by way of Glenbeg and over the "Eagle's Nest" to the Findallachar burn. On the lower levels the trees are tall and taper slightly. From a wood-merchant's point of view they are regarded as all that can be desired. At various parts of the journey discussions were raised regarding the cubic contents of some of the larger trees. Several of the trees were carefully measured, and it was found that the general views were more or less correct. Mr. Michie throughout the tour of inspection enlightened the party on many interesting points. He showed the visitors the highest point at which it is possible to grow trees for timber. The trees which he pointed out at an altitude of 1,400 or 1,500 feet took a longer time to reach a marketable size than those on the lower ground. He said the fact was that they required almost two rotations, thus reducing to a certain extent their commercial value. Turning to the left the party returned by the Garrawalt Falls, and viewed the fine specimens of natural Scots pine growing between that spot and the Dee. It was unnecessary to inform the company that the noble specimens were grown in strict accordance with the principles of sylviculture. They had not been thinned out beyond what was necessary, and from the present appearance of the trees it was evident that in bygone days the rules of forestry had been adhered to. It was of interest that in the Braemar and Balmoral districts there are woods producing commercial timber at elevations up to 1,700 feet, a fact which is remarkable, seeing that the general "timber line" is considered to be from 800 to 1,000 feet. On the lower ground much interest was evinced in the growth of Japanese larch. Discussions arose as to the merits of trees grown from seed collected in the Tyrol, the native home of larch, and the general opinion expressed was in favour of Tyrolese seed. Comment was made as to the interesting features connected with the whole neighbourhood, and especially as to the extraordinary growth of timber and the high elevation at which the trees grew.

The afternoon was devoted to a visit to Invercauld, the property of Mr. Farquharson. Here some capital specimens of Scots pines and spruce were seen, and also a number of fine weeping beeches. Mr. Andrew Smith, factor on the estate, then conducted the party through several young plantations of Scots fir, larch, and spruce, which were much admired. Surprise was shown at the luxuriance at such a high altitude. Through the kindness of Mr. Farquharson the company were entertained at tea at Invercauld House. From thence the foresters proceeded through Braemar, past Mar Lodge, and through the finely wooded country now owned by the Duchess of Fife, on to the Linn of Dee. Here the party were loud in their admiration of the view of the torrent of the Dee as it forces its way between the linn or gorge. Tired, but thoroughly delighted with the day's work, the company returned to the Fife Arms Hotel, Braemar, where the night was again spent.

### GARMADDIE WOODS, ETC.

The programme for Wednesday included visits to the eastern portion of the Ballochbine Forest, Garmaddie Wood, Invergelder, and Craig-gowan, Balmoral Grounds, Abergeldie, Birkhall, and Lynn Wood. The route lay along the low drive, over the Garrawalt, and on to Craig Deign, where the twenty motor cars stopped, and the excursionists ascended the Craig for the purpose of seeing clearly the timber line of the district. This Craig, is, perhaps, the highest point in the locality at which timber can grow, and it was pointed out that not far above an altitude of 1,500ft. could even the native pine be expected to produce commercial timber. This, it was stated, showed there was danger in these days of fashionable forestry of spending national money in a manner in which no return in timber of actual value could be expected, and no better criterion of that could be obtained than the height at which the indigenous trees of the country would grow. The monument on the top of Craigdeign interested the visitors to a great extent. The story was told of how Ballochbine Forest was sold, according to ancient tradition, to Farquharson of Invercauld for a tartan plaid, said to be the prettiest in Scotland, by McGregor, the last laird of Ballochbine. The monument was erected by the late Queen Victoria in allusion to this circumstance. The inscription on the monument read: "Queen Victoria entered into possession of the Ballochbine, May 15, 1878. The Bonniest Plaid in Scotland."

Descending from the Craig, the party proceeded eastwards at a much lower level to view the fine timber in the Garmaddie Wood. A visit was paid to the sawmills at Invergelder, and thereafter the journey eastwards to Balmoral Castle was continued. Prior to visiting the Castle, however, an ascent of Craig-Gowan was made in order to see a great variety of exotic and home trees, all in vigorous, healthy growth. Conspicuous amongst them are the Douglas fir, growing luxuriantly at a higher altitude than can be found, perhaps, anywhere else in Scotland. There, too, are very fine clumps of Pinus Cembra, P. monticola, and P. Strobus. Besides those, there were seen a good sprinkling of the native and Tyrolese larches, and a couple of specimens of the Japanese larch (Larix leptolepis), the last-mentioned having been among the first brought to this country. It has been thought by many that this larch would supersede the European species, but, although it grows rapidly for the first ten years or so of its life, the tree gradually loses its vigorous character.

### BALMORAL WOODS.

The visitors then proceeded to the lawn at Balmoral Castle, where a large marquee was erected. Here lunch was served, which his Majesty the King had been pleased to provide for the party. The weather was bright and warm, and the whole setting of the function was memorable. Mr. John Michie, M.V.O., the King's factor, presided, and was supported by Sir John Stirling-Maxwell, Sir John Fleming, of Dalmuinzie; Sir Leonard Lyell, of Kinnordy; Mr. H. J. Elwes, of Colesborne; Colonel James Ogston, of Kildrummy; Mr. Wilson, forester on the Balmoral estates, etc.

After lunch, Sir John Stirling-Maxwell, in proposing "The Health of the King," said they had been going about the Balmoral estates for the last two days, and what they had seen everywhere was good judgment and good taste, which showed the personal supervision which had been bestowed upon it by its owner. It might be surprising to find in a department of estate management which was so little understood in Scotland, that the King's woods afforded a model to other proprietors. They had been spending a great deal of their time in Ballochbine, where there were the old natural pines, which did not now form a subject of practical forestry, but his Majesty has been well advised in preserving this relic of the past. It may not be many generations before it is the only wood of the kind left in Scotland.

The grounds and gardens around the Castle were then inspected, and no little admiration was expressed for the admirable work done here by Mr. Troup, head gardener to his Majesty.

Late in the afternoon two trees were planted on the lawn to the east of the Castle by Sir John Stirling-Maxwell, to commemorate the visit of the society.

In the afternoon and evening an inspection was made of the Abergeldie, Birkhall, and Lynn Woods, and then the party proceeded down the valley to Banchory, which for the concluding two days of the tour became the headquarters of the society.

(To be continued.)

**Some Effects of Last Year's Sunshine.**—Your correspondent, "H.," in dealing with the above subject on page 356, strikes such an optimistic note that one is forced to the conclusion that he hails from an unusually favoured district. While vegetation of all kinds is this year particularly early, and the floral display of trees and shrubs unprecedented, yet, within the London area at least, vegetables are so scarce that were your correspondent obliged to purchase his own, he would, I think, soon look upon the matter in a different light, for I never remember them so dear as they are now. With cabbages realising from fifteen to eighteenpence a dozen, sprouting broccoli from four to six shillings a bag, and spinach four to six shillings a bushel at Covent Garden (as given in the GARDENERS' MAGAZINE for April 27), the scarcity of vegetables must be apparent to all. The condition of the grass, too, may in some cases fully apply, but, on the other hands, there are many districts where the grass has already suffered terribly from the drought. At Kew, a few days ago, it was very noticeable that in some parts the condition of the grass was more suggestive of the month of August than the beginning of May. Such a state of things is readily understood, for in this locality, not far to the south-west of London, we only had about a quarter of an inch of rain throughout the entire month of April, while the unusual amount of bright sunshine was accompanied by very drying winds.—S. W.

# GREAT EXHIBITION AT HOLLAND PARK.

## JULY 2 to 4.

After a year's absence, the Royal Horticultural Society was able once more to hold its summer exhibition at Holland House, Kensington. This year the exhibition was arranged for three days instead of the usual two. The site is an excellent one, as it is surrounded by fine trees and the old and historically interesting Holland House forms a stately background. The gardens immediately surrounding the house afford ample evidence of the taste in gardening which the owner, Mary, Countess of Ilchester, possesses, and their upkeep reflects great credit upon the veteran gardener, Mr. C. Dixon. These grounds were once more open to visitors at a small charge, the proceeds being devoted to charities.

CATTLEYA GIGAS, LOUIS VAR.

A finely-flowered specimen exhibited by Sir George Holford at Holland Park.

It was, perhaps, because there was no Temple Show this year that this Holland House Show was the largest yet held, no fewer than ten large tents being required to accommodate the exhibits; while, in addition, the outdoor displays far exceeded anything hitherto arranged at this summer function. The light canvas used and the ventilation of the tents were items tending to make matters better, both for exhibitors and visitors.

Orchids and horticultural sundries, usually such important sections of this show, were by no means largely represented; it was suggested that the International Exhibition had proved a great tax upon the orchid exhibitors, and it was whispered that high charges for space kept many sundriesmen away. Stove and greenhouse plants and ferns were splendidly arranged, and there were enough pot fruit trees, well cropped, to fill a good-sized orchard. Naturally, hardy flowers were much in evidence, but their arrangement was such as to prove that, given a fair space, the old method of setting up bunches, rank above rank, is practically over. Water and rock gardens, terrace and Japanese gardens, and flower borders, all of good design and well furnished with suitable plants and flowers, formed no mean feature of this fine show. Topiary work and garden furniture were presented in some quantity. Roses were largely shown, white sweet peas occupied an unusually prominent place throughout the shows. Carnations were of outstanding merit, and begonias provided a grand display of glorious colour.

In one or two of the tents the bare backing of some of the displays was unsightly; exhibits having a high background of wood and baize, etc., might well have been placed back to back, and no doubt this would have been done had the exhibitors notified their intention of erecting such high stands. We remember something similar at the Festival of Empire Rose Show last year, and, to say the least of it, the result is not pretty.

We tender our congratulations to all the society's officers, whose hard work and courtesy make such a big show a pleasing success. We learn with pleasure that for a period of five years the society's summer show will be held at Holland House, the society and the Countess of Ilchester having come to an arrangement in this matter.

The weather might have been kinder. Heavy rains on Monday and Tuesday did not add to the comfort of exhibitors, especially those with outdoor exhibits. On the opening day the council, as usual, entertained the members of its standing committees at lunch.

### ORCHIDS.

Mr. J. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, filled a considerable space with choice orchids, and gave his plants a setting of ferns, asparagus, and nepenthes. Sobralias, Oncidium macranthum, odontiodas, and Odontoglossum Phœbe were used as a background, and in the centre were good examples of Odontoglossum armainvilliersense xanthotes, a lovely Odontioda Bradshawiæ, Lælio-cattleya Sunrise, L.-c. Phœbe, Cattleya Rex, good forms of Odontoglossum crispum, and the wonderful Bulbophyllum grandiflorum, and Cirrhopetalum pulchrum. Notable flanking specimens were of Miltonia vexillaria radiata, Odontioda papilio Gattonense, Angræcum Eickleri-anum, Brassia Lawrenceana, and Anguloa uniflora.

Mr. Harry Dixon, Spencer Park Nursery, Wandsworth, presented a small group of orchids wherein Odontoglossum Fascinator, O. Jasper, and the bright Lælio-cattleya Cowani were leading features. From Mrs. W. J. Briggs, Enfield, came a fine flower of Cattleya Mossiæ Wagneri, some good examples of C. gigas, Odontioda Diana, etc. Mr. E. H. Davidson, Borlases, Twyford, put up a pleasing display of orchids set prettily in maidenhair ferns; Cattleya Mossiæ Wagneri, C. Mendeli, the handsome C. Thurgoodiana, C. Gaskelliana, and Odontioda Charlesworthi, were especially good.

Messrs. Sander and Sons, St. Albans, had a few fine and rare plants in Miltonia vexillaria Lambeauiana, with four spikes of lovely white flowers, Dendrobium Regium, the splendid Odontioda Bradshawiæ var. Ruby, with large, orange-scarlet flowers; Catasetum tenebrosum, Bollea Lalindei, and the beautiful Lælio-cattleya Ceres var. Emblem.

From Westonbirt Mr. Alexander, grower to Lieut.-Colonel Sir George Holford, brought up Cattleya gigas Louis var., with six spikes, and a total of twenty-two flowers; C. Warscewiczi Frau Melanie Beyrodt, with two white-petalled blooms; the lovely orange-centred Cattleya Artemis, and C. Warscewiczi var. Othello. Mr. Jules Hye brought over Miltonia Hyeana var. La Conquerant, from Ghent. Mr. Shill, gardener to Baron Bruno Schroder, The Dell, Egham, showed Cattleya Dupreana, with three enormous purple flowers. Magnificent spikes of Odontoglossum percultum var. King George V., Odontioda Lambeauena and Odontonia Lairessiæ with over fifty blooms, came from Mr. F. Menteith Ogilvie, The Shrubbery, Oxford.

A large and very beautiful exhibit was admirably staged by Messrs. Mansell and Hatcher, Rawdon, Leeds. Odontoglossums and Renanthera Imschootiana were freely used in the background among the palms. Throughout the group there were first-rate specimens of Lælio-cattleya Pacavia superba, L.-c. Martinetti, L.-c. Canhamiana, and L.-c. Canhamiana alba, Cattleya Mossiæ, C. Dupreana (very fine), C. gigas, and C. Mossiæ. Miltonia vexillaria was well displayed, as also were M. Bleuana Laekenense, M. vexillaria Lambeaueana, Odontoglossum crispo-Harryanum, the brilliant O. Queen Alexandra, Cœlogyne Dayana, odontiodas in variety, Dendrobium Lowi, Saccolabium Blumei, with two long spikes, Cœlogyne pandurata, and Odontoglossum Williamseanum—altogether a fine exhibit. The contribution from Mr. E. V. Low, Hayward's Heath, included Cœlogyne pandurata, Cattleya Mossiæ Peetersi, C. Mossiæ Wagneri Vale Bridge var., C. Dietriechiana, etc.

A large and charming exhibit of orchids, delightfully staged, from Messrs. Charlesworth and Co., Haywards Heath, attracted a large amount of attention. The bold central feature consisted of about sixty-five spikes of Rimistadiana set over a mound of Epidendrum vitellinum majus. At either end were flanking groups of splendid spikes of Odontoglossum ardentissimum, O. crispum, O. Jasper, O. armainvilliersense, O. percultum, O. Lambeauianum, O. hibernicum, etc. With these were associated Odontioda Bradshawiæ, and O. Charlesworthi. In other parts of this handsome exhibit, we noticed Oncidioda Cybele, the new white and yellow Odontonia Edna, Gramangis Ellisi, the fine old Epidendrum prismatocarpum, Peristeria elata, the quaint Cryptophoranthus Dayana, a number of examples of the fringed Brassavola Digbyana, Lælio-cattleya Ceres Princess Mary, gold and crimson; a fine Cattleya Mossiæ Wagneri, L.-c. aphrodite, C. Germania, and the long-spiked Oncidium Claesianum.

The group from Mr. H. A. Tracy, Twickenham, included a good batch of Cypripedium Curtisi, C. niveum, Cattleya Mendeli, C. Mossiæ. Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford, had a double-sized group of large dimensions, composed of orchids set pleasingly in a beautiful collection of selaginellas, each plant a large specimen. Both orchids and selaginellas were admirable. Odontoglossum ardentissimum, O. percultum, O. armainvilliersense xanthotes, forms of O. crispum, O. amabile, Cattleya Mossiæ, and C. gigas, were the leading orchids.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, were large exhibitors of orchids. Their high central feature was composed of Renanthera Imschootiana, Cœlogyne asperata, and Acineta Humboldti. Oncidiums were freely used to give grace and colour to the ends and back of the group. Vanda teres was well shown, and Cattleya gigas, C. Mossiæ Reineckiana, C. Thurgoodiana Apollo, C. gigas Meteor, with a fine ruby lip, Miltonia Bleuana, Lælia tenebrosa Walton Grange var., and Oncidium pulchellum were a few of the leading subjects in the foreground.

### CARNATIONS.

A bold and pretty display of carnations came from Messrs. S. Low and Co., Enfield. The flowers were put up in vases of varying shape and size, in hanging baskets, in bowls, and in bouquet-like bunches; Malmaison varieties were largely shown with such perpetual varieties as Mikado, Baroness de Brienin, Scarlet Glow, Lady Alington, and Princess Juliana.

Mr. Jas. Douglas, Edenside, Great Bookham, displayed some delightful carnations, border varieties of fine form and colour. There were about thirty vases of blooms, and some of the best varieties were Trojan, Cardinal, Elizabeth, Schiffner, Mrs. R. Gordon, Mrs. Elliott Douglas, Lord Nelson, the pink Cupid, and the white Kate Nickleby.

Perpetual carnations were largely shown by Mr. C. Engelmann, Saffron Walden, whose exhibit was composed chiefly of large sheaves of Carola, Sunstar, Harlequin, Rex, White Perfection, Enchantress, Salome, and other good sorts. Mr. H. Burnett, Guernsey, displayed splendid perpetual carnations in tall glass vases, and the fine blooms were well set up. We noted Mikado, Niagara (white), Mrs. H. Burnett, Mrs. Totton, R. F. Felton, Scarlet Glow, White Wonder, Rose Dore, and Rose Pink Enchantress as especially good in a fine set.

Mr. Hillman, gardener to W. M. Gott, Esq., Frenython, Par Station, Cornwall, was a large exhibitor of cut carnations, the malmaison variety Princess of Wales being the variety best displayed. Mr. Bertie E. Bell contributed a lovely lot of carnations, and set up the flowers lightly and artistically in vases of various heights. Some of the leading varieties were Mikado, Rose Dove, Mrs. C. W. Ward, Beacon, Winsor, Coronation, and Britannia.

Border carnations from Mr. H. Lakeman, Thornton Heath, were well set up in vases and bamboo stands; The King, Miss Willmott, Linkman, Lady Hermione, and Amy Robsart were best shown. Mr. C. Blick, The Warren Nurseries, Hayes, Kent, put up a few splendid carnations, and again showed his new malmaison variety Charles Blick; of border varieties he showed good blooms of Pater, San Remo, Queen Mary, R. Morton, very fine; May Day, Linkman, Skirmisher, a fine fancy; and Medusa.

Mr. C. Lange, Hampton, was also an exhibitor of fine carnations, and he confined his attention to perpetual varieties such as O. P. Bassett, Enchantress, Mrs. C. W. Ward, fine salmon-pink; Scarlet Glow, Cardinal, and Afterglow. Messrs. J. Peed and Sons, West Norwood, had a semi-circular group of carnations, and showed growing plants as well as cut blooms of perpetual and malmaison varieties.

LILIUM WARLEYENSE.

Flowers rich orange-scarlet. F.C.C., R.H.S., July 2. Miss Willmott, Warley Place.

## ROSES.

Mr. George Prince, Longworth, Berks, presented a splendid display of roses arranged in most tasteful style. The background was formed with three huge arches, on which were trained Hiawatha, Lady Gay, and Dorothy Perkins, while splendid pyramids of Rayon d'Or, Lyon, Juliet, Mrs. A. R. Waddell (in splendid colour), Mrs. W. J. Grant, Beaute de Lyon (a wonderful colour), Mildred Blackburne, Lady Pirrie, and Lady Hillingdon contributed their quota to a splendid exhibit.

Messrs. F. Cant and Co., Braiswick Nurseries, Colchester, contributed a splendid exhibit of roses. The best features were the tall bamboos filled with the rambler and decorative sections. Especially notable were Helene, Leontine Gervais, Debutante (in splendid condition), Frau Marie Weinbach, Minnehaha, and Sweetheart. Large vases were filled with splendid examples of Rayon d'Or, Lyon Rose, Lady Pirrie, Mrs. W. J. Grant, Joseph Hill, Mrs. Wakefield, Christie Miller, Mrs. E. J. Holland, Gloire de Chedane Guinneseau, Hugh Dickson, and Killarney; while the boxes of exhibition flowers arrested attention by their size and colour. Especially good were Mrs. T. Roosevelt, Florence Pemberton, J. B. Clark, Ethel Malcolm, Berthe Ganlis, Juliet, Avoca, and Madame Jules Gravereaux.

A REMARKABLY BEAUTIFUL ARRANGEMENT OF ROSES.
Exhibited by Messrs. W. Paul and Son at Holland Park Show, and awarded a Gold Medal.

PAUL
WALTHAM CROSS
GM 302

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, presented a display of roses which were truly remarkable for their huge size. Columns of Richmond arranged in moss were truly remarkable; Mildred Grant was simply immense; while other fine stands were Lady Pirrie, Molly Sharman Crawford, Miss A. de Rothschild, Rayon d'Or, Joseph Lowe, White Killarney, and Chateau de Clos Vougeot. A really fine exhibit. Messrs. Paul and Son, Cheshunt, occupied a corner in the large tent with a fine arrangement of roses. The background was formed with fine weeping climbers, all in splendid condition. The finest examples were Hiawatha, Dorothy Perkins, American Pillar, Lady Gay, and Trier. On the floor were baskets and other receptacles filled with splendid examples of Lyon Rose, Victor Hugo, Horace Vernet, the latter being remarkably fine; while other fine examples were George C. Waud, Prince de Rohan, Cheshunt Scarlet, Mrs. T. Roosevelt, and Harry Kirk, the whole being beautifully arranged.

Messrs. W. Paul and Son, Lim., Waltham Cross, had an exquisite group of roses, which were most effectively arranged. Tall ramblers were to be seen in the background, while specimen weepers were used as dot plants throughout, while the floor was a veritable bed of roses. The most effective of the ramblers were White Dorothy, Hiawatha, Blush Rambler, Delight, and Dorothy Perkins. It was difficult to pick out the best of the baskets, but a few of the most striking were Juliet, Lyon Rose, Nerissa—in splendid form, Rayon d'Or—a splendid colour, Mrs. Herbert Stevens, Pharisaer, Betty, Bianca, George C. Waud, Margaret, and Warrior.

Messrs. W. Cutbush and Son, Highgate, confined their efforts in roses to a group of the polyantha and Wichuriana types. These were represented by groups of Jessie, in five-inch pots, with miniature standards, Maman Levasseuer covered with flowers, Orleans Rose, Mrs. F. W. Flight, Mrs. W. H. Cutbush, and Hiawatha. All the plants bore the hall-mark of excellent culture. From Mr. Chas. Turner, Slough, came a glorious group of roses. The tall standard trees were truly remarkable for size and colour, some of the best being Sweetheart, Ethel, White Dorothy Perkins, Blush Rambler, and Lady Gay; while the huge pillars of Ethel and Coronation were a source of attraction to everyone. Other fine examples were Geoffrey Henslow, Lyon Rose, Juliet, and Mrs. S. Crawford; a really fine exhibit.

Messrs. G. Jackman and Sons, Woking, exhibited roses extensively, both in tall bamboo stands and vases, while others occupied the orthodox boxes. Some of the leading features were Lady Hillingdon, Liberty, Lyon Rose, Le Progres, Joseph Lowe, Mrs. E. Mawley, Mrs. A. R. Waddell, in fine colour, as were also Harry Kirk, Warrior, Irish Elegance, and Ed. Meyer.

The Wigan Challenge Cup for roses was won by Mr. John Mattock, New Headington, Oxford, with a splendid exhibit, the background being carried about ten feet high with arches and columns. These were formed with Blush Rambler, Treir, and Helene; the columns were Richmond, His Majesty, Irish Elegance, Lady Curzon, and Madame Melanie Soupert; while the baskets contained masses of Lady Ashtown, Mrs. E. G. Hill, General McArthur, Lady Pirrie, Geo. C. Waud, Marquise de Sinety, and Mrs. W. C. Miller; the front being formed with a variety of roses in small receptacles.

From Messrs. D. Russell and Son, Essex Nurseries, Brentwood, came a nice collection of specimen blooms in boxes, backed with bamboo stands, filled with decorative varieties. In the former the finest flowers were Frau Karl Druschki, Molly S. Crawford, Lady Ashtown, Lyon Rose, and Mrs. Miles Kennedy. A pretty table of roses came from the Rev. L. C. Chalmers Hunt, Willian Rectory, Hitchin, the vases of Mrs. W. J. Grant, Alice Lindsell, Joseph Lowe, and Lyon Rose being very fine. The same exhibitor also staged a nice exhibit of sweet peas.

One expects to see a fine display of new roses from the firm of Messrs. Hugh Dickson, Lim., Belfast, and on this occasion they were not disappointed. The fine single varieties, Simplicity and Sir Hugo, were much admired. Lady Pirrie, Leslie Holland, Archie Gray—a grand colour, Miss Cynthia Forde, Mrs. Sam Ross, Mr. W. Sargent, Mrs. Chas. S. Hinking—a glorious colour, and Sir Edward Carson were certainly some of the finest varieties. Mr. P. Le Cornu, Jersey, exhibited his new seedling roses, Duchess of Normandy in fine form; also Mrs. P. Le Cornu, both of which appear to be promising varieties.

Mr. R. C. Notcutt, Woodbridge, also presented a nice exhibit of roses. The rambler varieties were lightly arranged at the back, while in the vases excellent examples of Juliet, Mrs. J. Holland, Pharisaer, Mons. Jos. Hill, and the Lyon Rose were to be seen. Messrs. G. Boltón and Son, The Nurseries, Buntingford, had a goodly exhibit of roses. Dawn was particularly bright, while other good varieties were Dorothy Page Roberts, Dean Hole, Avoca, and Juliet.

From Messrs. W. and J. Brown, Stamford,

came a nice display of decorative roses, which were beautifully fresh and bright, especially so were Lady Ashtown, Madame A. Chatenay, Pharisaer, Mrs. Peter Blair, and Dorothy Page Roberts. Mr. W. Gaslea, Danecroft Nursery, Eastwood, Essex, also exhibited a nice collection of roses, the most prominent being Lady Hillingdon, Leutchflur, Harry Kirk, Juliet, Mrs. A. Tate, Duchess of Wellington, Jessie, and Little Dorrit, a nice pink polyantha rose.

One looks for new roses in the exhibits from Messrs. Alexander Dickson and Sons, Newtownards, co. Down, and is not disappointed; on this occasion good things were Irish Fireflame, Queen Mary, salmon and yellow; Theresa, fawn-pink; Lady Pirrie, Mr. Fred Straker, pink; G. C. Waud, and Melody, a lovely yellow fragrant variety, free and beautiful. Messrs. B. R. Cant and Sons, Colchester, contributed a glorious lot of roses, and arranged their flowers on boards, in stands, and in vases. Blush Rambler, Richmond, Madame Melanie Soupert, St. Helena, Rose du Barri, and Lady Waterlow were freely used at the back, while in the foreground of a grand display we noticed good specimens of Pharisaer, Lyon, Nita Weldon, Lady Hillingdon, Rayon d'Or, Edu Meyer, Bent Cant, and Victor Hugo. Messrs. George Bunyard and Co., Maidstone, exhibited roses in quantity, and presented dozens of fine flowers of Frau Karl Druschki, Juliet, Lyon, General McArthur, Marquis of Salisbury, Edu Meyer, Papillon, etc.

A large and comprehensive collection of roses from Messrs. Hobbies, Lim., filled a large space in the tent usually devoted to sundries. Put up in their usual artistic fashion, this firm displayed quantities of Rayon d'Or, Mildred Grant, Juliet, Richmond, Mdme. Abel Chatenay, their new Pink Pearl and Effective, Mdme. Melanie Soupert, General McArthur, Lady Ashtown, Ecarlate, Harry Kirk, and various showy rambling varieties.

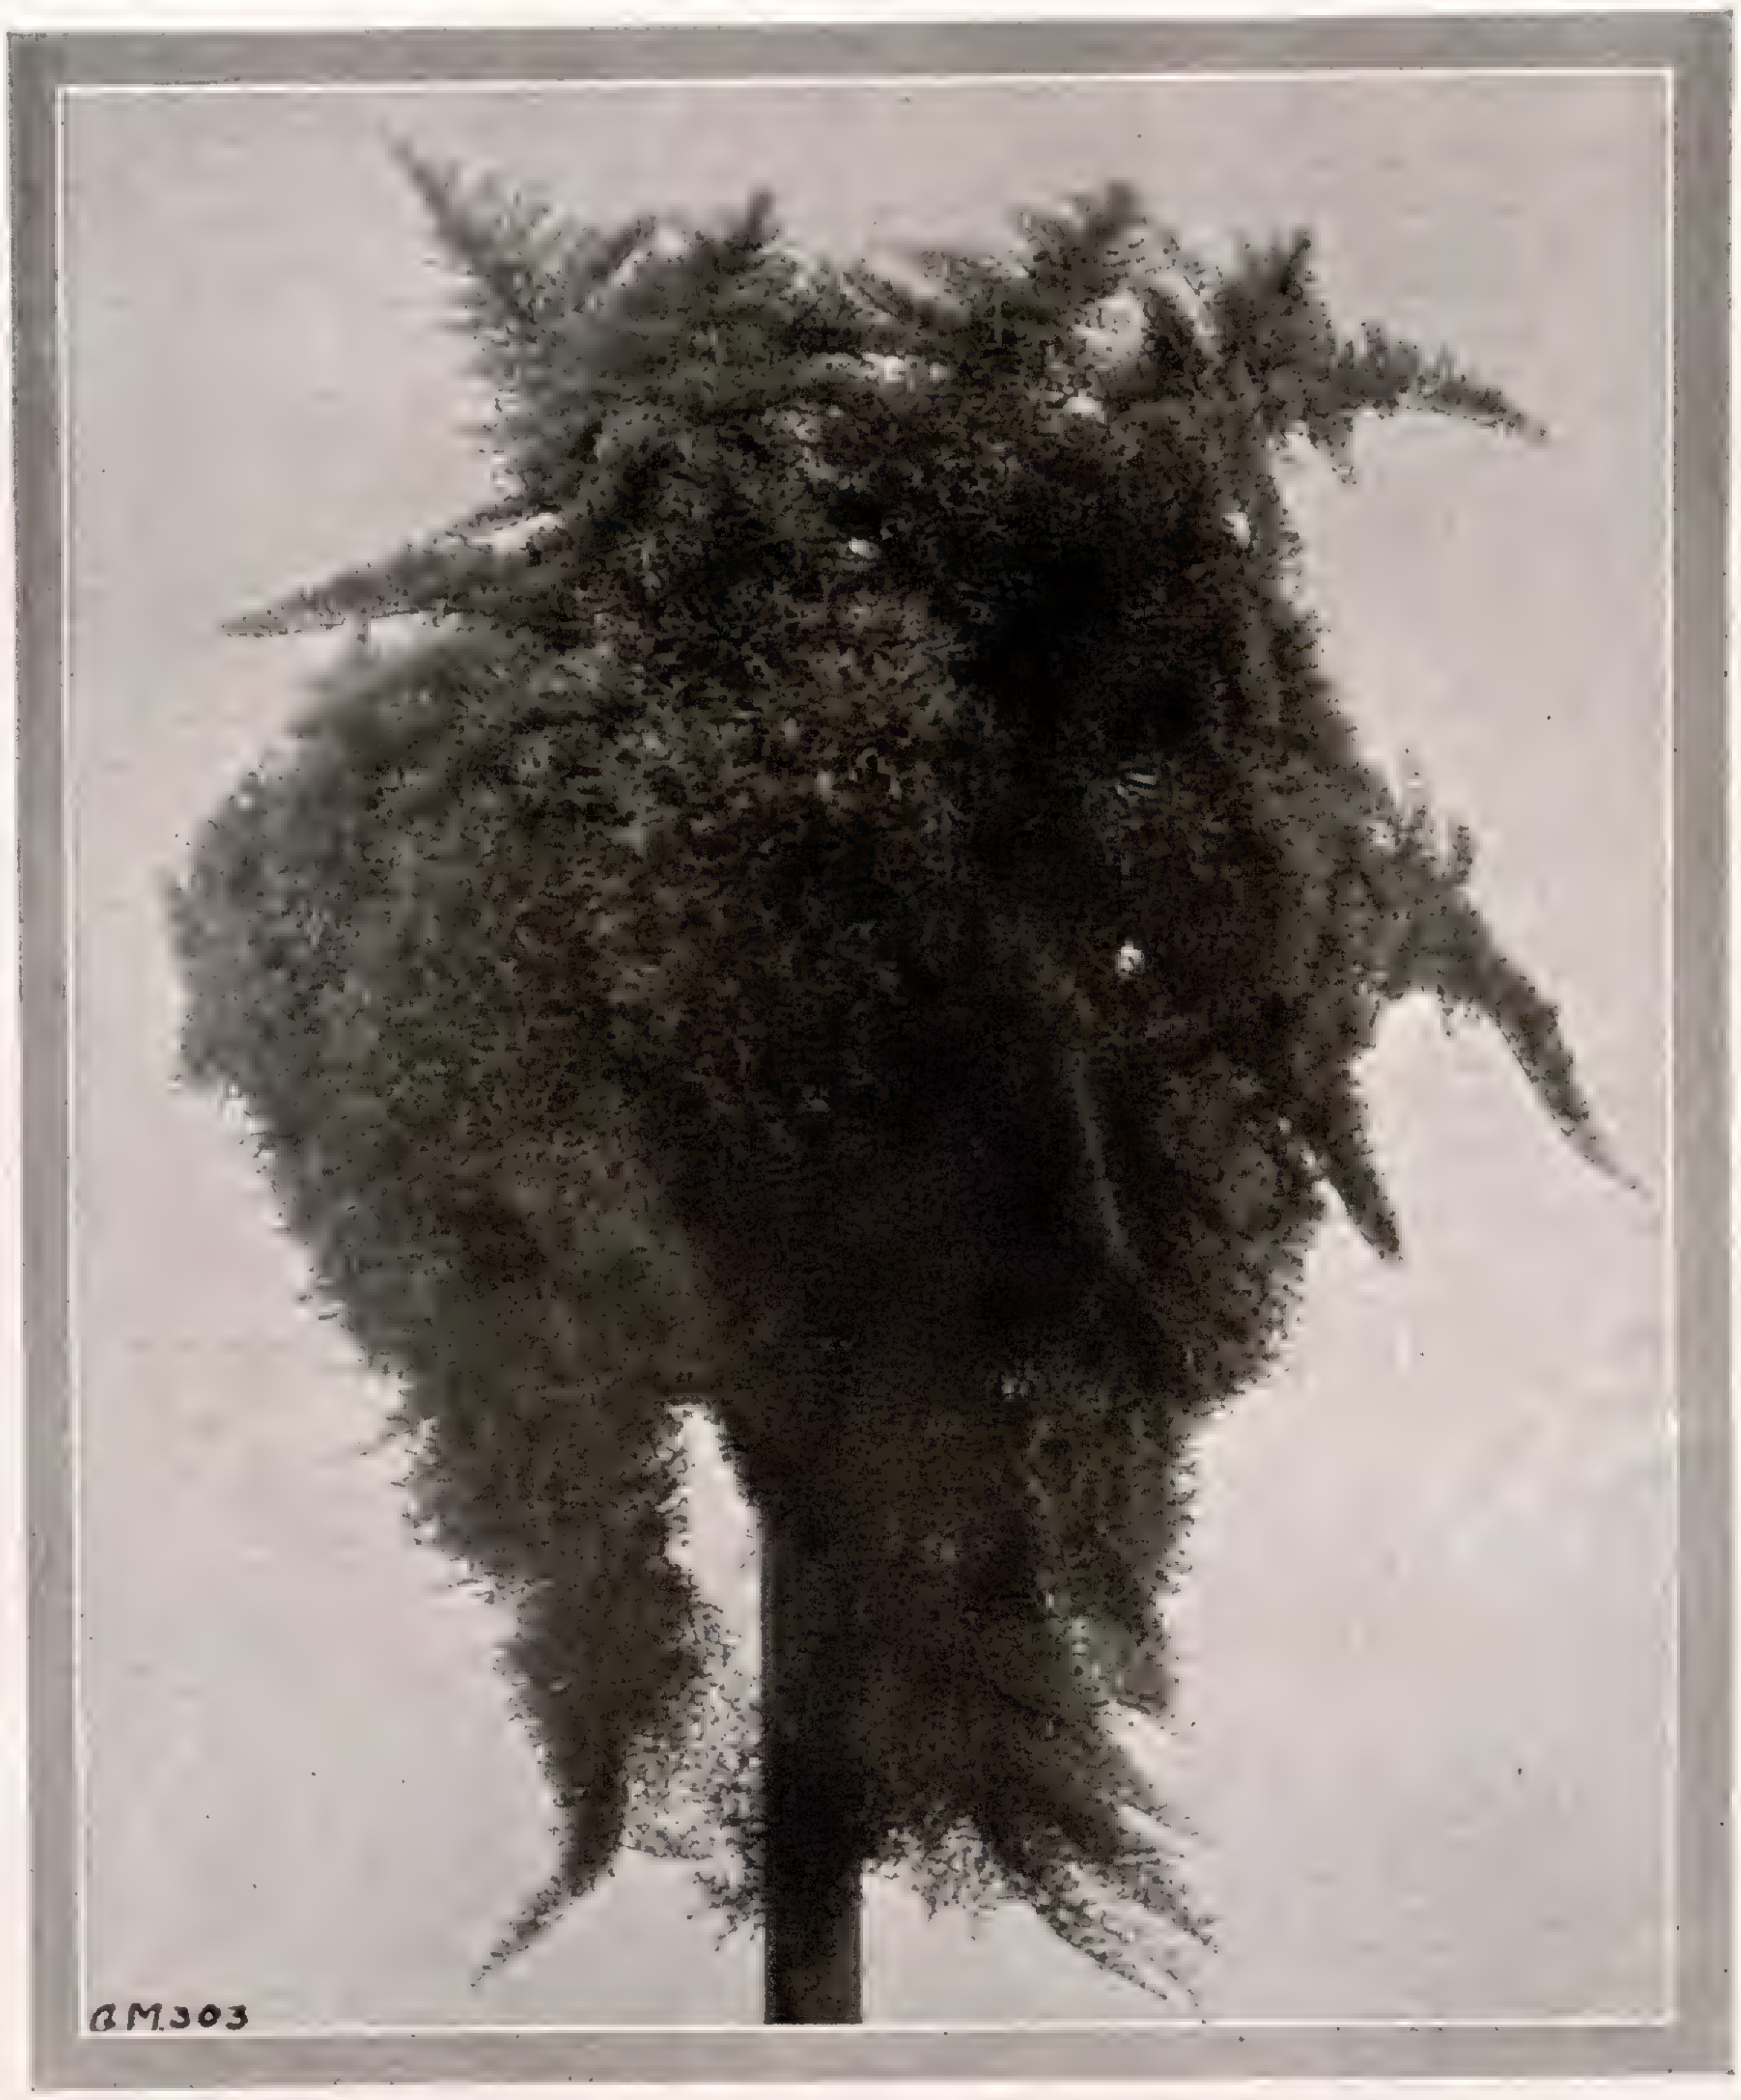
## SWEET PEAS.

Messrs. Sutton and Sons, Reading, had an enormous exhibit of sweet peas that made a striking picture. The flowers were displayed in huge masses, both columns and vases being represented; graceful arches of asparagus and smilax trails relieved the brilliant colours. The most striking varieties were Doris Usher, Brilliant Scarlet, Old Rose, Princess Victoria, Lady Althorpe, Mrs. W. J. Unwin, Elsie, and Helen Lewis, the whole being most effectively arranged. In the same tent were Messrs. Dobbie and Co., Edinburgh, whose display was not only unique for its brilliant colouring, but also for the tasteful way in which the flowers were arranged. Thos. Stevenson was in great form, as were also Lady Miller, Elfrida Pearson, Mrs. Cuthbertson, Queen of Norway, Dobbie's Scarlet, Stirling Stent, Marks Tey, Melba, Edrom Beauty, and Brunette. The quality throughout was remarkable.

Mr. C. W. Breadmore, Winchester, filled out a long length of tabling with well-grown sweet peas, staged in goodly bunches and tall stands. A few striking varieties among a few score were Mrs. Routzahn, Melba, Princess Mary, King Alfred, Mrs. C. W. Breadmore, Stirling Stent, Doris Usher, Aggie Elder, and Etta Dyke. Messrs. G. Stark and Son, Great Ryburgh, staged a large display of sweet peas, which were in fine form. The most conspicuous being White Queen, a very fine white, Stark's Salmon, Hercules, Mrs. W. R Pitt, Maggie Stark, Margaret Cook, and Helen Lewis, the whole forming a most creditable exhibit. Mr. J. D. Webster, Nurseries, Chichester, also exhibited sweet peas, in vases and bamboo stands. The best examples were Elfrida Pearson, Senator Spencer, Barbara, Marjorie Willis, Mrs. W. J. Unwin, and Scarlet Monarch.

Sweet peas from Messrs. E. W. King and Co., Coggeshall, were beautifully arranged. The arches, columns, and vases were all linked together with trails of smilax and asparagus. The flowers were lightly arranged, the whole being most effective. The most striking varieties were Anglican Cerise, Anglican Cream, Gladys Burt, Blue Jacket, Anglican Pink—a glorious colour, Hercules, and Rosabelle. From Messrs. J. King and Sons, Coggeshall, came a more formally-arranged display, but the flowers were really splendid. A series of arches formed the front, Florence Nightingale in the centre being especially bright in colour, flanked on either side with Etta Dyke and Paradise Ivory, while Prince Edward of Wales bids fair to make a fine pink variety. Needless to add, the exhibit comprised a fine collection.

Mr. James Box, Lindfield, had a dazzling display of sweet peas, and produced a fine effect by setting up masses of James Box, Orange Perfection, Thos. Stevenson, Mrs. Gibbs Box, Chas. Foster, Barbara, and a lavender seedling. Messrs. S. Bide and Sons, Farnham, Surrey, had a most artistic exhibit of sweet peas, arranged in large baskets on tall pedestals; while vases were grouped underneath. The most prominent varieties were Eric Harvey, Mrs. Stewart Champion, Edna Harland, Queen of Norway, Lancashire, Dorothy, Melba, and Stirling Stent. The flowers were all beautifully bright and fresh.



NEPHROLEPIS EXALTATA ROCHFORDI.
A.M., R.H.S., July 2. Messrs. T. Rochford, Lim., Broxbourne.

Mr. Marshall Y. Green, The Lodge, Eynsford, Kent, had a really fine exhibit of sweet peas that bore evidence not only of skill in cultivation, but also in the art of displaying them, for the vases were most lightly arranged.

A good exhibit of sweet peas came from Sir Randolph L. Baker, Bart., M.P., Ranston, Blandford (gardener, Mr. E. A. Usher). It is hardly necessary to say the exhibit was a very fine one, but on this occasion he certainly surpassed himself. The flowers were very large, and the colours bright and vivid, Lavender, George Herbert, Barbara, May Campbell, Mrs. W. J. Unwin, Thos. Stevenson, Tennant Spencer, Edrom Beauty, and Eric Harvey being the brightest and best. The arrangement was weak.

Messrs. R. Sydenham, Lim., Tenby Street, Birmingham, had an effective display of sweet peas, which were grouped in colours, and produced a nice effect. Some of the most prominent were Thos. Stevenson, Clara Curtis, Elfrida Pearson, Barbara, Lilian, Iris, and Lady Evelyn Eyre. The arrangement here was decidedly good. Messrs. Jas. Carter and Co., Raynes Park, exhibited a fine trophy of sweet peas; the exhibit was in the form of a huge crown, the different varieties being built up in the centre, from which a huge basket was hanging. Smilax was lavishly used and with good effect. A few of the most prominent varieties were Mrs. C. W. Breadmore, Elfrida Pearson, Mrs. Cuthbertson, Loyalty, R. F. Felton, George Herbert, Queen of Norway, Clara Curtis, and Edrom Beauty; the colours were beautifully blended, and the general effect very fine.

Sweet peas were beautifully shown by Mr. W. E. Alsen, Denmead, Hants, whose flowers were very clean and very brilliantly coloured. Very fine were the bunches of Sterling Stent, Melba, Colonel S. Clarke, Annabel Lee, Marjorie Willis, Mrs. H. Dickson, Edrom Beauty, Mrs. W. J. Unwin, Maud Holmes, A. A. Fabius, and May Campbell.

## BEGONIAS.

A bold display of begonias from Messrs. T. S. Ware, Lim., Feltham, was a centre of attraction. Some suspended baskets of Gladys showed its scarlet blooms to advantage. Underneath were glorious examples of the lovely pink Lady Cromer, the new orange Maurice Glyn, Laura Ashdown, the yellow

Captain Lambton, the salmon King George V., the scarlet Lord Dalmeny, and the new large pink P. W. Jameson, a fine new variety.

Messrs. Blackmore and Langdon, Twerton-on-Avon, exhibited finely-grown begonias, chiefly double varieties and frilled single forms, the latter very pretty and now finely developed. Among large-flowered doubles some of the finest were Wm. Marshall, Mrs. Robert Morton (A.M.), soft yellow; Florence Nightingale (A.M.), white; Mrs. James Douglas, Lady Dorrington, the lovely pink Princess Victoria Louise, the golden Mrs. W. L. Ainslie, and the free-flowering white Empress Marie.

Double begonias is a great variety of colours formed the chief feature of Messrs. J. Carter and Co.'s exhibit; with these were associated a fine strain of streptocarpuses and four corner groups of arums. Another fine exhibit of begonias was staged by Mr. A. L. Gwillim, Sidcup, who universally shows well. His Mrs. J. E. Gwillim, Sea Shell, Mrs. H. Harris, Primrose, and Miss Monet Edwardson were fine.

## FRUIT AND VEGETABLES.

Messrs. G. Bunyard and Co., Lim., Maidstone, had a very fine exhibit of fruit trees in pots. Peaches and nectarines, trained in fan fashion at the back of the group, were covered with brightly-coloured fruits, while in the front were to be seen splendid examples of apples, plums, pears, figs, and peaches, the apples James Grieve, Lady Sudeley, and Ribston Pippin, being fine both in size and colour; while the plums included well-cropped specimens of Jefferson, Old Greengage, Early Normandy, and Sultan. The peaches, too, were well cropped, especially Sea Eagle and Prince of Wales.

Messrs. James Veitch and Sons, Lim., Chelsea, presented a grand exhibit of fruit trees in pots, the display extending over one thousand square feet. Peaches, nectarines, plums, and gooseberries were all well represented. The gooseberries were quite an attraction, for every plant was trained, and loaded with fruit. The peaches were ripe, and included well-coloured fruits of Peregrine, Early Alfred, and Duke of York. Mention should also be made of the plums, for the trees, though only growing in small pots, carried very heavy crops, especially Oullin's Golden Gage, Brandy Gage, Early Transparent Gage, and Blue Rock. The whole exhibit gave evidence of the highest cultural skill.

Messrs. Laxton Bros., Bedford, delighted fruit growers with their exhibit of strawberries, which were displayed in baskets, with greenery lightly placed between them. Laxton's Latest were most tempting, fine in size, with the Waterloo colour. Rival was also great; The Earl, Maincrop, Utility, and Givon's Late Prolific were also remarkably fine, while Red Currant Laxton's Perfection attracted much attention for its huge size. Messrs. Stuart Low and Co., Bush Hill Park, exhibited figs in pots, vines, and Phenomenal berry. The figs were well cropped with ripe and green fruit. The varieties Brown Turkey, Violet Sepore, White Tschia, and Bourjasotte Eriol were excellent. The grapes were Appley Towers and Muscat of Hungary.

The King's Acre Nurseries, Lim., Hereford, again displayed their ability to put up a fine exhibit of fruit trees. The apples, pears, figs, and peaches were carrying good crops of luscious fruit. Some of the best specimens were nectarine Cardinal, Belgian Purple plum, Souv. du Congrès pear, with splendid examples of apples Alexander, Norfolk Beauty, and Worcester Pearmain. The black currants, too, were excellent. A collection of strawberries in twelve varieties came from the Duke of Rutland, Belvoir Castle, Grantham; gardener, Mr. W. H. Divers. The best were Ewan's Late Prolific, Dr. Hogg, Epicure, President, and Gunton Park.

A fine exhibit of fruit trees in pots came from Mr. S. Heilbut, Holyport, Maidenhead; gardener, Mr. G. Camp. These were trees ten to twelve feet high, and were fine examples of cherries and nectarines. The latter were Early Rivers, and the plants were splendidly cropped, as were also the cherries, the varieties Emperor Francis and Late Black Bigarreau being in fine condition.

The Halliford French Garden, Shepperton, staged a nice display of the products from such gardens. The radishes were in the pink of condition, and represented by about four varieties. Cauliflowers were fine, and in excellent condition, as were also the lettuces, both cos and cabbage. Marrows, carrots, kidney beans, and melons were also well cultivated, the whole forming a pleasing exhibit.

## FERNS.

Messrs. H. B. May and Sons, Upper Edmonton, arranged a magnificent bank of ferns, in quite a new style. The group was well displayed, coming from the ground to the eaves of the roof. Nephrolepis in variety formed the background, while huge specimens of Polypodium Knightæ, P. Vidgeni, Nephrolepis Whitmanni, Adiantum farleyensis glorisum, Nephrolepis Neuberti, and Lycopodium japonicum were all in fine condition, while almost every plant was in perfect condition, and the gold medal awarded was worthily won. Messrs. H. B. May and Sons, Edmonton, also exhibited an interesting collection of good varieties of hardy ferns; Lastrea pseudo-mas Doddsi, L. p.-m. Mapalebecki, Anthurium felix-fœmina plumosa divaricata, A. f. f. gemmatum, Adiantum pedatum, Osmunda palustris crispato congesta, and Athyrium Goringianum especially attracted our attention.

A splendid group of ferns, grandly set up by Messrs. J. Hill and Son, Edmonton, contained giant specimens of Dicksonia antarctica, Gleichenia rupestris glaucescens, Asplenium nidus, Cyathea dealbata, the graceful Polypodium Knightæ, Platycereum Veitchi, P. grande, Osmunda javanica, Polypodium quercifolium, P. giganteum, and smaller examples of Nephrolepis Marshalli, Gymogramma elegantissima, Davallia retusa, and D. tenuifolia Veitchi. It was a large group, facing either way in the centre of the big tent, and it was greatly admired. Mr. W. A. Manda, St. Albans, Herts, had a nice group of ferns and foliage plants. In the former were fine examples of Polypodium Mandaianum, a very distinct form, with Nephrolepis Whitmanni, N. Gratresi, and N. Roosevelt.

## ROCK, WATER, AND ALPINE GARDENS.

One of the most-talked-of exhibits in the whole show was the three-fold one arranged by Messrs. R. Wallace and Co., Colchester, who are past masters at the elegant and tasteful display of hardy flowers. One end consisted of a set of flower borders behind a low plant-filled wall. The centre was a terraced garden reached by easy old steps, and bounded by a box hedge. The other end was a big water garden, and one that was not overdone. There was a pool of water lilies spanned by a few rough stones; at the back above the grassy banks were fine masses of spiræas, Astilbe ceres, and bamboos; while in front were pretty groups of Japanese irises. Along the terraced garden the borders were filled with Erigeron speciosa, and pentstemons of the "Gem" type, while below the wall a few liliums rose from a border of choice varieties of hardy ferns. In the lower garden, the low wall was crowned with small œnotheras, campanulas, the scarlet Verbena chamædrioides, sedums, hypericums, etc. On the inner side a narrow border of Nepeta Musseni separated the grass plot from the flagstone path that led alongside a bold flower border where Pentstemon Southgate Gem was associated with Lilium candidum, and where delphiniums and golden verbascums towered close by masses of Lilium auratum vittatum, Eremurus Sir Michael, E. Olgæ, E. Olga Rosy Morn, and E. Peach Blossom, made a show of themselves; but Lilium elegans, L. excelsum, L. longiflorum, delphiniums, cineraria, and Anthemis Kelwayi were pressed into service, and the whole was a delightful garden of rare and beautiful plants, delightfully displayed.

A little wild garden, with nymphæas afloat on the water, and the margin beautiful with Japanese irises, funkias, hardy ferns, Primula involucrata, and spiræas formed part of a large exhibit from Messrs. Thos. S. Ware, Feltham. An alpine garden came next with colonies of Œnothera riparia, Œ. taraxifolia alba, Campanula pumila, the sweet Thymus coccineus, Conadendron amondioides, Edelweiss, the double form of Tunica saxifraga, and the yellow Sedum origanum. Next followed a fine collection of hardy border flowers in goodly bunches, and here phloxes, Campanula macrantha, Linaria dalmatica, Alstrœmeria aurea, Lychnis chalcedonica, and Isatis glauca were particularly effective. Mr. H. Hemsley, Crawley, put up an alpine garden thoroughly well furnished with very bright colonies of Coronilla cappadocica, Silene armeria, Campanula pusilla Miss Willmott, Gentiana septemfida latifolia, Ruta patavina, Erigeron speciosa, Inula Roylei, Campanula valdensis. Mr. Leslie Greening, Richmond, exhibited a tiny rock and water garden.

The rock garden put up by Messrs. Wm. Fells and Son, Hitchin, Herts, was a very pretty one, and flowering plants were pleasingly associated with hardy ferns. Primula involucrata, Calceolaria polyrhiza, Œnothera speciosa, Campanula pusilla, C. p. Miss Willmott, Delphinium nudicaule, and Dianthus Napoleon III. Messrs. Phillips and Taylor, Bracknell, had a raised flower border made gay with border carnations, a selection of delphiniums, Galega Her Majesty, and Anchusa italica Dropmore, the whole fronted by small campanulas, sedum, nepetas, etc.; the same firm had a water garden in which Nymphæa Gladstoniana was particularly fine in a surrounding of reeds, alisma, the double sagittaria, etc.

Messrs. Whitelegg and Page, Chislehurst, were extensive exhibitors of hardy flowers, and put up large masses of delphiniums, Galega Her Majesty, their fine Geum Mrs. Bradshaw, Phygelius capensis, Pentstemon Southgate Gem, Scabiosa caucasica, Lilium candidum, and Leucheras. In the centre of their group they had a delightful lot of water lilies in a pool surrounded by water lilies and bamboos. The "Newberry" was also shown by this firm. A garden of beautiful flowers was arranged in the big tent by Mr. Maurice Prichard, Christchurch. One end was a border of herbaceous plants, such as Isatis glauca, delphiniums, eremuri, Hemerocallis aurauticea major, phloxes, the blue-based Campanula latifolia Mrs. Prichard, Salvia turkestanica, and œnotheras. At the other end a rock and bog garden combination merited attention because of the pleasing arrangement of the little colonies of Dianthus E. T. Anderton, Acantholimon venustum, Cytisus shiphænsis, Campanula G. F. Wilson, Hypericum enpetrifolium, Œnothera speciosa rosea, and Nierumbergia rivularis backed by astilbes, thalictrums, bamboos. A circular bed set in the curve of the flower border was filled with Lavatera Olbia and the blue Delphinium Cineraria.

Messrs. J. Cheal and Sons, Lim., Lowfield Nurseries, Crawley, presented a fine exhibit of rock and alpine plants, arranged in a most natural way. Some of the best plants were Fuchsia procumbens, Cistus algarvense, campanulas in good variety, sedums, Genista tinctoria plena, with a large variety of suitable conifers and acers suited for such positions; the entire arrangement being well carried out. The Guildford Hardy Plant Company, Guildford, were represented by a fine display of hardy flowers, which included some choice alpines. The campanulas and delphiniums were very good here. The Misses Hopkins, Mere Gardens, Shepperton-on-Thames, also displayed a natural garden.

Mr. Amos Perry, Hardy Plant Farm, Enfield, produced an enormous exhibit of hardy flowers, which occupied about 250 feet run. Delphiniums were grouped in large masses at either end, while rock work was mounded up most naturally; here were to be seen masses of Prunella Webbiana rosea, Erigeron hybrida, verbascums in variety, a fine group of Amaryllis formisissima and astilbes. The hardy ferns made a delightfully cool-looking spot. The plants were beautifully developed, and most tastefully arranged. Tanks of nymphæas were splendid, the deeper tanks employed gave them quite a natural appearance; while the edge of the pools were surrounded with ferns, irises, and water grasses. Iris Kæmpferi in variety were much admired, as were also the liliums, which included Lilium elegans semi plena, L. elegans aureum, L. Parryi, L. Pardalinum, L. Krameri, and a number of others. Pinks in variety, phloxes, and monardias all helped to swell this truly magnificent display of hardy plants and ferns.

Messrs. Pulhams, Elsenham, Essex, had a pleasing exhibit of rock and alpine plants on which were to be seen campanulas, Dianthus Elsenham Seedling, Orchis maculata, and Chrysogonum virginicum; the same firm also displayed hardy plants. Messrs. Thompson and Charman, Bushey, Herts, set up a nice rockery garden of hardy and herbaceous flowers, and showed Lychnis Haageana, and the new Lilium myriophyllum in good form, with numerous other subjects.

### HARDY FLOWERS.

A long, narrow, wavy border of flowers from Messrs. Kelway and Son, Langport, was filled chiefly with the delphiniums for which the firm is famous; there were hundreds upon hundreds of spikes of single and double varieties in every shade of blue from palest hue to deepest purple-violet. Sweet peas were also used, and so were gaillardias, pyrethrums, and gladioli. Dusky Monarch, Chandelier, Mrs. Tree, Prince Charming, F. Carr, Zinfandel, Queen of Spain, and Lord Elgin were a few of the best of the delphiniums on view.

Delphiniums were well displayed by Messrs. R. H. Bath, Wisbech, their fine spikes making a good setting for border carnations, cluster roses, coreopsis, Chrysanthemum maximum Mrs. Daniels, and other good hardy subjects. Campanula humosa, a semi-double form with large blue flowers, was a conspicuous subject in a modest group of hardy flowers from Messrs. G. Bolton and Sons, Buntingford, Herts. Conspicuous in the display of hardy flowers from Messrs. W. and J. Brown, Peterborough, were Gaillardia Lady Rolleston, G. Lady Exeter, G. The King, very brilliant; and Ostrowskia magnifica. Mr. Howard Crane, Highgate, brought up a sweetly-fragrant exhibit of violas and violettas, and arranged the dainty flowers in low pans. Butterfly, Forget-me-Not, Rock Yellow, Eileen, and Reggie were delightful violettas suitable for border or rock garden.

Herbaceous phloxes were uncommonly well exhibited by Messrs. H. J. Jones, Ryecroft Nursery, Lewisham. A long, gently-sloping bank of these grand border flowers was arranged, all the plants being in pots. In many cases the heads of fragrant flowers rose 5ft. high. A few striking varieties were Frau Ant Buchner, Boule de Feu, Meteore, G. A. Strohlin, General Von Hentsz, Dr. Charcot, Sheriff Ivory, Mons. Kind, Frau Von Lansberg, Elizabeth Campbell, the lovely white Fiancee, Iris, the rosy coloured Atalia, and the rosy-eyed Selma. A very fine contribution. A beautiful lot of delphiniums from Messrs. Blackmore and Langdon, Bath, included splendid spikes of Rev. E. Lascelles, Chantry Queen, Conspicua, Statuaire Rude—a superb, large-flowered lavender-blue variety with long massive spikes; Sergeant Beranger, the vivid violet Novelty, and the dark violet-purple Henry Moissan. The lovely Viola cornuta purpurea was finely represented by Messrs. Gunn and Sons, Olton, with V. cornuta alba and a backing of spikes of Lilium auratum.

Messrs. Gunn and Sons, Olton, invariably show phloxes well, and on this occasion they staged bold masses of good spikes of Elizabeth Campbell, Border Beacon, the bright salmon-red Baron von Dedem, Wilbur Wright, Flora, Selma, the splendid purple Le Mahdi, Josephine Gerbeaux, Frau Von Lassberg, and the brilliant George A. Stroehlin. Messrs. F. Smith and Co., Woodbridge, provided a bright exhibit of hardy flowers, Anthemis Kelwayi, phloxes, and scabious being the chief features.

A fine display of hardy flowers from Mr. James Box, Lindfield, had a brilliant centre composed of stately spikes of deep blue delphinium and Eremurus Shelfordi and E. Bungei. Gladiolas were pleasantly displayed with gaillardias, phloxes, œnotheras, erigerons, and a few alpines. Messrs. G. and A. Clark, Dover, made a great show with fine groupings of Gilia coronopifolia, Iris ochroleuca aurea, alstrœmerias, the lovely old Lilium candidum, Asperula tinctoria, delphiniums, Eremurus Bungei, Salvia turkestanica, Scabiosa caucasica, Helenium Bolanderi Golden Gem, and the rosy-pink pyrethrum John Malcolm. The firm had also a little pool of water lilies and Japanese irises. The very handsome strain of large cup-and-saucer Canterbury bells Messrs. W. J. Godfrey and Sons, Exmouth, have raised was finely represented on this occasion by giant spikes and massive blooms in many charming shades of colour. Messrs. Jarman and Co., Chard, were involved in the stage smash, and so their fine sweet peas, roses, sweet sultans, and pelargoniums suffered considerably, but the latter were the best survivors.

Messrs. Gibson and Co., Leeming Bar, Yorks, were exhibitors of choice hardy flowers, and they set up lovely forms of delphiniums, Verbascum Ivanhoe, V. Caledonia, and V. A. M. Bourne, all very fine things. Messrs. Rich and Co., Bath, were represented by phloxes, pentstemons, the handsome Verbascum Weidmaniana, and a collection of violas. Gladioli were very pleasingly shown by Mr. Frank Lilley, Guernsey, and, as the spikes of red, rose, pink, and white flowers were set up with grassy foliage, they made a pretty effect.

Gaillardias were gaily shown by Messrs. B. Ladhams and Sons, Shirley, Southampton, and fine varieties were Superb, Aurora, Sulphur Gem, Gloria, and Brilliant; the new Salvia Ladhamsi was staged, and also a collection of hardy border flowers. Mr. R. C. Notcutt was represented by a collection of hardy flowers, wherein Verbascum Chauxi alba, Salvia turkestanica, Lilium elegans, and Anthemis Kelwayi were commanding subjects.

Messrs. Bees, Lim., Liverpool, displayed choice alpines, and a selection of the best delphiniums, eremuri, irises, spiræas, and Primula cortusoides.

Messrs. W. Wells and Co., Lim., Merstham, presented a fine exhibit of hardy flowers, which included fine masses of phloxes, campanulas, gaillardias, and scabiouses, also some fine carnations, both in pots and a cut state. Messrs. G. Mallett and Co., Cheddar, had a pleasing exhibit of hardy flowers, where large clusters of Lilium candidum, L. longiflorum, and L. excelsum were to be seen. Dianthus, campanulas, and early phloxes were also quite a feature here.

Messrs. W. Cutbush and Sons presented a most natural exhibit of hardy plants. The water garden was furnished with nymphæas in variety, with water grasses, and other subjects, while masses of Iris Kæmpferi were grouped on the banks. Around were phloxes, gladioli, delphiniums, gaillardias, and similar plants, the whole forming a charming picture. Mention should be made of Lilium giganteum also in this group. A nice table of cut shrubs came from Mary Countess of Ilchester, Abbotsbury Castle; gardener, Mr. Kempshall. There were to be seen fine examples of Lonicera Hildebrandi, Eucalyptus ficifolia, Phormium alpinum, philadelphus in variety, and many other flowering shrubs.

Messrs. G. Jackman and Son, Woking, had a very fine group of clematises flanked with hardy flowers. The former were all trained specimen plants, and the brightest appeared to be Lady Betty Balfour, Miss Crawshay, Star of India, Mrs. Geo. Jackman, Otto Froebel, and Lady Northcliffe. The best features of the hardy flowers were the delphiniums, Betonica rosea, and richly-coloured gaillardias. Mr. Eames, Floral Nurseries, Frome, presented a nice collection of hardy flowers. The scabiouses were particularly fine, especially the variety Mrs. R. F. Felton, a lighter variety than the species. The delphiniums, too, were in fine condition, as were also a good variety of gaillardias.

Messrs. Barr and Sons, Covent Garden, had a splendid bank of hardy flowers, in which were noted the new hybrid lupins with their quaint shades of colour, the summer flowering gladioli, irises, gaillardias, and liliums. A pleasing water garden was also admirably arranged; the spiræas here were quite a feature, while the nymphæas were tastefully placed in a cool-looking pool of water, while other attractive subjects were Campanula pusilla, delphiniums in fine variety, a huge mass of Salvia variegata nemorosa, and a large clump of a hardy orchid named Gymnadenia conopæi, with tall spikes of purple flowers. The exhibit occupied the entire side of one tent.

Messrs. Carter Page and Co., 52, London Wall, London, made a fine display of hardy flowers. The violas were arranged in pans, and gave a very good idea of their appearance in a bed. The same firm also had a fine exhibit of pæony and cactus dahlias, also a number of the new collarette varieties, with a number of brilliant zonal pelargoniums tastefully displayed in vases. Mr. J. MacDonald, Harpenden, had a splendid exhibit of grasses suited to all purposes. The species were exhibited in sterilised and unsterilised soil, and the results were remarkable. Quite a feature of the exhibit was the grasses grown for decorative work, which were grown on matting, and would certainly produce a highly decorative effect.

Messrs. G. Bunyard and Co., Lim., Maidstone, made a fine effort with their hardy flowers, the whole bank making a pleasing display. The chief features were the delphiniums, which were clean and bright, liliums in variety, eremuri, Pentstemons Southgate Gem and Thos. Shaw, astilbes in pink and rose, a fine selection of nymphæas, erigerons, English irises, and a small alpine garden with excellent campanulas growing. A large table of hardy flowers came from Mr. G. Reuthe, Hardy Plant Nursery, Keston. Here were to be seen Bahia cornuta, Erica cinerea rosea, a beautiful colour, the early flowering gladioli, magnolias, eremuri, and liliums in large variety, the whole forming a fine exhibit.

Messrs. Paul and Son, The Old Nurseries, Cheshunt, sent a most interesting collection of cut shrubs, both foliage and flowering subjects being used; especially noticeable were Weigelia Eva Rathke, Spiræa Aitchinsoni, S. Anthony Waterer, Ligustrum multiflorum, Fagus tricolour, and a large number of phloxes, which were in splendid form. Messrs. R. Veitch and Son, Exeter, exhibited some splendid plants of Calceolaria Veitchi, and the Bronze Age, also Golden Glory, which created much interest; with a few vases of choice flowering shrubs.

### STOVE AND GREENHOUSE PLANTS.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, contributed a very fine bank of choice stove and greenhouse plants, backed with tall cocos palms and tree ferns. The dracænas, crotons, and caladiums were all in fine colour, while the anthuriums in variety found many admirers. The nepenthes, too, were a fine feature, while masses of ixoras, cannas, and Solanum Wendlandi were a fine, effective piece of colour amongst the foliage plants. One also noted well-coloured plants of the new Araucaria Silver Star, and a group of orchids in the centre, which included cattleyas in variety, cypripediums, oncidiums, Odontioda Lambeauiana, and O. Bradshawiæ. The whole exhibit was remarkable for the high culture displayed, and the free style in which they were arranged. Messrs. Jas. Veitch and Sons, Chelsea, were (in another tent) involved in a disaster; the whole of the staging in one part of the tent gave way, and the whole of the plants fell over and many were smashed up. After rearrangement the exhibit consisted of a fine strain of streptocarpuses, standard fuchsias, cannas, Solanum Wendlandi, greenhouse rhododendrons, malmaison and perpetual carnations, and the fine Begonia Lucerna. Messrs. J. Peed and Sons, Norwood, had a very fine lot of beautiful gloxinias and streptocarpuses bedded in ferns, but many of these came to grief in the breakdown. Mr. Vincent Slade, Taunton, afforded a bright bit of colouring with zonal pelargoniums in goodly bunches. Messrs. J. Piper and Sons, Barnes, exhibited a group of fuchsias. The tall pyramids in the background were well clothed in flower, while the groundwork was composed of dwarfer plants. It was rather a pity that the varieties were not named, for the exhibit suffered in educational value.

Messrs. H. J. Jones, Lim., Lewisham, had a splendid exhibit of zonal and ivy-leaved pelargoniums. In the former were the Crampel seedlings in wonderful colours, a few of the brightest being Alfred Simpson, A. Lovett, Germania, Harry Jones, and E. Newman. These, backed by a long vista of colour from the phloxes behind them, produced a gorgeous mass of colour. A quaint exhibit was that from Mr. H. N. Ellison, West Bromwich, who exhibited a large collection of cacti for Mr. F. A. Haage. One would think the whole horticultural world was interested in cacti judging from the number of people who were crowded around the exhibit, which certainly embraced a most comprehensive collection.

From Messrs. Thos. Rochford and Sons, Lim., Turnford, came a fine group of the new Araucaria excelsa Silver Star. The plants were most effective, arranged in a group, and it will doubtless prove a boon in this class of plant. The same firm also exhibited plants of the new fern Nephrolepis exaltata var. Rochfordi, a very dense-growing form. A rare splash of colour was provided by Mr. L. R. Russell, Richmond, who exhibited a long, even bank of the useful and glowing scarlet Salvia Pride of Zurich, backed by the silvery Abutilon Sawitzi.

Messrs. W. Cutbush and Son, Highgate, N., presented a delightful exhibit of carnations, border, Malmaison and perpetual varieties, arranged in mounds and valleys amid ferns and palms, and some polyantha roses. Very fine were the carnations Mrs. Trelawney, King Arthur, Lady Coventry, Lord Rothschild, Enchantress, and The Queen. Tall crotons, the new Silver Star araucaria, and new hydrangeas were associated with the carnations, the whole forming a large and beautiful display. Colour in foliage alone comes as a relief from the vivid shades of the flowers, hence the large exhibit of caladiums, with their large leaves of soft rose, pale-green, silver, carmine, buff, and rose, formed a pleasing display. The plants were well grown and well arranged with ferns.

Mr. Philip Ladds, Swanley, was represented by the new zonal pelargoniums Ambrosia, White Queen, and Champion, the latter a very free and attractive pink variety. Stove foliage plants from Mr. J. Bruckhaus, Twickenham, made a brave show; giant palms and growing caladiums and crotons were associated with aspidistras, pandanus, acers, etc. Show and fancy pelargoniums from Mr. W. Treseder, Cardiff, included the new deep maroon, red-edged Lord Bute, a striking variety.

The reviving interest in scented pelargoniums was evidenced by a large and very interesting collection of species and varieties, represented by neat specimens, from Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. Some striking sorts were P. crispum maximus, P. Moore's Victory, P. Purple Unique, the quaint little P. grossularioides variegata, P. aspera, P. abrotanifolium, the glowing P. ardens, P. Blandfordianum with grey leaves and white flowers; P. echinatum, with fairly large, white, red-blotched flowers; P. artemesioides, and the large-leaved P. tomentosum. A new ivy-leaved pelargonium named Queen Mary, deep salmon, with deep red edge and marks, was sent by Mr. H. Hemsley, Crawley; it is free-flowering, and a promising plant for window-boxes, etc.

Succulent plants are not often shown nowadays, therefore a fairly representative collection is of special interest. Such a collection was staged by Mr. C. Dixon, gardener to Mary Countess of Ilchester, Holland House. The leading subjects were Aloe macrocarpa, Mamillaria sanguinea, M. pusilla, M. Gasteria verrucosa, G. latifolia, Dyckia marifolia, Pilocereas senilis, and Agave filamentosa. It was said that the plants had all been raised at home from seed. Cannas were finely shown by Messrs. H. Cannell and Sons, Swanley; the large heads of glorious blooms were very effective. The salmon Paul Crampel pelargonium, gloxinias, and tuberous begonias completed a gay exhibit.

Messrs. Godfrey and Son, Exmouth, sent a large display of hardy flowers, Cape pelargoniums, in large variety, also a fine exhibit of decorative pelargoniums such as Andre Lauret, Lady Mildred Cooke, Bystock, Lady Doreen Long, and a bright orange-red zonale named Captivation. The same exhibitor also staged some fine sweet peas. Mr. L. R. Russell, Richmond, exhibited some very fine examples of Anthurium crystallinum, the bold Cyanophyllum magnificum, alocasias, caladiums, and crotons, these making up a handsome exhibit.

### OUTDOOR EXHIBITS.

The heavy rains during the day and the consequent unpleasant conditions out of doors, prevented a proper inspection and full appreciation of the many fine displays that had not the shelter of canvas.

Foremost among these was the Japanese garden designed and planted by Messrs. J. Carter and Co., Raynes Park. Here was a large nymphæa-studded pool, bridged by a low, artistic bridge that led to a Japanese tea house, embowered in roses, and set about by conifers, bamboos, hydrangeas, and liliums. A little valley was bordered by low rockwork pleasingly planted, and led to large plantations of lovely Japanese irises that made a rare show of delicate colouring. Japanese maples, pigmy trees, stone lanterns, bronze storks, and other beautiful things occupied points of vantage, and gave character to the whole. The whole design was most attractive, and a fine opening day would have seen the garden crowded with enthusiastic visitors.

Messrs. Pipers, Barnes, arranged a pleasing garden out of doors. Rocky mounds were tastefully planted with the choicest of alpines, and against a background of conifers, liliums, and hydrangeas they planted an iris swamp with stepping stones along the little stream among the fine varieties of Iris Kæmpferi, planted in considerable quantities. Here, too, was a garden that under brighter skies would have been a centre of attraction on the opening day. This firm's Dutch garden, with its wealth of clipped trees—even a wheelbarrow in clipped box—and its neat railed fence in clipped box, was vastly interesting. The collection of Japanese maples arranged to form a large and well-designed group by Messrs. Fromow and Sons, Chiswick, was a fine demonstration of the grace, beauty, colour, and usefulness of this charming set of hardy shrubs.

Mr. L. R. Russell, Richmond, arranged one of the finest collections of golden, silver-leaved and green tree ivies, in pots, dwarfs, and standards, and pyramids that we have ever seen. This exhibitor also presented a water garden, a fine collection of bamboos, and some giant freely-flowered specimens of Hydrangea hortensia. Large and magnificent specimens of golden and green yews, of perfect outline, and altogether finely grown, were exhibited in great tubs by Messrs. John Waterer and Sons, Bagshot. Mr. Reg. Prichard, West Moors, Wimborne, filled a long table with dwarf alpine plants, but his position beneath the dripping trees was not a happy one. He had a very fine colony of the pretty Wahlenbergia saxicola.

Messrs. J. Forbes and Co., Lim., Hawick, arranged a group of phloxes, pyrethrums, and pentstemons in the open air. The latter were particularly fine, especially F. Forbes, R. H. Thompson, Sandringham, Marquis of Linlithgow, and Crimson Gem, while the phloxes were extra fine. From Mr. Clarence Elliott, Six Hills Nursery, Stevenage, came a tasteful rock garden in the open air. Here the variegated thyme, Campanula Miss Willmott, Nepetas, œnotheras, and Orchis foliosa were most conspicuous in a nicely-arranged exhibit. Messrs. W. Cutbush and Son, Highgate, sent a large collection of clipped box and yew trees, which attracted much attention, for they were in splendid trim. Mr. Carlton White, New Bond Street, also had a collection of clipped trees in most fantastic forms, varying from mere pigmies to huge specimens.

### HORTICULTURAL SUNDRIES.

Messrs. H. Hartjen and Co., Noble House, Noble Street, E.C., exhibited a large collection of the Holder Pneumatic Sprayers, which attracted much attention from the growers present. The Three C.'s Company, 67, Dale Street, Liverpool, had an exhibit of their continuous cloche system, which is undoubtedly the last word in the cheap protection of plants and vegetables. Messrs. Jeyes, Lim., 64, Cannon Street, London, exhibited their horticultural sprays and washes, while Mr. M. Johnston, New Park, Cranleigh, Surrey, had a good exhibit of his fibrous yellow loam that would delight the hearts of all plant lovers. Messrs. E. A. White, Lim., Paddock Wood, Kent, had a display of their syringes and sprayers, also their well-known insecticide.

Messrs. W. Cooper and Nephews, Berkhampsted, displayed their various washes and fumigating compounds, also a force pump suitable for spraying purposes, while Messrs. Wakeley Bros., Honduras Wharf, Bankside, S.E., exhibited their hop manure surrounded with flowers and foliage plants. Messrs. R. Sydenham, Limited, Tenby Street, Birmingham, had a good exhibit of rustic table decoration devices.

Messrs. Liberty and Co., Regent Street, W., exhibited Japanese garden ornaments in large variety; also garden seats, copings, and a number of sundials. From Messrs. G. Trollope and Sons, Belgrave Square, came a quaint well-head in stone, with an ornamental beaten-iron top frame, surrounded by plants; while Messrs. J. Cheal and Sons had a tea-house, with trellises, fencing, gates, seats, and so on in most artistic style.

Some fine wrought-iron gates came from Messrs. J. Crowther and Son, North End Road, Fulham; also ornamental sundials and a variety of garden ornaments. The Leyton Timber Company, New Cross, displayed summer-houses, low fences, garden seats, arbours, etc.

The Potters' Art Guild, Compton, Guildford, sent examples of their art in the shape of vases, sundials, and other artistic pottery. Messrs. H. Freeman, Lim., Mulgrave Road, Sutton, had examples of greenhouses, seats, lights, and garden frames; while Messrs. Castles, Millbank, Westminster, had a fine display of garden seats and various other garden appurtenances in teak and oak from old ships' timber.

### MEDALS AND CUPS.

Gold Medal.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Sir Jeremiah Colman, Bart., V.M.H., Gatton Park, for orchids; to Messrs. Wm. Cutbush and Son, Highgate, for carnations; to Messrs. Wm. Cutbush and Son, Highgate, for group of flowering plants, etc.; to Messrs. Paul and Son, Cheshunt, for roses; to Messrs. James Veitch and Sons, Chelsea, for fruit trees in pots; to Messrs. James Veitch and Sons, Chelsea, for stove, foliage plants, and orchids; to Messrs. R. Wallace and Co., Colchester, for an Old English flower garden; to Messrs. James Carter and Co., Raynes Park, for Japanese garden and sweet peas; to Messrs. Dobbie and Co., Edinburgh, for sweet peas; to Messrs. J. Hill and Son, Lower Edmonton, for ferns; to Messrs. Wm. Paul and Son, Waltham Cross, for roses; to Mr. Amos Perry, Enfield, for herbaceous plants, ferns, etc.; to Messrs. H. B. May and Sons, Upper Edmonton, for ferns; to J. Gurney Fowler, Esq., South Woodford (gardener, Mr. J. Davis), for selaginellas and orchids; and to Mr. Maurice Prichard, Christchurch, for herbaceous plants and water garden.

Coronation Challenge Cup. — To Messrs. James Veitch and Sons, Chelsea, for fruit trees in pots and stove plants.

Wigan Challenge Cup.—To Mr. John Mattock, Oxford, for roses.

Silver Cup.—To E. H. L. Davidson, Esq., 9, Oxford Square, W., for orchids; to Messrs. Mansell and Hatcher, Rawdon, for orchids; to Messrs. Blackmore and Langdon, Bath, for begonias and delphiniums; to Messrs. G.

and A. Clark, Dover, for herbaceous flowers; to Messrs. L. R. Russell, Richmond, for stove and ornamental plants, etc.; to Sir Randolph Baker, Bart. (gardener, Mr. Usher), for sweet peas; to Messrs. Sutton and Sons, Reading, for sweet peas; to Messrs. E. W. King and Co., Coggeshall, for sweet peas; to Messrs. C. Turner, Slough, for roses; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. F. Cant and Co., Colchester, for roses; to Messrs. A. Dickson and Sons, Newtownards, for roses; to Messrs. Hugh Dickson, Belfast, for roses; to Messrs. H. Burnett, Guernsey, for carnations; to Messrs. Thos. S. Ware, Lim., Feltham, for begonias and hardy plants; to S. Heilbut Esq. (gardener, G. Camp), for fruit trees in pots; to Messrs. G. Bunyard and Co., Maidstone, for alpines, roses, fruit trees, and herbaceous plants; to Messrs. H. J. Jones, Lewisham, for phloxes and pelargoniums; to Mr. G. Reuthe, Keston, for herbaceous, shrubs, and alpines; to Messrs. J. Piper and Son, Bayswater, for Dutch and water garden; to Messrs. J. Veitch and Son, Chelsea, for flowering plants and bay trees; to Messrs. Hobbies, Lim., Dereham, for roses; to Messrs. Jackman and Son, Woking, for clematis and herbaceous; to Mr. J. MacDonald, Harpenden, for grasses, showing methods of cultivation; and to Messrs. J. Peed and Sons, West Norwood, for caladiums and flowering plants.

Silver-gilt Hogg Medal. — To Messrs. Laxton Bros., Bedford, for strawberries.

Silver-gilt Knightian.—To King's Acre Nurseries, Hereford, for fruit trees in pots; and to the Duke of Rutland (gardener, Mr. W. H. Divers), for fruits.

Silver-gilt Flora.—To Messrs. S. Low and Co., Enfield, for orchids; to Mr. F. A. Haage, jun., Erfurt, for cacti; to Messrs. W. Wells and Co., Merstham, for herbaceous plants; to Mr. W. E. Alsen, Denmead, for sweet peas; to Mr. B. E. Bell, Guernsey, for carnations; to Mr. C. Engelmann, Saffron Walden, for carnations; to Messrs. Gunn and Sons, Olton, for herbaceous plants; to Messrs. Barr and Sons, Covent Garden, for herbaceous plants and pigmy trees; to Messrs. S. Low and Co., for roses; to Mr. C. Elliott, Stevenage, for alpines; to Mr. G. Prince, Oxford. for roses; to Messrs. H. Cannell and Sons, Swanley, for miscellaneous group; to Messrs. J. Cheal and Sons, Crawley, for garden and herbaceous plants; to Mr. F. Lilley, Guernsey, for gladioli; to Mr. R. C. Notcutt, Woodbridge, for herbaceous plants; and to Messrs. Carter Page and Co., London Wall, for flowering plants.

Silver-gilt Banksian.—To Mr. C. W. Breadmore, Winchester, for sweet peas; to Messrs. S. Bide and Sons, Farnham, for sweet peas; to Messrs. R. Sydenham, Lim., Birmingham, for sweet peas; to Mr. J. Douglas, Great Bookham, for carnations; to W. W. Gott, Esq., Cornwall, for carnations; to Mr. G. Lange, Hampton, for carnations; to Messrs. James Carter and Co., Raynes Park, for begonias; to Messrs. W. Fromow and Sons, Chiswick, for maples; to the Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham, for pelargoniums; and to the Countess of Ilchester (gardener, Mr. C. Dixon), Holland House, for cacti, etc.

Silver Knightian.—To Messrs. S. Low and Co., Enfield, for figs; to the Rev. C. Chalmers-Hunt, Hitchin, for sweet peas, vegetables, and roses; to Halliford French Garden Company, for vegetables.

Silver Flora.—To Mr. S. W. Flory Tracey's Nursery, Twickenham, for orchids; to Messrs. H. Dixon, Wandsworth, for orchids; to Messrs. J. K. King and Sons, Coggeshall, for sweet peas; to Messrs. G. Stark and Son, Great Ryburgh, for sweet peas; to Mr. J. Box, Lindfield, for herbaceous flowers, etc.; to Mr. H. Pakeman, Thornton Heath, for carnations; to Mr. C. Blick, Hayes, for carnations; to Messrs. R. H. Bath, Lim., Wisbech, for herbaceous plants; to Messrs. Godfrey and Son, Exmouth, for herbaceous plants; to Mr. H. Hemsley, Crawley, for alpines; to Messrs. C. Ladhams, Lim., Shirley, for hardy herbaceous; to Messrs. S. Low and Co., Enfield, for carnations; to Messrs. Phillips and Taylor, Bracknell, for herbaceous plants; to Mr. R. Prichard, West Moors, for alpines; to Mr. C. Rassell, for rock garden, etc.; to Messrs. Whitelegg and Page, Chislehurst, for herbaceous plants, etc.; to Mr. J. D. Webster, Chichester, for sweet peas, roses, and carnations; to Messrs. J. Forbes, Hawick, Lim., for phloxes and herbaceous; to Messrs. G. Gibson and Co., Bedale, for delphiniums; to M. G. Green, Esq. (gardener, Mr. W. White), for sweet peas; to Mr. A. L. Gwillim, Sidcup, for begonias; to Messrs. J. Kelway and Son, Langport, for delphiniums; to Mr. W. A. Manda, St. Albans, for foliage plants; to Messrs. T. Rochford and Sons, Broxbourne, for araucarias; to Messrs. F. Smith and Co., Woodbridge, for phloxes and herbaceous; to Messrs. J. Waterer and Sons, Bagshot, for yews; to Messrs. Castles' Shipbreaking Company, Millbank, for garden seats; to Mr. T. Crowther, Fulham, for garden ornaments; to Messrs. Liberty and Co., Regent Street, for garden pottery; and to Lieut.-Colonel Sir George Holford (gardener, Mr. H. Alexander), Westonbirt, for orchids.

Silver Banksian.—To Mons. Vacherst, France, for new carnations; to Mr. J. Bruckhaus, Twickenham, for aspidistras, palms, etc.; to Mr. H. H. Crane, Highgate, for violas and violettas; to Messrs. G. Mallett and Co., Cheddar, for lilies, spiræas, etc.; to Mr. H. C. Pulham, Elsenham, for herbaceous and alpine; to Messrs. H. Freeman, Lim., Sutton, for rustic work; and to the Leyton Timber Company, Lim., Leyton, for rustic work; to the Countess of Ilchester (gardener, Mr. Kempshall), for cut shrubs; to Guildford Hardy Plant Company, for alpine and herbaceous plants; and to Messrs. Jarman and Co., for centaureas, sweet peas, and pelargoniums.

Bronze Flora.—To Messrs Bees, Lim., Liverpool, for hardy flowers; to Mr. Carlton White, New Bond Street, for box trees; to Messrs. W. Fells and Son, Hitchin, for rock plants; to the Misses Hopkins, Shepperton, for miscellaneous plants; to Messrs. Rich and Co., Bath, for hardy flowers; to Mr. V. Slade, Taunton, for cut blooms and plants; and to Messrs. Thompson and Charman, Bushey, for perennials.

### CERTIFICATES AND AWARDS.

First-class Certificates. — To Miltonia Hyeana Le Conquerant, from M. Jules Hye de Crom, Ghent; to Cattleya Artemis, from Lieut.-Colonel Sir George Holford, Westonbirt; to Cattleya Dupreana, The Dell var., from Baron Bruno Schroder; to Polypodium Mandaianum, from W. A. Manda, St. Albans; to Lilium Warleyense, from Miss Willmott, V.M.H., Great Warley; to Lastrea patens Mayi, from Messrs. H. B. May and Sons.

Award of Merit.—To border carnations Jean Douglas and John Ridd, from Mr. J. Douglas, Great Bookham; to Clematis Lady Betty Balfour, from Messrs. Jackman and Son, Woking; to Astilbe Avalanche, from Messrs. Van Waveren, Haarlem; to Nephrolepis exaltata Rochfordii, from Messrs. T. Rochford and Sons, Broxbourne; to begonias Mrs. Robert Martin and Florence Nightingale, from Messrs. Blackmore and Langdon, Bath; to climbing rose Ethel, from Mr. C. Turner, Slough; to rose Mrs. Charles S. Hunting, from Messrs. Hugh Dickson, Belfast; to strain of Phlox Arendsi, from M. G. Arends, Ronsdorf; to Brasso-cattleya Marion, from Messrs. J. Veitch and Sons, Chelsea; to Lælio-cattleya rubens The Kaiser, from Mr. E. H. Davidson, Twyford; and to Cattleya Thurgoodiana Apollo, from Messrs. Stuart Low, and Co., Enfield.

**Begonia nitida.** — Interesting as being the first begonia to flower in this country, and withal a very pretty plant, this species merits at least a passing notice. It forms an erect woody stem, and may be treated as a climbing plant, but at the same time is more useful when grown in a loose, bushy form. The bright green leaves are particularly glossy, and the flowers, either white or pink, are borne freely in good sized panicles. It is a very pretty subject for the greenhouse in the summer, and in an intermediate temperature will flower throughout the greater part of the winter. A native of Jamaica.—K.

THE
GREAT ROSE SHOW
OF THE YEAR
Will be held by the
NATIONAL ROSE SOCIETY
in the
ROYAL BOTANIC GARDENS,
Regent's Pk., N.W., on Tuesday, July 9th.

The two Champion Challenge Trophies will be competed for, also numerous other Cups and Pieces of Plate and Money Prizes to the value of over £400.

New Seedling Roses in a separate tent.

Bands of the ROYAL HORSE GUARDS (THE BLUES) and SCOTS GUARDS.

Luncheons, Teas, and other Light Refreshments.

ADMISSION—
Noon to 3 p.m., 5s.; 3 to 5 p.m., 2s. 6d.;
5 to 7 p.m., 1s.

E. MAWLEY,
Hon. Secretary, Rosebank, Berkhamsted.

Cardiff & County Horticultural Society.
24th GRAND ANNUAL SHOW
SOPHIA GARDENS, CARDIFF,
Wednesday & Thursday, July 17 & 18, 1912.
Specially good prizes in every Section, amounting in Money and Plate to nearly £500.
Tents lighted by electricity by Messrs. Fred Price and Co., Ltd.
POPULAR PRICES.
Schedules from the Secretary,
Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

MALVERN ROSE AND SWEET PEA SHOW.
THURSDAY, JULY 11th, 1912.
Open Classes in Roses and Sweet Peas.
Nearly £100 in Prizes.
Entries close July 8th.
For Schedules and Entry Forms apply to A. D. MELVIN, Secretary, The Poplars, Malvern Link.

ROYAL LANCASHIRE AGRICULTURAL SOCIETY.
GREAT HORTICULTURAL EXHIBITION will be held in connection with the above at Preston, August 1st, 2nd, 3rd, and 5th. Entries close July 15th. Schedules on application to PETER BLAIR, Trentham Gardens, Stoke-on-Trent.

TAUNTON FLOWER SHOW.
THURSDAY, AUGUST 1st.
Entries close Friday, July 26th.
R. A. GOODMAN, Secretary,
3, HAMMET STREET, TAUNTON.

WOLVERHAMPTON.
GREAT FLORAL FETE.
JULY 9th, 10th, and 11th, 1912.
NEXT WEEK.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

SASH BARS.—Special lines in certain lengths only, 1½ x 1, 2/6 100ft.; 3 x 1½, 5/9 100ft.; quotations for special lengths or for any kind of timber, garden lights, greenhouses, and woodwork. Send 5d. for the most up-to-date illustrated list of Builders' Woodwork and Timber in the World; or 1/- for list and rule—worth 2/6.
C. JENNINGS and CO., Timber Merchants, General Woodworkers, 916, Pennywell Road, Bristol.

PROTECT YOUR GARDENS —I DO NOT REQUIRE PAYMENT UNTIL YOU HAVE SEEN AND APPROVED OF THE NETTING. —Netting, good strong, stout, small mesh, will not rot, THE VERY BEST, as supplied to the ROYAL GARDENS by ME, 25yds. by 1yd., 1s.; by 2yds., 2s.; by 3yds., 3s., and so on; any length or width supplied. Orders over 5s. car. paid. List and samples free. Commoner and tender netting, as sold by others, 60 sq. yds. for 1s. — H. J. GASSON, Net Works, Rye. Est. 126 years.

When answering Advertisements please mention "Gardeners' Magazine."

# WORK FOR THE WEEK.

## STOVE PLANTS.

THYRSACANTHUS RUTILANS. — This stove plant is worthy of a place in collections for the beauty of its long racemes of bright crimson flowers, which are borne in winter and spring. Propagation is readily effected by cuttings taken from the old plants when they have finished flowering in spring. Assuming that sufficient numbers were rooted at that time, they will now be ready for their flowering pots. If single plants are grown, 6in. or 7in. pots will answer for the final shift. A compost of two parts fibrous loam, one of leaf soil, and one made up of dried cow manure, crushed charcoal, and a sprinkling of sand and bonemeal, will answer well. Pot firmly, and pinch out the leading points to induce branching. This thyrsacanthus does not branch out freely, even when pinched, therefore I adopt the plan of growing two or three in a pot. If these do well they may be flowered in 32's or 24's. Grow on freely in a heated pit or house for a few weeks, and when thoroughly established, afford cooler treatment for the remainder of the summer, to ensure well-ripened wood, on which free flowering depends. When in full growth, give plenty of air, and shade only from the hottest sun.

COLEUS THYRSOIDEUS. — This is another useful winter-flowering plant, now immensely popular. Its bright blue flowers are borne in profusion on long, erect panicles. The habit of growth is very similar to the foregoing, and precisely the same treatment will give good results.

POINSETTIA PULCHERRIMA. — Note should be made of the number of plants of poinsettias that have already been rooted; if there is any deficiency, insert more cuttings without delay. These late-struck cuttings make useful material if well looked after, and grown on freely, yet sturdily. A heated pit, not too deep, is an excellent place to grow them in, as they can be kept near the roof-glass, and lowered occasionally as growth advances. A close atmosphere must be maintained, accompanied by abundance of moisture for a few days after each repotting, taking care not to overwater at the roots. One good application immediately after potting will suffice for some days, provided frequent syringings are afforded daily. When it is seen that they have become re-established in the new compost inure gradually to full air and light, in order to ensure robust, short-jointed growth. Plants grown in strong heat, and given but little ventilation, give poor results.—H. T. MARTIN, Warren Wood Gardens.

## THE ORCHID HOUSES.

CYPRIPEDIUMS.—The members of this genus, which require a warm treatment, are not so extensively cultivated as the cooler-growing species; nevertheless, there are many very beautiful and attractive plants which produce their flowers at this season of the year. C. Stonei, C. Rothschildianum, C. Curtisi, C. ciliolare, C. barbatum, C. callosum, C. Lawrenceanum, with their varieties C. c. Sanderæ and C. L. Hyeanum, and various others, are amongst them. There are several hybrids which also bloom during the summer months. The majority of these plants require stove heat, and a liberal treatment generally, and are easy to cultivate. C. Lawrenceanum, with its varieties, also C. callosum and its varieties, with C. barbatum and C. superbiens are best grown at the warm end of the intermediate house. As they pass out of flower, they should be thoroughly examined, and any that require repotting must have attention, potting them in the same manner, and using a compost, as advised early in the year for winter-flowering cypripediums. The more simple we can make our practice, undoubtedly the more easy is it to follow, and the greater success shall we achieve. The whole of these plants are propagated easily, and may be divided again and again, provided care be taken in the operation. I do not advise division into the scraps we often see, as in the first place they do not produce flowers in the same proportion as fair-sized plants, neither are the flowers of the same quality, and as the plants are cultivated for their flowers it should be the aim to produce them in their best form. After repotting a watering should be given to settle the compost around them, and be set where they may be shaded from strong sunshine, and be sprayed overhead from time to time, especially on hot days. There must be no lack of moisture at the root, or in the atmosphere, but the usual caution must be used in watering until the plants are re-established. Insect pests rarely attack healthy plants of this genus. Should any plant become a prey to any abnormal attack of any insect pest, we can rely upon it that the conditions under which it is growing is not according to its liking or requirements.

THE SELENIPEDIUM GROUP, such as C. Schroderi, C. grande, C. Sedeni, and others may be treated in the same manner when they have finished flowering; the whole of this group thrives in the intermediate house at all seasons.

C. NIVEUM AND C. BELLATULUM, and others of the same section, which many have a difficulty in cultivating, may have attention soon after the flowers have faded. They have thick, fleshy roots, differing in character from either of the preceding, and they require a different compost and treatment. When repotting this section, great care must be taken to preserve the roots and leaves from injury. The leaves, being of a thick, succulent nature, can withstand drought much better than most. These cypripediums should be grown well up to the light at all times, in a stove temperature, where they can be protected from strong sunshine, and they must not be sprayed or syringed overhead. They will thrive in a compost of equal portions of peat, osmunda, and loam fibre, and sphagnum moss, from which all the fine particles have been taken. A few pieces of broken limestone may be added, and will be beneficial, especially where the water is deficient in lime. The plants may be potted much in the manner as an ordinary plant, leaving sufficient space between the surface of the compost, and the rim of the pot for sufficient water to thoroughly soak the whole.—J. T. BARKER. The West Hill Gardens.

## FRUITS UNDER GLASS.

LAYERING STRAWBERRIES.—Push on with this work, and finish without delay. No doubt where plants have to be grown for very early forcing this work has been accomplished; but, if necessary, layering can still be done, and good strong plants will result by the autumn. Great care must be exercised to select good strong runners that are just beginning to emit roots, and confine them to one plant on each runner; these should be securely pegged down, into three-inch pots, which have been previously filled with a good rich loam made moderately firm, the pots should be plunged nearly up to their rims in the soil between the rows, and this will materially assist the new compost to remain in a moist condition without the aid of frequent waterings. Damp over the plants occasionally during bright, sunny weather, in a few weeks' time they will have become well established in the small pots, when they should be detached from the old plants, and placed in ashes on a border facing west until they can be placed in their fruiting pots.

YOUNG POT VINES.—The young canes should be at least from ten to twelve feet in length; pinch out the growing points, and rigidly stop all laterals to one leaf; admit air by the top and side ventilators during bright weather, and maintain a day temperature of from 70 to 75 degrees, allowing a night temperature of 65 to 70 degrees. Syringe the plants early in the afternoon, and allow the temperature to rise to 90 or 95 degrees with sun-heat. The vines should be full of vigour, and the pots well filled with roots. Make every effort to induce the plants to build up good strong canes during this month; judicious feeding with chemical and artificial manures should be given. We find it necessary to administer some stimulating manure at least three or four times a week if the best results are to be attained. Keep a sharp look-out for red-spider and thrips, and, if discovered, immediate steps must be taken for their eradication. Mildew sometimes makes its appearance upon the young lateral leaves, which, if neglected, will soon ruin the foliage; a dusting with flowers of sulphur should be given, and the top ventilator left open a little for a few nights.

LATE VINES.—These will be making a large quantity of lateral growths, which must not be allowed to develop a great length before being pinched; it is a serious mistake to allow laterals to develop fully before removing them. This work should always be done gradually. Give the border a good soaking with weak lime water, examine the outside borders, and, if required, give sufficient water to thoroughly moisten the soil down to the drainage, and place a good mulching of stable manure upon the surface immediately after the watering has been done.—HENRY R. FARMER, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

THE MIXED BORDER.—This requires a good deal of attention to keep it smart and tidy, but no pains should be spared to give the different subjects necessary attention. Remove all dead flower stems, and continue to attend to the support of all plants in active growth. Do not allow any of the subjects to suffer for want of water at the roots, but give liberal soakings whenever the first signs of drought appear. Dahlias, Lobelia cardinalis, and any large-leaved foliaged plants that are employed will derive especial benefit from thorough waterings, without which they will not attain their full development. Various subjects will be greatly benefited by a good mulching after water has been applied, as this keeps the roots cool and moist. Keep the spaces between the plants regularly stirred with the Dutch hoe, while hand weeding must be practised where the hoe cannot be used. Sweet williams should be removed as soon as they have done flowering, and their places filled with early-flowering chrysanthemums, which will need to be well supplied with water until established.

ROSES.—It is desirable to give attention to the climbing varieties at the present time, cutting out any old flowering shoots, and making room for the young growths. Take care not to injure the strong basal shoots, as these will form the flowering growths next season. Beds of roses should have the dead blooms picked off every week, and the surface soil carefully raked over. When water has to be given at the roots liquid stimulants can be applied with advantage, and when extra fine blooms are required disbudding must be judiciously carried out. Upon the first appearance of mildew, spray the plants with some reliable specific. Flowers of sulphur mixed with a little soft soap, and dissolved in warm water, forms a simple and effective remedy.

SEEDLINGS.—These need careful handling when they are pricked out, and those subjects required for next season's spring display are ready to be transferred to nursery beds. Most of these do very well with a space of eight inches between them each way. Give them an open position, and damp over during the evening after bright sunny days.

GENERAL WORK.—Azaleas and rhododendrons should have their seed pods removed. The various hedges can now be trimmed, and formally trained shrubs should be clipped. A further sowing of mignonette may be made on a shady border, and any other late-sown annuals should be thinned. Formal flower beds require frequent attention, as the various subjects, like fuchsias and heliotropes, must be neatly tied from time to time. Dwarf plants employed for carpeting require to be carefully pegged down.—J. GARDNER, Batsford Park Gardens.

# EXHIBITIONS AND MEETINGS.

## Windsor.

Held in beautiful surroundings, on The Slopes, Windsor Castle, the Windsor Society's exhibition on Saturday, June 29, was a splendid success. The roses were wonderfully fine, and the competition was splendid throughout. The arrangements are so excellent at Windsor, and everyone receives such a hearty and hospitable welcome, that we feel sure the committee will be pleased to consider two suggestions for even further improvement. One is that the addresses of exhibitors be written on the class cards; and the other, that a larger tent be provided for fruits and vegetables.

### OPEN ROSE CLASSES.

In the great class for forty-eight blooms, distinct, the King's challenge cup brought out eight competitors. The cup was won outright by Messrs. D. Prior and Son, Colchester, with a champion lot, in which Horace Vernet, Victor Hugo (a marvellous flower), Comte Raimbaud, Frau Karl Druschki, Her Majesty, Lady Moyra Beauclerk, Mrs. T. Roosevelt, Mdmes. Jules Gravereaux, Juliet, and Nita Weldon were superb; Messrs. Alex. Dickson and Sons, Newtownards, second; and Messrs. B. R. Cant and Sons, Colchester, third. Mr. J. Prince annexed the premier award for eighteen tea or noisette roses, with a beautiful set of flowers, his Mrs. Foley Hobbs and Mrs. E. Mawley being excellent; Messrs. Alex. Dickson and Sons, a good second; and Messrs. D. Prior and Son, third.

For a dozen trebles, Messrs. Alex. Dickson and Son, Newtownards, secured the first prize among seven competitors, and their best blooms were Mdme. Chédane Guinoisseau, Frau Karl Druschki, Mrs. T. Roosevelt, George Dickson, and Lyon; Messrs. D. Prior and Sons, Colchester, second; and Messrs. B. R. Cant and Sons third. With Mildred Grant, Messrs. D. Prior and Son scored for a dozen blooms of any H.P. or H.T. rose; Mr. G. Prince came second with Frau Karl Druschki; and Mr. H. Drew, Longworth, third with Mildred Grant. Seventeen entries.

Mr. Prince led for a dozen blooms of any tea or noisette rose with a delightfully even set of Mrs. Foley Hobbs; Messrs. B. R. Cant and Sons second with Muriel Grahame; and Mr. H. Drew third with Mrs. Foley Hobbs. The class for eighteen bunches of decorative roses brought out five competitors, and here Messrs. Frank Cant and Co., Colchester, scored for a finely staged lot of lovely flowers, Irish Elegance, Zephyrine Drouhin, Lady White, Alister Stella Gray, and Papillon being especially good; Mr. Chas. Turner, Slough, second; and Mr. G. Prince, Longworth, third.

Messrs. B. R. Cant and Sons were to the front in the class for twelve blooms, each of a white and a red rose, and they won with Horace Vernet and Bessie Brown in fine form; Messrs. D. Prior and Sons second with J. B. Clark and Frau Karl Druschki; and Messrs. Harkness and Co., Hitchin, third. Ten competitors.

### AMATEURS.

The Windsor Chellenge Cup in the amateurs' section for the best twenty-four blooms was won by Mr. E. B. Lindsell, Hitchin, with a capital set, in which Mildred Grant, Comte Raimbaud, Mdme. Jules Gravereaux, Horace Vernet, Ulster, Frau Karl Druschki, A. K. Williams, Mrs. T. Roosevelt, and Comtesse de Nadaillac were very fine; Mr. G. A. Hammond second; and Mr. Conway Jones, Hucclecote, Gloucester, third. The cup presented by Princess Alexis Dolgorouki for eight trebles was also won by Mr. E. B. Lindsell with a superb set of Mdme. Jules Gravereaux, Bessie Brown, Wm. Shearn, Frau Karl Druschki, Mildred Grant, Her Majesty, Florence Pemberton, and Dean Hole; Rev. J. H. Burnside second, and Mr. G. A. Hammond third. Mr. Conway Jones scored for a dozen teas or noisettes, Maman Cochet and Mdme. Jules Gravereaux being especially good; Rev. F. R. Burnside second, and Rev. J. A. Fellows third. In another section Mr. W. O. Times, Windsor, scored for two dozen blooms, his Comte Raimbaud being a lovely bloom; Mr. L. S. Pawle, Beaconsfield, second; and Rev. J. A. Fellows third. The Rev. F. R. Burnside and Mr. R. Pryor secured the awards for twelve blooms.

### LOCAL CLASSES.

Mr. J. B. Fortescue, Dropmore, won the Lady Arkwright Cup in the local class for two dozen blooms, distinct, but was very closely followed by Mr. T. Stevenson, with Mr. A. F. Govett third. Mr. Stevenson won the cup presented by Mrs. B. Fortescue for the best eighteen H.T.'s or T.'s; Mdme. Constance Soupert, Mildred Grant, and Mdme Melanie Soupert were finely shown in this stand; Mr. E. F. Brown second; and Mr. D H. Davies, J.P., third.

Mr. T. Stevenson, gardener to E. Mocatta, Esq., Addlestone, won the first prize for six bunches of decorative roses, with capital bunches of Mrs. Peter Blair, Edu Meyer, Mdme. Abel Chatenay, Rayon d'Or, Crimson Rambler, and Irish Elegance; Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, second; and Mrs. P. Pope third. In another class for six bunches the Rev. J. B. Shackle, Dropmore, won the cup presented by Lady Evelyn Mason, and he showed Irish Elegance and Maharajah finely; Mr. R. Arkwright second, and Mr. A. L. Cook third.

The Rev. J. B. Shackle scored for nine teas or noisettes, and also for six blooms of a tea or noisette rose with Mdme. Jules Gravereaux. Mr. Colin Romaine had the best six blooms of an H.P. or H.T. rose, and won with Bessie Brown.

In the smaller growers' sections, Mr. E. F. Brown, Mr. A. Gilliatt, Mr. R. Arkwright, Mr. A. H. D. Fraser, and Mr. Randall secured the chief awards.

Mrs. J. B. Shackle had the best basket of roses, and showed a fine exhibit of Lady Curzon. Mrs. J. Bide, Farnham, led for a table decoration, and used Lady Hillingdon rose admirably; Mrs. Maslin came second with pink sweet peas; and Mrs. Redcliffe Sergeant third with pink carnations and blue sweet peas.

### PLANTS AND FLOWERS.

Mr. Phillips, gardener to E. Wagg, Esq., The Islet, Maidenhead, won outright the cup presented by the Marchioness of Normanby for a group of plants; this is the eighth time Mr. Phillips has been first prizewinner in the group class, and he has now won the cup three years in succession; he used palms, clarkias, carnations, and Francoa ramosa effectively with other suitable plants.

Mr. E. Clifton Brown led for six bunches of hardy border flowers, and Mr. C. Page, Dropmore, was second. Mr. E. Clifton Brown scored for a dozen bunches of sweet peas with a good clean set; Mr. A. L. F. Cook second, with blooms scarcely their best; Mr. F. A. Bishop, third. Miss Langworthy scored for nine bunches, with Lady Tress Barry, Windsor, second.

### FRUITS AND VEGETABLES.

In the fruit classes Mr. E. Jennings, gardener to W. L. Jackson, Esq., scored for white grapes, and Mr. R. Brown, gardener to Lady Tress Barry had the best black grapes. Mr. Jennings was ahead for four dishes of dessert fruits, and Mr. J. Orton, gardener to Colonel F. Cox, second. Mr. Stevenson led for nectarines with River's Early, and Mr. Jennings for peaches with Crimson Galande. Mr. C. Page scored for strawberries with fine dishes of Royal Sovereign and Bedfordshire Champion.

Mr. E. Johnson, gardener to A. Gilliat, Esq., scored for a collection of vegetables in the class provided by Messrs. J. Veitch and Sons; his Autumn Giant cauliflowers were excellent. Messrs. J. Carter and Co.'s prizes for six kinds of vegetables were won by Mr. W. Holden, gardener to Mrs. Adair, and Mr. T. Stevenson. In the class for six kinds, provided by Messrs. Sutton and Sons, Mr. Stevenson was first, Mr. Jennings second, and Mr. Burt third. Messrs. E. Webb and Sons also offered prizes for vegetables, and their premier award was secured by Mr. T. H. Bolton, gardener to the Earl of Devon, Powderham Castle, Devon.

### NON-COMPETITIVE.

Trade exhibits were very good, and notable displays were made by Mr. Charles Turner, Slough; Messrs. Jas. Veitch and Sons, Chelsea; Messrs. S. Bide and Sons, Farnham; Mr. W. Alsen, Waterlooville; Messrs. Fletcher Bros., Ottershaw; Mr. W. E. Tidy, Ascot; the King's Acre Nurseries, Hereford; Messrs. Jackman and Son, Woking; Mr. T. Tubb, Slough; and the Cherry Nurseries.

## The Royal Show at Doncaster.

JULY 3 to JULY 6.

A horticultural exhibition was as usual held in conjunction with the Royal Agricultural Society's show, and was held in fine weather despite the downpour of the previous day. The show was held in three huge tents, which were admirably arranged under the direction of Mr. Peter Blair.

The competitive classes were not supported as one would expect them to be, but the trade made up a splendid show. The groups of plants were undoubtedly the finest feature of the show. The premier class was for a group of plants occupying 350 square feet. Here there were four competitors, Messrs. J. Cypher and Son, Cheltenham, winning the first prize of £30 with one of their well-known groups. The arrangement, while being bold, was exquisitely light and graceful. The crotons stood out as a leading feature, the background being formed with palms, with an arch just behind filled with crotons and orchids. Cattleyas were massed with ferns, caladiums, and Rex begonias, while oncidiums were scattered throughout the group, the bright Clerodendron fallax lending colour to the general scheme, the whole forming one of Messrs. Cypher's best efforts.

The second prize of £25 was awarded Mr. W. A. Holmes, West End Nurseries, Chesterfield, who made a fine display with crotons, especially C. Warreni, Cocos Weddelliana, carnations, dracænas, and Humea elegans, the whole group being lightly arranged with considerable skill. Mr. J. S. Sharp, Valley Nurseries, Banksford, Almondbury, was placed third with a very bright group, the dracænas, crotons, and caladiums being assisted with bright red crassulas. Mr. W. Vause, Leamington, was fourth with some splendid plants.

For a collection of orchids, arranged for effect on a stage one hundred feet square, Messrs. J. Cypher and Son were the only exhibitors, and deservedly gained the first prize. The group was well arranged with the aid of suitable foliage plants. The chief subjects employed were Cattleya gigas, C. Mendelli, Odontoglossums percultum and Pescatorei, with fine miltonias and oncidiums.

The group of begonias that secured the first prize for Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath, was remarkably fine; one could not pick out a really weak plant. They were chiefly large double varieties, the most prominent being Florence Nightingale, Mrs. R. Moreton, W. H. Fry, and the Hon. J. R. C. Boscawen, while the baskets of Golden Shower, Fleur de Chrysanthemiste, Gladys, and Lena were greatly admired.

Mr. B. H. Brooksbank, Sandrock, Rotherham, was third, but somewhat overpowered by the first-prize group.

Messrs. J. Cypher and Son were the only exhibitors for a collection of stove and greenhouse plants in flower. These secured the first prize, and worthily so; the chief subjects were Statice profusa, Ixora Fraseri, Erica ventricosa Bothwelliana, Clerodendron fallax, Allamanda nobilis, and Clerodendron Balfouri.

For a display of herbaceous flowers, bamboos, liliums, and foliage, Messrs. James Backhouse and Son, Lim., York, were the first-prize exhibitors. They fully maintained their reputation, making a fine show with an artistic arrangement, in which were noted Orchis foliosa, Viola cornuta purpurea, sarracenias, and a nice collection of hardy ferns. In the pools were to be seen nymphæas and similar subjects. Messrs. W. and J. Brown, Stamford, were third with a bright and attractive group, in which were seen fine clumps of Gaillardia Lady Exeter, Dianthus Napoleon III., with liliums in large variety, Verbascum Miss Willmott, and Thalictrum Delevayi—a capital exhibit.

The prizes for collections of hardy perennials brought out a keen competition. Messrs. Harkness and Son, Bedale, however, proved the victors in a tight tussle. They displayed large vases of Verbascum Caledonia, Gaillardia Ideal, liliums, Delphinium Corsair Gladioli delicatissima, English irises and campanulas, the whole being admirably displayed. Messrs. Artindale and Sons, Sheffield, were second, staging some fine vases of Gladioli Blushing Bride, Lilium croceum, irises, delphiniums, and anchusas.

For a collection of cut roses, Mr. F. M. Bradley, Peterborough, was placed first with a highly decorative exhibit. Tall ramblers made a good background, while the bamboo stands contained splendid examples of Edward Mawley, Irish Elegance, Mrs. Peter Blair, and Lady Wellington. Messrs. W. and J. Brown were second with a very meritorious exhibit. They had excellent examples of Lyon Rose, Duchess of Wellington, Arthur E. Coxhead, and Harry Kirk, while Messrs. R. W. Proctor and Sons, Chesterfield, were third.

The class for a collection of carnations was left to Mr. C. Englemann, Saffron Walden, to maintain its reputation, and he did it well, too, staging in a light and attractive manner superb blooms of Carola, Lady Northcliffe, Beacon, Elecktra, Sunstar, and Harlequin, with several others.

For eight kinds of vegetables the only competitor was the Duke of Portland; gardener, Mr. J. Gibson, Welbeck Abbey, Worksop, who was deservedly awarded the first prize for a really fine collection. The best dishes were Carrot Sutton's Favourite, Cauliflower Magnum Bonum, really perfect; Onion White Leviathan, Centenary peas, Tomato Satisfaction, and Potato Gadiator.

Mr. J. Gibson was practically the only exhibitor in the fruit classes, and he certainly deserved the number of firsts he obtained. For four bunches of grapes, distinct, he won first with nice examples of Black Hamburgh, Muscat of Alexandria, Black Alicante, and Buckland Sweetwater. Mr. Chas. Thelhussen was second with Chasselas Napoleon, and Madresfield Court as his best examples.

Mr. J. Gibson was the only competitor for two bunches of Muscat of Alexandria, and obtained first prize. The same exhibitor also was awarded first for Black Hamburgh, receiving the same award for Madresfield Court; while the first prize for two dishes of peaches was awarded him for fine examples of Dymond and Goshawk. The class for nectarines was also undisputed, Mr. J. Gibson again winning first prize.

The strawberry class for four varieties, went to Mr. C. Thelhussen, who had nice nice boxes of Royal Sovereign, Leader, and Givon's Late.

Mr. J. Gibson was the only exhibitor of a collection of thirty dishes of ripe fruits, decorated with flowers and foliage. Although left to himself, Mr. Gibson produced a fine effect, using vases of Malmaison carnation Princess of Wales as a background, with other suitable flowers and foliage. The best dishes were Dryden nectarine, Brown Turkey figs, splendid examples of James Grieve apples, Governor Wood cherries, Early Transparent gages, Muscat of Alexandria grapes, and a fine dish of Waterloo strawberries.

### NON-COMPETITIVE EXHIBITS.

These certainly comprised the bulk of the show, most of the leading firms of the North and Midlands being represented, while some from the South, though busy at the Holland House Show, managed to put in a good appearance.

Messrs. Alex. Dickson and Son, Lim., Newtownards, staged a splendid exhibit of roses, which attracted so much attention that it was difficult to get near the exhibit. A few of the most attractive features were Irish Fireflame, G. C. Waud, Mrs. H. Brocklebank, Betty, and Lyon Rose. Messrs. Young and Co., Cheltenham, staged a fine collection of carnations, which were admirably arranged in tall vases.

Mr. H. L. Ellison, West Bromwich, had a pleasing group of ferns, in which good examples of Pteris Parkeri, Cibotium Schiedi, Platycerium grande, and Nephrolepis Whitmanni were noted, also a large collection of cacti. Near by Mr. Thos. Davis, Syderstone Nurseries, Norfolk, exhibited his Challenge rhubarb in great style, also a number of other varieties.

A choice collection of vegetables came from the Hon. Vicary Gibbs (gardener, Mr. E. Beckett), Aldenham House, Elstree. These were arranged in Mr. Beckett's well-known style.

Messrs. W. J. Godfrey and Son, Exmouth, staged some splendid examples of Campanula calycanthema, with border carnations, decorative pelargoniums, zonals and ivy-leaved varieties; mention should also be made of some fine pentstemons, and plants of Solanum Wendelli.

Carnations from Mr. A. F. Dutton, Iver, Bucks, attracted quite a crowd. He staged a fine table, containing good vases of Mrs. A. F. Dutton and Duchess of Westminster.

From Mr. H. Morse, Westfield Nurseries, Eaton, Norwich, came some charming roses that were worthy of a little more time in staging. He had, however, splendid vases of Madame Ravary, Harry Kirk, General McArthur, Marquise de Sinety, and Duchess of Wellington. Messrs. Stuart Low and Co., Bush Hill Park, fully maintained their reputation in roses, carnations, and orchids, which they staged in distinct groups. The roses were in fine form and well staged, as were also the carnations and orchids. The roses were particularly attractive, being large, of good colour, and delightfully fresh.

Hardy flowers from Messrs. G. Gibson and Co., Leeming Bar, were much admired for their freshness and good arrangement.

From Messrs. R. H. Bath, Lim., Wisbech, came a pleasing display of hardy flowers. which included fine delphiniums, roses, and carnations; while their exhibit of sweet peas was very fresh and bright.

Mr. W. Sydenham, Melbourne, Derbyshire, exhibited violas and hardy flowers in good form, the violas being most attractive.

Sweet peas from Mr. R. Bolton, Warton, Carnforth, attracted much attention for they possessed wonderful colouring, especially the varieties Agricola, R. F. Felton, Charles Foster, and Sterling Stent. Messrs. Jarman and Co., Chard, had a capital collection of roses, sweet peas, carnations, and their well-known hybrid centaureas.

Messrs. Broadhead and Son, Huddersfield, were represented by a tasteful rock garden on which all the plants seemed quite at home.

Messrs. J. King and Sons, Coggeshall, had an exhibit of sweet peas, also a fine collection of vegetables, which were put up in an attractive manner.

Messrs. G. Massey and Sons, Spalding, were represented by a collection of hardy flowers, and some capital vegetables, but the two do not go well together. The vegetables were worthy of a table to themselves.

Messrs. Whitelegg and Page, Chislehurst, had an exhibit of their Newberry, which appeared to attract considerable attention.

Messrs. E. W. King and Co., Coggeshall, displayed sweet peas in their well-known style; while the roses from Messrs. B. R. Cant and Sons, Colchester, came in for much admiration, the fine columns of Warrior, St. Helena, Sunbeam, and Ed. Mawley being excellent. Messrs. Burrell and Co., Cambridge, also sent a fine collection of roses.

Messrs. Dickson and Robinson, Manchester, had a large group of hardy flowers most tastefully arranged, while a group of retarded Azalea mollis in fine condition appeared to be popular with the visitors.

Messrs. Sutton and Sons, Reading, had a magnificent collection of gloxinias and nemesias in the tents; needless to add, this was admirably arranged, and greatly admired.

From Messrs. Bakers, Wolverhampton, came a choice group of hardy flowers, in conjunction with a water garden. The English irises and nymphæas were the chief features here.

The King's Acre Nurseries, Lim., Hereford, had a fine group of fruit trees in pots that created a small sensation, for the apples, pears, peaches, and plums were well fruited and in a ripe condition; they were also arranged in an attractive manner.

### AWARDS.

Large gold medals were awarded to Messrs. J. Gibson, Young and Co., R. Bolton, Bakers, and J. Cypher and Sons.

Gold medals to Messrs. E. W. King and Co., Blackmore and Langdon, Pennell and Sons, H. B. May and Sons, A. W. Dutton, Stuart Low and Co., J. Waterer and Sons, Alex. Dickson and Sons, Lim., and C. Thelhussen.

Silver-gilt medals to Messrs. Kent and Brydon, Godfrey and Son, R. H. Bath, Lim., King's Acre Nursery Co., Dickson and Robinson, Sutton and Sons, Toogood and Sons.

Silver medals to Messrs. H. J. Ellison, H. Morse, Jarman and Co., B. R. Cant and Sons, Seagrave and Co., W. and J. Brown, C. Waters, Broadhead and Co., Burrell and Co., W. Sydenham, E. J. Batchelor and Son, W. Artindale and Son, Clibrans.

## Cambridge Horticultural Society.

This old society, established in 1824, held its exhibition in the delightful grounds of St. John's College on Wednesday, July 3. The early morning proved threatening, with occasional showers, but from midday onward warm, bright weather prevailed. The society has had a varied experience, but probably never has it had a finer show than this year, and those competent to judge considered that the roses were particularly fine, both in numbers and quality, and a great advance upon the roses of recent years. Hardy flowers, sweet peas, and pelargoniums were other excellent features, and small fruits were very fine. Altogether Mr. Rupert Fuller and his committee have good reason to congratulate themselves upon the success of this exhibition.

There were several important classes for roses, and three of these were open to all. Lord Peckover presented the first prize for forty-eight blooms, distinct, and this was won by Messrs. J. Burrell and Co., Cambridge, with a heavy, bright set of blooms that included fine examples of Mrs. T. Roosevelt, Lady Barham, Her Majesty, Mildred Grant, Mdme. Jules Gravereaux, Lady H. Vincent, Souv. de Pierre Notting, and Hugh Dickson; Mr. John Pigg, Royston, second; and Messrs. G. and W. H. Burch, Peterborough, third.

For three dozen blooms, distinct varieties, the prizes fell in order of mention to Mr. J. Pigg, Royston, whose blooms were particularly bright and fresh; Messrs. J. Burrell and Co., Cambridge, who had some very weighty blooms; and Messrs. G. and W. H. Burch. Twelve tea or noisette roses is usually a good class. On this occasion there were five competitors, and first prize was awarded to Messrs. J. Burrell and Co., who had a fine box of Mdme. Constant Soupert, White Maman Cochet, Souv. de Elise Vardon, Mr. Dudley, W. R. Smith, and A. Hill Grey; Mr. J. Pigg second, and Rev. J. A. Fellowes third.

Five rose classes were provided for members only. In the leading one, for twelve blooms, Mr. Hinckly, gardener to Rev. J. A. Fellowes, scored with a fine lot of blooms, his Mildred Grant, F. K. Druschki and Helen Keller being very fine; Mr. C. E. Inglis second, and Mr. M. Coulson third. Mr. R. N. Biffen led for six roses with a lovely even set, in which Mr. David McKee and Mr. T. Roosevelt were a trifle the best; Mr. W. Dunn second, and Mr. M. Coulson third. For six teas the prizes went in order to Mr. E. W. Miller, Mr. W. Dunn, and Mr. A. Colin Lunn; while Mr. R. M. Biffen was an easy first for three tea roses; and Mr. M. Coulson scored for three other than tea roses in a keen competition.

Mr. Ridgewell, gardener to R. J. Fuller, Esq., St. Andrews Street, led for a dozen varieties of pelargoniums, three trusses of each; Mr. Andrews, gardener to J. M. Linton, Esq., second, but neither labelled their varieties. Mrs. Routh had the best set of six varieties, Mr. Ridgewell coming second in this class. Mr. C. Smith scored for a dozen vases of delphiniums with a capital exhibit, and Dr. Dalton led for six bunches of hardy flowers. Mr. C. Smith led for a dozen bunches of hardy flowers in a very keen competition, his bunches of scabious, Lilium candidum, L. elegans, and potentillas being excellent; Mr. J. Hall second, and Mr. R. Burn third.

The premier set of eighteen bunches of sweet peas was won by Mr. F. Hian with a grand lot of Mrs. R. Hallan, Douglas Unwin, King Edward Spencer, Arthur Unwin, Clara Curtis, etc.; Mr. A. Murrell second, and Rev. J. A. Fellowes third. Mr. Hian was a capital first for a dozen bunches of sweet peas, and he showed grand spikes of leading varieties; Mr. P. Hawkes second, and Mr. W. P. Neal third. Dr. Keynes led for six bunches of sweet peas, with Mr. Hian, Mr. Hawkes, and Mr. Murrell taking other awards.

First prize for a decorated table was won by Mrs. A. E. Warren with a beautiful design in pink and pale blue sweet peas and gypsophila; Mrs. Edwards second, and Mrs. J. Hall third. For a table with roses as decorative subjects, Mrs. R. M. Biffen scored with a bold display of Mdme. Abel Chatenay, Mrs. Tate, etc.; Dr. Keynes second, and Mr. Edwards third.

The premier award for a large group was won by Mr. W. P. Neal with a bright contribution, in which crotons, variegated abutilon, anthuriums, begonias, and Statice Suworowi were well arranged; Mr. R. S. Hudson second. Mr. Hudson annexed the chief prize for six specimen ornamental foliage plants, a giant Kentia being his chief plant. Sir John Sandys had the best fuchsias, and Mr. W. A. Harding second.

Mr. R. S. Hudson led for ten orchids with good Vanda cærulea, Thunia Marshalliana, Cypripedium barbatum, etc.; Mr. W. A. Harding second. The latter had the best specimen fern, and also the finest three ferns, one of these being a grand Adiantum cuneatum. Mr. Hudson beat Sir John Sandys for six exotic ferns, and each showed well, the latter winning for six hardy ferns. Mr. R. J. Fuller had the best dozen single zonal pelargoniums, staging freely-flowered specimens in 6in. pots, and carrying fine trusses; Mrs. Routh second. For six double-flowered plants these competitors had positions reversed, and for six singles Mr. P. Hall led.

Strawberries were grandly shown, and the first prize fell to Mr. A. Lelliott for superb berries of Givon's Late Prolific; Messrs. R. M. Jones and Son second. In the flavour class Dr. Dalton scored with British Queen. Mr. Lelliott scored for raspberries, Mr. Dann for gooseberries, Mr. Dobbs for black currants with enormous berries, and Mr. Lelliott for red currants.

Mr. W. A. Briscoe had the best eight dishes of vegetables, and his French beans, tomatoes, marrows, and potatoes were capital. Mr. Routh had a splendid bunch of carrots, a perfect set, and won first prize. Mr. C. E. Englis led for peas, Mr. R. J. Hall for potatoes, and Mr. C. Forbes for tomatoes.

Messrs. Wood and Ingram, Huntingdon, contributed a very fine non-competitive collection of roses, their Rayon d'Or, Marquise de Sinety, Gen. MacArthur, Molly Sharman Crawford, and Lady Pirrie being excellent. Messrs. J. Burrell and Co. also exhibited roses in goodly numbers and of good quality.

## METEOROLOGICAL OBSERVATIONS.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, trees, fruits, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

GALLS ON RHODODENDRON LEAVES.—L. F., Newark: Please tell me the cause of the galls on enclosed rhododendron leaves, and cure, if possible.—The galls are due to the presence of a fungus named Exobasidium rhododendri, and all infested leaves should be at once removed and burned, so that they do not produce their spore-bearing organs and spread the disease.

DISEASED TOMATOES.—B. S., Devon: A number of my tomatoes have black patches on the fruits (specimens enclosed), and I shall be glad if you will tell me how to stop the trouble.—The black patches are ample evidence of Black Rot (Macrosporium tomato), a disease that is fairly common in tomatoes. A moist, stagnant atmosphere always encourages fungus troubles, hence great care should be taken with watering and ventilation. It is said that the black rot disease is a wound parasite, and can only find entrance by means of wounds or cracks in the fruit. This, again, points to the need of more care than is frequently exercised in tying and training the plants. Remove and burn all affected fruits, and spray the plants with a potassium sulphide solution (1oz. to 2½ gallons of water) at intervals of about a week.

URSINEA PULCHRA.—L. C., Seaford: During the winter we received some seeds from South Africa, and were told that they came from a very pretty yellow-flowered annual. We treated the seeds as for half-hardy annuals, and have now a considerable batch just in bloom. I enclose a few blooms, which are very showy, the blackish zone setting off the yellow colouring finely. There is something familiar about the plants, but no one here can tell me the name. Perhaps you will help me.—The flowers are those of Ursinea pulchra, a South African species that is occasionally catalogued as Sphenogyne speciosa. It is a showy annual, best treated as half-hardy, and it is one that suggests great possibilities in the hands of some clever and patient grower. There is a form with wholly yellow flowers. Careful selection should make sturdier plants, and give variety in colour.

SEDUM SIEBOLDI.—D. R. P., Chelmsford: I enclose a small piece of a plant which I understand is Sedum Sieboldi. I have seen it cultivated as a pot plant, and should be glad if you will kindly give me some particulars concerning its management.—Sedum Sieboldi is a trailing Japanese species that is not quite hardy in all parts of the country, but is a capital greenhouse plant, and one especially suitable for cultivation in hanging baskets, or in pots for the decoration of bench margins. The specimen sent is S. Sieboldi variegatum, and this is more effective than the type, as it has a bright creamy blotch on each leaf, whereas in the type the leaves are wholly blue-green. S. Sieboldi has pink flowers, each petal with a green spot, and these appear about August. Early spring is a good time to divide and repot old plants; the soil should be sound loam, with some old mortar rubbish and sand. An ordinary greenhouse will suit the plant very well at such season, but before potting and after re-establishment a minimum temperature of 40 degrees will suffice if a light position is provided. In some districts Sedum Sieboldi and its variegated form are largely grown by cottagers, who suspend their plants inside the front-room window throughout the winter, and hang them over the doorway or window, outside, during the summer.

LARGEST-BERRIED WHITE GRAPE.—M. M., Worthing: Will you please tell me which is the largest-berried white grape?—Duke of Buccleuch is regarded as the largest-berried white grape in cultivation. When well grown the berries are of wonderful size, and, as they seldom have more than two seeds, their useful content is large. This variety was raised by Mr. Wm. Thomson, when at Dalkeith, and gained a first-class certificate from the Royal Horticultural Society in 1872.

HARDY FLOWER BORDER. — A. S., Chelsfield: What would you suggest to make an effective border 5ft. wide and 20ft. long, backed by a creeper-covered wall? I have been using antirrhinums, mallows, ageratums, and stocks. The border has a box edging.—In the early autumn clear the border, and trench the ground, working in plenty of well-decayed manure. As soon as the soil has settled plant a selection of Michaelmas daisies, delphiniums, and helianthuses towards the back, with erigerons, pyrethrums, varieties of Chrysanthemum maximum, heleniums, rudbeckias, achilleas, geums, etc., along the centre and towards the front. Leave room for a few antirrhinums, and early-flowering chrysanthemums, coreopsis, and gaillardias, to be planted in the spring. Two or three pillar roses might be added; while, in flowing groups along the front, pinks and violas should be provided, as these flower so freely. This is a mere outline of what you could do. Bulbs should be planted for spring effects among the other subjects. We suggest that you pay special attention to our numerous articles on hardy plants; look round gardens and flower shows in your neighbourhood, and make notes of plants that appeal to you, and then, later on, write us again, and we will be pleased to give you all the help we can.

### NAMES OF PLANTS.

L. C., Seaford.—Ursinea pulchra.

A. S., Chelsfield.—A poor specimen, probably Chelone Lyoni.

F. F., Upminster.—1, Geranium armenum; 2, Lychnis alpina; 3, Phlox ovata.

G. W. P., Bromborough.—1, Thalictrum odoratum; 2, Campanula glomerata; 3, Coronilla iberica.

W. K. H., Wivelsfield.—Campanula garganica; 2, Alyssum argenteum; 3, Lychnis chalcedonica; 4, Silene saxifraga.

S. B., Church Stretton.—1, Gypsophila prostrata; 2, Ligustrum chinense; 3, Achillea Clavennæ; 4, Campanula Van Houttei.

R. B., Bramshott. — 1, Deutzia crenata fl.-pl.; 2, Deutzia crenata; 3, Philadelphus Gordonianus; 4, Cistus ladaniferus; 5, Kalmia latifolia; 6, Spiræa confusa.

H. M., Wareham.—1, Kalmia latifolia; 2, Platystemon californicus; 3, Diplopappus chrysophyllus; 4, Silene maritima; 5, Hemerocallis fulva; 6, Allium Moly.

### GARDENING ENGAGEMENT.

Mr. E. Harriss, fruit foreman at the Royal Gardens, Windsor, has been appointed head gardener to Lady Wantage, Lockinge Park, Wantage, Berks, in succession to the late Mr. W. Fyfe.

**Primula obconica.**—With the improvement in the flowers of this now well-known and popular primula, it seems—at least, as far as my limited experience goes—that the leaves are less poisonous than was at one time the case; at all events, we do not hear as many complaints as we formerly used to. Personally, however much I handled them, I was never affected thereby. —K.

KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

——, Esq., Jamaica Street, Glasgow.
"I have to thank you for the plants I received from you in the spring. Everything, without exception, has done splendidly, and my border at the present time is simply grand."

CALCEOLARIA, KELWAY'S PERFECT MODEL.—This is the premier existing strain. It possesses an unequalled variety of delicate as well as gorgeous tints, and the flowers are well rounded, of enormous size, and extraordinarily freely produced. Apply to your Seedsman anywhere for Kelway's true strain, and take no other. 1s. 6d., 2s. 6d., 3s. 6d., and 5s. per pkt. in Kelway's packets. New crop.

CINERARIA, KELWAY'S PERFECT MODEL GRANDIFLORA.—The finest existing strain. Extraordinarily large, beautifully formed flowers of many tints, including fine real blues, cardinal colour, rose, pink, and purest white. Apply to your own Seedsman anywhere for the true "Perfect Model" strain, and insist on receiving this kind only in Kelway's packets. New Crop, 1s. 6d., 2s. 6d., 3s. 6d., and 5s. per pkt.

## To be Sold.

### IN CHANCERY.

### MESSRS. H. CANNELL AND SONS,

SWANLEY, ST. MARY CRAY, AND EYNSFORD.

These old-established Nurseries, universally known as the "HOME FOR FLOWERS," may be acquired by Private Treaty as a going concern, either as a whole or in three Lots.

THE PROPERTIES COMPRISE:—

A.—The Home Nurseries, Swanley, about 15 acres, with all the Glasshouses, Seed Warehouse, Office, Trade Buildings, and Residence.

B.—Eynsford Nursery, Part 1: 40 acres, Glasshouses, and Residence.

B.—Part 2: 229 acres of land, with a very extensive stock of young fruit trees, and part also permanently planted as orchard. Farmhouse and numerous buildings.

C.—St. Mary Cray, the Cockmannings Nursery, 35 acres: Conifers, Ornamental Trees, and General Nursery stock. Farm House and Buildings.

The Nurseries at Swanley and Eynsford abut, to a considerable extent, upon the Railway, and this offers exceptional advantages for advertising the business.

The Firm have been successful Exhibitors at the most important Shows for many years, and obtained a Gold Medal for their exhibit of Cannas, Pelargoniums, Calceolarias, etc., at the recent International Show at Chelsea.

Full particulars may be obtained from Messrs. Stone, Morris, and Stone, Solicitors, 5, Finsbury Circus, E.C.; Messrs. T. P. Child and Son, 8, Frederick Place, Old Jewry, E.C., Chartered Accountants; and Messrs. Protheroe and Morris, Auctioneers and Estate Agents, 67-68, Cheapside, E.C.

RARE ALPINES CHEAP, profits devoted to patriotic objects. Apply for list. LADY C., The Abbey, Much Wenlock, Shropshire, and please enclose fully addressed and stamped envelope.

FOR SALE, 8 volumes of Nicholson's Illustrated Dictionary of Gardening, cost £3 8s.; will accept £2 10s., or nearest offer. Apply A. BIRT, Dunkirk, Inchbrook, Stroud, Gloucestershire.

## Wanted.

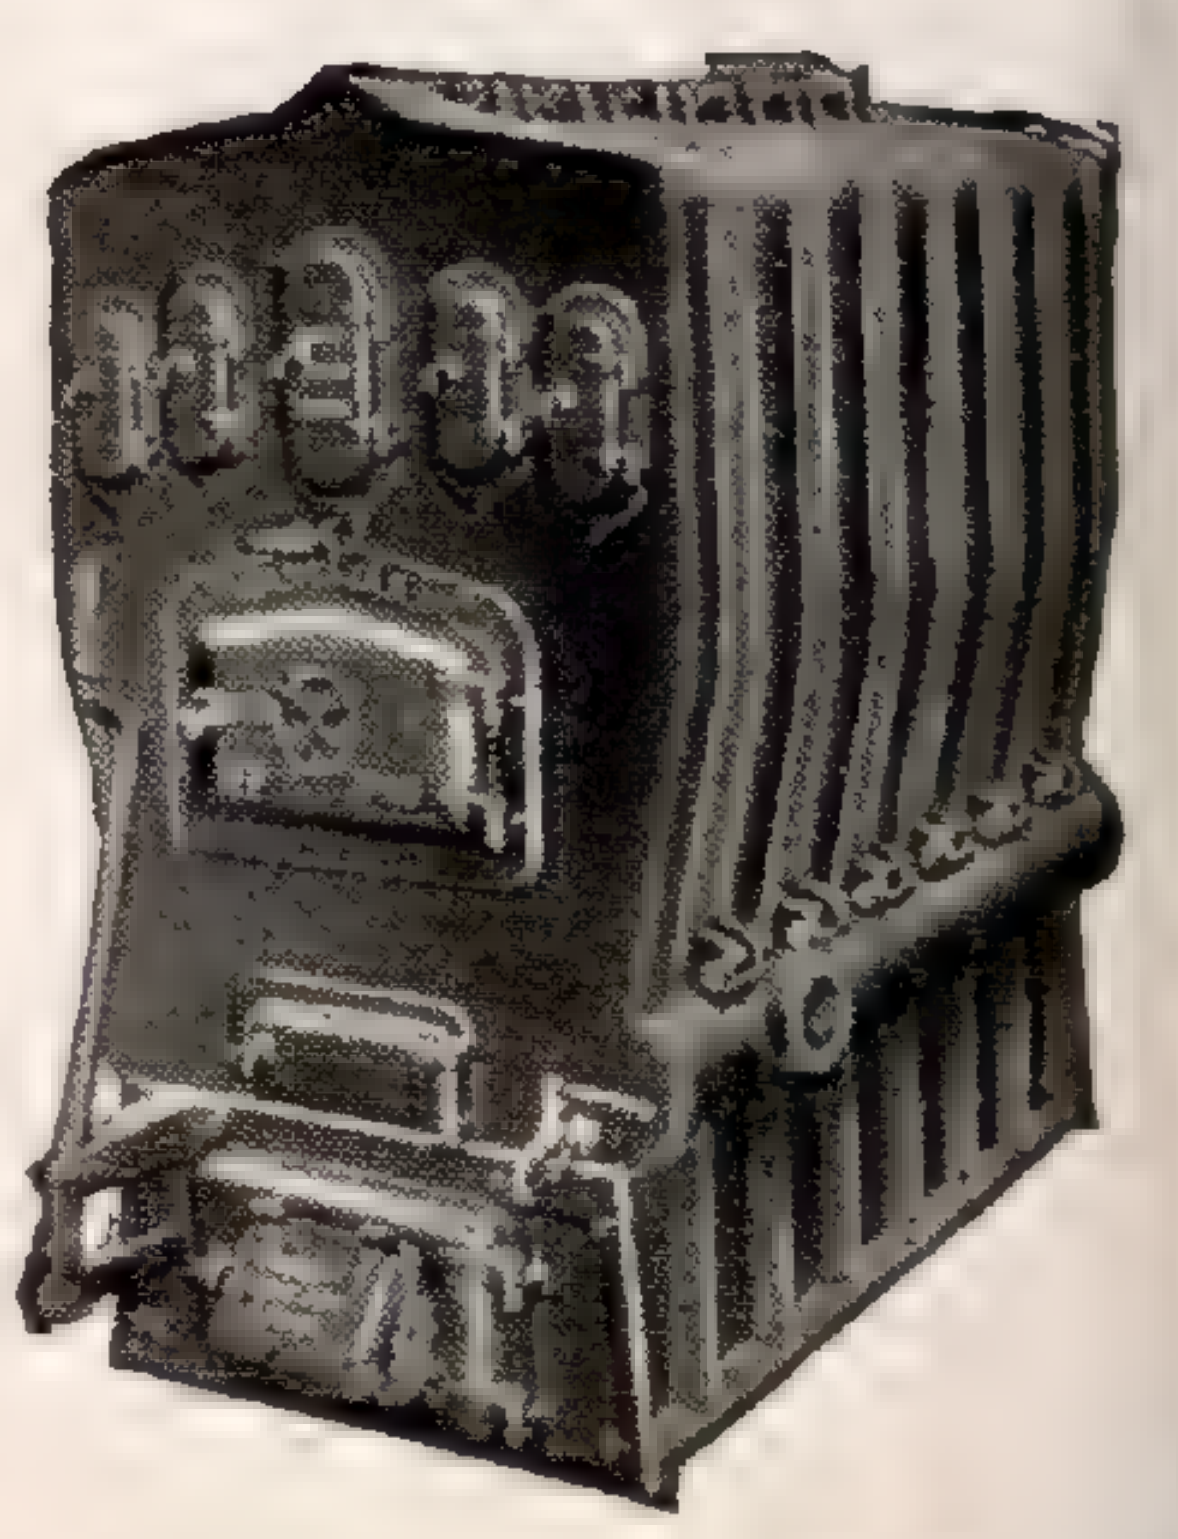
WANTED, Large Kentia Palms up to 25ft. high; large, well-coloured Dracænas and Crotons, also Aspidistras.
ROBERT GREEN (1911), Ltd.,
28, Crawford Street, London, W.

## Orchids! Orchids!! Orchids!!!

The undersigned begs to announce to the Public that he is in a position to supply, wholesale or retail, **Burma Orchids**, of 50 varieties at a moderate price. Further particulars on application.—**J. C. PRAZER, Orchid Collector, KALEWA, BURMA.**

N.B.—Please register orders early for Dendrobium Nobile, thick-bulbed variety; Dendrobium Jamesianum, Dendrobium Bensoni, Renanthera imschootiana, Vanda Cœrulea Lushai Hill variety, dark blue type; Cypripedium spicerianums of five and six growths, as these are scarce and expensive collecting.

## Kinnell's Boilers



**THREE LEADING TYPES:—**

*The* **"ANGLIAN," Sectional**, heats 800 to 8,000 ft. 4in. pipe.
*The* **"ROCHFORD," Tubular**, heats 600 to 8,000 ft. 4in. pipe.
*The* **"HORSE-SHOE"** for the small Greenhouse.

**Saddle Boilers, Trentham Boilers, and all classes of Pipes, Fittings, etc., ready for immediate despatch.**

THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Bedding Roses.

Chief among the more important of the many changes that have been made within recent years in connection with roses and their cultivation, are the general recognition of the great value of the dwarf-growing and continuous-flowering varieties for beautifying the flower garden throughout the summer, and the appreciation of the desirability of arranging them in beds and masses of one variety. It will be remembered by those who have taken an active interest in roses for any considerable period that it was long the practice to proceed on much the same lines in the purchase and planting of roses as were followed by those who gave attention to fruit growing. Until about a quarter of a century ago it was a quite common practice for those who were desirous of forming new fruit plantations, or adding to the fruit trees already established, to visit an exhibition of fruit, and select therefrom varieties that were remarkable for the attractive appearance of their fruits, and in some instances as many varieties were selected as the number of trees required. The result of this unfortunate practice was to fill the garden with fruit trees that varied much in productiveness and in the quality of their fruits, and the supplies suffered in consequence. In following the same lines the amateur rosarian visited the principal rose shows, and with pencil and note-book in hand, jotted down such of the roses that, by reason of their large size, shapely form, or beautiful colouring attracted his or her attention. The varieties were in due course purchased and planted, and, as shown by the results later on, the beds and borders were filled with roses of varying degrees of merit. Amateur rosarians are not wholly to blame for the mistakes that were made in the past, for writers on roses, both in books and periodic literature, devoted the greater proportion of their space to dealing with the details associated with the production of blooms for exhibition, and, with but few exceptions, appear to have failed to recognise the fact that some of the beautiful varieties which were essential to those desirous of obtaining honours at the exhibitions were not sufficiently vigorous in growth to be of value for garden decoration. This was one weak point in the old practice, which happily has given way to the new, and another point certainly not free from weakness was the planting in the same beds a multiplicity of varieties evincing a wide divergence in habit. The diversities in habit, in the size and form of the flowers, and in the colours afforded by any considerable number of roses, possess so much interest to those who are keenly alive to the varied charms of the rose that it would not be difficult to defend the planting of large selections representative of the more important classes. No objection could well be raised to the planting of a large number of varieties for the purpose of studying their individual characteristics, provided they are not planted where they will form a prominent part of the decorative aspects of the garden. Arranged in a spacious border, or indeed in a series of beds in a remote part of the garden, they would, throughout the season, give an immense amount of pleasure to those who are so keenly interested in roses as to derive enjoyment from a study of the individualities of varieties. When, on the other hand, roses are intended for the production of colour effects in the flower garden, and especially those parts which, by reason of their contiguity to the residence are constantly under observation, such collections as these are wholly inadmissible. It is, indeed, essential that varieties should be selected that are neat in habit, free and continuous in flowering, and attractive in colour. In other words, those who would have their gardens beautiful with roses from early in June until the autumn is well advanced, must plant the varieties that are commonly known as bedding roses, and devote each bed to one variety. The best rose for bedding is one that is between eighteen and thirty inches in height, is free-branching, and blooms freely and continuously throughout the season. Some varieties, as in the case of Dupuy Jamain, are very attractive early in the season, but as the summer progresses they produce willow-like growths that rise above the blooms, and hide a considerable proportion of them from view. What is needed in bedding roses is not so much a mixture of flowers and foliage as an abundance of flowers rising to a fairly uniform height above the growths, and free from formalism as in the case of Caroline Testout, which still maintains a foremost position among bedding roses. There are many others that are of immense value, as for example, Augustine Guinoisseau, popularly known as the white La France; Comtesse du Cayla, a bright red China; Ecarlate, a semi-double variety with bright scarlet flowers; Gustave Grunerwald, a charming pink rose; Joseph Hill, salmon-pink, with copper-yellow centre; Lady Ashtown, deep pink, a specially fine variety for bedding that produces a glorious display of colour throughout the season; Madame Abel Chatenay, a rich rose-pink flower, so largely grown for the production of flowers for market; Madame Leon Pain, the flowers white, tinted with pink-fawn; Mrs. E. G. Hill, pale pink; Madame Jules Grolez, silvery-rose; Madame Ravary, yellow, with orange centre; Pharisaer, pale salmon; and Prince de Bulgarie, rose, suffused apricot. These comprise but a few of the good bedding roses, and they are mentioned here for the purpose of suggesting to those who are interested in this aspect of rose culture to study their habit, their flower production, and their colours during the season, a thorough acquaintance with them being of assistance in determining their adaptability to special positions, and also the merits of other varieties of promise for bedding purposes. Some of the newer varieties, with yellow and orange-tinted flowers, have promise of proving useful for bedding purposes, such as Rayon d'Or, James Coey, Lady Pirrie, Melody, and Mrs. C. E. Allen, and, giving quite new shades of colour in the bedding class, they should have a full share of attention. Last year the weather was so unfavourable to the full development of roses that a proper estimate could not be formed of the suitability of the newer forms for the production of continuous displays of flowers. It is only by limiting each bed to one variety that a tasteful and otherwise satisfactory effect can be obtained, and it will be in every way better to multiply the number and reduce the size of the beds than to have a few large beds and use a number of varieties in furnishing them. In the utilisation of roses for bedding purposes it is essential to success that the beds be prepared on generous lines previous to their being planted, and that the fertility of the soil be maintained by manurial applications annually. Even when this is done, the roses will not retain their full vigour for an indefinite period. Some varieties will grow freely, and bloom profusely for a longer period than others, and the cultivator should keep a close watch on the beds, and as soon as there are signs of deterioration, and not before, the old plants should be taken up, and the beds, after undergoing the necessary preparation, be replanted with young plants, early in November being the best time for effecting the change.

---

**Roses by the Waterside.**—Those who are in any way interested in the question of beautifying the margin of water with roses should, as far as is practicable, visit the Royal Gardens, Kew, within the next few days, and see what has been accomplished there in this phase of decorative rose culture. The majority of our readers will have seen at some time or other the large lake between the principal museum and the palm-house, and they will remember that it has a stone balustrade on the south, north, and western sides. On the northern and southern sides there is an expanse of turf and alongside the balustrade a narrow border was formed a few years since, and planted with Dorothy Perkins and Lady Gay, the first-named being on the northern and the other on the southern side. In both cases the growth is trained over the balustrade, and the effect produced is most attractive throughout the season of growth, for the elegant sprays of glossy green leaves present a very pleasing contrast to the grey-white stone-work. Had the roses no other attraction than the glistening green leafage their use in this manner would be amply justified. But when, as is at present the case, the leaves form a setting to some tens of thousands of bloom, the effect is startling in its great beauty. Two years since the display produced at Kew by the two ramblers mentioned was very fine, and we illustrated a portion of the rose-covered balaustrade on the northern side of the lake. In the summer of 1911 the great heat so seriously affected the colour and duration of the flowers that they were very pale, and soon lost their freshness and beauty. At the present time the flowers are abundant, of full size, and brilliant in colour, and may be expected to retain their freshness for a considerable period.

**Gardeners and National Insurance.**—We are glad to learn that the United Horticultural Benefit and Provident Society has been approved under the National Insurance Act, and at its monthly meeting on Monday, July 8, no fewer than eighty-two new members were elected. This is a great record for one meeting, and we hear that applications are coming in so fast that the committee proposes to meet once a fortnight for a short time to come. Our reference to this splendid society, in the issue of June 29, has, we are pleased to learn, helped materially to swell the number of applications for membership.

**Presentation to Mr. J. Gurney Fowler.**—On Friday evening, the 5th inst., the directors of the Royal International Horticultural Exhibition celebrated the completion of the most important of their duties by dining together at the Hotel Cecil, with the president, the Duke of Portland, in the chair. The after-dinner proceedings were of an informal character, the only toasts being "The King" and "The Directors." In the course of the proceedings, the Duke of Portland, on behalf of the directors, presented Mr. J. Gurney Fowler, chairman of the board, with a handsome silver cigar-box. In making the presentation, he said that the directors so highly appreciated both the ability and the courtesy shown by Mr. Gurney Fowler in the discharge of the arduous duties associated with the important position he occupies, that they felt they should like to ask his acceptance of some token of their esteem that would remind him of their pleasant association during the long period over which the preparatory work of the exhibition extended. The silver cigar-box that was presented to Mr. Gurney Fowler is remarkable for its handsome design, and is large enough to hold three or more boxes of cigars.

**Lancashire Experimental Station.**—A few days since the members of the Preston Gardeners' Association, to the number of about sixty, visited the horticultural experimental station, which has recently been established at Hulton by the Lancashire County Council. Mr. A. G. Sowman, the horticultural instructor for the county, met the members and conducted them over the station, and explained the experiments that are being made. He was so successful as a guide that the visitors were so interested in the work that is being done that they expressed a wish that they might have an opportunity of seeing the plots when the work has reached a more advanced stage. At the close of the inspection Mr. Philip Park, the vice-chairman of the Lancashire County Council, expressed the pleasure he had in meeting so representative a body of practical horticulturists, and hoped they had been interested in what is being done at Hulton. The work that had been undertaken was in its infancy; its object was purely educational, and the committee would be ready to give full consideration to any suggestions the members of the society may make at any time. Votes of thanks were accorded the committee and the staff, and the members returned homewards fully satisfied with what they had seen at the experimental station.

**Excursion of the Horticultural Club.**—The annual excursion of this club has been arranged for Thursday, July 18, when Burnham Beeches, Cliveden, and East Burnham Park will be visited. The members and their friends will meet at Paddington Station, G.W.R., and proceed by the 10.40 a.m. train to Slough, whence the party will proceed by the conveyances waiting in readiness to Burnham Beeches, calling on the way at Stoke Poges church. After luncheon the party will drive to Cliveden, the residence of W. W. Astor, Esq., and make a tour of the gardens. The members will then proceed to East Burnham Park, where they will be entertained at tea by Sir Harry and Lady Veitch.

**Presentation at Holland Park.**—In our issue of the 6th inst. we recorded the fact that exhibition cups were, on the first day of the Holland Park Show, presented by Mr. J. Gurney Fowler on behalf of the exhibitors at the Royal International Horticultural Exhibition, to Mr. E. White, Mr. G. T. Henslow, and Mr. S. T. Wright. We now wish to say that Mr. White was also presented with a handsome rose bowl for Mrs. White. Purses of gold were presented to Mr. Henslow, and Mr. Henslow only. It is much to be regretted that those who had charge of this matter did not take the trouble to notify the time of the presentation that we might have arranged for a representative to be present.

**Pentstemons and Phloxes.**—Prominent among the many attractive features at the recent exhibition held by the Royal Horticultural Society at Holland Park, was the large and finely-grown collection of herbaceous phloxes and pentstemons contributed by Messrs. J. Forbes, Lim., of Hawick. Additional interest was given to this exhibit from the fact that the firm has for a long period devoted much attention to the improvement of these beautiful classes of flowers, and introduced a considerable number of varieties possessing much merit. The collection included many of the fine pentstemons of Messrs. Forbes' introduction, and the visitors had an opportunity of seeing these beautiful border flowers at their best. With the finest of the florist's varieties of these flowers were several of the elegant "Gem" pentstemons, which have within recent years attained to a high degree of popularity, both for bedding purposes and for contributing to the attraction of the mixed border.

**"Botanical Magazine."** — The plants figured in the issue of this publication for the current month comprise Agave marmorata, a handsome species collected by Rozel in the Province of Tehuacan, Mexico, and comparatively rare in gardens. Erica ciliaris is a beautiful species indigenous to this and some other countries, and in Portugal there is besides the ordinary form, one that is far superior to it for garden planting. This fine geographical form was described in 1882 under the name of Erica Maweana, and of late years has been largely propagated and planted at Kew, where it produces a fine display of flowers from July to October. Styrax Wilsoni, a compact-growing shrub, bearing rather small white flowers, which was discovered by Mr. E. H. Wilson when collecting for the Arnold Arboretum in 1908; Cotyledon subrigida, a distinct and handsome succulent, bearing large flowers, with orange-tinted corolla, and Pseuderanthemum lilacinum, a handsome stove plant, producing spikes of lilac-coloured flowers, and rather closely related to Eranthemum Teijsmanni, under which name it was received at Kew from the Singapore Botanic Garden three years since.

**Mr. and Mrs. Orpen** have exhibited at the metropolitan exhibitions of the National Rose Society for so long a period without a break that their absence from the society's exhibition on Tuesday gave rise to many enquiries from the rosarians present. Their absence was not in any way due to any decrease in their interest in roses, but we regret to say that Mr. Orpen has during the past two months been suffering from a nervous breakdown. He is now much better, and, in common with ourselves, his many friends will be glad to hear of his speedy restoration to health.

**Flower Show in a City Bank.** To encourage the married members of their staff to cultivate beautiful flowers at home, the directors and manager of the British Linen Bank have assisted in the institution of an annual flower show, and this is held at the offices of the bank, 38, Threadneedle Street, E.C. The second exhibition was held on Saturday afternoon last, and all the members of the staff, with wives and children, were present to see who were the most successful competitors. Exhibitors are usually cleared out of the hall or tent when horticultural exhibits are being judged, but on this occasion the judge performed his duties under the keen eyes of the whole staff. The chief classes were for six roses, a vase of roses, a vase of garden flowers, a vase of sweet peas, six bunches of sweet peas, and six varieties of violas. The flowers were well shown, and did great credit to the cultivators. Mr. Andrew Kingsmill, of Harrow, has taken a great interest in this bank flower show, and it would be a capital thing if other bank officials would foster an interest in gardening on similar lines.

**Regulations Relating to the Importation of Plants.**—The summary of the regulations relating to the importation of plants, weeds, insects, etc., from Great Britain into certain other countries that has been issued by the Board of Agriculture, should prove of much use to nurserymen and seedsmen who have business transactions with the colonies and foreign countries. This publication is intended for the use of nurserymen and others in Great Britain who wish to export vegetable produce, and only those regulations have, as a rule, been printed which affect importation from this country. As, however, those clauses would often be unintelligible by themselves in many cases, much matter has been printed which is not directly relevant to the subject, but which appears to be necessary for the context. In order to guide readers as to the nature of the regulations, and to help in a comparison between the laws of different countries, a brief abstract has been added under the name of each country describing very shortly which plants are refused admission, which are accepted, and under what conditions. The reader should, however, always consult the text for details, as the abstract is not intended to be exhaustive, and only gives a general indication of the nature of the regulations and the more important plants affected. The summary, which extends over upwards of 100 pages, has been prepared from authoritative sources, and is published at one penny.

# NATIONAL ROSE SOCIETY'S EXHIBITION.

## JULY 9.

Although the season of roses is this year exceptionally early, and the date of the National Rose Society's Metropolitan show later than usual, the exhibition which drew many thousands of rose lovers to the gardens of the Royal Botanic Society on Tuesday was one of the most successful of the gatherings the society has held in London. The society had not, on this occasion, the advantage of the huge ballroom that was available last year, but several huge tents were provided for the accommodation of the roses, all of which were in competition, and every foot of staging space was fully occupied. There were no vacant spaces either from the cold wet weather as in some previous years that will be readily called to mind, or from excessive heat and brilliant sunshine, as was the case at the corresponding exhibition of last year. All the space provided was fully utilised for the accommodation of roses possessing more or less merit.

There was a strong competition in the classes in which the premier award included a challenge trophy or cup, and in the leading class open to nurserymen the competition was of the keenest, and the challenge trophy was carried off with one of the finest collections of which we have recollection, the blooms being equally remarkable for their size, form, and colour. There was a manifest improvement in the nurserymen's classes for representative collections of roses, and the contributions to the several classes filled one end and the side of the largest of the marquees and produced the finest display of its class that has yet been seen in this or any other part of the world. Goodly numbers of large blooms were to be met with in a critical inspection of the roses, but the majority were, as a whole, more remarkable for fine form and perfect development of their colours than for exceptional size. The crimsons were remarkable for their intensity, the reds for their brightness, the pinks and rose shades for their freshness and clearness, and the yellows for their richness. Rosarians have before now had opportunities for seeing excellent blooms of the Lyon Rose and Juliet, but on no occasion has there been so good a display of these two roses as on this occasion. Rayon d'Or, Lady Hillingdon, and other of the yellow and orange-tinted roses that have been introduced within recent years were finely shown, and formed a distinct and pleasing contrast to the shades of red, rose, and pink, in which the rose garden is so rich.

Table decorations and other arrangements of roses were plentiful and good, and, as in former years, formed a distinct and delightful feature, and received a full share of attention from the visitors. A goodly number of new roses were submitted for awards, and among them were several that, by reason of their large size and perfection of form or for rich and distinct shades of colour, promise to attain to a high degree of popularity. Especially noteworthy among these were Messrs. J. Cocker and Son's Mrs. Andrew Carnegie, which might be described as a lemon-coloured Frau Karl Druschki; Messrs. McGredy's Old Gold, the most richly-coloured of all the yellow and orange roses; and Messrs. Alex. Dickson and Sons' Queen Mary, which may be regarded as a veritable triumph in colour development in the rose.

The exhibition was in the forenoon visited by Queen Alexandra, who was received by Miss Willmott, the Rev. J. H. Pemberton, the president, Mr. E. Mawley, V.M.H., and several members of Council, and under their guidance devoted an hour or more to the inspection of the several sections of the exhibition.

### NURSERYMEN.

### DIVISION A.

The Nurserymen's champion class for seventy-two blooms, distinct varieties, is always an attractive one, and on this occasion there were five entries for the challenge trophy and gold medal. The successful winners were Messrs. Alex. Dickson and Son, Lim., Newtownards, who staged in magnificent style. The boxes were very level, while the whole of the flowers were clean, fresh, and bright. Some of the finest blooms were those of Dr. O. Donel Browne, Chas. J. Grahame, Brilliant, Juliet, Mrs. Cornwallis West, Mildred Grant, Leslie Holland, grand colour, Geo. C. Waud, Lyon Rose, H. V. Machin, Horace Vernet, Mrs. W. J. Grant, Duchess of Westminster, Mrs. E. Mawley, Mabel Drew, the deep crimson, George Dickson, in grand form, and Conway Jones. Messrs. R. Harkness and Co., Hitchin, came a capital second. Their best flowers were Ben Cant, Gladys Harkness, Ellen Drew, Edward Mawley, Lyon Rose, Madame Jules Gravereaux, Mildred Grant, Horace Vernet, Earl Dufferin, and Chas. Darwin. Messrs. D. Prior and Son, Colchester, were a close third, some of their best varieties being Mrs. W. J. Grant, Mrs. J. Laing, Chas. J. Grahame, J. B. Clark, Beauty of Waltham, Victor Hugo, and Bessie Brown. Messrs. B. R. Cant and Son, Colchester, were fourth.

H.T. ROSE MRS. ANDREW CARNEGIE.

Soft lemon-white. Gold Medal, N.R.S., July 9. Messrs. J. Cocker and Son, Aberdeen.

The class for forty trebles was a splendid one, the winner holding the challenge cup. This fell to Messrs. B. R. Cant and Sons, Colchester, who won in fine style. They staged large, clean flowers, with good leathery petals. The best varieties were Her Majesty, O. Terks, Cynthia, A. K. Williams, St. Helena, Lieut. Chaure, Pharisaer, Chas. J. Grahame, Lyon Rose, and Wm. Shean. Messrs. Alex. Dickson and Sons, Lim., were a good second, with some fine examples of Geo. C. Waud, Mrs. Foley Hobbs, Mabel Drew, Helen Keller, Horace Vernet, and Medea. Messrs. D. Prior and Sons, Colchester, were a capital third, the colours of the dark varieties being especially good.

### DIVISION B.

For forty-eight, distinct varieties, Mr. G. Prince won first prize, and secured the China Challenge Trophy with a very fine display. Perhaps the finest examples were Ethel Malcolm, Dean Hole, Mrs. David McKee, Leslie Holland, Edward Mawley, Juliet, Lady Ursula, Mrs. Amy Hammond, and White Maman Cochet. Messrs. G. and W. H. Burch, Peterborough, followed closely for second place with fine flowers of Mildred Grant, Mrs. T. Roosevelt, Molly Sharman Crawford, Mrs. Armitage Moore, Alice Lindsell. Mr. F. Woollard, Lewes Road, Brighton, was a good third.

### TEAS AND NOISETTES.

The D'Ombrain Cup was offered in the class for twenty-four distinct varieties, and there were three entrants. Mr. G. Prince, Longworth, was placed first with a nice level box, the finest examples being Molly Sharman Crawford, Mrs. Ed. Mawley, Maman Cochet, White Maman Cochet, Mdme. Cusin, and Mdme. Vermoral. Messrs. D. Prior and Son, Colchester, were second, with smaller flowers; while Mr. John Pigg, Royston, was placed third, with blooms that were clean and bright.

H.T. ROSE OLD GOLD.

Old gold and copper-red. Gold Medal, N.R.S., July 9. Messrs. McGredy and Sons, Portadown.

In the class for twelve the competition was keen, there being no less than eight entries. Messrs. Burrell and Co., Cambridge, won first prize with a beautiful board. The most prominent flowers were Muriel Grahame, Mrs. Miles Kennedy, Catherine Mermet, Comtesse de Nadaillac, and Mrs. Dudley Cross. Mr. J. Mattock was second with fine examples of Mrs. E. Mawley, Mdme. C. Soupert, Harry Kirk, and W. R. Smith. Mr. W. R. Chaplin, Waltham Cross, was a good third.

In the class for sixteen trebles, teas and noisettes, there were three competitors, the first prize falling to Mr. Geo. Prince, who had a beautiful exhibit. Conspicuous were Molly Sharman Crawford, Mdme. C. Soupert, Marechal Niel, Comtesse de Nadaillac, Mrs. E. Mawley, Souvenir de Pierre Notting, and Mdme. Jules Gravereaux. Mr. H. Drew, Longworth, was second, with Maman Cochet, White Maman Cochet, Muriel Grahame, and Mrs. E. Mawley as his best flowers; while Messrs. W. Crisp and Sons, Fordham Heath, were third.

### ROSES IN VASES.

For twelve vases of teas or noisettes, to include not more than six blooms, there was a good entry. Messrs. Alex. Dickson and Sons, Lim., won first prize for handsome blooms, which were well staged. The best were Duchess of Westminster, Lyon Rose, A. K. Williams, Earl of Warwick, Gloire de Chedane Guinnesseau, and Mrs. E. Mawley. Messrs. D. Prior and Sons, Colchester, were a capital second, showing fine Avoca, Richmond, and Mrs. T. Roosevelt. The King's Acre Nurseries, Lim., were third, with blooms of much merit. In a smaller class for nine vases, seven blooms each, there were three entries. Mr. G. Prince lead off with fine fresh examples of White Maman Cochet, Molly Sharman Crawford, Mrs. E. Mawley, and Madame C. Soupert. Mr. H. Drew was second and Mr. J. Mattock third, both having excellent exhibits.

### DECORATIVE ROSES.

The President's prize was offered for nine baskets of roses, distinct varieties. These basket classes certainly formed one of the finest features of the show. The entries in this particular class occupied nearly the whole side of a tent. Mr. W. Easlea, Danecroft Nursery, Eastcroft, won the premier award with some glorious baskets, which included Joseph Hill, Mrs. A. Tate, Prince de Bulgarie, Madame A. Chatenay, and Marquise de Sinety. Messrs. Hugh Dickson, Lim., Belfast, followed closely for second place with excellent baskets of blooms that were particularly good in colour. Mr. J. Mattock was placed third. There were eight competitors. While for five baskets there were six entries, Mr. W. R. Chaplin winning with superb baskets of Harry Kirk, Lyon Rose, good in colour, Betty, Pharisaer, and Madame A. Chatenay. The second award went to Messrs. W. Spooner and Son, Woking. Mr. E. J. Hicks, Hurst, was third with capital baskets.

The class for eighteen vases of seven sprays each was well filled, the entries being numerous, and the quality high. Mr. J. Pigg secured the first prize with a bright collection of flowers, but they were unnamed. Mr. J. Mattock was second, having some capital decorative vases, which included Mrs. Massey, Gottfried Keller, Trier, La Tosca, and Lady Waterloo, while Messrs. W. Spooner and Son were third.

For nine vases Mr. E. J. Hicks led off with fine examples of Ecarlate, Lyon Rose, Richmond, Harry Kirk, and Countess of Gosford. Mr. Will Taylor, Hampton, came second, having Madame Ravary, Edu Meyer, and Madame P. Ducher in good form. Messrs. H. Lane and Son, Berkhampstead, were third. In the class for sixteen varieties, staged in the regulation boxes in vertical lines we had another keen competition. The first prize went to Mr. W. R. Chaplin, who had a very bright exhibit. Some of the best were Duchess of Wellington, Mrs. A. Tate, Countess of Derby, Liberty, Lyon, and Lady Hillingdon. Mr. E. J. Hicks was second, having Rayon d'Or, Lyon Rose, and Harry Kirk good. Mr. J. Mattock was third.

### DECORATIVE ROSES, GENERAL.

The Turner Challenge Cup for thirty-six varieties, not over twelve trusses of each variety, produced a glorious display. Messrs. F. Cant and Co., Colchester, secured the

(Continued on page 544.)

## FOXGLOVES.

These handsome flowers are among the most effective hardy perennials for naturalising on the outskirts of shrubberies, in rhododendron beds, or in various places in the wild garden. If planted in large masses they form especially picturesque objects during the early months of summer, and in a number of cases they seed freely, and many plants spring up year after year. They are not at all particular as regards position and cultural management, as they succeed well in full sunshine or in partial shade, and self-sown seedlings flourish on uncultivated ground almost as vigorously as those growing in prepared borders. Foxgloves can be obtained in a variety of colours, including white, cream, rose, red, purple, and other shades. One of their greatest charms, however, lies in their throat markings, the spots and blotches of deep purple and maroon rendering them very beautiful. It is well to sow seeds in a cold frame early in the summer, and afterwards to transplant them to their permanent quarters. Many of the cultivated forms obtainable are very charming, and some lovely colours can be had from a packet of seed. After the main flower-spike has done flowering, it should be cut off, as this will encourage the side shoots to make more growth and produce a good display of bloom later on. J. Gardner.

AN ARRANGEMENT OF FOXGLOVES AND IRIS IN THE GRASS AT BATSFORD PARK.

---

**Cereus flagelliformis.** — In a window of a local dairy there is a fine plant of this old-fashioned rat's-tail cactus, which is growing in a suspended pot. The branches hang down for a considerable distance, and are studded with beautiful rose-coloured blossoms. This used to be a favourite plant in cottager's windows, but I do not think it is met with as much now as formerly.—S. W.

## WHITETHORN, OR QUICK, FOR HEDGES.

On page 499, date, June 20, "E. M." asks for information respecting my advocacy for planting thorn hedges in double lines in preference to one single line of plants. My explanation of this is that, when planted in double lines, and the plants placed alternately with each other, more can, without undue crowding, be inserted within a given length or space; furthermore, should any fail to grow the vacancy thus created is less noticeable than would probably be the case where the single row system is practised. Secondly, and this is most important, with a double line of plants it is obvious that a broader base for the future hedge prevails from the start, and, providing the after-treatment is carried out timeously and judiciously, I can see no reason why the plants should not retain their lowermost shoots equally as well as others placed in single line. That a single line of plants, under proper after-treatment, could be made to answer every purpose, and eventually form a dense and, for larger animals, an impenetrable barrier, I entertain no doubt. On this estate, both systems have long been practised, and other things being equal, there is but a very slight margin for choice between them.

"E. M." admits that a hedge can be formed more quickly by means of double lines of plants. This, I consider, the best argument in favour of the system, as rapidity in arriving at a serviceable state is, in this case, of very great importance. I may state that my experience and remarks relate principally to results in Scotland, where climatic and soil conditions may not be so conducive to growth and rigidity as is the case in the sunny south. Here, eight years, as a rule, must necessarily elapse from the time of planting a thorn hedge to that when it may be relied on as an effective barrier to cattle without any extraneous aids. The latter usually take the form of post and wire, or post and bar erections, which, for the division of agricultural land, must be erected on both sides of the young hedge. Guards of this sort, made with uncreosoted material, remain fairly strong and sound for the time specified, but if required longer repairs are generally necessary. If by double line planting a year is gained in the growth, and more particularly in the impregnability of the hedge, whereby post and wire fences may be dispensed with while yet in fair order, thus avoiding secondary expense, it must be considered good economy in estate management, and also shows an advantage over the single row system of planting.

"E. M." concludes by referring to the common faults in the care of hedges in general, particularly that of allowing almost unrestricted growth in their earlier stages. With this I quite agree, and would endeavour to impress upon the mind and consideration of the person responsible the necessity of severely checking the progress of the upper growths until a substantial base is formed, after which freer extension may be allowed, until the requisite height and form is attained. Coupled with this may be given the equally important advice to keep the hedge-row clear of weeds and rank grasses for at least two seasons after planting. This is a matter which seems much neglected at the present time, but it is one which, if consistently carried out, exercises a great influence for good upon the stability and appearance of the hedge or hedges. James Day.

Garlieston, Scotland.

## IN THE DEESIDE WOODS.

(Concluded from page 511.)

### BALLOGIE WOODS.

Thursday's programme proved interesting, for on that day there was inspected Scots pines, which one and all declared they had not seen their equal. Before breakfast many of the visitors had a ramble around Banchory, one of the prettiest, and certainly the most popular, villages on Deeside. After breakfast a start was made for Ballogie Woods, owned by Mr. W. E. Nicol. At Ballnacraig the party were welcomed by Mr. George Wyllie, manager of the Ballogie estates. Attention was here drawn to a number of very fine ornamental trees, including a grand old ash of huge dimensions. Five feet from the ground it measured 15ft. 8in. in circumference. Potarch Woods were then visited, and a plantation of 200 acres, growing about 2,500 trees to the acre, was gone through. The former crop was of old Scots pine and larch cut out in blocks of 50 acres. Before planting this plantation a thin turf was removed for the purpose of giving the trees more vigour, and thus enabling them to resist the attack of pine weevil. This purpose has been evidently attained, for the trees showed excellent growth. Several other woods having been traversed, all showing capital growth, a halt was made at a very fine wood of Scots fir and larch, ninety years old. It grows 200 trees to the acre, and gives 4,000 cubic feet. It was much admired, and the opinion was unanimous that no better is to be found in this country. Altogether the impression made on the minds of the visitors concerning this part of the country was that the tree growth was splendid. Nearer to the mansion house of Ballogie some exceedingly fine conifers were viewed. Among those measured were: Abies nobilis, height 77ft., circumference 6ft. 11in.; A. nordmanniana, height 79ft. 6in., circumference 9ft.; A. lasiocarpa, height 74ft., circumference 5ft. 10in. Lunch was here served, after which the party proceeded by Ennochie, where the remarkable phenomenon of twin firs was seen. It was the subject of much discussion among the company, and there was a considerable difference of opinion.

### FINTZEAN WOODS.

At Powlair the party entered upon the estate of Fintzean, owned by the Right Hon. Robert Farquharson. Here they were met by Mr. F. J. Cochrane, of Balfour, factor for Dr. Farquharson, and Mr. George Donaldson, ground officer. These gentlemen led the way to Easter Clune, which stands on the south side of the river Feugh. This ancient estate of the Bishops of Aberdeen is 200 acres in extent, where grows natural larch about 40 years old. The trees are exceptionally well developed, and their number to the acre is perfect. A sample area measured brought out 1,800 cubic feet per acre. Were it sold at present it was considered the wood would command a considerable sum. The party now drew near to Fintzean House, a fine old mansion, part of which dates from 1686. Here the most interesting feature so far as forestry was concerned was the avenue of superb Scots pine, called in the district "Dr. Farquharson's walking-sticks," or "The Laird's walking-sticks." The trees are so closely grown that they show a clear bole of about 60 feet, the total number of cubic feet being far ahead of what is generally expected to be produced from ground under Scots pine. They extorted general admiration, one and all declaring that they had not seen anything to compare with them.

Tea was served at Fintzean, on the invitation of Dr. Farquharson, whose enforced absence was greatly regretted, and to whom the warmest thanks of the society Sir John Stirling-Maxwell asked Mr. Cochrane to convey for his kindness to them that afternoon. The cars were then re-entered just as heavy rain began to fall, and Banchory was soon reached.

### CRATHES CASTLE WOODS.

The weather on Friday, the concluding day of the excursion, broke rather dull and disagreeable, but, with the exception of one or two showers, the weather kept up wonderfully well. The day's programme opened with a visit to Messrs. A. and G. Paterson's sawmills, a short distance from Banchory, where Mr. Donald Munro, the chief partner, acted as guide. Keen interest was manifested in the various processes shown, especially in the number of squirrel-eaten boards which Mr. Munro had exhibited for examination. After partaking of Mr. Munro's hospitality, Mr. Elwes, in returning thanks, said he had never seen a better equipped sawmill, nor had he in all his excursions in England obtained so much practical information about the trees they grew as that given them by Mr. Munro.

Crathes Castle, the seat of Sir Thomas Burnett, Bart., of Leys, was the next halting place, and here the party was met by Mr. J. C. F. Dunbar, factor on the estate. Attention was first directed to some remarkably fine trees in the avenue, including specimens of Thuia gigantea, Cupressus Lawsoniana, cedars, and Douglas firs, all of which evoked much admiration. Great interest was shown in the close avenues of tall lime trees in splendid condition, and in the wonderful yew hedges, with arched passages through them. Ornamental turrets, formed of no fewer than five trees geometrically arranged, are placed at certain points. Those yew hedges were planted more than three centuries ago—in 1596, the date of the erection of the Castle. The gardens were next visited, and here the fine work of Mr. Andrew Petrie, head gardener, was greatly admired, all departments being found in capital order. The lakes, too, created much interest, and undoubtedly proved one of the best instances of landscape gardening seen in the course of the excursion. At the visit the islands presented one mass of rhododendrons in blossom, and the bright pink and crimson reflected in the waters had a very picturesque effect.

### DURRIS WOODS AND PLANTATIONS.

Durris, the extensive estate of Mr. Baird, was the last, and certainly not the least interesting place of call. Here the party found ample demonstration of what practical sylviculture can be brought to. Much of the work viewed here was done under the supervision of Mr. John D. Crozier. The work is being ably continued by Mr. Ernest Lees, factor, and Mr. Charles Steward, head forester. An outstanding feature of the day was a visit to a couple of plantations of Picea sitchensis (P. Menziesi), growing at an elevation of from 700 to 900ft. above sea level, on boggy ground, surrounded by moorland. The plantations are 34 years old, and are said to be unique—at least so said the late Professor Mayer, of Munich, the eminent forest expert, when he visited this country two years ago. The first of the plantations visited was somewhat mixed, the picea mentioned having been planted along with common spruce, Scots fir, and a few larch. It was self-evident that the picea had practically suppressed the other trees. But the most interesting block visited was that solely devoted to P. sitchensis, at an elevation of 900ft. Closely planted, the trees have grown up tall and straight, almost excluding the light from the lower portion of the wood. Thirty-four years of age, and in fine, healthy condition, there is no other wood to equal it in this country, and even in America there is no record of any artificially planted wood of this tree approaching it, although in the original forests a different state of matters may prevail. This is undoubtedly a wood which provides, and will continue to provide, a most useful object lesson on a question regarded by arboriculturists as of considerable importance—the place of this picea among commercial trees. It was little wonder that the general consensus of opinion expressed was that the wood amply and right well repaid the visit. After lunch a pleasant hour was spent in walking through the extensive gardens and hothouses, under the guidance of Mr. Andrew Reid, head gardener, whose work was greatly admired, and the horticulturists of the party were high in their praises of all they saw. The ornamental trees in the policies also claimed much attention, some especially handsome specimens of Cupressus macrocarpa, Abies grandis, Thuia gigantea, fine old yews, eagle-claw maple, and Douglas firs being greatly admired. The "den" was then visited, where were found many fine old oaks and larches, said to have been planted during the Duke of Gordon's proprietorship of the estate. Some of the larches were over 100 feet in height and from 8 to 10¼ feet in circumference five feet from the ground. A specially fine old Douglas fir noted here, now about 80 years old, measured 112 feet in height and 12 feet 6 inches in circumference at five feet from the ground.

One of the most memorable and most successful excursions under the auspices of the Society was now concluded, and the party returned to Aberdeen delighted with the lovely scenery and the extensive additional knowledge they had gained by their visit to Royal Deeside. Of all the party none were better pleased at the success of the excursion than the worthy president, Sir John Stirling-Maxwell, and the secretary and treasurer, Mr. Robert Galloway, S.S.C., Edinburgh, to whose admirable arrangements and wise counsel great praise is due.

We understand that Switzerland has been chosen for next year's excursion.

---

## DESSERT CHERRIES.

The excellent examples of dessert cherries recently exhibited at the metropolitan shows should demonstrate to lovers of gardens the adaptability of these fruits for pot culture, and their excellence for inclusion in a dessert.

Where there is not a suitable soil in gardens for cultivating cherry trees in the open quarters, they can always be grown in pots, and, failing a house for ripening the fruits in, there is often a place in moderate gardens where the trees may pass through the flowering period, and later ripen outside, with some protection from birds.

Even when the soil is not suitable for outside culture, considering the small quantity of soil which, of the right sort, will keep a tree in pot in a fruitful condition, it does not require much outlay to provide the same for outside fruiting.

One may frequently meet with fair examples of cherries fruiting in pots, but the finest and most prolific trees I remember having seen are trees of Black Tartarian in the gardens at Hurstbourne Park. This variety is known to be an abundant bearer, and I had the pleasure of seeing some trees in fruit, and a good idea of the crop may be realised when it is stated that from a tree which had ripened its crop 60lb. of fruit was taken. One can easily understand that quantity when looking at the crops on the trees not gathered

I am told the trees, which are growing in pots in a lean-to house, are some fifty years old. They have been under the care of Mr. Perry for more than twenty years, and bear testimony of his success in cherry culture. A younger tree of another variety, Noir de Schmidt, was also carrying a heavy crop. This is a fine black cherry of sweet and excellent flavour, with much firmer flesh than Black Tartarian. An enquiry as to their treatment elicited a smiling remark, which, to those who know, signifies much.

Other fruits are well grown at Hurstbourne, and these do not form all the interesting things seen in the gardens. The short time spent with Mr. Perry was an interesting one, and one had evidence of his capability as a gardener.

PAUL T. MORE.

## LILIES IN THE GARDEN.

The lily planting season begins in August, as soon as the stems of Lilium candidum have yellowed. We should all realise what a magnificent plant this is, from the decorative point of view, how easy of cultivation also, and attractive in foliage long before blossoming time. Owing probably to its stately growth it is usually employed in borders, but for bedding purposes it is not only highly ornamental, but actually supplies a want. The best method is to alternate it all over the middle of a bed of some bulbous flower, such as the tulip or hyacinth, to be followed by some bushy bedding subject of considerable height, such as well-developed pelargoniums, heliotropes, marguerites, or fuchsias, the leaves of which will cover the lily stems when these at last become unsightly. Either pink or vermilion geraniums make a fine show with the snow-white lily spikes rising at even intervals between them. If a permanent bed is the object the most satisfactory companion will be a dwarf Polyantha rose, such as the pink Mignonette, which can be trusted to bloom early and continue late; in this case crocuses may form an edging belt, and also be dotted about in groups between the lilies and roses so as to give early colour.

Sweet peas, having no colour beauty for the first eighteen inches of their stems, can well be associated with a foreground row of the Madonna lily; the rich soil treatment that the sweet pea demands will suit its neighbour excellently, yet lilies never succeed so well, never exhibit the perfection of thick velvety petal texture, unless given a trench of special compost consisting of six to nine inches of old cow manure well below the bulbs, and a filling of mingled parts of peat, loam, leaf-mould, and coarse sand.

The flower garden can be splendidly enriched by a border in the open, in which scarlet and salmon sweet peas are grown between rows of white lilies. White sweet peas similarly give a delightful display if introduced in autumn or spring between lines of the rose or the crimson variety of Lilium speciosum. This Japanese lily should be planted in September or October, so that it may have its best chance for the following season. None of the varieties are really costly, the most expensive, L. speciosum album novum, an immense white, with effective yellow anthers and broad foliage, being obtainable for eighteen shillings a dozen. Melpomene is one of the most handsome, as the crimson petals are spotted with purple and edged with white. L. speciosum album Krætzeri, a giant white with orange anthers, and L. s. Schrymakersi, rose-spotted maroon, can be cordially recommended.

The St. Joseph's lily, Lilium longiflorum, should be planted at the end of summer; the long white trumpet blooms may be slightly less effective than the sturdier blossoms of the Madonna lily, but they are more elegant in appearance. A fine lawn bed might be partly made up with the silver-variegated kind, the leaves of which are handsomely striped. Then we may make lavish use of the well-known Lilium Harrisi, a member of the same family, and the taller strong-growing Lilium longiflorum robustum, which flowers rather late.

A consideration of lilies in the garden would be incomplete indeed without a mention of the noble Swamp lily, Lilium giganteum, which reaches a height of twelve feet, and has large heart-shaped leaves. Many a damp low-level lawn could contain beds of this King of Lilies, or shrubbery clearings might have groups of it planted. The safest method is to pot the bulbs and grow them on in frames for putting out permanently late in spring.

The later lily planting season will enable us to place vivid-hued beauties where colour is especially required, beside dull walls or dark shrubs, for example. Lilium elegans may be had in apricot, lemon, orange, blood-crimson, and gold, the Scarlet Turk's Cap lily, the carmine-spotted Oregon lily, even the common Lilium croceum, or Cottager's Orange lily, will supply splendid masses anywhere in sunshine. Dark hues, exceedingly effective by white buildings or silver shrubs, are offered by the varieties of Martagon lily; vermilion, orange, gold, and crimson appear in the different Liliums pardalinum.

Lilies by the waterside are especially lovely, and the bulbs can be safeguarded from excess of moisture by planting them on low hillocks of suitable soil; the rock garden, too, can have its suitable lilies, such as the scarlet Lilium pomponium, L. concolor, the purple-spotted lemon L. coridion, and the pink L. Krameri. M H.

A FINE GROUP OF PHLOXES AND PENTSTEMONS.

Exhibited by Messrs. J. Forbes, Lim., Hawick, at the Holland Park Show, and described in the report which appeared in our issue of the 6th inst.

---

**Begonia Golden Shower.**—Considerable advances have within recent years taken place in the varieties of tuberous-rooted begonias suitable for hanging baskets, and that at the head of this note is one of the finest of all for such a purpose. It was given an award of merit on June 18 by the Royal Horticultural Society, and is well illustrated in the Gardeners' Magazine for June 29. In colour the large, semi-double blossoms suggest a good form of Rose W. A. Richardson.—K.

## GARDENERS AND GARDENING.

It would be interesting to know how many of the vast crowd who visited the Royal International Horticultural Exhibition and admired the many forms of floral beauty thereat displayed, had any idea of the amount of skill and forethought that had been expended on their production. It is only on occasions such as these that it is possible to realise the time needed for a gardener to become master of so vast a field of knowledge, and the labour expended in studying the requirements of such a number of subjects. Here we had plants from all parts of the globe, extending from the Tropics to remote parts of the Northern and Southern Hemispheres; from high altitudes, and from swamps and jungles.

The proficient gardener has not only to make himself acquainted with the names of numerous genera and species of plants, but he must know the kinds of soil suited to the several species, the position most adapted to their well-being, the proper temperature needed to produce a healthy growth, the various diseases to which they are subject, and the various insect pests that attack them, and also the best and most effectual means of preventing or destroying such pests.

He must be well versed in entomology, ornithology, geology, chemistry, etc. He must be able to draw plans and give estimates for the erection of various buildings; know the value of various kinds of timber, and how to measure the same, and have many other varied qualifications ere he can attain to that exalted position of a head gardener, and receive for all his ability and skill the handsome remuneration, may be, of £80 or so per annum!

One often wonders now there is so much talk about "raising the status" of the gardener, how this is to be brought about. It is, unfortunately, too true that many gardeners are not so well educated as they might be, but what inducement is there held out to them to study? The bothy, though, no doubt, much improved of late, is not even now all that could be desired, and the social life in the country is far different to what it is in towns. Gardeners for the most part are brought up in the rural districts, and the schooling many of them receive in their early days is scant. They are taught to order themselves lowly and reverently to all their betters, and to go to church on Sundays, and all the amusement they get is in the school playground. There are few, if any, night schools at these out-of-the-way places, and when a lad becomes old enough to go to work he must put in full time, working from six in the morning until the same hour in the evening, and he is then too tired to do much studying. Few know this better than the writer, who, in his early days, spent weeks together in one of the most dreary bothies in the kingdom. Even in these days when bicycles are so cheap, it requires a great amount of courage and energy for a young fellow to ride from fifteen to twenty miles on a winter's evening in order that he may attend the nearest night school—which is the distance in many parts. How are we then to improve the education and raise the status of the gardener?

It is quite useless to think that a man will ever make a good gardener who is brought up in a horticultural college. He cannot obtain the necessary qualifications in such institutions, so that the time and money spent on them are wasted. I admit it is possible for such students to learn the rudiments of gardening, but unless brought up in a private establishment, and taught the requirements of such places, they will never be able to give satisfaction. The gardener has not only his employer to please, but there is the cook, the butler, and a host of others to be considered. There is a vast difference between gardening in a private establishment and at a horticultural college or other public institution. To be a good gardener one must be qualified in every branch, whether it be in the cultivation of orchids, plants and flowers, fruit and vegetables, or the care of lawns, roads, and woods. So vast a field of work requires much study, one must admit, but unless this can be combined with practical instruction it avails but little.

Where is there one of our horticultural institutions that contains a collection of orchids, or one whose instructor is well versed in their cultivation? It is very amusing to find people setting themselves up as experts in horticulture. I noticed one or two such at the Royal International Horticultural Exhibition. One would be interested to learn where they were trained, who were their instructors, and what their success. Writing of gardeners being educated reminds me of William Cobbett, who once said he did not consider a farm labourer an ignorant person if he was able to find the nearest way across a field, thus signifying that though in book learning he might not be very proficient, he was a master in the art of ploughing. It is not always the man who is well versed in classics that is the most practical person. What is the use of Greek, Latin, and French to a sailor in an open boat on the sea with a hole a foot square in the boat, and only one piece of board to repair the damage with, and this pieces sixteen by nine inches? It would be far more to his advantage if he could see, at a glance, how he could cut his board to fill the hole. A knowledge of French and Latin does not assuage the wrath of the cook if there be an inadequate supply of fruit and vegetables at a particular season, neither does it bring a valuable plant back to life that has been lost through a want of knowledge of its requirements.

It has on several occasions been my misfortune to have to deal with young men who have been instructed in some of these horticultural colleges. Not a very long time ago one, who had a certificate from the R.H.S., applied for a situation under a friend of mine; though furnished with these credentials, he was hardly sufficiently advanced either in education or practical knowledge to commence an apprenticeship. We cannot all be Paxtons and Flemings, neither can be all fill places like Trentham and Chatsworth, but we can all strive, and if by chance one should be "facile princeps," he need not look down on his less fortunate fellows, who, though quite his equal in every respect, have not had good fortune to smile on them when seeking to improve their position.

Gardening cannot be learned in a year or two, and it is impossible for those who have not gone through a proper training themselves to teach others, therefore one should dismiss at once the idea of employing horticultural experts who even, though they are versed in all the sciences, yet lack the rudimentary training so essential in a sound, practical, business-like profession. Professors there are many. Thoroughly practical men are like stars on a stormy night—few and far between.

H. C. P.

## THE SMALLER MOCK ORANGES.

When the bulk of spring-flowering shrubs are over the mock oranges come in with a rush, and in the month of June, extending some seasons partially through July, they form one of the most attractive outdoor features of our garden. In many cases, at least, the mock oranges have been this year particularly fine, and I have been greatly struck with the beauty of the large-flowered Philadelphus grandiflorus, in many unfavourable spots in the gardens and courtyards of London, where, in some cases, cribbed and confined, it has proved independent of all its surroundings. For limited spaces, however, and, in fact, for massing in large gardens, the various hybrid kinds that have made their appearance within recent years are particularly desirable. The comparatively dwarf habit is caused by the influence of the twiggy growing Philadelphus microphyllus, introduced from New Mexico about thirty years ago. By crossing with some of the original species and the hybrids raised therefrom, a great number of varieties have been obtained and distributed by MM. Lemoine et Fils, of Nancy, France. The first was the variety Lemoinei, followed by Lemoinei erectus, which last I still consider to be one of the best. A double-flowered form of this group, Virginal, was given a first-class certificate this year, and during the present season two varieties, namely, Bouquet Blanc, and Voie Lactée, have received awards of merit. W.

## ROMNEYA COULTERI.

Few plants are more beautiful than Romneya Coulteri (Californian Poppy) when well grown, as its silvery-grey foliage is quite as attractive as its large white sweet-scented flowers. I send a photograph—[Unfortunately not suitable for reproduction.—ED.]—taken last year, which shows a plant over ten feet high, growing in a warm position, sheltered from the north-west, in a rather heavy loam, rich in potash. Unfortunately, the background detracts from the effect, and prevents the boldness of the plant and its handsome appearance being seen to full advantage.

Although not hardy in many parts, yet much might be done in some of the more inland and colder localities of the country to secure such a desirable ornamental subject, by planting it in cosy corners, and giving it a certain amount of protection during the winter and spring months. Along the Welsh coast, the south of England, and most of Ireland, this plant should luxuriate and multiply without the assistance of shelter, provided it has a fairly strong well-drained loam to grow in. The composition of the soil in which the plant mentioned thrives is rich in potash, but deficient in phosphates and lime. I have seen some good examples doing well in peat containing a little sand, but their strength of stem, size of flower, and broadness of foliage fell short of those of this specimen. PEDESTRIAN.

**Begonia Sutherlandi.**—This is a tuberous-rooted begonia, native of Natal, and quite distinct from the various South American species. Forming as it does a large irregularly-shaped tuber of a rather firm texture, B. Sutherlandi pushes up therefrom slender reddish stems clothed with pointed leaves of a bright green colour with red veins. The flowers, which are freely borne towards the upper parts of the arching stems, are not large, but conspicuous by reason of their bright salmon-red colour. This species has not been much employed by the hybridist, but it is one of the parents of B. Weltoniensis, a favourite of days gone by.—S. W.

## ROSE GOSSIP.

Writing these notes at the end of June, I must say it is long since I saw so many and thoroughly representative a show of roses by this early date. Even many of our later blooming ramblers, such as Crimson and Blush Ramblers, also Felicité Perpetué, with several others that seldom come into flower until the first weeks of July, are already quite showy. Indeed, there would appear to be a record season for us among these later flowering climbers and ramblers.

Queen Alexandra, Goldfinch, Thalia, Waltham Bride, Wedding Bells, Tausendschon, Tea Rambler, Leuchtstern, Psyche, Helene, Gardenia, and many others have already given us their best display for this season. Among the most charming of all with me is American Pillar. I do not remember it so bright, even among the beautiful examples seen in pots from time to time. Doubtless the cooler and fairly moist atmosphere has much to do with the intensity of colour in many roses, and this is very noticeable among the yellows with the charming orange and metallic copper shades now prevalent among a number of Teas and their hybrids; many of which have quite surpassed themselves during the past two or three weeks.

The glorious blendings found in Theresa, Souvenir de Stella Gray, Theresa Bevan, Souvenir de Catherine Guillot, Marquise de Sinety, Arthur R. Goodwin, Mrs. A. R. Waddell, Canarienvogel, Lyon Rose, Duchess of Wellington, Hugo Roller, Jacques Vincent, Lady Pirrie, Mrs. Aaron Ward, Prince de Bulgarie, and Sunburst will long remain in my memory. The deep yellows of Harry Kirk, Miss Alice de Rothschild (a yellow that has risen as high in my estimation as any of recent years; instead of paling, this is intensified as the blossoms age), Senateur Mascurand, Billiard et Barri, Le Progress, Jean Coey, and Madame Pol Varin-Bernier have been more than usually clear.

Our maidens, both upon dwarfs and standards, have greatly intensified these shades, which are seen to the best advantage by reason of clean bronzy foliage that has been made since the cold snap that caught much of the earlier growths upon cut-backs. I have seldom seen the maidens looking better, and in the case of most varieties they promise to continue good for a long time.

With the advent of so many good-habited and constitutioned Teas and their crosses, we have many maidens that simply improve as the season advances, both in size of plants and production of flower. So many of the older roses gave us one or two good spurts of blossom, and only a scanty show between, not even that in several instances; and the continuity of flowering is a strong point in favour of what I may perhaps be allowed to call our modern roses. We seem to have reached the height of perfection in this class, and among the dwarf polyanthas; so much so that anything must indeed be good to surpass three or four dozen varieties that will readily occur to all rose lovers.

A. Piper.

---

**Desfontainea spinosa.**—To the uninitiated a flowering example of this is always an object of wonder, as the leaves bear a marked resemblance to those of the holly, and the blossoms are decidedly showy, being tubular in shape, of a thick wax-like texture, and in colour yellow, tipped with scarlet. It is a native of Chili, and, like many subjects from that region, it thrives best in a fairly humid atmosphere, such as in the extreme west, and in some parts of Ireland. Where it will thrive it is a decidedly handsome shrub.—W.

## THE WATER GARDEN.

A rock garden is hardly complete without water in some form or other. Of course, it is not an essential feature, although it must be admitted that a suitable pool, enriched with choice water lilies, or a bog-bed bedecked with aquatics, or a leaping, rushing torrent of water dancing fantastically from rock to rock like a cascade of diamonds, lends adornment to Nature's scenes. There are many of these water gardens in different parts of the country, and the riotous growth of the different species of aquatics is a delightful aspect to every garden lover. They form a part of almost every wild garden, whether the water be obtained by artificial or natural means. The smallest streamlet may be diverted or otherwise adapted so as to supply water for the garden scheme, or it may be lead in some simple manner through a hollowed trunk, to fall into a pool near the pathway.

If the side of a wide stream is available where the water is always changing, little difficulty will be experienced in forming a most pleasing water garden; but apart from such situations, there are numberless ornamental aquatic plants that will thrive where the water is perfectly still. Even where it has to be introduced artificially, and is laid on in pipes, but a small supply can be adapted to many different purposes. Speaking practically, the water supply in the majority of gardens is introduced by artificial means, and in this form it is certainly under better control than where a natural spring or streamlet is the only available source. Its course can be shaped according to any particular scheme, whereas a natural stream must remain unchanged, and the scheme adapted to it.

Natural or artificial ponds are excellent subjects for adornment. They may be planted at the sides with suitable aquatics, the most pleasing effects being gained by planting thickly the promontories or those portions of the bank which protrude into the water, and leaving comparatively bare the bays or concave portions of the bank. This method has the effect of creating an artificial perspective, which causes the pond to appear larger than it actually is. Many beautiful subjects can be introduced into such situations, notably the waterside irises, spiræas, etc. The former are invariably stronger, healthier, and freer in bloom when the roots are submerged below water. The sides and bottoms of such ponds or streams must necessarily be made permanent or secure in some manner, and the best material to use is cement concrete, this being in turn entirely covered by river gravel and pebbles at the bottom and rocks or grassy banks at the sides.

In planting water lilies and all species of nymphæas or other aquatics in such situations, the usual plan is to build small plateaus of loose stones, filling up with soil to a depth of about fifteen inches below the water level. Sometimes the lilies are sunk in baskets to the same level. The waterside plantings must not approach anything of the nature of garden order or system, where rows or borders are set out with the particular subjects in almost mathematical precision. If such an effect is created, even to the slightest semblance of a flower border, it should be immediately destroyed by planting quite close to the edge, and between the perennial undergrowth. One striking example of waterside beauty is a mass of self-sown Primula rosea; another can be secured by surfacing a bog-bed or space by the side of a pool with the feathery spiræas, or yellow and purple irises.

Now, as regards the fall of water, one needs to exercise a considerable amount of care to avoid anything approaching artificial construction. There must be higher ground beyond the cleft in the rocks whence the water apparently emerges, so as to give the effect of a natural supply at a higher elevation. Otherwise, if the water is introduced by means of a pipe placed at the highest part of the rockwork, an unnatural and ugly effect will be created.

For planting in ponds, where the water is comparatively deep, the hardy water lilies in white, crimson, pink, and yellow are the most suitable. The Cape Pond Weed (Aponogeton distachyon) is also a useful subject, and among others are the Water Soldier (Stratiotes aloides), Villarsia Humboldtiana, and V. nymphoides. Suitable aquatics for shallow waters include Acorus Calamus, Typha minima, and T. dealbata (bullrushes), Calla palustris, Thalia dealbata, Butomus umbellatus, scirpus in variety, Arum italicum, Sagittaris sagittifolia, Menyanthes trifoliata, Typha augustifolia, and Pontederia cordata.

The most suitable aquatics for bog-beds or for the waterside are the Japanese irises, especially varieties of I. Kæmpferi; the American irises might also be used with advantage, and of this type many charming colour gradations are to be found in I. virginica, I. keresina, I. Hansoni, and I. Fosteri. Apart from these we have the Siberica group of irises, I. orientalis, I. Blue King, I. Snow Queen, and I. Baxteri; I. setosa, I. aurea, and I. pseud-acorus (Bastard Acorus). Carex pendula and C. riparia, Juncus effusus spiralis, and J. zebrinus, dodecatheon in variety, Funkia Sieboldiana, Caltha palustris, fl. pl.—all these are suitable for bog-beds, and especially for sunny positions. In the shady spots, the following may be planted: Primula japonica and P. sikkimensis, Mertensia virginica, Saxifrage peltata, Podophyllium Emodi, Bergenia cordifolia, Cypripedium spectabile, and C. pubescens, Orchis foliosa, and Saxifrage Fortunei.

Further, to create a bold appearance by the waterside, Gunnera manicata, with its large parasol-shaped leaves, is useful, as also is G. scabra, with huge rhubarb-like leaves. Rheum Emodi and other sorts are also valuable, and among others well adapted for similar purposes are Arundo Donax (ribbon grass, painted grass, or ladies' laces), Chelone barbata (scarlet, bearded), C. glabra (white, smooth), C. Lyoni (purple), Inula Helenium (or Elecampane, which furnishes the Vin d'Aulnée of the French), Liatris pycnostachya (dense-spiked), Meconopsis Wallichi, Osmunda regalis (the Royal Fern), Senecio japonicus, Spiræa gigantea, S. lobata, S. venusta, and Struthiopteris germanica.

Very dwarf plants for bog beds or for the waterside include Cardamine trifolia, Dondia epipactis, Dryas Drummondi, D. Lanta, Primula rosea grandiflora, Lysimachia nummularia; while for shady spots the following are preferable: Epigæa repens, Galax aphylla, Gentiana bavarica, Linnæa borealis, Polyala Chamæbuxus, Spiræa filipendula, and Silene virginica.

J. C. N.

---

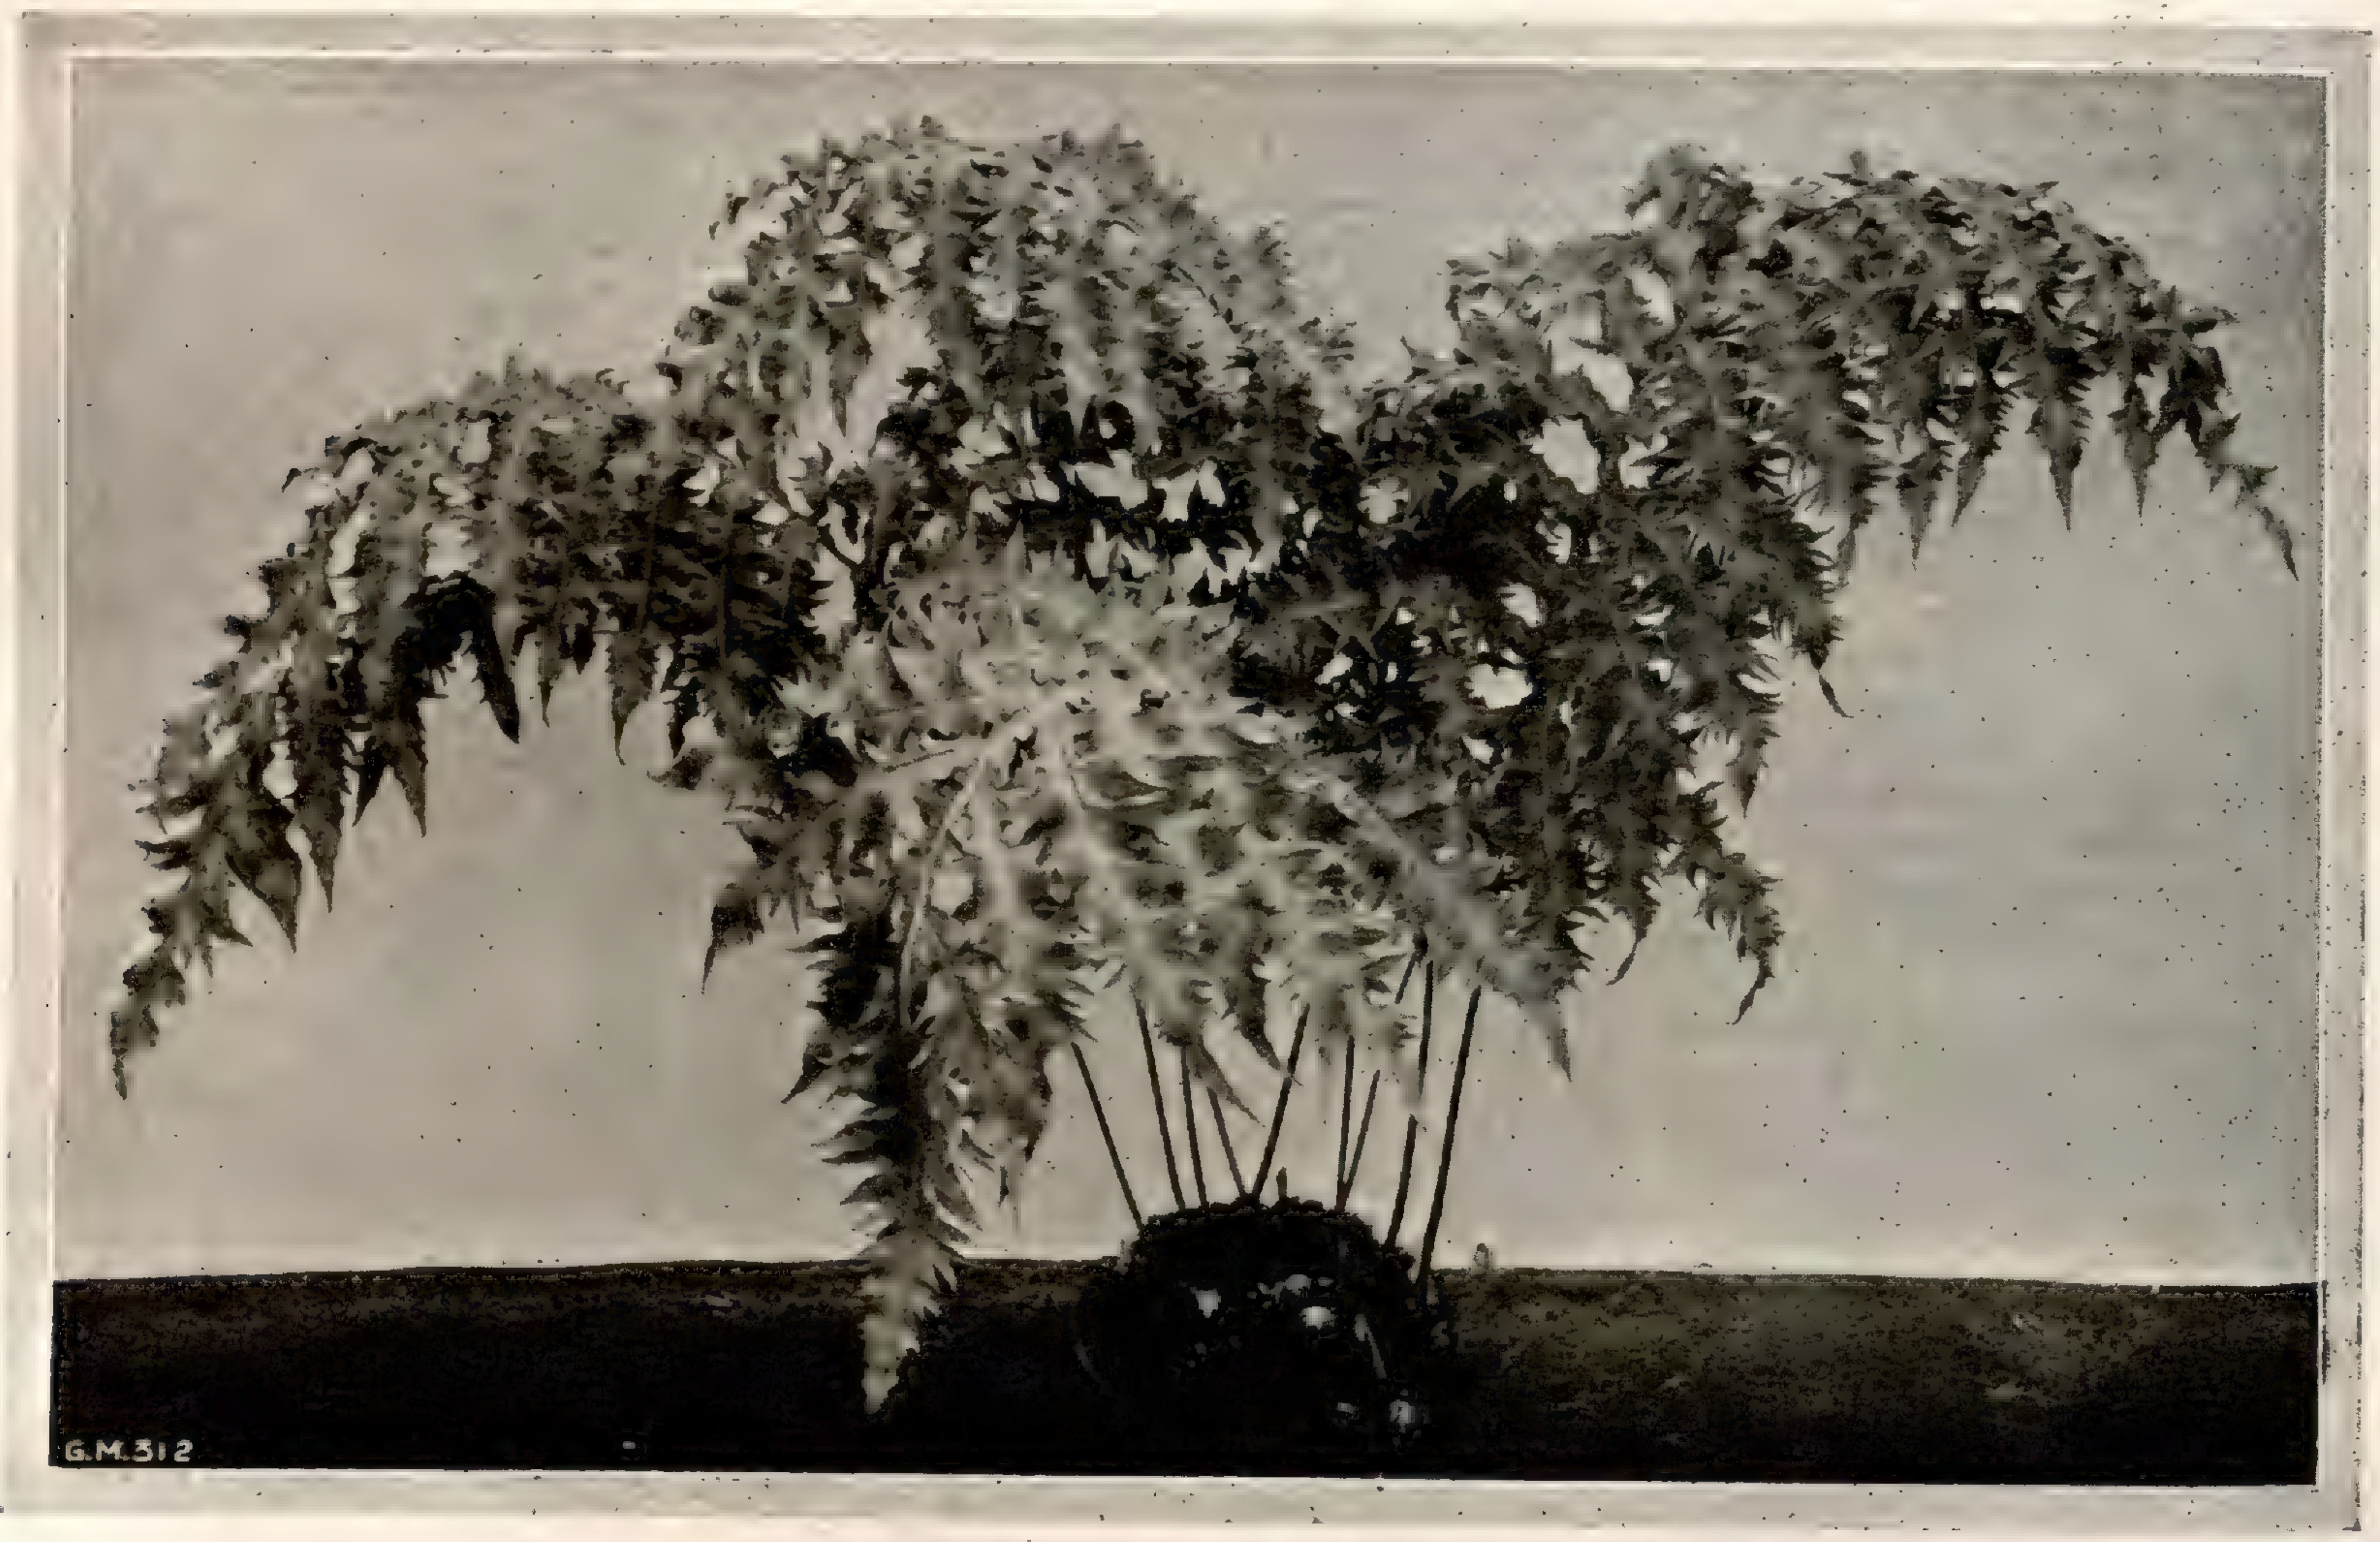
**Heuchera sanguinea Walkeri.**—While all the heucheras are very pretty, there are, to my mind at least, too many with flowers of an undecided tint, while in some cases at least they do not bloom as freely as one would like. The variety at the head of this note (Walkeri) I take to be one of the best of all, the blossoms being large, and of an intense rich crimson colour, while they are borne in considerable profusion.—W.

## NEW PLANTS, ETC.

◆

### POLYPODIUM MANDAIANUM.

A giant polypodium that appears to be a form of P. aureum. It bears splendid green, glaucous-tinted fronds that are deeply divided and are lightly crested. For specimens and for use in large floral arrangements this promises to become a fine subject. F.C.C., R.H.S., July 2. Mr. W. A. Manda, St. Albans.



POLYPODIUM MANDAIANUM.
F.C.C., R.H.S., July 2. Mr. W. A. Manda, St. Albans.

### CATTLEYA ARTEMIS.

This beautiful cattleya, obtained by crossing C. Iris with C. Gaskelliana, has large flowers and fine form. The pink sepals and petals form a pretty setting for the large crimson-purple lip. The latter is rendered particularly effective by reason of its large orange-yellow base. F.C.C., R.H.S., July 2. Lieut.-Colonel Sir George Holford (gardener, Mr. H. Alexander, Westonbirt, Tetbury.

### CATTLEYA DUPREANA, DELL VAR.

A magnificent cattleya, with enormous and substantial flowers that have much in common with C. Warscewiczi with the rounder form and refinement of C. Warneri. The sepals and petals are rose-purple, the lip deep crimson-purple, with a brilliant yellow base and throat. F.C.C., R.H.S., July 2. Baron Bruno Schroder (gardener, Mr. Shill), The Dell, Egham.

### CATTLEYA THURGOODIANA APOLLO.

An effective form, with large, vivid rose-red sepals and petals, and a large dark purple-crimson apex to the lip. A.M., R.H.S., July 2. Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

### LÆLIO-CATTLEYA RUBENS THE KAISER.

This is one of the hybrids from Lælia pumila, and its large flowers seem all the larger by comparison with the lowly stature of the plant producing them. Not only are the flowers large but they are shapely; the sepals and petals deep purplish-rose; lip deep purple with a yellow base and throat. A.M., R.H.S., E. H. Davidson, Esq. (gardener, Mr. Cooper), Borlases, Twyford.

### MILTONIA HYEANA LE CONQUERANT.

A handsome variety, with large and beautiful white flowers, and a large butterfly-like, red-purple disk at the base of the lip. F.C.C., R.H.S., July 2. M. Jules Hye de Crom, Ghent.

### BRASSO-CATTLEYA MARION.

Of unrecorded parentage this orchid is not less beautiful without a pedigree. It is an effective form with large fringed lip. The colouring is white and rose-pink with purple veining on the lip. A.M., R.H.S., July 2. Messrs. James Veitch and Sons, Chelsea.

### ODONTOGLOSSUM PERCULTUM KING GEORGE.

A showy variety, the large flowers having a white ground and numerous large bright purple blotches. A.M., R.H.S., July 2. F. Menteith Ogilvie, Esq. (gardener, Mr. Balmforth), The Shrubbery, Oxford.

### ODONTONIA EDNA.

A charming little orchid derived from Miltonia Warscewiczi and Odontoglossum Wilckeanum. The branched flower spike carried a number of pretty, white flowers, each blotched with yellow. Certificate of Appreciation, July 2. Messrs. Charlesworth and Co., Haywards Heath.

### LASTREA PATENS MAYI.

This beautiful fern we have previously described, as it gained an A.M. at the Royal International Horticultural Exhibition. Shown in fine condition now it has received the higher award. F.C.C., R.H.S., July 2. Messrs. H. B. May and Sons, Edmonton.

### LILIUM WARLEYENSE.

A superb lily that promises to be an immense success in garden decoration if it can be freely propagated or imported in quantity. It is a Chinese plant, and its spikes rise four feet high, bearing about a score of pendant blooms of great beauty. The flowers are on slender pedicels that stand well out from the spike. The flowers are about three inches across, and the segments recurve as in the Turk's Cap lily. The colour is vivid orange-red, and from this ground colour numerous brown spots stand out conspicuously. The leaves are slender, numerous, and graceful, so that altogether this lily has much to recommend it. (See fig., page 513.) F.C.C., R.H.S., July 2. Miss Willmott, V.M.H. (gardener, Mr. C. Fielder), Warley Place, Great Warley, Essex.

### CARNATIONS.

**John Ridd.**—A handsome border variety belonging to the yellow-ground fancy section. The ground colour is bright and freely splashed and marked with bright rose. A.M., R.H.S., July 2. Mr. Jas. Douglas, Great Bookham.

**Jean Douglas.**—A beautiful scarlet self variety of excellent form and bright colouring. A.M., R.H.S., July 2. Mr. Jas. Douglas, Great Bookham.

### BEGONIAS.

**Mrs. Robert Morton.**—A glorious begonia with large beautifully-formed double flowers of a deep, soft yellow shade, tinted with salmon. A.M., R.H.S., July 2. Messrs. Blackmore and Langdon, Twerton, Bath.

**Florence Nightingale.**—A lovely white, double begonia, of moderate size and exquisite form, a free bloomer. A.M., R.H.S., July 2. Messrs. Blackmore and Langdon, Twerton, Bath.

### PHLOX ARENDSI.

Under this name an award was granted to a strain of dwarf phloxes with flowers ranging from palest lavender to violet. About 2ft. high, and bearing heads of bloom on stiff wiry stems, these hybrid phloxes are full of promise. The parentage is said to be P. canadensis and P. decussata. A.M., R.H.S., July 2. Mr. G. Arends, Rousdorf, Germany.

### ROSES.

**Ethel.**—A semi-double Wichuraiana variety with flowers of fair size, rich pink, with white centre. It is a fine-growing, free-flowering rose, and was well shown at Windsor on June 29. A.M., R.H.S., July 2. Mr. Chas. Turner, Slough.

**Mrs. Chas. S. Hunting.**—A lovely hybrid tea rose of good form and size. It has broad, rounded petals that make up a fine bloom. Colour, deep apricot-yellow. A.M., R.H.S., Messrs. Hugh Dickson, Lim., Royal Nurseries, Belfast.

### CLEMATIS LADY BETTY BALFOUR.

A strikingly beautiful variety that cannot fail to become popular. It is very free flowering, belongs to the Viticella group, and has rich violet-purple flowers of rounded form and with stout segments. In the centre of each bloom is a cluster of whitish stamens. A very fine addition to flowering climbers. A.M., R.H.S., July 2, Messrs. G. Jackman and Son, Woking.

### ASTILBE AVALANCHE.

A beautiful variety with fine plumes of pure white flowers, these latter being larger than those of most kinds. The plant grows and flowers freely, and should be valuable in a warm bog garden as well as first-rate for forcing. A.M., R.H.S., July 2. Messrs. Van Waveren and Kruyff, Sassenheim, Holland.

### NEPHROLEPIS EXALTATA ROCHFORDI.

The variations of Nephrolepis exaltata seem to be endless, and several of the forms are very nearly alike. This new-comer has much in common with N. Marshalli compacta, but has longer fronds, exquisitely moss-like in their division and of a lovely shade of green. A.M., R.H.S., July 2. Messrs. Thos. Rochford and Sons, Lim., Broxbourne.

CLEMATIS LADY BETTY BALFOUR.
Flowers rich violet-blue. A.M., R.H.S., July 2. Messrs. Jackman and Son, Woking.

**The Common Jasmine.**—A general favourite is this, the jessamine of older writers. The spotless purity of its flowers and their delicious fragrance are great points in its favour. Though good examples are often to be seen in cottage gardens, and even in unlikely spots in London, yet for some reason or other its merits as a beautiful climbing shrub are apt to be overlooked. True, its blossoms are not so large as some of those subjects now so popular for the purpose, but they possess a quiet beauty of their own, their production extends over a long period, and they are very sweet-scented. The nearly allied Jaminum affine, whose young leaves are reddish and flower buds tinged with colour, is not so good a plant as the common kind.—S. W.

## HYNING, LANCASHIRE.

A short distance from the town of Carnforth, and in a beautiful district, lies the mansion of Hyning, the residence of John Platt, Esq., who has done much to develop and improve the gardens, and through whose kindness the writer has twice had the privilege of visiting Hyning, the last time towards the end of June.

In the period which has elapsed between the two visits, Mr. Platt has made many improvements, which have been ably carried out by Mr. W. G. Watson, his gardener, who, with an augmented staff, continues to keep everything in the most perfect condition. The gardens are of considerable size, and include flower gardens, rock garden, rose garden, orchard, and vegetable garden, with a considerable amount of glass.

In front of the mansion is a beautifully-kept lawn, a little circumscribed in size by some noble old trees, whose removal, however, would be unwelcome and undesirable. Here are some fine beds and borders, filled with flowering and other shrubs, and bedding plants, such as begonias, etc. The conservatory here is kept well supplied with flowers in bloom, and with the adjoining fernery is highly attractive. Here are some fine fuchsias, begonias, Primula obconica—an excellent strain—pelargoniums, spiræas, and astilbes, and other good plants for the house. Since my former visit a good collection of cypripediums, including many of the new varieties, have been introduced, and these are thriving excellently. In the fernery there are some extremely good adiantums, plants of A. gracillimum being especially good.

Near this, and still in front of the mansion is a corner devoted to a small rock garden, this being the one originally erected. Here are a number of good alpines, now of considerable size, but as the majority of the plants here are also represented in the other rock gardens, they may be named in the notes relating to the latter.

The rock garden consists of a series of rockwork pockets, against one of the garden walls, and is both well arranged and supplied with many good alpines. The walls at this part are low, and are planted with flowers, and some interesting points of culture arise. For example, we have Polygonum affine (or Brunonis), growing on the top of a dry wall with little soil beneath. The aspect is about N.N.W. Other plants on the walls here are such subjects as Saxifraga Wallacei, on the top, and Androsaces lanuginosa, sarmentosa, and Chumbyi. Sheets of thymes are also pretty. In the rock garden is an exceptionally well-grown plant of Gentiana verna, growing and flowering with unusual freedom. G. acaulis is also flowering well. Campanulas are represented by the best of the dwarf species and varieties, such as C rotundifolia pallida, very fine on the wall; C. portenschlagiana, C. pulla, C. pumila pallida, and a number of others. The dianthus family is strongly favoured, and we find, for example, Dianthus frigidus, very well done; D. aridus, very pretty; D. glacialis, D. neglectus, and others. The pretty Morisia hypogæa is doing well, and a choice collection of saxifrages of all sections is to be seen. I noted S. Grisebachi as in very good condition, and here mention may be made of a fine rosette of S. longifolia in another wall. This has been for eight years on this dry wall, and it is now some eleven inches in diameter. Oxalis enneaphylla, very fine; oxytropises, aubrietias, sedums, Buxton's variety of Geranium Wallichianum, Veronica cinerea, and many shrubby species of veronica were also seen, while a special note must be made of the splendid way in which Iris gracillipes was doing in the rock garden. Other subjects must be left unnoticed, but it may be said that the plants are numerous, well-chosen, and, as a rule, in excellent order.

Close by are the beds of hardy heaths, the best of the early, mid-season, and late species and varieties being selected, so as to have bloom over many months. Two tanks also contain a capital collection of the new nymphæas. Some of these had become too large, and were broken up this season, but all are doing well.

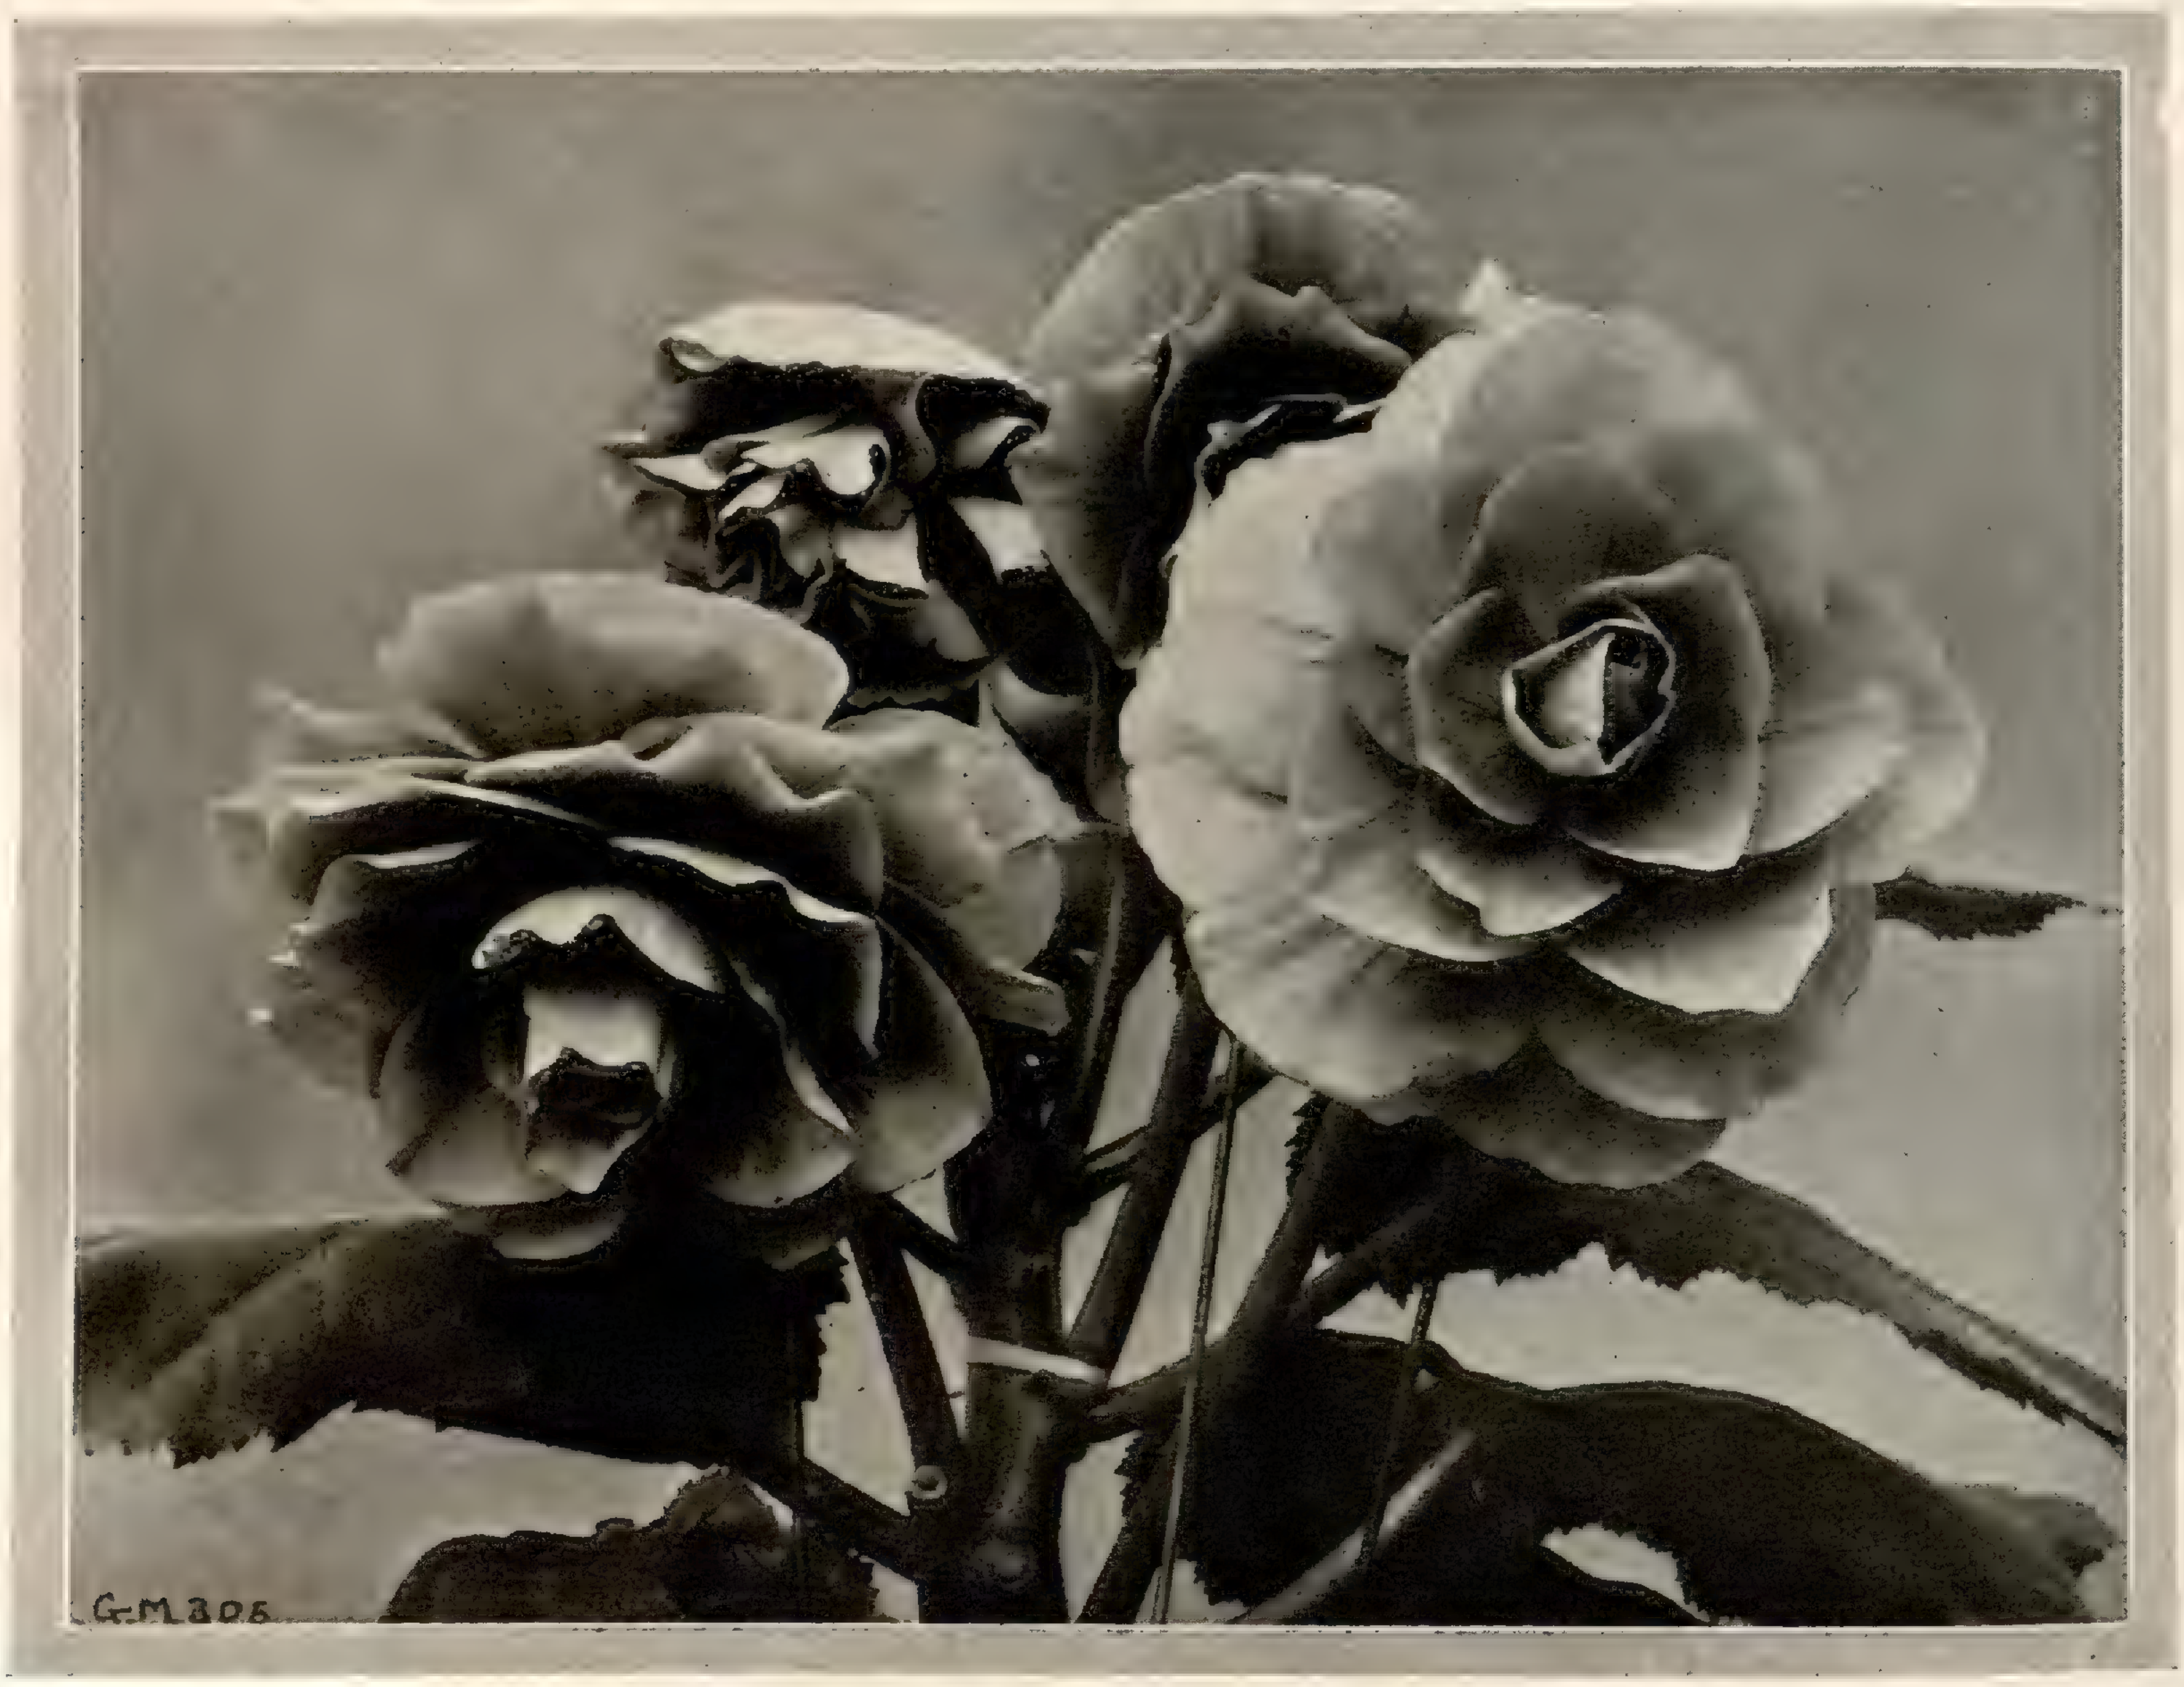
From this rock garden we pass into a rose garden, where are beds of roses in the grass, with Wichuraiana and other climbing roses on pillars and in the form of standards. A bed of the Lyon Rose was extremely fine, and among other roses observed were Evangeline, Dorothy Perkins, Lady Gay, Climbing Caroline Testout. Auguste Barbier, Elise Robichon, and François Guillot.

Thence we pass into the orchard, where the trees are now in good bearing condition. Apples, pears, plums, etc., are giving excellent crops, and fine crops of raspberries, and other small fruits, including the Japanese wineberry and the loganberry are secured. A collection of the newer sweet peas is grown on wire supports in circles cut in the grass. Among them we observed Lancashire (R. Bolton), a fine pink variety; and another fine new pink one, Mrs. Watson, another of Mr. Bolton's raising and named in honour of the wife of Mr. Watson. Others observed were Mrs. C. Foster, Charles Foster, Nancy Perkin, Mrs. A. Malcolm, Sterling Stent, Marchioness of Tweeddale, very good; Mrs. George Charles, Mrs. Alec Ware, Evelyn Hemus, and many others. In another part of the garden rows of other sweet peas are also cultivated. Mr. Watson is a highly successful cultivator and exhibitor of the flower. Here, also, is a new vinery and a tomato house, the vines having been planted about three years ago. The principal variety is Black Hamburgh, and Mr. Watson is securing a fine crop from his vines. Tomatoes are also well done. A carnation house contains a splendid selection of these popular flowers.

The flower garden behind the house is a pretty one, and a good variety is maintained. Some tastefully planted herbaceous borders are furnished with a first-class choice of the best border flowers. Roses are a strong feature here also, and the best of the H.T.'s and the H.P.'s are cultivated in the highest way. Ferns are great favourites, and many choice varieties of the best species were in this and other parts of the grounds.

In the vegetable garden the same high cultivation prevails, and peas, carrots, potatoes, onions, celery, and, in brief, the usual standard vegetables, are excellent and of the highest quality. Strawberries in beds here were very fine, and a leading variety at Hyning is Laxton's Fillbasket, which was bearing literally enormous crops. Among the other varieties we observed the new strawberry George Monro. Here, also, are beds of flowers for cutting.

Many interesting points have been left unnoticed, but a reference must be made to the garden at Mr. Watson's picturesque cottage, where, among other subjects, a bed of rare and choice hardy ferns was particularly fine. The whole place shows what may be done when in the hands of a gentleman who is both willing and able to expend money on his garden, and who is supported by a gardener of ability and skill. Both of these are happily associated at Hyning—hence the high condition of the place and the interest it has for lovers of horticulture in all its branches. S. Arnott.



BEGONIA MRS. ROBERT MORTON.
Colour soft yellow. A.M., R.H.S., July 2. Messrs. Blackmore and Langdon, Bath.

## CLEMATIS MONTANA.

Though one of the smallest-flowered, this clematis is one of the most useful of the whole family for general purposes. Its rapidity of growth, profuseness of flowering, hardiness, and adaptability to almost any purpose for which climbing plants can be used, combine to render it one of the indispensable plants of the garden. It is generally said that all clematis prefer a chalky soil, but this one seems to do equally well in any soil if it is well fed. The main thing to be considered in planting is to give it a good start in the way of deep cultivation and manuring, when it will soon get established, and after the first year grow with amazing rapidity.

Its natural method of growth is to throw out long slender streamers, which are covered the following May with its white anemone-like flowers. If these long wiry shoots are trained in any way it is apt to spoil the natural character of the plant. It is a capital subject for arbours and pergolas, or for running over unsightly outbuildings, walls, fences, etc., but one of the best ways of growing it is to let it run into, and over, some thin, bare, or unsightly tree, planting it some little distance from the stem, and giving it a good start. Grown in this way it may be left to itself year after year, and even when accessible it needs no pruning beyond the thinning out of crowded growth, and the removal of weak and exhausted vines. Immediately after flowering is as good a time as any to do this. It should never on any account be cut down after the manner of the Jackmanni section.

When the flowers are nearly past their best they give off a sweet scent, not unlike vanilla. Alger Petts.

## CHRYSANTHEMUMS.

### Taking Buds of Late Varieties.

Last year, owing to the great heat mainly, the buds of many late chrysanthemums that showed at the end of July were very hard. In some instances the buds were so full of petals that they had not room to develop. In normal seasons the first crown buds are splendid, and the present one will be, I think, a good one for early crowns.

The experienced cultivator treats the plants of a number of varieties in two or three ways, that is, he has plants bearing first natural crowns, others bearing first crowns from early stopping, and, again, some bearing second crowns.

If he knew beforehand what the summer season was going to be like he would know exactly how to treat, practically, every variety; but he does not know, and so he acts accordingly to his judgment.

Many growers will be anxiously watching the progress of that splendid white-flowered Japanese, Mrs. Gilbert Drabble. Of course, it is a very late variety, and needed early stopping. The resultant shoots soon appeared as if they were going to bear premature buds, and any cultivator who may have noticed their condition, and, taking alarm, pinched the shoots again, did a wrong thing, as the bud has not appeared, and will not do so before the proper time—early in August

Last year the variety Frances Jolliffe came almost pure straw-yellow from early crowns, the pink in the petals being very faint indeed. One large grower exhibited some exquisitely coloured blooms from first crowns taken rather late; the pink in them rather predominated. Mary Poulton was persistent in showing buds, and only good blooms resulted from those "taken" rather late. Very early ones had many centres.

I saw blooms of Evangeline last autumn as pink as the old variety Belle Poule when at its best, and in the same stand were pure white blooms resulting from early buds. It seems to be wrong to describe this variety as white, and it would be risky to exhibit it in a class as such, as nearly all the blooms that I have seen were tinted with rosy-pink.

I feel quite such that the colours from the first crown buds this year will be much richer than they were last year, simply on account of the cooler season.

I learn that some growers have put their plants in their flowering pots several weeks earlier than usual, and that, so far, the specimens are far more promising than they have been in previous years. I can quite understand this; too often the young plants are retained too long in the 32's.

### Feeding and Top-dressing.

I am a firm believer in the top-dressing of the plants in the month of July. Many cultivators do not top-dress before the buds are "taken," but this, I consider, is too late, especially in the case of plants finally potted on June 1. If a surface mulch be put on in July another one can be added at the end of August, and there will be many more roots than if only one surface dressing was given after bud-taking. I also believe in feeding according to the condition of the plants. The latter should be kept steadily progressing, and I would feed at any time if it be necessary. I strongly advise beginners to be careful in the use of nitrate of soda. This year I have seen the bad effects of strong doses. The cuttings from the old stools did not make satisfactory progress in the propagating frame, and the plants have not grown out of their sickly condition.

Geo. Garner.

## MENDELISM.

The following is the text of the important lecture on "Mendelism" delivered by J. M. Hector, Esq., B.Sc., before the members of the North of England Horticultural Society at Leeds, and is reproduced by the courtesy of the executive. In this lecture, all reference to animals has been omitted. It should be noted, however, that Mendelism applies to animals as well as plants.

Every new theory challenges criticism. If it be found of general application, it becomes, sooner or later, part of the intellectual currency of the age. In the case of Mendel's theory, however, this acceptance was strangely slow. For the paper was published in 1866, and practically ignored until 1900, when interest in its matter was once more aroused through the re-discovery of the facts by three independent investigators.

How to account for these years of silence is somewhat difficult. They were not due to lack of interest in the subject; nor were they altogether due to chance oversight. The leading authority on hybridisation in Mendel's time, not only read the paper, but corresponded with its author. Yet the theory left no impression on his mind, for Mendel lived before his age. His standpoint was totally different from that of his contemporaries, and it required the progress of thirty-five years to enable scientists to grasp the scope of the theory.

### Mendel's Standpoint.

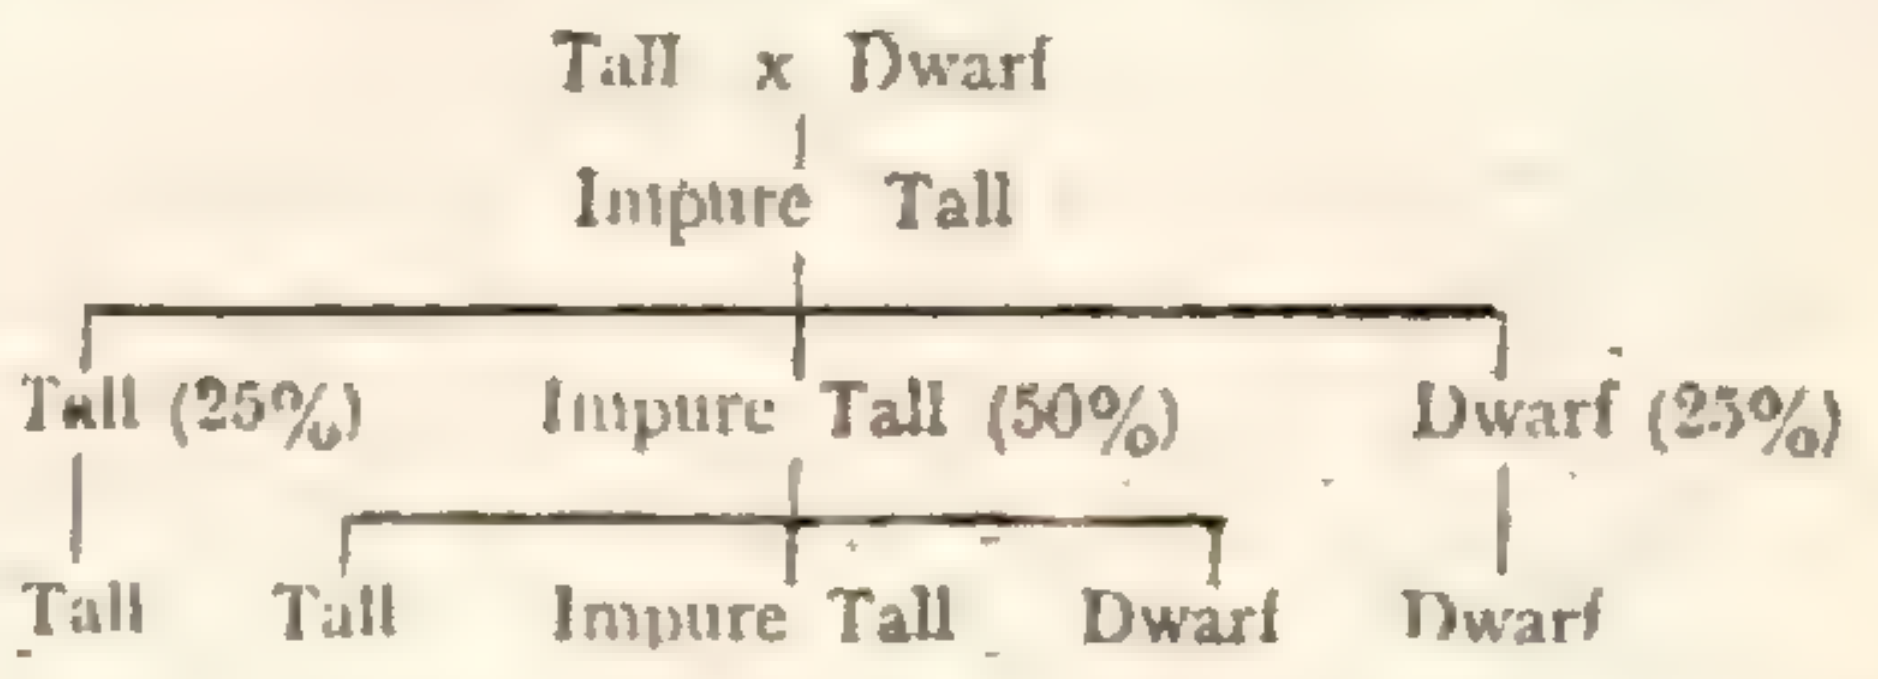
What then was Mendel's standpoint? When we describe a plant (or animal), we do so character by character. When we say that a child resembles one parent in one feature, the other parent in another feature, we are unconscious Mendelists. For if our statement means anything, it assumes that these features have been separately inherited. This was Mendel's position. He looked on plants not as individual units, but as aggregates of characters, each character capable of separate inheritance.

To demonstrate this, Mendel crossed varieties of peas which differed in one or more pairs of characters. Thus, tall peas were crossed with dwarf; green-seeded peas with yellow-seeded; smooth-seeded peas with wrinkled; peas with white-coated seeds and grey-coated seeds. Altogether, the inheritance of seven pairs of characters was thus tested for several generations. All other characters were for the time being ignored.

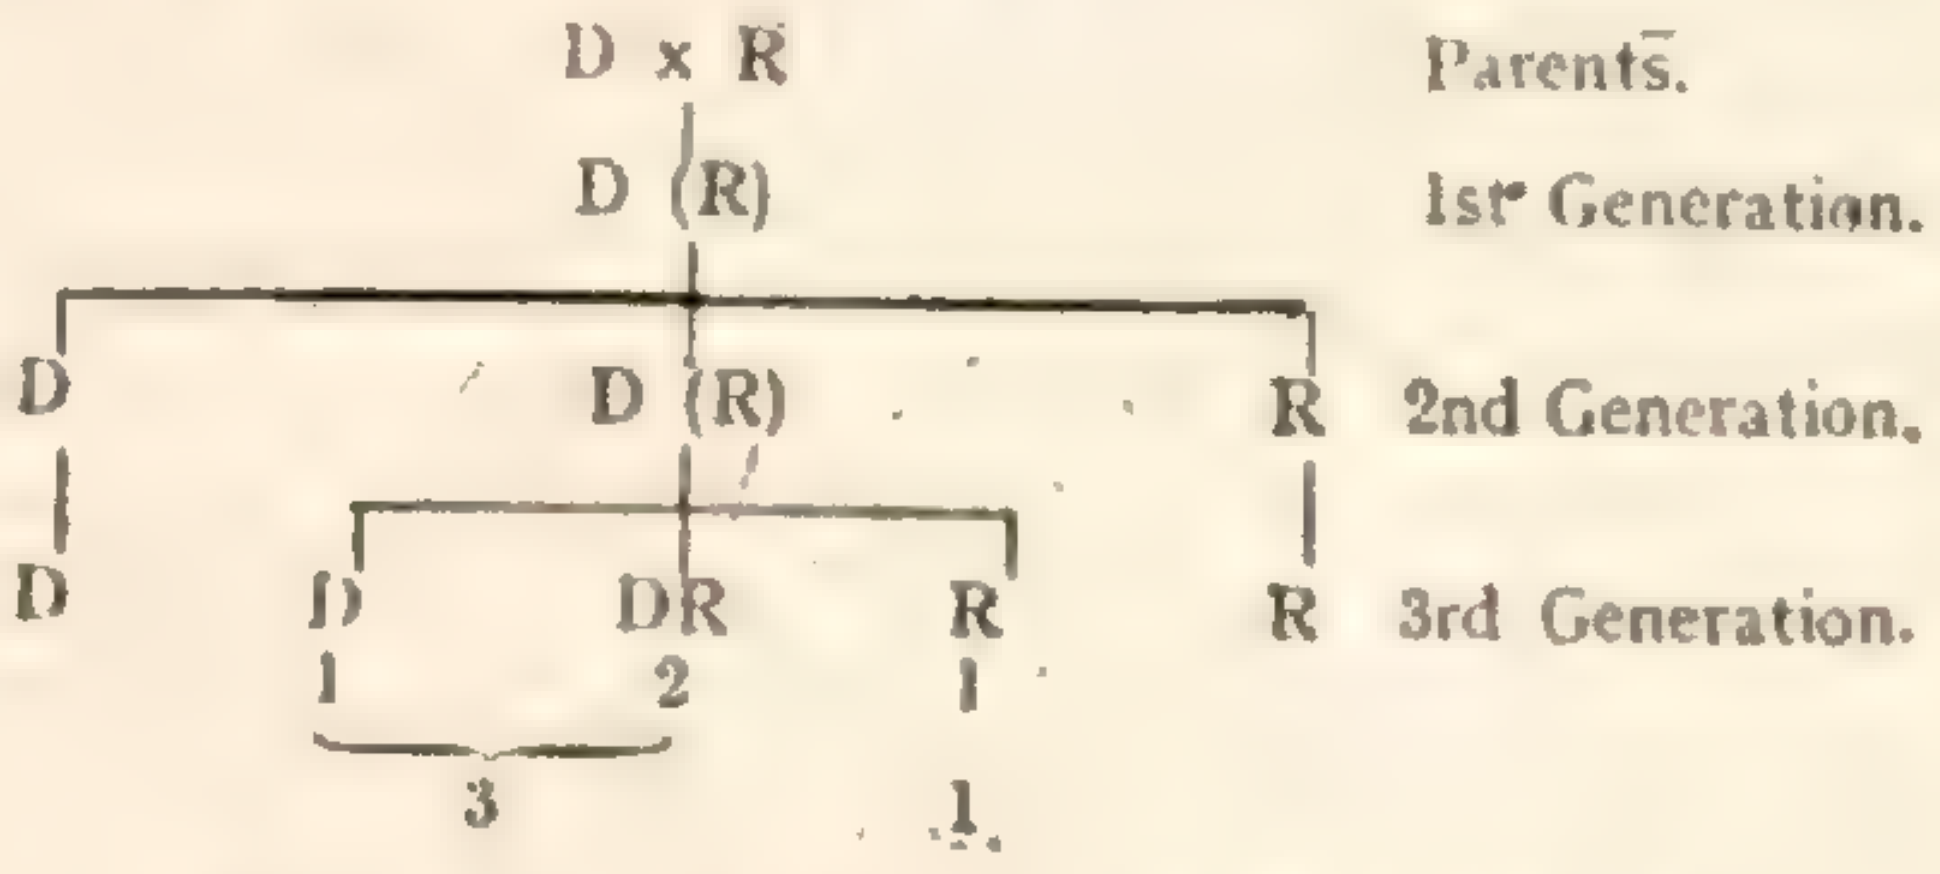
On crossing a tall pea with a dwarf, the hybrids of the first generation were all tall plants, no matter which plant was the seed parent. This tall character was termed the dominant character; the alternative character, dwarfness, which had (outwardly) no expression, he named the recessive. Mendel then asked himself if the dwarf character had actually disappeared; or whether it was still present, but latent, in the constitution of the hybrids. To solve this, he sowed seed from the self fertilised hybrids, and examined all the resulting plants. He found that the dwarf character must have been present in the first generation for the second generation gave both tall and dwarf plants. Further, there were three times as many tall plants as there were dwarf.

Again the question as to the purity of these two sets of plants presented itself. Were the tall and dwarf plants "pure" talls and dwarfs or not (i.e., were they capable of transmitting the alternative characters "dwarfness" and "tallness")? The seed of these plants was accordingly sown, and the plants of the third generation examined individually. Dwarf plants were found to give rise to dwarfs, and to dwarfs only. Not so with the talls. Some gave rise to talls, but from the seed of the others, tall and dwarfs resulted in the proportion of 3: 1. It was also found that the tall plants which gave rise to tall plants were only half as numerous as those which gave rise to tall and dwarf. That is to say, the tall plants of the second generation were not identical. Some were pure tall (minus the dwarf character), and others, twice as numerous, were impure tall (containing the recessive character, dwarfness). In the fourth generation the same phenomena were found.

Summarising these results, we find



Having established the mode of inheritance in one pair of characters, Mendel extended the principle to the other pairs already mentioned, and found it to hold good for all. Letting D stand for dominant, R for recessive, and D (R) for impure or hybrid dominant, we can tabulate the results thus:



### Explanation of Ratios.

Mendel then attempted to explain the ratio of 3: 1, and succeeded in formulating a theory which fits the facts with great accuracy. He supposed that each character would be represented in the pollen grain and the ovule (the future seed) by a single factor, which for simplicity we may postulate as an actual physical substance. Further, he stated that a pollen grain or ovule could contain either the one factor or the other of a pair, but never both. Also, there would be an approximately equal number of each kind of pollen grain and ovule. In other words, the factors would segregate when the reproductive cells form.

Thus, a tall plant would produce pollen grains and ovules, both carrying the factor for tallness. Similarly the dwarf plants would have pollen grains and ovules containing the factor for dwarfness. On crossing these two varieties a hybrid results with only the one character expressed, the other latent. But when this hybrid produces its reproductive cells the two factors segregate, and pollen grains and ovules form, one half of each carrying the factor for tallness, the other half carrying the factor for dwarfness. We have, therefore, two sets of pollen grains and two sets of ovules, approximately equal in number; e.g., 50 pollen grains with the tall factor, and 50 pollen grains with the dwarf factor; similarly with the ovules. These pollen grains fertilise the ovules. The possible combinations are three in number, i.e., Tall x Tall, Dwarf x Dwarf, and Tall x Dwarf. According to Quetelet's "Law of Chance," the combination Tall x Dwarf must occur twice as often as either of the other two, provided we are dealing with a sufficient number of individuals. Hence we get the proportion 1 : 2 : 1.

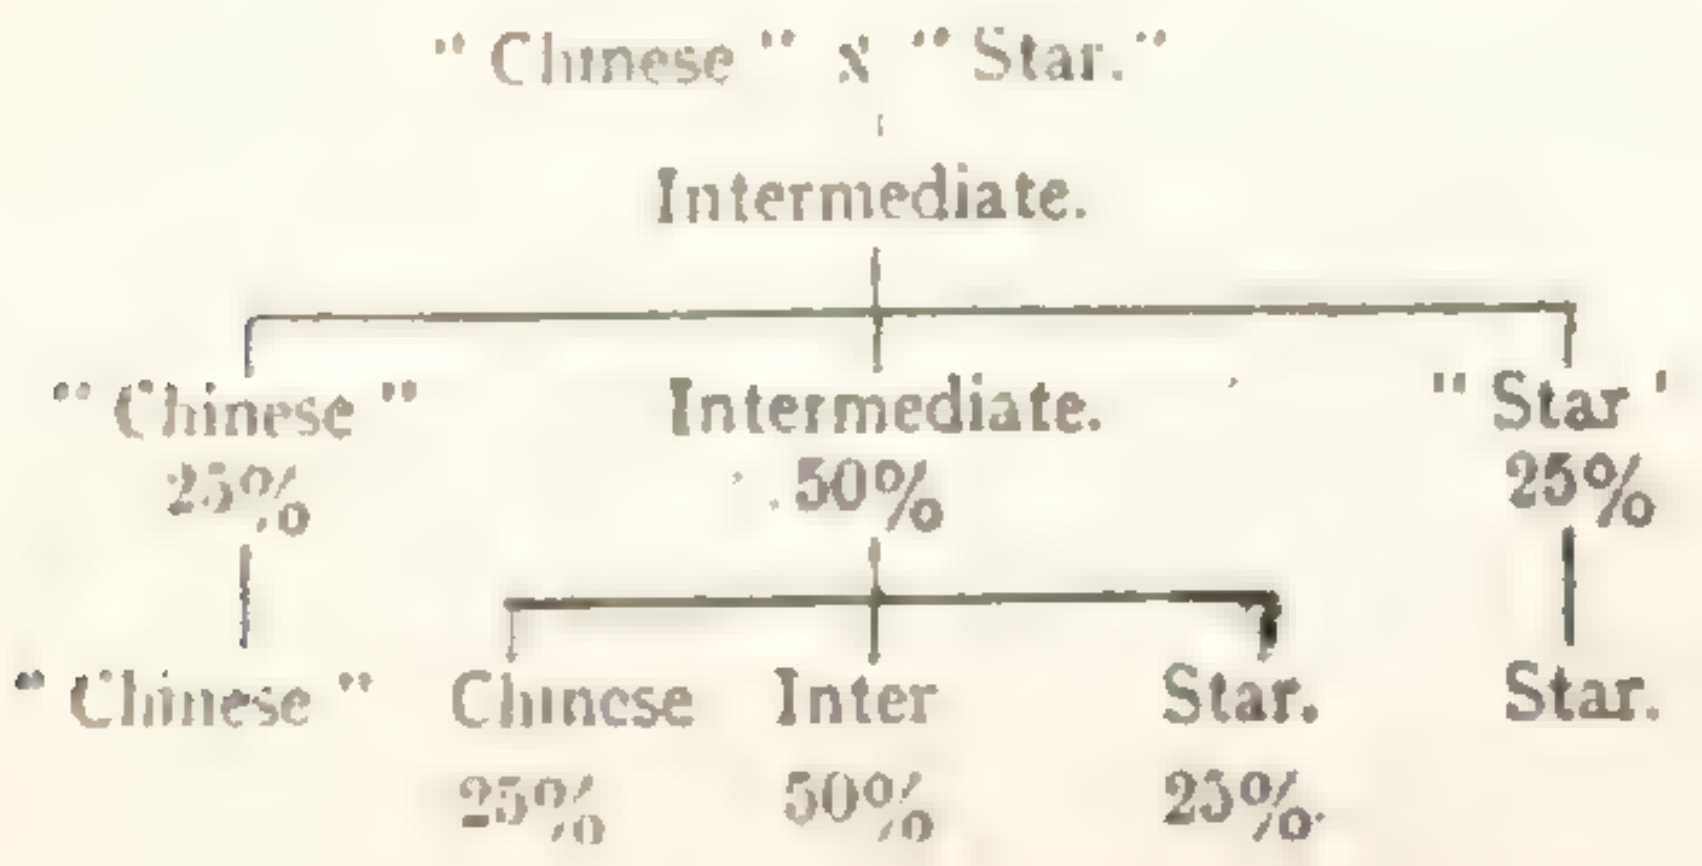
If we toss two pennies simultaneously we get one of the three following combinations, head and head, head and tail, or tail and tail. If we do this a sufficient number of times, we shall get the head and tail combination occurring twice as often as either of the others. That is to say, they will fall in the proportion of 1 : 2 : 1. The law of chance again determines the proportion. But in the case of plants, the mating of the tall and dwarf factors results in a plant looking exactly like a pure tall plant, owing to the dominance of the tall character. Hence the proportion appears to be three tall to one dwarf.

### Recent Experiments.

Within recent years Mendel's experiments have been tested on a large number of plants and animals, and no discordant results obtained. Some of the cases have been found to be of greater complexity than was at one time supposed, and in others, the phenomenon of simple dominance is not known. The hybrid of the first generation is intermediate between the two parents. But this does not negative Mendel's results.

If we cross a long-eared wheat with a short-eared, the hybrids are intermediate in length between the two parents. Seed from the hybrids produces three types, long, intermediate, and short. The proportion is as 1 : 2 : 1. It is here impossible to fix the intermediate form as it is and always must be "impure."

A similar instance is to be seen in the cross between the "Chinese" and "Star" varieties of primula. The former has large waved petals with ragged margins, the latter has small flat petals with a single notch on the margin. The hybrid between these two varieties is a "blend" of the two characters—intermediate in size, petals slightly waved, and with 2-3 notches along the margin of each petal. The second generation consists of 25 per cent. "Chinese," 25 per cent. "Star," and 50 per cent. intermediate or "blends."



### Inheritance of Characters.

We must now proceed to consider the inheritance of two pairs of characters. Thus, suppose we cross a variety of pea having round seed and yellow cotyledons (seed leaves), with one having wrinkled seed and green cotyledons, each character will be separately inherited. Since yellow is dominant to green, and round to wrinkled, the hybrids of the first generation will exhibit both dominant characters, i.e., the seeds will be yellow and round. In the second generations the dominant and recessive characters will both be present, each in the proportion of 3 : 1. Out of every sixteen plants, twelve must be yellow and four green (12:4=3:1). The round and wrinkled characters will also appear in the proportion of 3 : 1. Out of every twelve yellow plants, therefore, nine will be also round and three wrinkled. In the case of the four green, three will be round and one wrinkled. We thus find our second generation to consist of nine yellow round, three yellow wrinkled, three green round, and one green wrinkled.

This class deserves further analysis, for it shows how we may produce in limited time new varieties, whose characters will breed true. Let Y and R represent the two dominant characters and g and w represent the two recessive characters, then the constitution of the two parents will be represented by YR and gw, and the cross YR x gw gives a hybrid with the constitution YR (gw).

(To be continued.)

---

**Combretum purpureum.**—An old-time stove climber from Madagascar, whose scarlet flowers are borne from midsummer till in many cases autumn is well advanced. The flowers are individually small, and borne in branching panicles, each branch consisting, as it were, of a distinct spike. It is not of particularly vigorous growth hence good flowering examples may be trained round a few sticks, although it is really seen to better advantage when trained to the roof of the stove. This combretum is also known as Poivrea coccinea, and was introduced in 1818. At one time it was regarded as a good test of the propagator's skill, the cuttings being considered extremely difficult to root, but one hears little of it nowadays. However, like Ipomæa Horsfalliæ, young shoots may be readily grafted on to pieces of the roots taken from an established plant.—W. T.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

EPIDENDRUMS.—Besides the one mentioned in the issue of June 29 there are many species of this extensive genus which deserve general cultivation. When strongly grown, they produce large panicles of brilliantly-coloured flowers that open in succession for several months, and are extremely useful for table or other floral decorations. Among the brightly-coloured sorts are the well-known E. radicans, E. fulgens, E. cinnabarinum, E. ibaguense, and E. xanthinum (bright yellow). The distinct hybrids E. Boundi, E. Dellense, E. O'Brienianum, E. elongatum, and E. radico-vitellinum are also useful orchids, and worthy of cultivation. Those which are of semi-scandent habit, like E. radicans and E. Boundi, must be trained to some kind of support; for instance, they may be grown tied up to a wall or pillar, the shoots being fastened to wires, or a wooden trellis. Some growers prefer to grow the stems singly in small pots, using ordinary garden sticks for supports; plants grown in this way are very useful for decorative purposes. Larger plants can be trained round stakes much in the same way as ordinary greenhouse climbers are often grown. The plants of this section produce ærial roots from their stems, and frequent syringings overhead are a necessity whilst in full growth. Now that most of these plants have passed, or are about to pass, their flowering stage, and the old shoots having grown very long, those stems with young shoots on them may be cut down to about 2ft. or so in length, and be repotted or replanted. These epidendrums thrive well in light positions, either in the cattleya or intermediate house; and for convenience they should be placed together; so that they may be syringed overhead throughout their period of growth. They will succeed in the same kind of compost as cattleyas, but must not be potted too firmly; the drainage, as usual, must be ample.

OTHER EPIDENDRUMS that are worth growing, although of quite a different character, are E. fragrans, E. atropurpureum, E. Cooperianum, E. sceptrum, E. odoratissimum, E. aurantiacuno, with such hybrids as Epi-cattleya matutina, E.-c. Nebo, E.-c. radiata-Bowringiana, and others, which for cultivation purposes may all be treated as one section. These and similar plants may also be repotted as soon as growth begins and treated in exactly the same manner. Such kinds as E. Wallisi, E. Endresi, E. Endresio-Wallisi, E. Clarissa, E. elegantulum, and E. vitellinum majus do best when subjected to an even temperature the whole year round, placing them during the summer months in the cool house, and in winter in a cool position in the intermediate house. Now that we have two varieties of E. vitellinum flowering at different seasons of the year, it is obvious that the plants will require attention at different seasons. Careful observation will soon decide the proper time when to repot or disturb any plant. These epidendrums should be supplied with plenty of water at the roots when well established; but too much care cannot be taken in the application of water to a newly-potted plant, as by an overabundant supply the compost is ruined, and in many cases the plant killed. The plants should be cleaned from time to time, as in many localities red spider is persistent in attacking them, and a weak solution of some safe insecticide will keep them clean, and do them no harm.

THE WHITE-FLOWERED E. (Diacrium) BICORNUTUM require a higher temperature, the most suitable position being one quite close to the roof glass, in the lightest position in the East Indian house. Established plants, while at rest, need but very little water to keep them plumb, but when growing they need copious supplies whenever the compost appears to be dry. At this season the plants will begin to grow, and, as the young roots push out from the new growth fresh rooting material should be afforded to those in need of it. This species is best grown in shallow pans, and the compost as advised for the others will meet its requirements. The rare E. nemorale will succeed under the same treatment. — J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

WINTER-FLOWERING BEGONIAS, such as Gloire de Lorraine and its white variety Turnford Hall, Mrs. Heal, Agatha, Patti, L'Ideal, etc., will need constant attention now. Young plants which were rooted early in February, having been potted and kept growing, are now ready for their final shift into 6in. pots; this size is large enough for all general purposes, as these begonias, being fine-rooting subjects, do not need a large amount of root room in comparison to the size the plants attain. If very large specimens are required for exhibition, 8in. pots may eventually be used, but only for the very largest plants. These begonias resent overpotting and over-watering very much. The best compost to grow them in will be two parts fibrous loam, one part peat or leaf-mould, and one part silver sand passed through an ½in. sieve. The soil should be moist and workable, not sticky; it should also be warmed by being placed in the house in which the begonias are growing over night. Make the compost firm, but do not ram it. These begonias like a fair amount of heat when growing, but they cannot be classed as stove plants. A temperature of 60 degrees at night during the summer, with plenty of moisture overhead suits them admirably; they must also be shaded. Plants subjected to a high temperature become drawn and spindly, and during the winter (their flowering season) the flowers are pale and the flowering season short. A temperature of 50 degrees at night and 55 by day when in bloom suits them splendidly, and if the plants are staged in a conservatory or corridor where these conditions obtain they will remain in perfection for months. These begonias are also invaluable for house decoration.

PELARGONIUMS.—Show pelargoniums are now practically over, and the plants should be placed outside on an ash-bed in full sun to ripen the growth. In a fortnight the plants will be ready to be cut down, and the cuttings inserted for next year's stock. In all well-ordered gardens a list of stocks of every class of plants grown in the gardens should be kept, and hung up in the potting shed. This can be referred to at any time, and when batches of plants are being potted it acts as a reminder for all concerned. The cuttings are best placed three in a 3in. pot, in a sandy compost; kept close for a fortnight the cuttings will soon root, and they should be potted up singly directly they are rooted sufficiently. When the old stools show signs of breaking into growth from the hard stems they should be shaken clear of the old soil, have the roots trimmed, and be potted in 3½in. pots. Zonal pelargoniums intended for winter flowering should be potted into 32's at once, using a rich potting compost. These are best placed outside on an ash-bed. The leading shoots should be pinched frequently, and all the flower-spikes must be pinched out.

BOUVARDIAS.—Cuttings which were inserted in April are now making nice plants in 3in. pots and are ready for potting into 48's; the compost best suited to their needs will be loam, peat, sand, with a little mortar rubble and wood ash added. They are best grown in a slightly heated pit, and lightly shaded. When growing they should be pinched occasionally to encourage a bushy habit. Some growers plant their bouvardias in beds in the frames, and get good results also, but the great drawback to this method is that the plants often get a severe check when lifting them for potting. In this case the ball of soil close to the plant should be cut round by degrees a fortnight before potting operations commence.—Lewis Smith, Shotesham Park Gardens.

## THE KITCHEN GARDEN.

TOMATOES.—Spring-raised plants that are now in full bearing will need every attention to keep them in a fruitful condition till the later sown batches are in, and from the early sowing very fine fruits are obtained when six to ten feet of growth is made. Do not allow the plants to become dry or the fruits will crack after watering; and avoid over-feeding, but supply just sufficient nutriment matter to maintain a steady and even balance of fruit and foliage. Rather rely on occasional top-dressings of loam and a little burnt garden refuse added; this will be found to encourage a constant root action through the surface of the new soil. Tomatoes are fond of ordinary liquid manure made by equal parts horse and cow manure, with a little soot added. Place the whole in a bag and immerse in water. Dilute as required for watering. Pot or box later sowings when large enough, give plenty of air, and, wherever possible, place the plants in direct sunlight. Use a compost for these consisting of turfy loam, a little mortar rubble, and a slight addition of bones, particularly if the plants are weak from any cause.

OUTDOOR TOMATOES are growing freely, and will need every care and attention in tying the leads and suppressing the side growths as they appear. Tap the plants briskly when in bloom to disperse the pollen and ensure perfect fertilisation of the fruits. Top-dress as required, use horse droppings later for the same purpose.

AUTUMN-SOWN ONIONS.—These have grown apace, and will almost have finished their growth. When it is observed this is the case, gradually lift them to prevent the bulbs splitting, slowly dry them off, and store in a cool, dry place. Garden lights are perhaps best to use to obtain perfect ripening. Place the bulbs on hurdles, raising the light, with bricks t oallow a free passage of air through them. In dry weather during the day the lights should be removed, taking advantage then by turning the onions over occasionally.

CELERY.—This is not often required till late in September. Still, where a few exhibition heads are required in August, preparation should be made for their production by drawing any basal growth and lesser leaves. Give a top-dressing of nice loamy soil, and commence blanching with brown paper bands five inches in depth. Place fairly firm around the base of each stick, and add similar bands at fortnightly periods till the desired height is attained. Water as required, and keep a sharp look-out for slugs. Dust with soot as a preventive.

CABBAGE.—It will soon be time to make one small sowing of cabbage for an early spring supply. Here we usually make a sowing about the 25th of the present month; these are found so useful for planting on warm borders, independent of the main August sowing. Ofttimes we can cut nice heads in January if required. Sow the seed in a well prepared bed, using a little fresh soil, with burnt garden refuse. Net the bed securely from birds, and plant out as soon as ready in the positions above-mentioned. Excellent varieties are Sutton's April and Harbinger.—G. Ellwood, Swanmore Park Gardens.

## HARDY FRUITS.

PEACHES AND NECTARINES. — The training-in of young necessary shoots should have timely attention, particularly in the case of those varieties which ripen early; if the fruits are not fully exposed to the light before colouring commences there is the danger of scalding taking place, and the fruits will be both lacking in colour and flavour. As in previous notes, I would again emphasize the necessity of allowing ample space for each shoot to develop its foliage, and ensure the ripening of the wood without overlapping. When the laying-in of the shoots is completed any leaves which may obstruct free admission of sun and air to the fruits should be removed. Examine the ties on young and vigorous trees. Much harm occurs if the ties are too tight, and cutting into the young and tender bark. Gumming is the usual result of shoots injured in this manner. During sunny weather thoroughly syringe the trees—daily if possible and late in the afternoon. A cool and moist condition throughout the night is most beneficial to the trees, and materially assists the colouring up of the fruits. In places where the rainfall has been light, water should be freely applied. Soak the borders thoroughly; half and half measures do more harm than good. Trees infested with red spider should be sprayed with a suitable insecticide, and every effort should be made to cleanse the trees of this pest before the fruits commence to ripen. Sulphide of potassium, ½oz to a gallon of water, is an effective remedy. I have, however, found that the effect of sulphide of potassium on certain varieties of peaches and nectarines does more harm to the foliage than red spider. Varieties with leaves having deeply-serrated edges are those chiefly affected; leaves with smooth edges escape injury.

FIGS ON WALLS.—In the warmer parts of the country the young growths are sufficiently advanced to lay them in, and if the shoots are very strong pinching out of the points should be resorted to; as the foliage of the fig covers a considerable area thin training is most essential. Very few insect pests trouble fig trees. White scale is usually the most troublesome pest to deal with, and this calls for drastic winter treatment. Red spider at times shows itself. A thorough syringing will, however, keep the foliage free from this pest.

RED AND WHITE CURRANTS.—Protection from the attack of birds should be given, as they are very partial to the ripening fruits, especially to the white varieties. If growth from the spurs or side growths prevents free admission of light, such lateral growths may be pinched back to three or four leaves. This operation should be performed before the nets are put over the bushes.

GOOSEBERRIES.—These fruits are ripening fast in this district, and no doubt in other parts as well. Protection should likewise be given. Owing to the thorny nature of the bushes, it is not wise to lay netting on them; some form of support must be erected similar to that advised for raspberries in a previous calendar, the height of same to be adjusted in accordance to that of the bushes. Where possible, it is an excellent plan to make a plantation and cover with galvanised wire netting; the mesh must be small enough to exclude such small birds as tomtits and bullfinches. Having had experience of the value of this method of protection I strongly recommend it in every way. W. Messenger, Woolverstone Park Gardens, Ipswich.

**Jasminum Maingayi.**—This comparatively new and little-known species of jasmine from Eastern Asia is a very pretty climbing plant for the roof or rafters of a stove or intermediate house, where it will continue to flower for months together. The glossy foliage is decidedly attractive, and the white, starry, fragrant blossoms are borne freely.—T.

**Spring-sown Onions** are now bulbing beautifully. Every encouragement should be given them during the next six weeks, when practically the growth should be finished. Ply the hoe regularly, and assist them with dressings of artificial manure. At other times apply soot, with copious watering should dry weather prevail. Keep a sharp look-out for mildew; speedily remove the leaves having the slightest trace of the pest, and burn them. I believe that if the first spores were observed in time, no more would trouble us. Anyway, burn every piece, and as a preventive dust with equal parts sulphur and newly crushed lime when the plants are damp with dew. Treat the main sowing similarly as regards the dusting compounds.—G. Ellwood.

# EXHIBITIONS AND MEETINGS.

### Newcastle-on-Tyne Horticultural Society.

JULY 3 to 5.

The eighty-eighth annual show of the Durham, Northumberland, and Newcastle-on-Tyne Botanical and Horticultural Society was held in the Recreation Grounds on July 3, 4, and 5. The opening day being wet, and the following ones anything but seasonable, the society may be congratulated on so large an attendance. As many of the side shows were not included in the charge for admission the Society should be in a better financial position than has been the case of late years. The show generally was not up to the usual standard. There was little competition in the fruit classes, and there was a big falling off in the quality of the large groups, which have previously proved a great attraction to the Society's summer show.

The trade groups also were in many cases below the usual standard, and only locally represented. There can be no doubt that the Royal Show at Doncaster was one of the principal causes of the absence of the trade groups, but the earlier date of the show materially affected local exhibitors who usually competed, in the fruit classes more especially.

In the class for a group of miscellaneous plants, arranged for effect, Mr. H. H. Hillier, Darlington, was first. The arrangement was neatly carried out, the plants consisting principally of finely-coloured crotons, variegated acers, caladiums, alocasias, with roses, orchids, ixoras, and other flowering plants. Messrs. Carnegie and Co., Lim., Newcastle, were second, and Mr. T. Wilkinson, Newcastle, third.

In the class for twelve bunches of sweet peas, distinct varieties, there was a very strong competition, and Mr. W. H. Hardy, Three-Mile-Bridge, was first. The vases of Etta Dyke, Masterpiece, and Helen Lewis being very fine, and the colour and flowers generally were of high quality. Messrs. Castle Bros., Carnforth, second; Mr. T. H. Bolton, Exeter, third; and Sir George Trevelyan, Bart. (gardener, Mr. E. Keith), fourth. In competition for the prizes for three bunches Mr. F. Bell, Whitley Bay, was showing very fine examples of Afterglow, Prince George, and Barbara. Mr. T. H. Bolton, second; and Messrs. Castle Bros., third. In the open classes for roses there were some very fine exhibits. For thirty-six roses, eighteen distinct varieties, Messrs. H. Dixon, Lim., Belfast, was first, Mrs. C. Dixon, Leslie Holland, Mrs. J. Pinkerton, John Cuff, and W. Cooper being particularly fine. Messrs. Gibson and Co., Bedale second, and Mr. T. Park, Bedale, third. For twenty-four roses, twelve distinct, Messrs. Dixon were first, Archie Grey, The Lyon, W. Sergent, and Leslie Holland being particularly fine. Messrs. Gibson and Co., second, and Mr. T. Park third. For twelve roses, eight distinct, the competitors were again placed in the same order. For twelve blooms of any hybrid or hybrid perpetual Mr. T. Park was first.

The amateur and limited classes were well filled, but the quality was not so good as in previous years.

The class for eighteen bunches of flowers of herbaceous plants brought the most meritorious plants exhibit in the show. Messrs. Gibson and Co. were easily first, the most remarkable being delphiniums in varied tints, Verbascum Caledonia, Campanula Mrs. Lawrenson, and gaillardias. Messrs. Harkness and Sons, Bedale, were second, and Messrs. G. Longster and Sons, third. For twelve herbaceous or hardy flowers Earl Grey (gardener, Mr. W. Lambert) was first, and Mr. E. Keith second.

For the best collection of cut carnations Mr. J. E. Hathaway, Baldersby Park, Thirsk, obtained premier honours, and Messrs. W. Lawrenson and Sons, Newcastle-on-Tyne, were second. For a group of carnations in pots Messrs. Lawrenson was first and Mr. D. Marshall, Yarm, second.

In the classes for collections of eight and four dishes, Mr. Hathaway was the only exhibitor, and was deservedly awarded the first prize in each class. Mr. Hathaway was also the only competitor for four bunches of grapes, not less than two varieties, and two bunches of Muscats, and was awarded the first prize in each class. For two bunches of white grapes, any other variety, Mr. Hathaway was again first; Mr. Dodds second. For two bunches Black Hamburgh, Mr. J. Hathaway was again first, Mr. W. Lambert second, and Mr. Dodds third.

The first prize for two bunches of black grapes, any other variety, was awarded to Mr. E. Keith for good clusters.

For a dish of peaches Mr. Hathaway first, Mr. A. Woods, Beamish Park, second, and Mr. Dodds third. For a dish of nectarines Mr. Hathaway first, Mr. Clark, Morpeth, second, and Mr. Woods third. Mr. Hathaway obtained premier honours for a dish of cherries and Mr. W. Lambert was second. For strawberries and tomatoes Mr. Hathaway was first in each class.

The local nurserymen made some meritorious displays. Messrs. Finney and Co., Lim., Granger Street, Newcastle-on-Tyne, were awarded a gold medal for floral designs, decorative foliage and flowering plants. Messrs. W. Lawrenson and Sons were awarded a gold medal for rockwork, carnations, flowering and foliage plants, roses, and hardy flowers. Messrs. Laing and Mather, Kelso, received a gold medal for a very well-designed rockery, hardy flowers, and conifers.

Silver medals were awarded to Mr. F. J. Bell, Whitley Bay, for a fine exhibit of violas, etc., and to Messrs. Ord Bros., North Shields, for tuberous begonias, liliums, and decorative plants, etc.

Messrs. Michie and Co. Alnwick, received a certificate for pink Mrs. Beckett Chayter and Mr. W. J. Sanderson, Warkworth, for delphinium True Blue.

## Bournemouth Gardeners' Association.

### VISIT TO MICHELGROVE HOUSE GARDENS.

About fifty members of the above-named association visited the lovely gardens at Michelgrove House, Boscombe, on the evening of June 28, by the kind invitation of Walter Childs Clark, Esq., F.R.H.S. The members were conducted round the gardens by Mr. Clark, and his son-in-law and daughter, Mr. and Mrs. G. Hamilton. The gardens were in the best possible condition, and roses were to be seen everywhere. Mr. Clark is an enthusiast, and grows about two thousand plants as dwarfs, standards, and climbers. He advocates the growing of the Lyon rose as a standard, and all the red varieties and Lyon in partial shade. There are many pine trees growing all over the gardens, except on a portion of lawn in front of the mansion, and these cast a shade which seems to greatly benefit the roses, as the colours are very rich and last for a long time in a fresh condition. One variety, Lady Waterlow, does not receive any sunshine, and yet its colours were exquisite. That grand rose, Hugh Dickson, was in the best possible condition under some trees, and looked magnificent in the glinting sunlight which came through the branches of the pines overhead. On the trunks of many of these pines climbing roses were trained to a height of nearly 20ft. The golden oak was equally rich in colour, under the pine trees. Hiawatha, Crimson Rambler, Climbing Caroline Testout, and American Pillar were grand as trained on trees. Some of the climbers were growing in front of rhododendrons, and had their shoots trained over the more prominent branches of these evergreen shrubs, and most beautiful the effect was. Mr. Clark believes in hard pruning of the variety Juliet, and certainly his treatment answered, as the resultant blooms were very fine. There is an utter absence of formality in the gardens; they are unique and most charming. New roses are added to this large private collection every year, and only the very best are grown. A few only can be named here. Clematises on trellises and rock pillars for pergolas are other features of these gardens.

After tea the members were invited, by Mr. Hamilton, to look round his gardens at Boscombe Place, which almost adjoins Mr. Clark's garden. Rockery and alpine plants were to be seen in good condition; roses were also very plentiful and good, and, in the wild garden lily of the valley and camellias were growing luxuriantly under pine and other trees. Mr. Hamilton said the camellias had flowered very well owing to the ripening of the wood last year. The kindness extended to the members was greatly appreciated, and very hearty votes of thanks were accorded both Mr. Clark and Mr. and Mrs. Hamilton before the party separated.

## Sweet Pea and Rose Show.

A very successful exhibition of sweet peas and roses was held in the Westover Palace Rink on Wednesday, July 3. The building is an immense one, central, and in every way suited to the arrangement of a fine flower show.

The object of the exhibition was to encourage the cultivation of sweet peas and roses, and to further the interests of the Bournemouth Gardeners' Society. The committee responsible for the arrangement are to be congratulated on the general success of the show, and the visitors were pleasantly surprised at the lovely display which they saw.

### SWEET PEAS.

For the best and most tastefully arranged display of sweet peas with any foliage on a table space 5ft. by 3ft. Mr. Evans, gardener to G. J. Fenwick, Esq., was first; Mr. Weaver, gardener to Major Tinker, Christchurch, being second. Mr. G. Garner, Bournemouth, was first in the class for a dinner table decoration of sweet peas and any foliage; Mr. Evans being second, and Mr. Weaver third. Mr. E. G. Cox was the winner in the class for nine vases of sweet peas with own foliage; Mr. Weaver was second; both of these exhibits were very fine. For three vases, distinct varieties, Messrs. Cox, Weaver, and C. Pearce won in the order named. Mr. Cox was the winner in the class for one vase, mixed varieties, followed by Messrs. Pearce and Weaver. Mr. Cox had the most tastefully arranged epergne of sweet peas with any foliage; Mr. Nippard taking second honours.

### ROSES.

For the best display of roses arranged on a table Mr. Weaver was the winner. Mr. G. Cockman had the best six vases, distinct varieties. Messrs. Cox and Pearce were the winners in the above order for three vases. Messrs. Pearce, Cox, and Evans won in the order named in the class for a bowl of roses with own foliage. Mr. Garner had the best basket of roses, Mr. Evans taking second honours. Mr. Garner also had first for a shower bouquet of roses with any foliage. The best H.P. rose was staged by Mr. Douch; he had a nice bloom of Margaret Dickson. Mr. Cockman had the best H.T.

### NON-COMPETITIVE EXHIBITS.

These made a grand display. Mr. J. Stevenson, Wimborne, Dorset, had sixty vases of sweet peas, occupying a table space of 50ft. run. It was a very beautiful exhibit. The flowers were very large and fresh, the stems being exceptionally long. Messrs. D. Stewart and Sons, Wimborne, had about one hundred vases of roses, and some new climbing varieties in pots. Mr. M. Prichard staged, in his well-known style, a beautiful collection of herbaceous cut flowers. Messrs. G. Watts and Sons, Palace Nurseries, Bournemouth, had cut blooms of sweet peas, roses, and carnations, and a group of stove and greenhouse plants. Groups of flowering and foliage plants were arranged by Mr. Evans, the Park Nurseries Co. (W. Welch, manager), and Mr. T. K. Ingram, Parkstone, Dorset. Mr. Reeves had sweet peas, Mr. Elford border carnations, and the Christchurch French Gardening Company salads and vegetables. Mr. Clark, of Michelgrove House, filled a table with some lovely new and choice roses.

## Parkstone Gardeners.

On Thursday, July 4, a very fine exhibition of rambling roses was held by the members of this association. Although the soil in this district is light and gravelly in many parts, the roses do well, and this year the colours are very rich indeed.

First-class certificates were awarded to Mr. Palmer, the hon. secretary, and head gardener to the Poole Corporation, for roses, and to Mr. E. G. Cox for sweet peas.

There was a good attendance of members —about fifty—and several ladies who are enthusiastic rose growers and supporters of the work of this society. Mr. Holmes occupied the chair.

## Wigtonshire Horticultural Association.

On Wednesday, June 26, about thirty members of this old-established society held their annual outing, which this year was confined to the county. Leaving Stranraer, the headquarters of the society, in the early morning, the party were conveyed in two motor brakes along the beautiful shores of Luce Bay to Monreith, the residence of Sir Herbert Maxwell, Bart. Here they were received by Mr. Gordon, the head gardener, and conducted through the interesting and extensive gardens and policies, and were enabled, owing to the brilliance of the weather, to view the fine collections of herbaceous and rock plants, as well as the grapes and vegetable crops, under the best possible conditions. From here the party journeyed across country to Galloway House, pleasantly situated upon the shores of Wigtown Bay. Here Mr. Day, head gardener, acted as guide, and several hours were happily spent in inspecting the inmates of the glass structures, and the flower and vegetable quarters of the enclosed gardens. Needless to say, fruit is a speciality here, and much interest was evinced in the crops, both under glass and in the open. Vegetables, too, were prominent, and, owing principally to the genial season, Mr. Day was able to show some excellent examples of early potatoes, one root of each variety being raised and exposed upon the ground, that all having an interest in the valuable tuber might leisurely inspect the produce, and be convinced of the general excellence of the earlier crops in Scotland this season. Carter's First Crop, Duke of York, Sharpe's Express, Sharpe's Victor, Sir John Llewellyn, and Midlothian Early were each in turn scrutinised, and as all had an equal advantage as to soil and aspect for development, it was a comparatively easy matter to detect their respective merits. It may be worthy of note that the first-named and the last-named secured the greatest number of admirers—both being in a way distinct—early and second early, and although the number of tubers to each root and the weight of crop was considered well above the average, scarcely any small or unusable tubers were observable. Three lines, having one hundred plants in each, of Carter's Beefheart Cabbage were also much admired for their size, symmetry, and vigorous appearance. The extensive grounds and flower gardens were afterwards visited, where many stately trees, finely flowered and fragrant shrubs were viewed and very favourably commented upon.

On the call of Mr. Belford, hearty cheers were given for Messrs. Gordon and Day (the former having accompanied the party from Monreith), to which both gentlemen replied, and the party left, as the shadows of evening were deepening, upon their forty miles' run back to the starting-point—Stranraer—regretting that no further exploration of the charms of the estates could then be made owing to lack of time.

**Cardiff & County Horticultural Society.**

**24th GRAND ANNUAL SHOW**
SOPHIA GARDENS, CARDIFF,
**Wednesday & Thursday, July 17 & 18, 1912.**
Specially good prizes in every Section, amounting in Money and Plate to nearly **£500.**
Tents lighted by electricity by Messrs. Fred Price and Co., Ltd.
POPULAR PRICES.
Schedules from the Secretary,
Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

THE HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY.

The TWENTY-FIRST SHOW of the above Society will be held in the CITY HALL, HULL, on WEDNESDAY and THURSDAY, 20th and 21st November next. Send for Schedules to
JAMES DIXON, Hon. Secretary,
County Buildings, Hull.

LEICESTER.—ABBEY PARK FLOWER SHOW, 6th and 7th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

ROYAL LANCASHIRE AGRICULTURAL SOCIETY.
GREAT HORTICULTURAL EXHIBITION will be held in connection with the above at Preston, August 1st, 2nd, 3rd, and 5th. Entries close July 15th. Schedules on application to PETER BLAIR, Trentham Gardens, Stoke-on-Trent.

**HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.**

## National Sweet Pea Society.

The exhibition held by this society at the Royal Horticultural Hall, Vincent Square, Westminster, S.W., on July 9 and 10 was the very finest it has ever held. In high quality and in the wide range of colouring exhibited by the fragrant flowers this exhibition has never been exceeded. The hall was well filled, and the table decoration class overflowed into the Lecture Hall upstairs. The show was, perhaps, scarcely so effective as usual because erections of baize-covered staging were placed down the centre of each table, spoiling the show as a spectacle, though perhaps it was to the advantage of some competitors. The gallery was tastefully decorated by Mr. Tigwell and the hon. secretary, and all round the hall were wonderful trade exhibits, all of sweet peas, certainly the finest trade displays the society has attained.

A rule to the effect that double standards would disqualify caused a good deal of trouble, and there were not a few disqualifications as the result of numerous protests against infringement of the rule. In several cases the best flowers were displaced because of double standards.

### GENERAL DIVISION—TRADE EXCLUDED.

In the Sutton Cup class for twenty-one bunches, distinct, Mr. A. Moring, gardener to A. W. Stirling, Esq., Holme Lea, Goring, led, and his best bunches were of Hercules, Thos. Stevenson, Elsie Herbert, Flora Norton Spencer, and J. Ingman. Mr. Humphrey, gardener to C. Hopton, Esq., The Cottage, Greenford, was placed second. The best twenty-four bunches, distinct, found Mr. F. C. Beale, gardener to Mrs. A. Kensington, Haverbrack, Uckfield, to the front with some lovely flowers, those of Helen Grosvenor, Winsome, Mr. W. J. Unwin, Clara Curtis, and Tenant Spencer being especially good; Mr. Moring secured the second prize. Mr. T. Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone, would have led the way in teh Eckford Cup class, but was disqualified, and so Mr. A. E. Usher, gardener to Sir Randolph Baker, Bart., Blandford, won the cup with grand flowers of Barbara, Clara Curtis, Lavender George Herbert, Dora Usher, T. Stevenson, and Evelyn Hemus; Mr. T. Bethell, gardener to Captain Twist, Earley Lodge, Reading, came second. Mr. Cowdy, Greenhall, Longhall, Armagh, won the Dobbie Cup with splendid flowers of Prince George, Mrs. Cuthbertson, W. P. Wright, R. F. Felton, and King Manoel—all other competitors were ruled out of court.

Mr. C. Stapylton, Englefield Lodge, Englefield Green, scored for three bunches of cream-pink varieties with Mary Longdown, Miss Chetwynd Stapylton, and Mrs. R. Hallam. Mr. Beale, gardener to Mrs. Kensington, led for three vases of double standard varieties, and here he showed Audrey, Crier; Orange Perfection, and Scarlet Emperor; Mr. Usher second, and Dr. Phillips, Malpas, was third.

SWEET PEA R. F. FELTON.
Lavender-colour. A.M., N.S.P.S., July 9. Mr. R. Bolton, Carnforth.

### OPEN CLASSES.

Mr. J. Stevenson, Poole Road, Wimborne, scored in the Classification class for twenty-four bunches, and he had Earl Spencer, Thos. Stevenson, and Maud Holmes; Mr. Tigwell second. In the class for a dozen bunches, distinct, everyone was disqualified, but the judges recommended prizes in order of merit to Mr. F. G. Bealing, Burgess Street Nurseries, Bassett; Mr. C. B. Gabriel, Easdale, Horsell; and Mr. Fairbairn, gardener to E. Otter, Esq., Stanhope Park, Greenford, each of whom showed finely.

In the novelty class for three bunches of seedlings, Mr. T. H. Chapman offered a special cup as first prize, and this was won by Mr. R. Bolton, Carnforth, with Andrew Aitken, apricot-pink; Agricola, lilac, mauve edge; Birdbrook, chocolate-marbled on blush; Mr. Moring second, and Mr. R. Wright, Formby, third. The E. W. King Challenge Cup for a dozen bunches was won by Mr. Cordell, gardener to A. F. Bladesby, Rookfields, Reigate; his best vases were of Melba, Hercules, Edrom Beauty, and Flora Norton Spencer; Mr. Prophet, gardener to R. P. Brooks, Esq., Par Station, Cornwall, second; and Mr. Cowland, gardener to R. J. Lemon, Esq., Bransfield, Godstone, third.

Mr. Prophet scored for six bunches of five stems each with good vases of Doris Burt, White Queen, Isobel Malcolm, Mrs. W. King, Dazzler, and Anglian Orange; Mr. Usher third, and Mr. W. Richardson, The Grange, Sutton, third. Mr. Bealing was the only prize-winner in the class for six bunches of spikes with double standards, and led with popular varieties; Messrs. Faulkner and Aitkin, Tarvin, Chester, second; and Mr. T. Cross, Bury St. Edmunds third.

In the Burpee Cup class for a table (8ft. by 4ft.), filled with fine waved varieties, each of the eleven competitors fell under the ban of disqualification, but the judges recommended prizes to Mr. W. E. Alsen, Denmead; Mr. W. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking; and Mr. C. W. Breadmore, Winchester, in the order named. This class, set down the centre of the hall, was a great attraction, and added materially to the effect of the show.

### DISTRICT CLASSES.

The district classes, to permit folks resident in a group of counties to compete on more or less equal conditions, formed a novel feature, and in these classes prizes of plate were given by Messrs. Barr and Son, Mr. Robert Bolton, Messrs. E. Webb and Sons, Mr. C. F. Faulkner, Messrs. E. W. King and Co., Mr. A. Hallam, Mr. W. E. Alsen, and Messrs. Dobbie and Co. In these classes there was a poor competition in some groups and a rare close fight in others.

SWEET PEA DECORATOR.
Cherry-red. A.M., N.S.P.S., July 9. Messrs. Dobbie and Co., Edinburgh; Messrs. G. Stark and Son, Great Ryburgh; and Mr. A. Malcolm.

Mr. Grigor, gardener to Mrs. Dunbar, of Dunbar, Seapark, Forres, scored with six bunches of fair quality in the Scottish class. Mr. Cowdy, Loughgall, led in the Irish class with superb blooms of Mrs. W. J. Unwin, Dobbie's Cream, Thos. Stevenson, and Tennant Spencer; Mr. Jas. Hall, Moy, a close second. Mr. Alan Gibbs, Dinas Powis, won the Webb Plate in the Welsh Class for nine bunches, and the colouring of Nancy Perkin, Afterglow, R. E. Felton, and Helen Grosvenor was exceptionally good; Mr. Thos. Jones, Ruabon, second.

Dr. Phillips led for nine bunches in the class for the Northern Counties with Clara Curtis, Flora Norton Spencer, Mrs. Cuthbertson, Hercules, and Thos. Stevenson in grand form; Mr. F. J. Harrison, Ulverston, second. Mr. Prophet was recommended for a first prize in the Western Counties Class for nine bunches, but he had double standards. The Eastern Counties Class for nine bunches brought out a grand competition, and here Mrs. F. E. Hall, Cumberland Cottage, Redbourne, was first prize winner with Hercules, Nubian, Clara Curtis, Edna Unwin, and Flora Norton Spencer in grand form and colour; Mr. A. Humphrey, gardener to Sir M. Turner, Bedfords, Havering, Romford, came second, and Mr. H. Tysoe, The Lodge, Bedford, was placed second.

Mr. Robert Hallam had a lovely set of nine bunches in the Midland Counties Class for nine bunches, and he staged Edna Unwin, Clara Curtis, Nettie Jenkins, Helen Lewis, Rosabelle, and King Manoel grandly. The Southern Counties Class for nine bunches was a strong one, and here Mr. Stevenson was well ahead with Moneymaker, Edith Taylor, Mrs. Routzahn, Edrom Beauty, Evelyn Hemus, etc.; second award fell to Mr. Usher, and third to Mr. A. J. Smith, gardener to A. L. F. Cook, Esq., Iver, Bucks.

### SINGLE-HANDED GARDENERS.

Mr. Cowdy won the Breadmore Plate in the single-handed gardeners' class, with a lovely dozen bunches, his Barbara, Captivation, and Clara Curtis being grand; Mr. White, gardener to M. J. Green, Esq., Eynsford, second. In a smaller class of similar character, for six bunches another Breadmore Plate was won by Mr. W. H. Smith, George Street, Hailsham; Mr. J. A. Newman second, and M. S. Gissing Skelton, Esq., Sudbury Croft, Harrow, third.

### AMATEURS.

The Hawlmark Cup for amateurs, for the best twelve bunches, was awarded to Mr. Thos. Jones, Ruabon, with a grand exhibit of Queen of Norway, Clara Curtis, Thos. Stevenson, Lavender George Herbert, etc. Commander Humphery's plate for six bunches fell to Mr. W. H. Smith, with a brilliantly-coloured set of popular sorts; Dr. Leggett, Harpenden, second. Mr. W. H. Smith also scored for three bunches.

### SMALL GROWERS' SECTION.

The Horace Wright Cup for a dozen bunches, distinct, open only to small growers, was won in a splendid competition by Mr. W. H. Holloway, Percyville, Shrewsbury, with lovely flowers of Mrs. C. Foster, Queen Victoria Spencer, Barbara, Mrs. Routzahn, Tom Bolton, Elfrida Pearson, Elsie Herbert, and Thos. Stevenson, all grandly coloured; he won well, followed by Mr. F. Green, The Beeches, Swaythling, Southampton; with Mr. C. Jaggs, Hertford Heath, third. In the same division, but for six bunches, the premier award—the Walter Voss Cup—was won by Mr. Ernest J. Gee, Broadway, Chesham, with beautiful bunches of May Campbell, Edrom Beauty, Chas. Foster, Flora Norton Spencer, Thos. Stevenson, and Masterpiece; Mr. H. Hesford, Addlestone, second, and Mr. Holloway third. Here, too, there was a famous competition.

In other small growers' classes the leading prize-winner was Mr. E. D. Marshall, Early Rise Arms, Reading.

### DECORATIVE CLASSES.

Mrs. W. Martin scored for a vase of sweet peas with a lovely combination of blue, pink, and cream; Mrs. A. R. Bide second. The best epergne or stand of sweet peas was one put up by Mrs. F. G. Bealing, Jesmond Dene, Bassett, and she had a delightful exhibit; Mrs. A. D. Ruff, Sharnbrook, Beds, second.

There were fifteen entries in the table decoration class, and first prize was awarded to Mrs. W. Fulcher, Moulsham Street, Chelmsford, for cream and pink flowers; Mrs. A. D. Ruff second with Melba and Thos. Stevenson; and Mrs. A. Everett, Fairview, Chappell, Essex, third.

### NEW VARIETIES.

After trial at Sutton Green, and Burbage, Hinckley, five varieties secured Awards of Merit. The cherry-red variety, Decorator, was sent from three sources—Messrs. Dobbie and Co., Edinburgh; Messrs. G. Stark and Son, Great Ryburgh; and Mr. A. Malcolm, Duns; so each gained an Award for it. Agricola, with lilac and mauve flowers, came from Mr. Robt. Bolton, Carnforth, who also sent R. F. Felton, a pretty lavender variety; Lady Miller, a lovely pinkish-cream, from Mr. Malcolm; and Bertrand Deal, a mauve, from Mr. Bertrand Deal, Brooklands, Kelvedon.

### TRADE EXHIBITS.

These were splendid, and we hope to make some further reference to the new varieties shown. The trade was certainly in great form, and the following medals were awarded:

Gold. — Messrs. Dobbie and Co., Rothesay; Mr. R. Bolton, Warton, Carnforth; Mr. W. J. Unwin, Histon; Messrs. S. Bide and Sons, Farnham.

Silver-gilt. — Messrs. Jarman and Co., Chard; Mr. W. E. Alsen, Denmead, Hants; Mr. Jas. Box, Lindfield, Sussex; Messrs. Jas. Carter and Co., Raynes Park; Messrs. E. W. King and Co., Coggeshall; Mr. C. W. Breadmore, Winchester; Messrs. Aldersey and Marsden Jones, Tilston, Malpas; Messrs. G.

Stark and Son, Great Ryburgh; Messrs. Jones and Son, Shrewsbury; and Mr. J. Stevenson, Poole Road, Wimborne.

Silver.—Mr. T. Cross, Bury St. Edmunds; Messrs. J. K. King and Sons, Coggeshall; Mr. W. O. Cantley, Bury St. Edmunds; Messrs. Barr and Sons, Covent Garden; Messrs. W. Voss and Co., Milwall, London; Mr. R. Sydenham, Birmingham.

### THE DINNER.

As is their custom, the judges and committee dined together at the Hotel Windsor in the evening of the first day. Mr. Robert Sydenham, the President, made a capital and genial chairman, and generously provided the drinkables and smokables. The gathering was of a quite international character, as it included Mr. Lester Morse and Mr. Howard Earl from Philadelphia; Mr. and Mrs. Trevethick and Mr. and Mrs. Carey Hill, from New Zealand; Mr. Beetson, from New South Wales; Mrs. Tonge, from the Cape; Mr. Ingram, from Egypt; Mr. Ainsworth, from Germany, and most of the notable British raisers and growers.

The speakers, in addition to the Chairman, were: Mr. L. Morse, Mr. S. B. Dicks, Mr. Trevethick, Mr. Carey Hill, Mr. Beetson, Mr. E. Sherwood, Mr. W. Cuthbertson, Mr. Thos. Stevenson, Dr. Phillips, Mr. C. H. Curtis, and Mr. Horace J. Wright. The President said that, although Mr. Stevenson was disqualified in the Eckford Cup Class, his exhibit there was such a fine one that it deserved some recognition, and so he, the president, would present him with a silver rosebowl for what was the finest amateur display in the show. The meeting was altogether a success, rare good feeling prevailing, and there was considerable humour over double standards.

## Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 2nd inst. Mr. Massie, the president, occupied the chair, and there was an attendance of ninety members.

A paper on "Geraniums," contributed by Miss Burton, New Saughton Hall, Polton, was the subject for the evening. After dealing with the historical part of the subject, and explaining that the various kinds of garden geraniums were really pelargoniums, and were derived from such species as P. inquinans, P. zonale, etc., mostly natives of South Africa, Miss Burton dealt with the cultivation of the plant, the uses of the various sections, and their treatment from the decorative point of view both for indoor and outdoor use.

The exhibits were: Collection of pelargoniums (including regal, double and single, sweet scented, variegated, and other forms), also new regal, zonal, and other pelargoniums from Messrs. Dobbie and Co., Edinburgh (the collection was awarded a Cultural Certificate, and a new variegated variety, "Snow Queen," was awarded a Certificate of Merit); collection of pelargoniums, from Mr. R. McAndie, Inveresk Gate, Musselburgh (awarded a Cultural Certificate); collection of pelargoniums, from Miss Burton (to illustrate paper); six new seedling delphiniums, from Mr. John Fraser, The Old Manse, Inverkeithing (highly commended for strain); new sweet-scented pæony, "Wm. Mesman," from Messrs. Dicksons and Co., Edinburgh; viola (seedling from V. cornuta), from Mr. Andrew Ogg, Knockdolian, Ayrshire; six vases of pinks from Mr. C. Comfort, Broomfield, Davidson's Mains; carnation showing reversion, from Mr. R. McAndie; and culinary peas, in pots, showing good results obtained by inoculation with helpful bacteria, after sterilisation of the soil in order to destroy the harmful bacteria, from Mr. Geo. P. Berry, Edinburgh, and East of Scotland College of Agriculture.

At the meeting on August 6 a discussion will take place on the training and education of the young gardener.

## Norfolk and Norwich Rose Show.

This year the society were fortunate in having a decidedly successful time for this fixture on July 4. As an experiment they held it in the principal park of the city, which, under the charge of Mr. J. Ward, the superintendent, and his staff, was looking in a better condition in every way than ever it has done before. Mr. C. E. Pilling, the untiring hon. secretary, spared no pains to work everything smoothly, and when one considers there were 104 entries for roses, 179 for other cut flowers, 68 for fruits, and 130 for vegetables, an idea can be formed of what this meant. The attendance was 5,656, and the gate money £140, exclusive of subscribers.

### ROSES.

The open classes for roses, in which the prizes were contested mainly by the nurserymen of East Anglia, contained the best roses. Messrs. B. R. Cant and Sons were first for forty-eight, with fine deep blooms, and so fresh looking. The collection also took Silver Medal. The same growers had the best eighteen varieties, three blooms of each. Their blooms of Lyon and Juliet caused quite a flutter round the stand. Messrs. G. Burrell and Co., Cambridge, had the best teas, a stand of eighteen winning them first place. In the amateur classes and local growers' classes, the outstanding feature was the abnormal success of the Rev. J. A. L. Fellowes, Bunwell. This enthusiastic rosarian took firsts for thirty-six, distinct; eighteen, distinct, three blooms each; twenty-four, distinct; twelve teas, distinct; and twelve teas, one variety; and in a good number of the classes he had to run up against the keenest and best local rose growers. These other growers had very good roses here and there, as is evidenced by the fact that Miss Penrice had the Medal for the best tea with Maman Cochet, and Mr. R. Steward the one "for other than tea" for a fine Frau Karl Druschki.

### SWEET PEAS AND HARDY FLOWERS.

Sweet peas maintain their popular favour, and this cannot be wondered at when one considers that, from a visitor's standpoint, these long rows of vases of delicate shades certainly appeal to one's taste more than compact show-boards of roses. Rather a keen fight was witnessed in the twenty-four bunch class at Norwich this year. For the two years past Mr. T. Notley, gardener to E. G. Buxton, Esq., Catton, had won this prize, with which goes a silver bowl, and his aim was to win it this year and thus retain it as his property. He was, however, beaten by Mr. W. Quinn, gardener to Lord Stafford, Costessey Hall, who had superb peas, long stems, bold flowers, and with colour that fairly outclassed his rival. The best twelve bunches were well shown by Mr. F. Wilby, gardener to F. A. Bainbridge, Esq., Hethersett. Mr. T. Notley had the best decorative vase, a charming combination of one pink variety with grasses, etc. The spectator who had a love for herbaceous flowers had a rare treat provided by Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham Park. This well-known gardener had arranged over sixty bunches of the choicest and best subjects from the herbaceous border; in no one case were they puny bunches. The judges granted this the R.H.S. Medal as the best exhibit in the show. Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead, had a nice collection of thirty-six kinds, and there were numerous other exhibitors in this section.

### FRUIT AND VEGETABLES.

Fruit, though not in such large quantities, was of fine quality. The best collection came from Mr. W. Hilson, gardener to Sir Fredk. Adair, grapes, figs, peaches, and nectarines being his primary features. In the grape classes he also had the best white varieties. Black grapes were good from several growers. Mr. W. Cockerell, gardener to G. E. White, Esq., won first for both melon classes, viz., scarlet and white fleshed kinds. Mr. Lewis Smith won first in a keenly contested class for peaches; and the best strawberries in all classes were without doubt the two dishes from Mr. F. J. Endersby, gardener to J. H. Gurney, Esq., Keswick, of The Latest and Givon's Late Prolific.

There were, of course, the many classes for vegetables, and extra good things were noticeable as one surveyed them. A special mention is due to Mr. W. Chettleburgh for his effective staging of his collection of vegetables. They were without doubt the best exhibited, but the arrangement went also a lot further in bringing the quality before the judges and visitors.

### MISCELLANEOUS.

The trade growers did extra well for the society by the large comprehensive groups they put up. Foremost among these were Messrs. Daniel Bros., Lim., Norwich, who had peas, roses in pots, and cut roses, aquatic plants, miscellaneous plants, and other good things, from their own nurseries (Silver Medal). Messrs. A. J. and C. Allen, Earlham, Norwich, had a fine display of roses, quite up-to-date; the pot roses were examples of good culture that one likes to comment upon (Silver Medal). Mr. G. W. Miller, F.R.H.S., Wisbech, had orchids in variety, and a varied collection of herbaceous flowers (Silver Medal). Two local rosarians, Mr. Hy. Morse and Mr. E. Morse, vied with each other with the best new roses for supremacy. We rather liked the stand of the former, with its many types of the newer yellow tints.

## GARDENING ENGAGEMENTS.

Mr. G. E. Bullen, late foreman at North Mymms Park, Herts, has been appointed superintendent of garden and farm to H. F. Harris, Esq., Harston, Chestnut Hill, Pennsylvania.

Mr. T. Cradduck, gardener at Sandling Park, Hythe, has been appointed gardener to the Earl of Jersey, Middleton Park, Oxon.

## TRADE NOTE.

Messrs. Dobbie and Co., Edinburgh, who held appointments as seedsmen and florists to the late Queen Victoria and King Edward VII., have now been honoured with a like appointment to His Majesty King George V.

**Begonia Kewensis.**—A shrubby begonia of garden origin, which, owing to the pendulous nature of its white blossoms, is seen to considerable advantage as a basket plant. Its origin is not stated, but it is very pretty both from a foliage as well as a flowering point of view.—T.

**The Royal Show.**—Mr. E. Beckett, V.M.H., was awarded a large Gold Medal for the collection of vegetables he exhibited at Doncaster on the occasion of the Royal Agricultural Society's Show. This award was accidentally omitted from the official list supplied to our representative.

"**Roses and Their Cultivation**" is a practical grower's guide. In its 193 pages will be found an immense amount of useful information on roses of all classes, ranging from propagation and planting to flower development. It is published by W. H. and L. Collingridge, Aldersgate Street, London, price 2s. 10d., post free.

**Stigmaphyllon ciliatum.**—This is a free-growing, profuse-flowering Brazilian climber that needs a warm house for its successful culture. Popularly it is known as the Golden Vine, a name which I think originated in the States, where all climbers are termed vines. At all events for a stove or intermediate house it is a very desirable climber, the long, rambling shoots being clothed with pretty glaucous leaves, while the floral display is spread over a lengthened period. The flowers are of a rich yellow colour, and in general appearance suggest some of the oncidiums.—W. T.

## NATIONAL ROSE SOCIETY'S EXHIBITION.

Continued from page 528.)

challenge cup, with a beautifully arranged group. The chief varieties were Lady Gay, Lady Hillingdon, Marie Van Houtte, Simplicity, A. K. Goodwin, Mrs. Herbert Stevens, Rayon d'Or, Lady Pirrie, and Jessie. Mr. J. Mattock was second, having fine vases of Duchess of Wellington, Mrs. A. Tate, Lady Pirrie, Simplicity, and Irish Glory; while for eighteen varieties staged in a similar way Mr. Chas. Turner, Slough, secured the first prize, having a well-arranged exhibit. The chief varieties were Lady Godiva, Betty, Madam Ravary, Jessie, Irish Elegance, and Le Progres.

For eighteen distinct varieties of summer-flowering roses in vases, Messrs. W. Spooner and Son were awarded the first prize for a very fine display. The chief varieties were Philadelphia, Dorothy Perkins, American Pillar, Sweetheart, and Delight.

In the class for nine varieties of new decorative roses, Mr. E. J. Hicks won first prize, having good bunches of Jessie, Mrs. W. Christie Miller, Mrs. Waddell, Orleans Rose, Lady Hillingdon, and Theresa Bevan. Mr. G. Prince followed with fine Rayon d'Or and Mrs. Massey; Messrs. W. Spooner and Son were third.

The Wichuraiana roses in twelve sorts made a grand display. Messrs. F. Cant and Co., Colchester, winning first with a charming exhibit. The best varieties were undoubtedly Lady Godiva, Minnehaha, Gardenia, Delight, Lady Gay, and Debutante. Mr. E. J. Hicks was second, and Mr. Chas. Turner, Slough, third, with a very fine exhibit.

For a representative group of roses, to occupy two hundred and fifty square feet, there were two splendid groups staged, the first prize being awarded Messrs. Paul and Son, Cheshunt, who had a lightly arranged group with tall climbers at the back, with tall standards of decorative varieties varying in height in front, while the floor was bedded with fine baskets. In the latter were to be seen fine clusters of Lyon Rose, Hugh Dickson, F. K. Druschki, White Killarney, Com. Felix Faure, C. J. Grahame, Firefly, His Majesty, and Joseph Hill. Messrs. Hobbies, Lim., Dereham, were second with a good exhibit of ramblers growing as tall weepers, while baskets of roses were grouped underneath. Some of the best varieties were Juliet, Rayon d'Or, Lyon Rose, Lemon Queen, and Excelsa.

For a group of cut roses staged on the tabling to occupy a space thirty-three feet long by three wide, the premier award went to Messrs. W. and J. Brown, Stamford, who staged in huge columns, with short ones in front, finishing off with bamboos. Some of the best were Lyon Rose, Liberty, Lady Hillingdon, and White Maman Cochet. The second prize was well won by Mr. F. M. Bradley, Peterborough, who had some splendid flowers, the best being J. B. Clark, Simplicity, Edward Mawley, Mrs. A. Tate, and the Countess of Shaftesbury. Messrs. S. Low and Co. were third, with a fine exhibit, their Rayon d'Or, Lyon Rose, White Killarney, Molly Sharman Crawford, Madame Melanie Soupert, Laurent Carle, and Juliet being very bright.

### OPEN CLASSES.

The first prize for twenty-four varieties was won by Messrs. Chapman and Collins, Thurmaston Road, Leicester, who had fine examples of Mildred Grant, John Cuff, Tom Wood, Countess of Rosebery, Lohengrin, Horace Vernet, Mrs. T. Roosevelt, and Mrs. David McKee. Mr. John Mattock was second with Bessie Brown, Victor Hugo, Lyon Rose, Avoca, Dean Hole, and Mildred Grant. Messrs. W. Crisp and Sons, Colchester, were placed third. Sixteen distinct trebles was the next class, Messrs. G. and W. H. Burch carrying off the first prize with some grand blooms. The most conspicuous were Mildred Grant, Horace Vernet, Mrs. T. Roosevelt, White Maman Cochet, O. Terks, and Wm. Shean. Mr. John Pigg was second, having the following varieties in good form: Mildred Grant, Lyon Rose, Geo. C. Waud, Juliet, and Caroline Testout. Messrs. J. Burrell and Co. were a good third.

For a group of representative roses in a space twenty feet by three, the first prize was won by Messrs. R. Harkness and Co., who had a wonderful display of garden roses. A few of the chief features were the columns of Dean Hole, Irish Elegance, Ecarlate, Harry Kirk, Madame Ravary, with a fine collection of polyantha varieties in the front. Messrs. G. Jackman and Son, Woking, came second with a well-arranged group; while Mr. H. Morse, Eaton, Norwich, was third. For twenty-four blooms in two sorts, arranged alternately, there were five entries, but Mr. W. Bentley, Belgrave, Leicester, proved the victor, using Mrs. Foley Hobbs and J. B. Clark, both being in fine condition. Messrs. D. Prior and Son were placed second with J. B. Clark and Frau Karl Druschki; while Messrs. B. R. Cant and Sons selected Ulrich Brunner and Frau Karl Druschki for third place. The first prize baskets could not be seen at the time of going round. Mr. W. Stevens, Fair Oak, Radlett, came second with fine examples of Frau Karl Druschki, while Mr. G. Prince was third with the same variety. In a similar class for any other varieties, there were fifteen entries. Messrs. H. Dickson, Lim., were placed first with a fine crimson; Mr. W. Bentley was second with beautiful flowers of Mrs. T. Roosevelt; and Mr. W. R. Chaplin third with Lyon Rose. For the baskets of any tea or noisette with a similar number of flowers, Messrs. F. Cant and Co. staged White Maman Cochet in excellent condition, and Messrs. D. Prior and Sons also good blooms of this variety. A special class was provided for Rayon d'Or, and there were eight entries, Messrs. S. Bide and Sons, Lim., Farnham, winning with a splendid basket; the colour was really remarkable. Mr. E. J. Hicks was second, and Mr. G. Prince third. Mrs. A. Bide, Farnham, won first for a bowl of cut roses, using Mrs. A. R. Waddell; Dr. F. H. Cooke, Birch, Colchester, was second, using a pink rambler; while Mr. E. J. Hicks, Hurst, was third with a charming arrangement of Mrs. W. T. Massey.

### AMATEURS.

In the champion class for thirty-six blooms, distinct, the competition was a first-rate one. The trophy fell to Mr. E. M. Eversfield, Dene Park, Horsham, who had a splendid collection. His most striking varieties were Mildred Grant, Alfred Colomb, Caroline Testout, Juliet, Hugh Dickson, Mrs. Ed. Mawley, Her Majesty, Bessie Brown, Lady Alice Stanley, Lyon Rose, J. B. Clark, and Ulrich Brunner. The second prize was awarded to Mr. E. B. Lindsell, Bearton, Hitchin, who had a nice display; especially good were the varieties Duke of Wellington, Dr. O'Donel Brown, Maman Cochet, William Shean, Ulster, Duchess of Bedford, and Her Majesty; while Mr. F. Dennison, Cranford, Leamington, was third with nice fresh blooms.

There were seven competitors in the class for twenty-four blooms, distinct, with the Ben Cant Memorial prizes, Mr. E. B. Lindsell won first position, having excellent flowers of Wm. Shean, Ulster, Dr. O'Donel Brown, Alice Lindsell, Madame Jules Gravereaux, and Hugh Dickson. Mr. F. Dennison was second with a capital board that improved as the heat increased; while Dr. T. E. Pallett, Earl's Colne, was third. For twelve trebles, Mr. E. B. Lindsell repeated his former successes, staging some fine varieties, especially Maman Cochet, Mildred Grant, Mrs. T. Roosevelt, and Madame Jules Gravereaux. Mr. F. Dennison was in capital form for second place with excellent flowers of J. B. Clark, Frau Karl Druschki, Mildred Grant, and Lady Ashtown; while Mr. Conway Jones had to be content with third place.

For nine roses, one variety, Dr. T. E. Pallett scored first with a fine exhibit of Avoca. Mr. G. A. Hammond, Cambrian House, Burgess Hill, was second with neat flowers of Ethel Malcolm.

The Hobbies Challenge Cup was awarded Mr. W. Boyes, Middleton-on-the-Wolds, East Yorks, who had nice flowers of Mildred Grant, Pharisaer, Marquise de Sinety, Mrs. David McKee, and Lyon Rose. The Rev. R. Powley, Warminster, followed with Juliet, Betty, Lady Ashtown, Caroline Testout, and White Maman Cochet as his best flowers; while Mr. H. R. Darlington, Potters Bar, was third.

### TEAS AND NOISETTES.

The trophy class in this section was for eighteen blooms, distinct, and contained five exhibitors. Here the veteran amateur, Mr. Alex. Hill Gray, Newbridge, Bath, again secured the trophy with an excellent board. His most conspicuous varieties were White Maman Cochet, Madame C. Soupert, Mrs. Miles Kennedy, A. Hill Gray, Dr. F. Guyon, R. W. Smith, Mrs. H. Taylor, Mrs. P. Hobbs, and Maman Cochet. Mr. E. M. Eversfield was the second-prize winner, having good flowers of Mrs. E. Mawley, Madame Cusin, The Bride, and Madame Hoste. Mrs. Beville Fortescue, Maidenhead, was third.

In the smaller class for twelve distinct varieties Mr. Alex. Hill Gray was again most successful, his best flowers being White Maman Cochet, Maman Cochet, Souv. de P. Notting, Jeanie Proudfoot, and Mrs. Hubert Taylor. Mr. E. M. Eversfield was a capital second, his flowers of Mrs. E. Mawley, Molly Sharman Crawford, Souv. de Pierre Notting, and Maman Cochet being good. Mr. Conway Jones was third. In the eight trebles Mr. E. M. Eversfield proved the victor, and he had evidently placed his strength in this class. He had fine flowers of Souv. de P. Notting, Souv. de S. A. Prince, White Maman Cochet, and Mrs. E. Mawley. Mr. Alex. Hill Gray was second. Mrs. B. Fortescue was third with clean, bright flowers. For six blooms, one variety, the Rev. F. R. Burnside, Great Stambridge Rectory, Essex, won first prize with splendid flowers of White Maman Cochet, Mr. Alex. H. Gray being second with the same variety, while Mr. E. M. Eversfield was third with Mrs. Ed. Mawley.

There was a good entry for the Prince Memorial Piece of Plate, which was offered for twelve teas or noisettes, confined to growers of fewer than five hundred plants. This was secured by Mr. F. Slaughter, Steyning, who was in a strong position for first place; he had White Maman Cochet, Mrs. E. Mawley, and Mrs. Foley Hobbs in fine style, followed by Dr. F. H. Cooke and the Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead, in the order named.

### PERPETUAL-FLOWERING DECORATIVE ROSES.

For eighteen distinct varieties of decorative roses, the Rev. J. H. Pemberton, Havering-atte-Bower, was placed first for a fine display. The best sprays were American Pillar, Blush Rambler, Danäe, Daphne, Fabvier, and Helene, while Mr. A. Tate, Downside, Leatherhead, was second with fine examples of Rene Andre, Fellenburg, Maharajah, and Moschata Nivea.

A glorious display of decorative varieties was made by Mrs. E. Wightman, Bengeo, Hertford, who won first prize for twelve distinct varieties. The best were American Pillar, Mrs. Cutbush, Gruss an Teplitz, Legion of Honour, and Gardenia. Mr. C. S. Gordon Clark, Fetcham Lodge, Leatherhead, was second, and Lady Sutton, Benham Valence, Newbury, third. In the novice class for twelve blooms Mr. F. A. Govatt, Holiday House, Sunningdale, won first prize with typical flowers of Lyon Rose, Mrs. T. Roosevelt, Florence Pemberton, and Caroline Testout. Mr. W. F. Schafer, Loom Lane, Radlett, was second with a bright exhibit, and Mr. A. Bee, Newark, third.

### LADIES' CLASSES.

There were ten baskets in competition for the lady amateurs, the first prize being won by Mrs. J. Walter Smith, Bushey Heath, Watford, who had a splendid arrangement of Irish Elegance. Mrs. F. H. Cooke, Colchester, was second with pink ramblers and pink hybrid teas; while Miss Jessie Langton, Raymead, Hendon, was third with a fine basket of Mrs. S. Crawford. The competition for a single vase of exhibition roses was most keen, the first prize being awarded Mrs. F. H. Cooke with pink roses and bronzy-rose foliage. Mrs. E. F. Brown, Slough, was second with Lyon Rose, and Miss M. E. West, Reigate, third, with Ulrich Brunner.

In the single rose class Mrs. F. H. Cooke was first with a charming arrangement of Pink Rambler, Mrs. J. W. Smith following with a fine arrangement of Irish Elegance; Miss Jessie Langton was fourth. The bowl of decorative roses was keenly contested, the bowls being well arranged. Mrs. F. H. Cooke led off with a coppery-yellow variety, followed by Mrs. F. A. Tisdall, Woodford Green, with some well-arranged Richmond; Mrs. J. Bide, Cowley Road, Uxbridge, being third with Mrs. G. Shawyer.

For a dinner-table decoration in the open class, Mrs. A. R. Bide, Farnham, was placed first with a nice arrangement of Sunburst. Miss M. Foden, Hemel Hempstead, was second, using Irish Elegance freely, while Mrs. F. M. Bradley, Church Street, Peterborough, was third with Irish Elegance.

The table decoration for amateurs was well patronised, Mrs. A. E. Brown, Reigate, winning first with a bold display of Richmond and Jessie, with suitable selaginella, the second prize going to a very dainty arrangement of Irish Elegance from Mrs. Walter Morrison, Reigate, while the third fell to Countess Olga Pouliatine, Weybridge, who utilised Lady Hillingdon.

The round tables were most artistically arranged. Mrs. Colston Hale, Warminster won first prize with an arrangement of Irish Elegance. Miss Jessie Langton was second with a fine table of Francois Juranville, very lightly built, while Mrs. F. A. Tisdall was third, using Lady Hillingdon to good advantage.

### MEDAL BLOOMS.

In the nurserymen section the Medal blooms were as follows: H.P., A. K. Williams, from Messrs. H. Lane and Son, Great Berkhampstead; T., White Maman Cochet, from Mr. G. Prince, Longworth; and H.T., Geo. Dickson, from Messrs. Alex. Dickson and Sons. In the amateurs' section the Medal blooms were: H.P., Horace Vernet, from Mr. G. Speight; H.T., Avoca, from Dr. T. E. Pallet; and T., White Maman Cochet, from Mr. A. Hill-Gray.

## NEW ROSES.

The new roses were contributed in considerable numbers, and proved a source of much interest to the visitors. Within a short time of the admission of the members to the gardens at noon, and some time before the judging of novelties commenced, a long queue was formed by those who were anxious to see the blooms immediately the tent was opened. A similar queue was maintained throughout the afternoon, notwithstanding the efforts of several policemen to keep the visitors on the move. The following awards were made:

### GOLD MEDALS.

To Mrs. Andrew Carnegie, shown by Messrs. James Cocker and Sons, of Aberdeen, the variety is said to have been raised from a cross effected between Frau Karl Druschki and Niphetos, and has blooms of the largest size, and of a pleasing lemon-white.

To Old Gold, a decorative variety, exhibited by Messrs. McGredy and Son, Portadown; this has small, prettily formed flowers of the richest old gold, with copper-red centre.

### SILVER-GILT MEDALS.

To Queen Mary, a very distinct and attractively coloured variety, shown by Messrs. Alex. Dickson and Sons, Newtownards; the blooms are of average size, the lower half of the petals bright yellow, and the upper half brilliant rose-pink with a suspicion of mauve.

To Mrs. F. W. Vanderbilt, yellow and copper-red; Lady Mary Ward, orange-red; and Mrs. E. Part, brilliant red, from Messrs. McGredy and Son.

To Mrs. C. S. Hunting, a beautiful light variety, and William Cooper, a deep rose-coloured variety, from Mr. Hugh Dickson.

To Mrs. E. Alford and Mrs. C. Reed, two beautiful light flowers, from Messrs. Lowe and Shawyer.

To Sunburst, a deep yellow decorative variety, from M. Pernet-Ducher.

### SILVER MEDAL.

To Moonlight, a distinct variety with small, semi-double white flowers, from the Rev. J. H. Pemberton.

### SUBURBAN ROSES.

Mrs. A. W. Atkinson, Palmer's Green, secured the suburban challenge cup for roses grown within eight miles of Charing Cross, sending fine well-coloured flowers of Mildred Grant, Maman Cochet, Frau Karl Druschki, Lyon Rose, Dean Hole, and White Maman Cochet. Miss B. H. Langton was second, and Mrs. W. E. Martin, Finchley, third.

### MISCELLANEOUS.

In the corridor Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C., had a tastefully arranged stand of gardening books, including "Roses and Their Cultivation." There were also extensive displays of sweet peas, carnations, hardy flowers, etc.

---

## DESTRUCTION OF WATER WEEDS.

In considering the question of the eradication of water-weeds from ponds, it is necessary to draw a distinction between the larger weeds, such as American Water Weed, Water Crowfoot, Duckweed, etc., and the smaller algæ.

The larger weeds are not only the most obnoxious, but are also the most difficult to eradicate, as they can only be kept down by cutting and dragging them out. In small shallow ponds this may be done by men wading in the water and using hand-scythes; or scythe-blades may be attached to ropes, which can be dragged through the weeds from a boat or from opposite banks of the pond. Special weed-cutting saws are also made for this purpose, and several other devices exist for use in large stretches of water. Some of these contrivances are of considerable size, and are very costly.

The smaller algæ are visible chiefly as a green or brown scum, and are commonly seen during the summer and autumn on still or nearly still water. These troublesome growths not only frequently destroy the beauty of ponds entirely for a time, but also have an offensive smell. For the destruction of these small, slimy weeds, copper sulphate has proved to be very effective, especially in fresh water. This material has been used with success in recent years, both for the smaller ponds at Kew Gardens and for the ornamental water in St. James's Park. Previous to the last two summers, it had been a costly and troublesome matter in the latter case to keep the water presentable in hot weather, men in boats being employed to remove the weeds with rakes, etc. As a result of the adoption of the copper sulphate treatment, however, the lake can now be kept practically free from weed at a much less expenditure in money and labour than formerly.

It must, however, be borne in mind that copper sulphate should only be applied with the greatest caution to ponds containing fish, some of which appear to be rather sensitive to copper sulphate. There is at the present time no detailed information as to the resisting power of English fish, and in the absence of such information it would not be advisable to treat any fish pond in this country, even with a very dilute solution, such as 1 part in 5,000,000, without first determining by experiments with one or two fish in a few gallons of water, the susceptibility of each species. It is, however, somewhat reassuring in this connection to learn that copper sulphate applied during the last two summers to the water in St. James's Park was found to be not only harmless, but even beneficial to the fish. In former years many had been found to be badly attacked by a fungus, but at the last cleaning out the fish were found to be quite free from the fungus disease, and remarkably clean and silvery.

If there are no fish in the pond, 1 part (by weight) in 1,000,000 (or 1lb. of copper sulphate to 100,000 gallons of water) may be applied without rendering the water dangerous for drinking purposes.

Ordinary commercial copper sulphate should be used, and, in standing water, may be easily applied, the only important point being that the copper sulphate must be thoroughly and rapidly distributed throughout the pond. In small ponds, the copper sulphate, broken small, and enclosed in a bag of loose texture, may be tied to the end of a pole and drawn backwards and forwards through the water. In large ponds the bag should be towed behind a boat, which should be rowed to and fro in parallel paths not more than from 10 to 20 feet apart. In water with a temperature of about 60 deg. Fahr., something like 100lb. of copper sulphate can be so distributed in an hour. The effectiveness of the treatment is found to depend to some extent on the temperature of the water, and, if this should be much below 60 deg. Fahr., or if the water is very hard, or contains much organic matter, more copper sulphate should be used. It is found that copper sulphate rapidly disappears from water to which it has been applied, presumably because it combines with the algæ which it destroys. Copper sulphate has also proved effective when applied to the surface of the slime in the form of a spray composed of 1½oz. of copper sulphate dissolved in 2 gallons of water; but if water-lilies are present they may be injured by this method of treatment.

It is necessary to calculate the amount of water in a pond in order to determine the amount of copper sulphate which may safely be applied, and this may be done with sufficient accuracy by multiplying together the average length, breadth, and depth of the pond in feet, and multiplying the result by 6¼, the approximate number of gallons in a cubic foot.—"Journal of the Board of Agriculture."

# ANSWERS TO CORRESPONDENTS.

CLARKIAS IN POTS.—S. W., Leicester: I have some small seedlings of clarkias, and should like to grow them in pots for autumn house decoration. How should I proceed?—Pot each seedling in a small pot, using a fairly rich, free compost. Grow in a cold frame and afford ample light and ventilation, and removing the lights during fine days. A second shift will be needed, and 48 or 32-sized pots will suffice for this, the former for preference. Provide a neat stake as each plant begins to extend, and when the larger pots are full of roots, afford weak liquid cow manure once or twice a week. If you have sufficient plants, divide them into three batches, giving one set the brightest position you can afford, and transferring them to a greenhouse fairly early, affording ordinary frame culture for the second batch, and preserving the smallest seedlings for a cool position. By this means the flowering season will be extended.

FAILING RED CURRANTS.—M. E. H., Cambridge: In my garden there are a number of quite old red currant bushes; apparently they have not received very kindly treatment; consequently the fruits they bear are small, and by no means plentiful. Do you think it would be a good plan to remove the bushes and plant young, healthy trees in their places in the autumn?—As soon as the fruits have been gathered grub up and burn the old, debilitated currant bushes, and at once deeply trench the plot they have occupied, working in a plentiful supply of half-decayed manure and burnt refuse from the garden fire. If this is done at once the ground will be in excellent condition to receive the new plants as early in the autumn as you can secure them. A new site would have been preferable, but with deep trenching and manuring, and an annual free top-dressing of manure, the currants should do well if the side branches are kept spurred back so that each long main branch resembles a cordon.

SLUG WORMS ON ROSES.—H. S., Chelsfield: Can you please tell me of a remedy for the eradication of enclosed pest from my rose trees? The little yellow-green larvæ have not left one green leaf on a rose bed containing fifty plants. I shall feel very grateful for an answer through your columns.—The pest is the rose slug-worm (Eriocampa rosæ), and one that is capable of doing a vast amount of harm in its larval stage. It attacks all kinds of roses, and is a common pest in many European countries, and also in North America. The eggs are laid in May or early June by the adult winged sawfly, but two or more broods may be hatched out in one season, hence the need of great care once there has been an infestation. The best remedy is hellebore wash sprayed over the rose trees, so as to wet every portion; the larvæ only eat out the upper epidermis and tissue of the leaves, rarely eating the lower epidermis, but they drop quickly from leaf to leaf, hence the need for spraying so as to reach every portion of each tree, and consequently every larva. The hellebore wash is made by mixing 1oz. of freshly ground hellebore and 2oz. of flour, with a little water, until a smooth, thin paste is formed, and then adding gradually enough water to make up three gallons of mixture. This wash must be kept well stirred during use, and must also be distributed in the form of a very fine spray.

## NAMES OF PLANTS.

M. H., Shere.—Cistus algarvense.

J. S., Alveston.—Arum Dracunculus, a very fine example.

L. B., Andoversford.—1, Spiræa Douglasi; 2, Anchusa italica; 3, Fuchsia procumbens.

G. B., Luton.—1, Erigeron speciosa; 2, Galega officinalis; 3, Salvia turkestanica; 4, Anthemis Kelwayi.

J. P. S., Frome.—1, Nierembergia rivularis; 2, Isatis glauca; 3, Acantholimon venustum; 4, Delphinium cineraria; 5, Prunella Webbiana; 6, Gentiana septemfida.

W. B., Uckfield.—1, Cistus ladaniferus; 2, Veronica Haasti; 3, Lobelia tenuior; 4, Pulmonaria augustifolia.

S. W. J., Leicester.—1, Chrysogonum virginicum; 2, Campanula pusilla; 3, Eremurus Bungei; 4, Scabiosa caucasica.

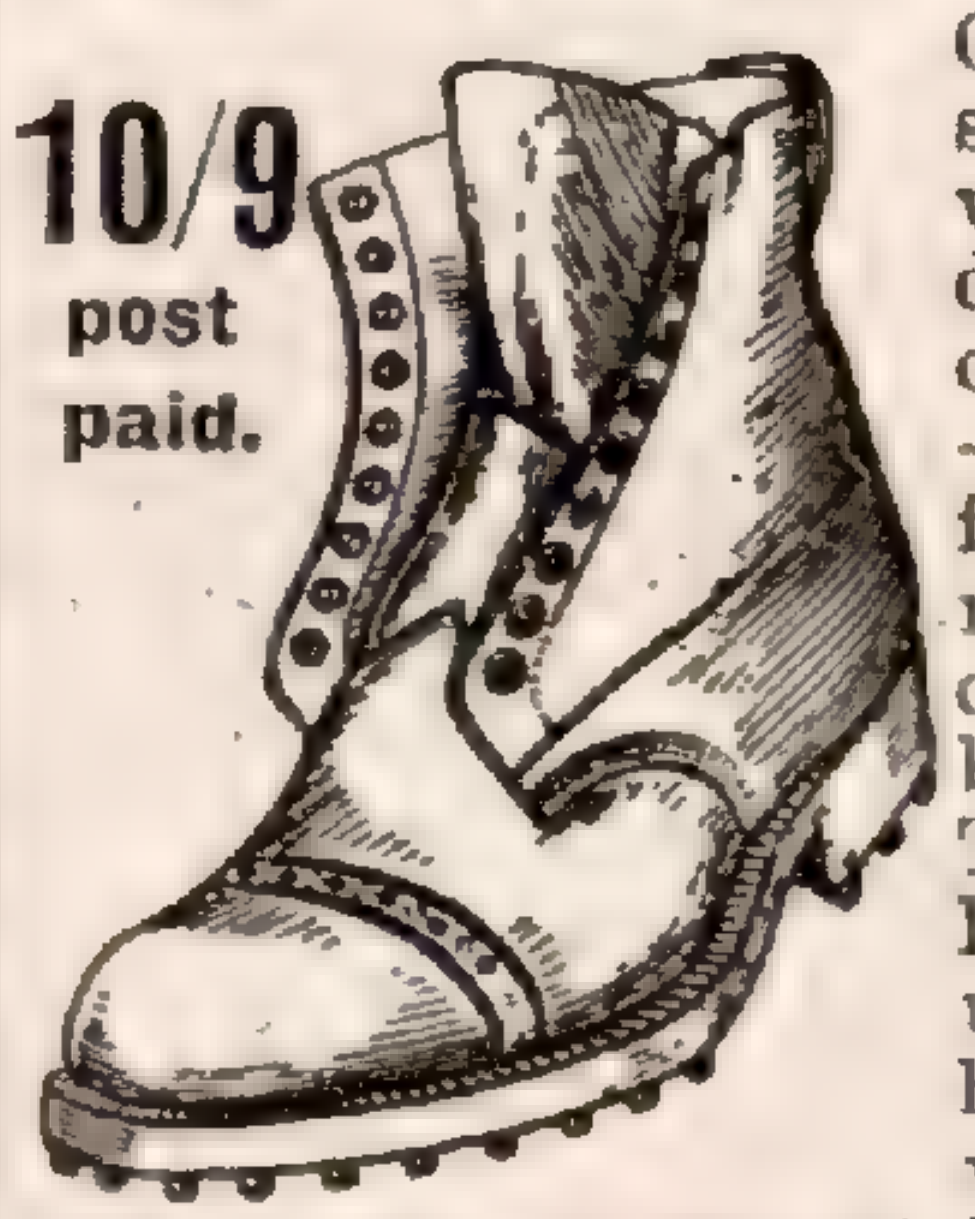
## Norwell's 'Perth' Boots



**10/9 post paid.**

GARDENERS must be snugly shod during the bad weather. Our special gardener boots are the result of many years' experience—we know exactly the boot for you. The men who make these boots are specially trained to make boots for outdoor service. This garden boot of ours has many good points. The uppers of home-tanned, hand-dressed curried hide, wear like pin-wire, and being bark-tanned, "not cured," keep the feet warm, dry, comfy

**Try a pair to-day at 10/9, post free.**

*Also send for Catalogue No. 2 and Self-measurement forms.*

D. NORWELL & SON,

**Terms for the insertion of these Business Card Advertisements may be obtained on application to W. H. & L. COLLINGRIDGE, 148 & 149, Aldersgate St., London, E.C.**

## To be Sold.

Sale or Partnership.

A BARGAIN AND SPLENDID OPENING. Lucrative NURSERY and JOBBING GARDENING BUSINESS FOR DISPOSAL, with Shop attached in adjoining large town, 30 miles from London.

The Nursery, which is situate in a rising residential neighbourhood, comprises Dwelling-house, several Greenhouses, Outbuildings, and about 2¾ acres of Land, and a large Jobbing Trade is done.

The properties are held at moderate rentals and the owner is prepared to sell outright, or would entertain a partnership as the business is capable of considerable development. Books open for inspection, which have been kept by Chartered Accountants.

Price for the whole £850 or offer, this includes book debts, but these need not be taken. No charge for goodwill. Partnership by arrangement.

Further particulars of Messrs. Protheroe and Morris, 67-68, Cheapside, E.C.

IN CHANCERY.
MESSRS. H. CANNELL AND SON, SWANLEY, ST. MARY CRAY, AND EYNSFORD.

THESE OLD-ESTABLISHED NURSERIES, universally known as the "Home for Flowers," may be acquired by private treaty as a going concern, either as a whole or in three lots. The properties comprise:—

A. The Home Nurseries, Swanley, about 15 acres, with all the glasshouses, seed warehouse, office, trade buildings, and residence.
B. Eynsford Nursery, part 1, 40 acres, glasshouses, and residence.
B. Part 2, 229 acres of land, with a very extensive stock of young fruit trees and part also permanently planted as orchard. Farmhouse and numerous buildings.
C. St. Mary Cray, the Cockmanning's Nursery, 35 acres. Conifers, ornamental trees and general nursery stock. Farmhouse and buildings.

The nurseries at Swanley and Eynsford abut to a considerable extent upon the railway, and this offers exceptional advantages for advertising the business.

The firm have been successful exhibitors at the most important shows for many years, and obtained a Gold Medal for their exhibit of Cannas, Pelargoniums, Calceolarias, etc., at the recent International Show at Chelsea.

Full particulars may be obtained from Messrs. Stone, Morris, and Stone, Solicitors, 5, Finsbury Circus, E.C.; Messrs. T. P. Child and Son, C.A.'s, 8, Frederick Place, Old Jewry, E.C.; and Messrs. Protheroe and Morris, Auctioneers and Estate Agents, 67 and 68, Cheapside, E.C.

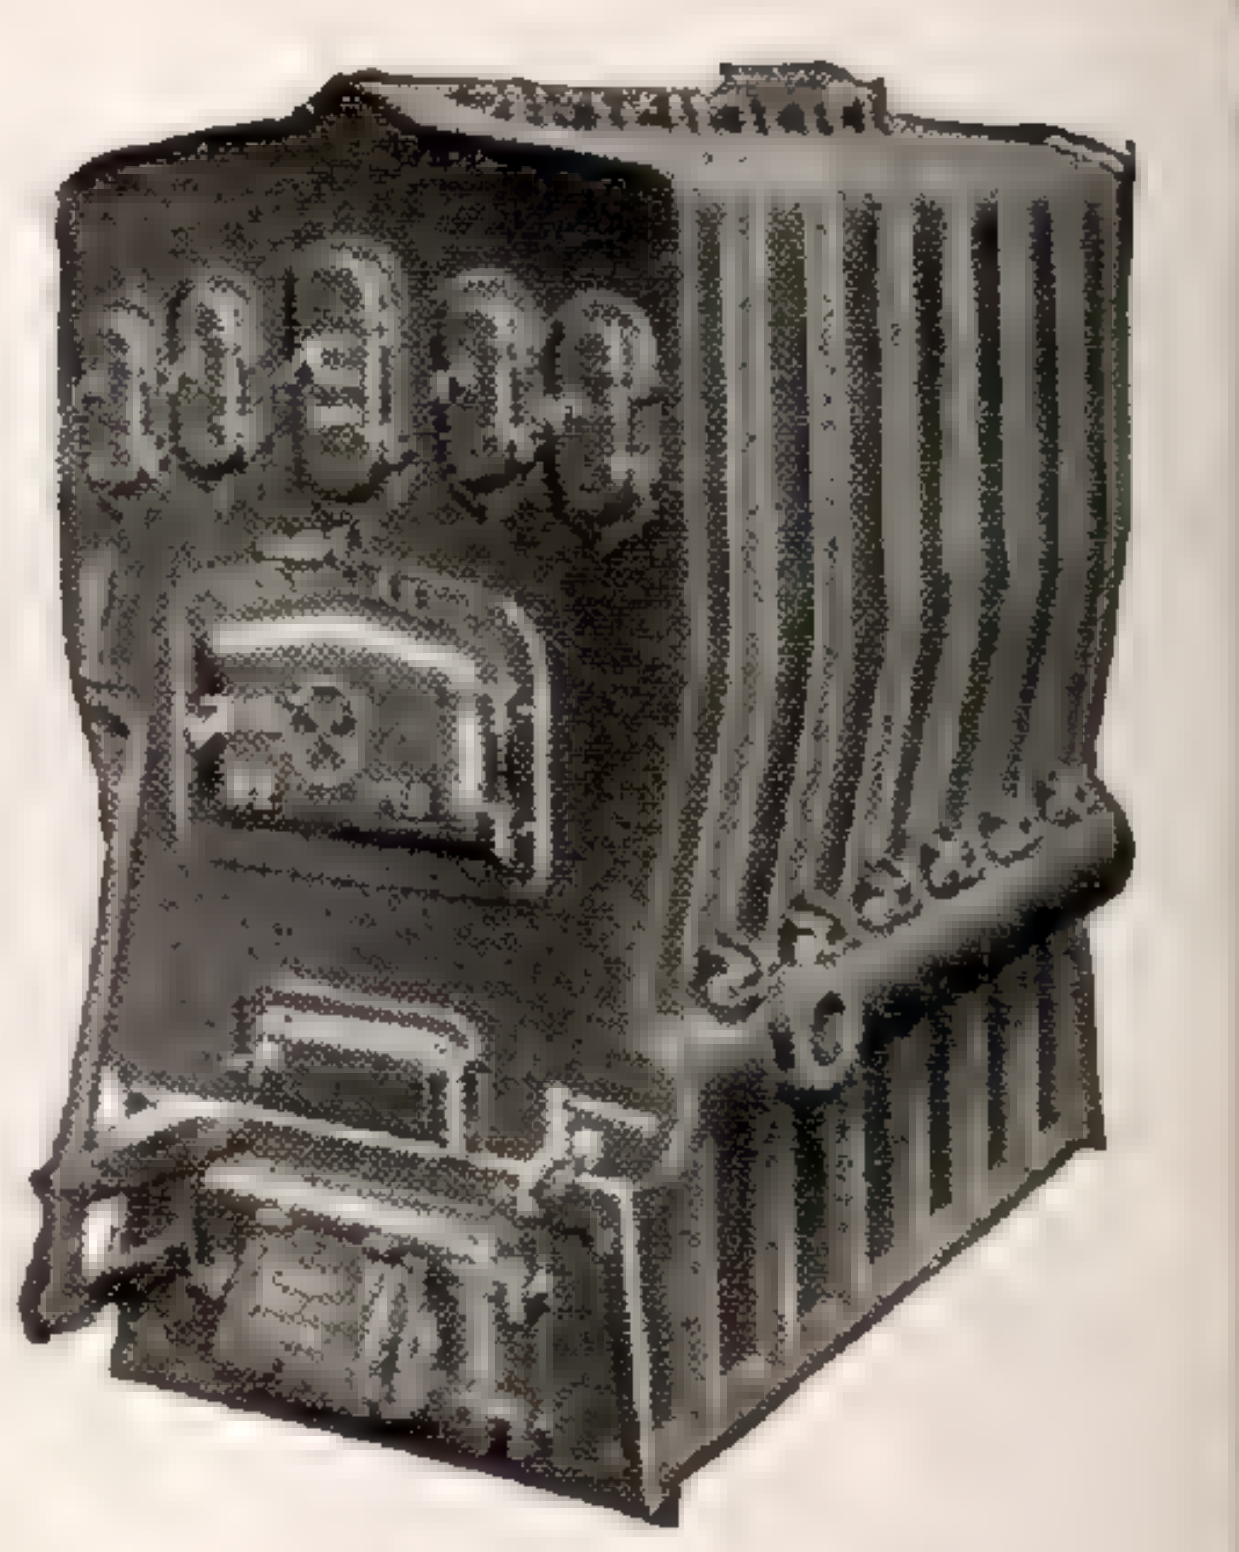
WARWICKSHIRE, KENILWORTH.

FOR SALE BY PRIVATE TREATY.

FREEHOLD MARKET NURSERY, comprising Four Acres of LAND, 24,000 square feet of GLASS HOUSE, OFFICE, STORES, PACKING SHED, BOILER HOUSE, Hot and Cold FRAMES, Seven-roomed DWELLING HOUSE; all modern and in first-class order. WHITTINDALE and WATSON, Auctioneers, Coventry.

FOR SALE, 8 volumes of Nicholson's Illustrated Dictionary of Gardening, cost £3 8s.; will accept £2 10s., or nearest offer. Apply A. BIRT, Dunkirk, Inchbrook, Stroud, Gloucestershire.

## Kinnell's Boilers



**THREE LEADING TYPES:—**

*The* **"ANGLIAN," Sectional,** heats 800 to 8,000 ft. 4in. pipe.
*The* **"ROCHFORD," Tubular,** heats 600 to 8,000 ft. 4in. pipe.
*The* **"HORSE-SHOE"** for the small Greenhouse.

**Saddle Boilers, Trentham Boilers, and all classes of Pipes, Fittings, etc., ready for immediate despatch.**

*Write for List No. 77, post free.*

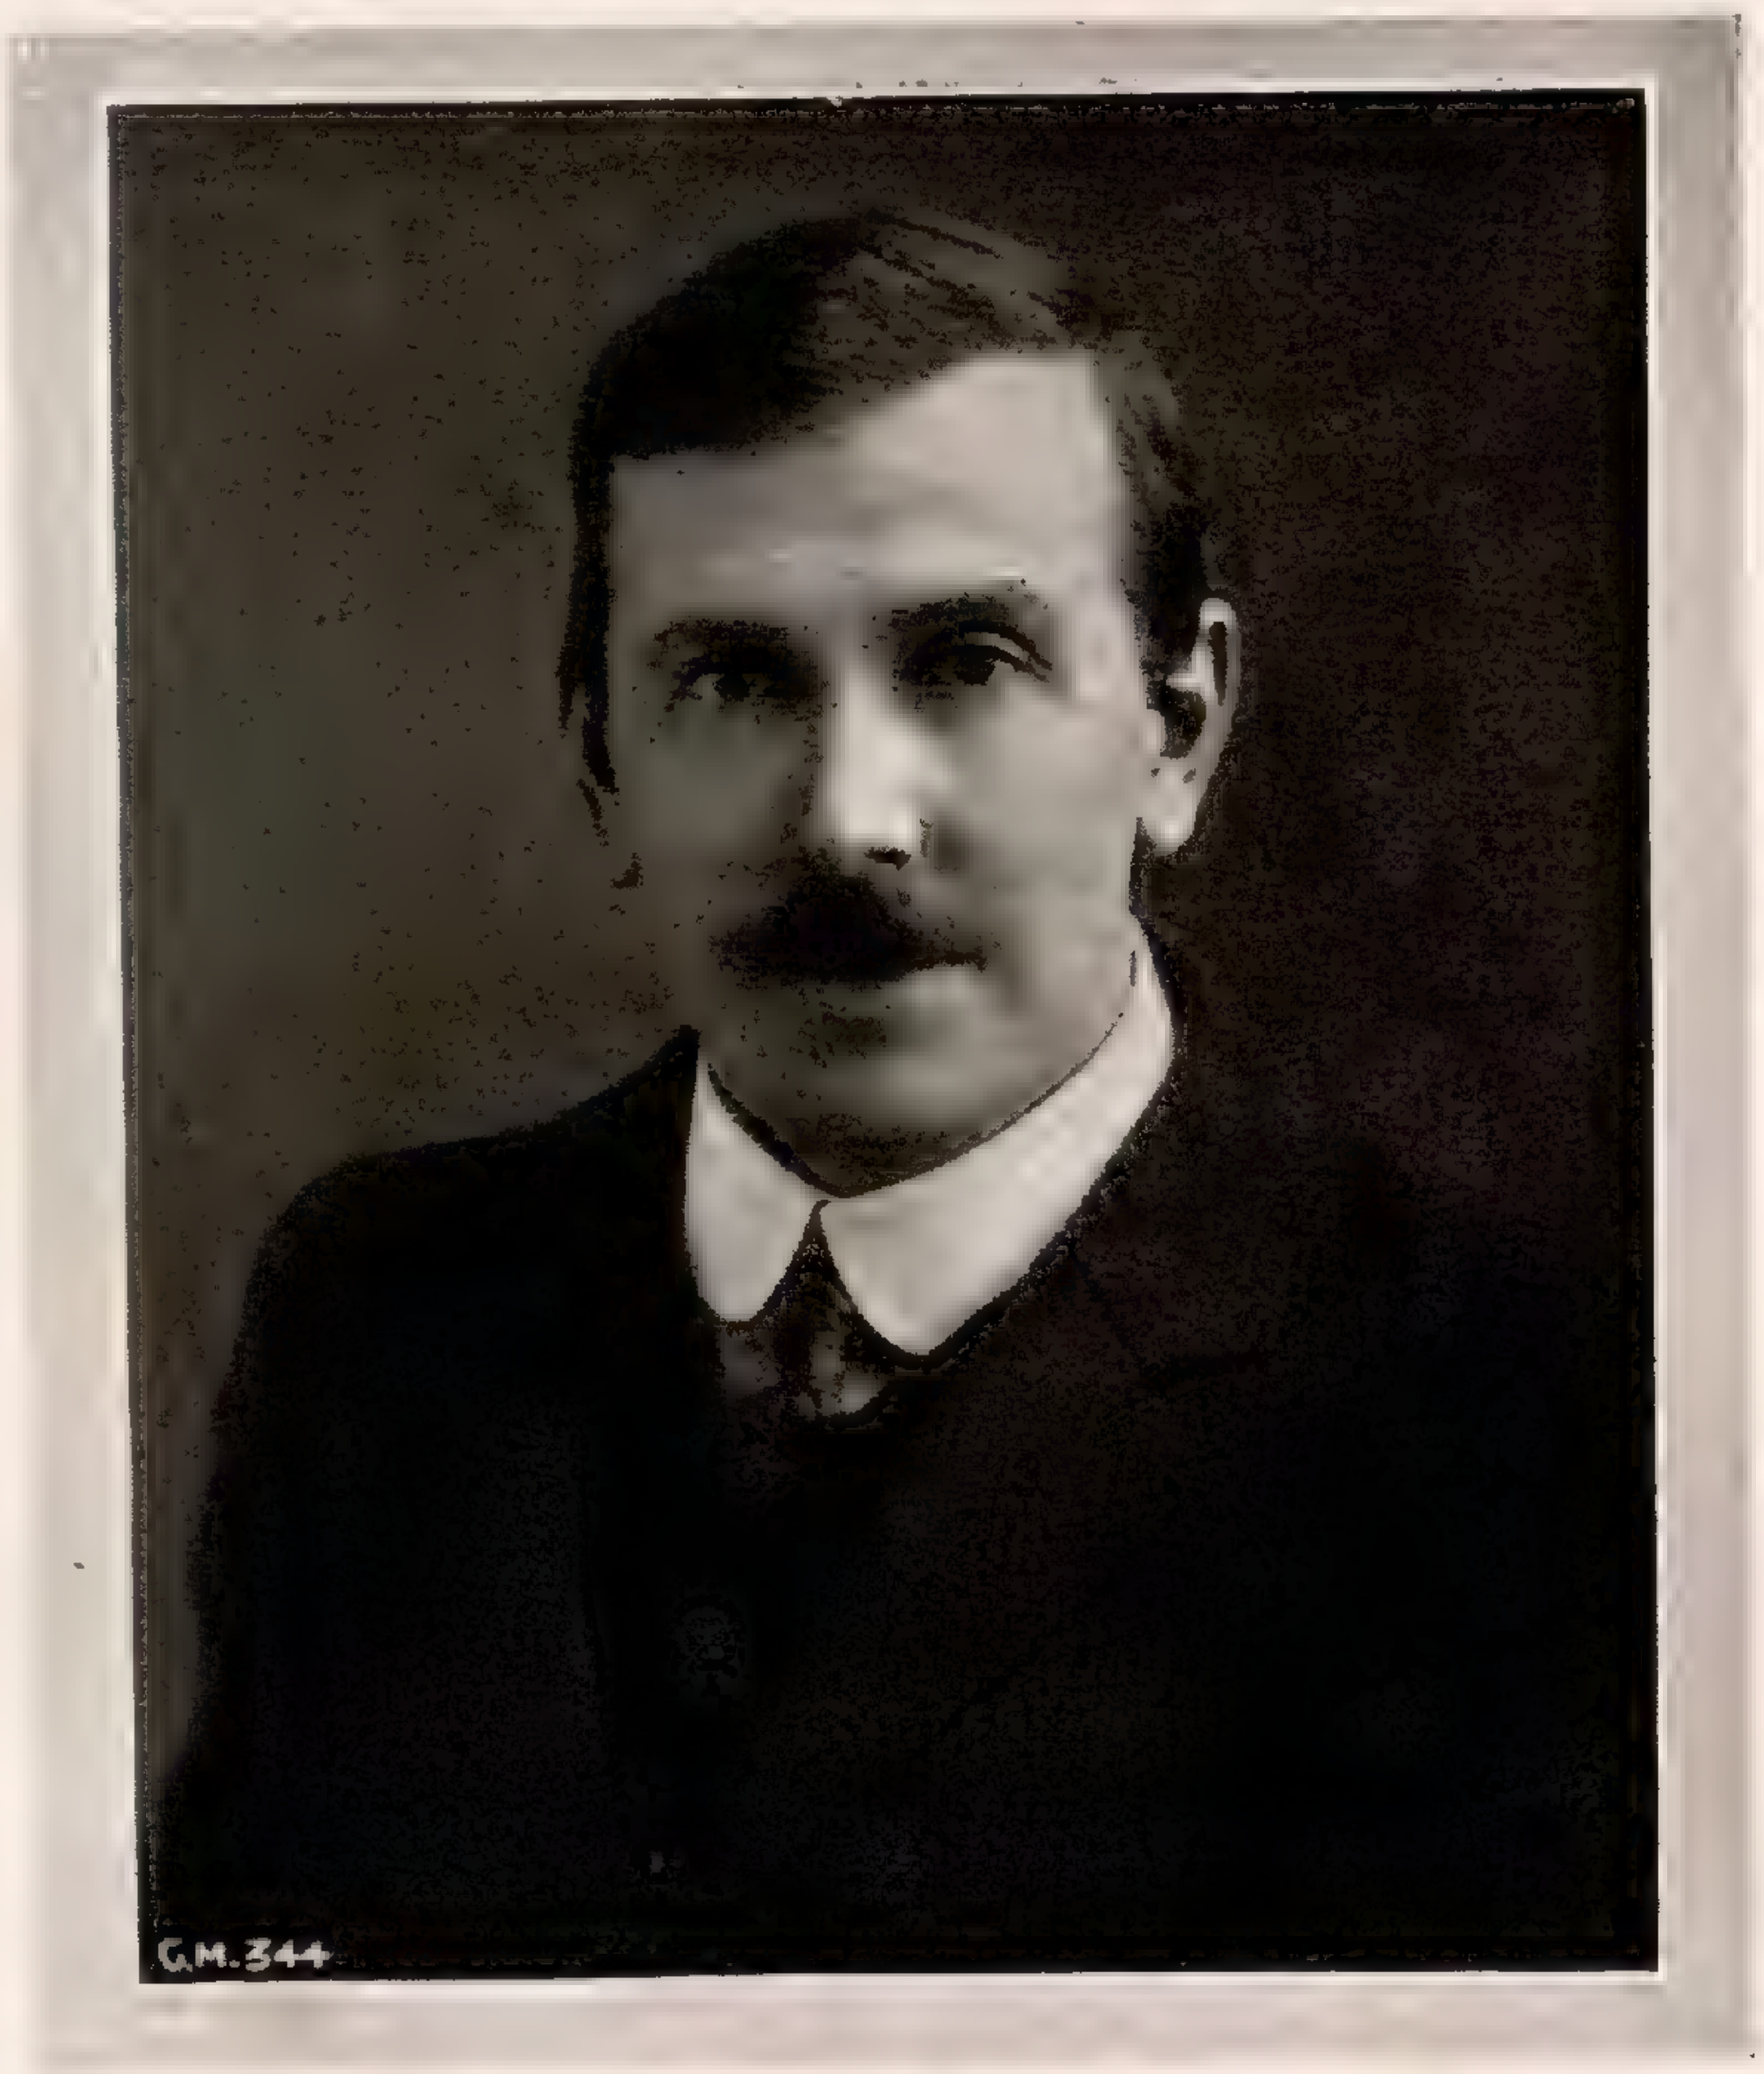
# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Double Flowers.

To the peculiar faculty which many, if not all, flowers possess of departing from their normal single and perfect character and assuming double forms, we certainly owe the majority of our chief horticultural gems, and every tendency evinced by a hitherto single flower to become double is immediately encouraged by selective breeding to, in the cultivator's opinion, improve it by developing the peculiarities. Such a tendency may be evinced at the outset by a simple deformation of the petals, and, in innumerable cases, this has been found to be inherited, with the result that, in a few generations, the whole of the petals have been transformed, and not only that, but the seed-forming apparatus, to which these petals are normally merely attractive adjuncts for reproductive purposes, have assumed the petal form as well, the flowers thus becoming entirely or partially barren. This, however, does not trouble the selective cultivator so long as the plant concerned can be multiplied by other means than seeds, such as by cuttings, grafting, or other methods, but entire barrenness handicaps him to the extent that, without seed, he is, as a rule, barring bud sports, deterred from improvement of the strain by selection from the progeny. From the point of view of Nature, however, a double flower is a mistake, a step in the wrong direction entirely, since it means a departure, on the part of the flower, from its fundamental duty of forming and perfecting as large a number of seeds as possible. Nature, to that end, has, in the course of æons of evolution, transformed the originally green foliage partially into the very different organs which bear the pollen and contain the embryo seed, and, in most cases, has courted the mediation of the insect world as matrimonial agents, by providing nectaries for its delectation and brilliantly-coloured petals, plus nutritious pollen, to indicate their whereabouts, and form an adequate reward for the services rendered. Hence, from the insect point of view, any extra attraction in the way of conspicuous colour associated with multiplied but naturally useless petals, probably devoid of such rewards, is nothing less than a fraud, and, in any case, the flower cannot possibly profit by their visits. In the case of those beautiful double-flowered members of the plum, cherry, and other normally fruit-bearing trees, which nowadays are so resplendent, though transiently so, in the spring, the impossibility of mere seed production is aggravated by the natural consequence that they bear no fruits, i.e., no luscious pulpy adjuncts, which repay the fruit growers for the all too brief enjoyment of their previous inflorescence. Nature, in point of fact, refuses to countenance such outrages to her laws, which are involved in selection of the barren and beautiful instead of her fertile and less pretentious creations. To the true lover of Nature, indeed, despite the splendour of our double roses, chrysanthemums, dahlias, etc., which form the popular attractions of our horticultural shows, the great host of simple or single flowers must always appeal to his sympathies with the greater force. Happily, selection and improvement, so called, is by no means confined to mere multiplication of petal. The small flower can be increased in size and number, and improved in colour, with no sacrifice to the natural charm of the single flower. Compare, for instance, our finest single clematis of to-day with the comparatively few double ones. There are in fact, many flowers whose normal beauty is such that any structural departure is resented by severyone with a "soupçon" of taste. The lily, par excellence, presents a vivid contrast to her rival queen the rose by her strict adherence to her natural simplicity, all the more natural as she has produced her most delightful and largest blooms in her unsophisticated native habitats, eclipsing far and away the selective cultivator's highest aspirations by the production of natural perfection under entirely natural conditions. That ideally perfect flower, the Madonna lily, has indeed produced a double (?) form, but of such a wretched type as to constitute a warning against, rather than encouragement to, any attempt to follow it up. Tastes, however, even good tastes, differ, and in championing the single forms, as we have done, it would ill become us not to recognise the beauty and charm of the host of double ones to which we have alluded, since, after all, barren or not barren, is, in human hands, largely immaterial, though Nature regards the point as of supreme importance, and takes an infinity of trouble to secure fertility in her creations.



MR. J. C. NEWSHAM, F.L.S.

---

**Mr. J. C. Newsham, F.L.S.,** head master and manager of the Agricultural and Horticultural School, Old Basing, Basingstoke, was brought up to farming, and then gave some attention to arboriculture. At a later date he underwent a training in landscape gardening with a Continental firm having offices in London. After this he entered Kew, and took full advantage of the opportunities this institution affords during his two years' stay. Like many other young men, he had to encounter some failures, and for many years he greatly regretted his inability to obtain the post of draughtsman and surveyor in the Parks and Open Spaces Department of the London County Council; he was one of the two candidates selected for the appointment, his successful rival being a capable foreigner who had the advantage of age and experience. Youth was also a handicap when Mr. Newsham was placed on the short list for the post of Curator of the Liverpool Botanic Gardens. When the movement for appointing properly trained men as lecturers and teachers of horticulture and agriculture developed Mr. Newsham's opportunity came, and here his early agricultural training stood him in good stead. He secured a position as lecturer under the auspices of the Hants County Council, and a few years later was made principal of the Farm School at Old Basing, a position he holds with great credit to himself and all concerned. Mr. Newsham holds strong views in connection with the education of gardeners. He believes that young men should take up definite courses of study, and so become well equipped scientifically as well as practically, and he is very anxious that the horticultural lecturer may soon occupy a position in every way equal to that of his agricultural confrère.

**Fruit Crops on the Continent.**—We are informed by the Board of Agriculture and Fisheries that reports have been received from His Majesty's Consuls on the condition of the fruit crops in certain districts in Germany, France, Belgium, and Holland. The Consul-General at Frankfort-on-Main, writing on prospects in Germany generally, reports that this year's crop of nearly all kinds of fruit in Germany will presumably be a small one. The fruit trees and bushes suffered heavily through the great drought of 1911, subsequently through the sudden change of temperature from warmth to intense cold in February, and finally through the spring frosts in April and at the beginning of May. In many districts a complete failure of the fruit crops is certain. In the district of Bühl, in Baden, the centre of the early plum cultivation, the loss sustained by the proprietors of vineyards and orchards is estimated at from £50,000 to £100,000. As to France, there is, generally, a great deficiency in every kind of fruit for exportation. There will only be available for export to the United Kingdom this year at most half the ordinary available quantities of pears, cherries, apricots, and apples; but of prunes, peaches, and black currants there will only be one-third, if as much, and their price will probably be about one-third higher than last year. The plum crop will be bad. In Belgium prospects are very poor. Early frosts destroyed the bloom, and the subsequent prolonged period of drought hindered the formation of the fruit. The crop is likely to be poor in quality and restricted in quantity. The fruit crops in Holland are reported to be satisfactory as a whole.

**Messrs. R. Wallace and Co.'s Rock Garden.**—As recorded in the report which appeared in our issue of May 25, Messrs. R. Wallace and Co., of Colchester, arranged at the Royal International Horticultural Exhibition a rock and water garden so remarkable for its taste and beauty as to obtain for the firm the award of the handsome cup offered by Queen Alexandra for the best exhibit in the section. A few days since Messrs. Wallace received from Colonel Streatfield, her Majesty's private secretary, the following letter having reference to their rock and water garden: "I am commanded by Queen Alexandra to thank you very sincerely for the beautiful water colour and photographs of your rock garden at the Royal International Horticultural Exhibition, which you sent to Her Majesty, through Sir George Holford. Her Majesty thinks Miss Du Cane's picture lovely, and is very glad to accept your kind present. Queen Alexandra is very glad to know that you won her cup, and thinks the award most justly made, as she has a pleasing recollection of the beauty of your garden when visiting the exhibition at Chelsea."

**The Potato Crop.**—At the present time potatoes present a very promising appearance, and, provided the climatic conditions continue favourable, the crop will closely approach, if it does not prove equal to, that harvested last year. The early potatoes suffered somewhat from the drought experienced in May, and in a few districts the potato disease made its appearance in June, but the change from the moist conditions that obtained during that month prevented the disease spreading to an injurious extent. Maincrop varieties are especially promising in the North of England and in Scotland.

**The Golden Tulip Tree** (Liriodendron tulipifera aureo-marginata) is remarkable both for its golden flowers and the yellow margin to its somewhat singularly cut leaves, and should prove a useful addition to the trees of special value for the garden. We are reminded of this distinct and beautiful form by several cut specimens that Messrs. Paul and Son, of Cheshunt, have kindly sent us. The flowers of this variety are of a more decidedly yellow hue than are those of the type, and the brown blotches on the petals that are characteristic of the flowers of the latter are replaced by others that are bright orange-yellow. The leaves are irregularly margined with greenish-yellow, the variegation extending in some cases over one-half the leaf.

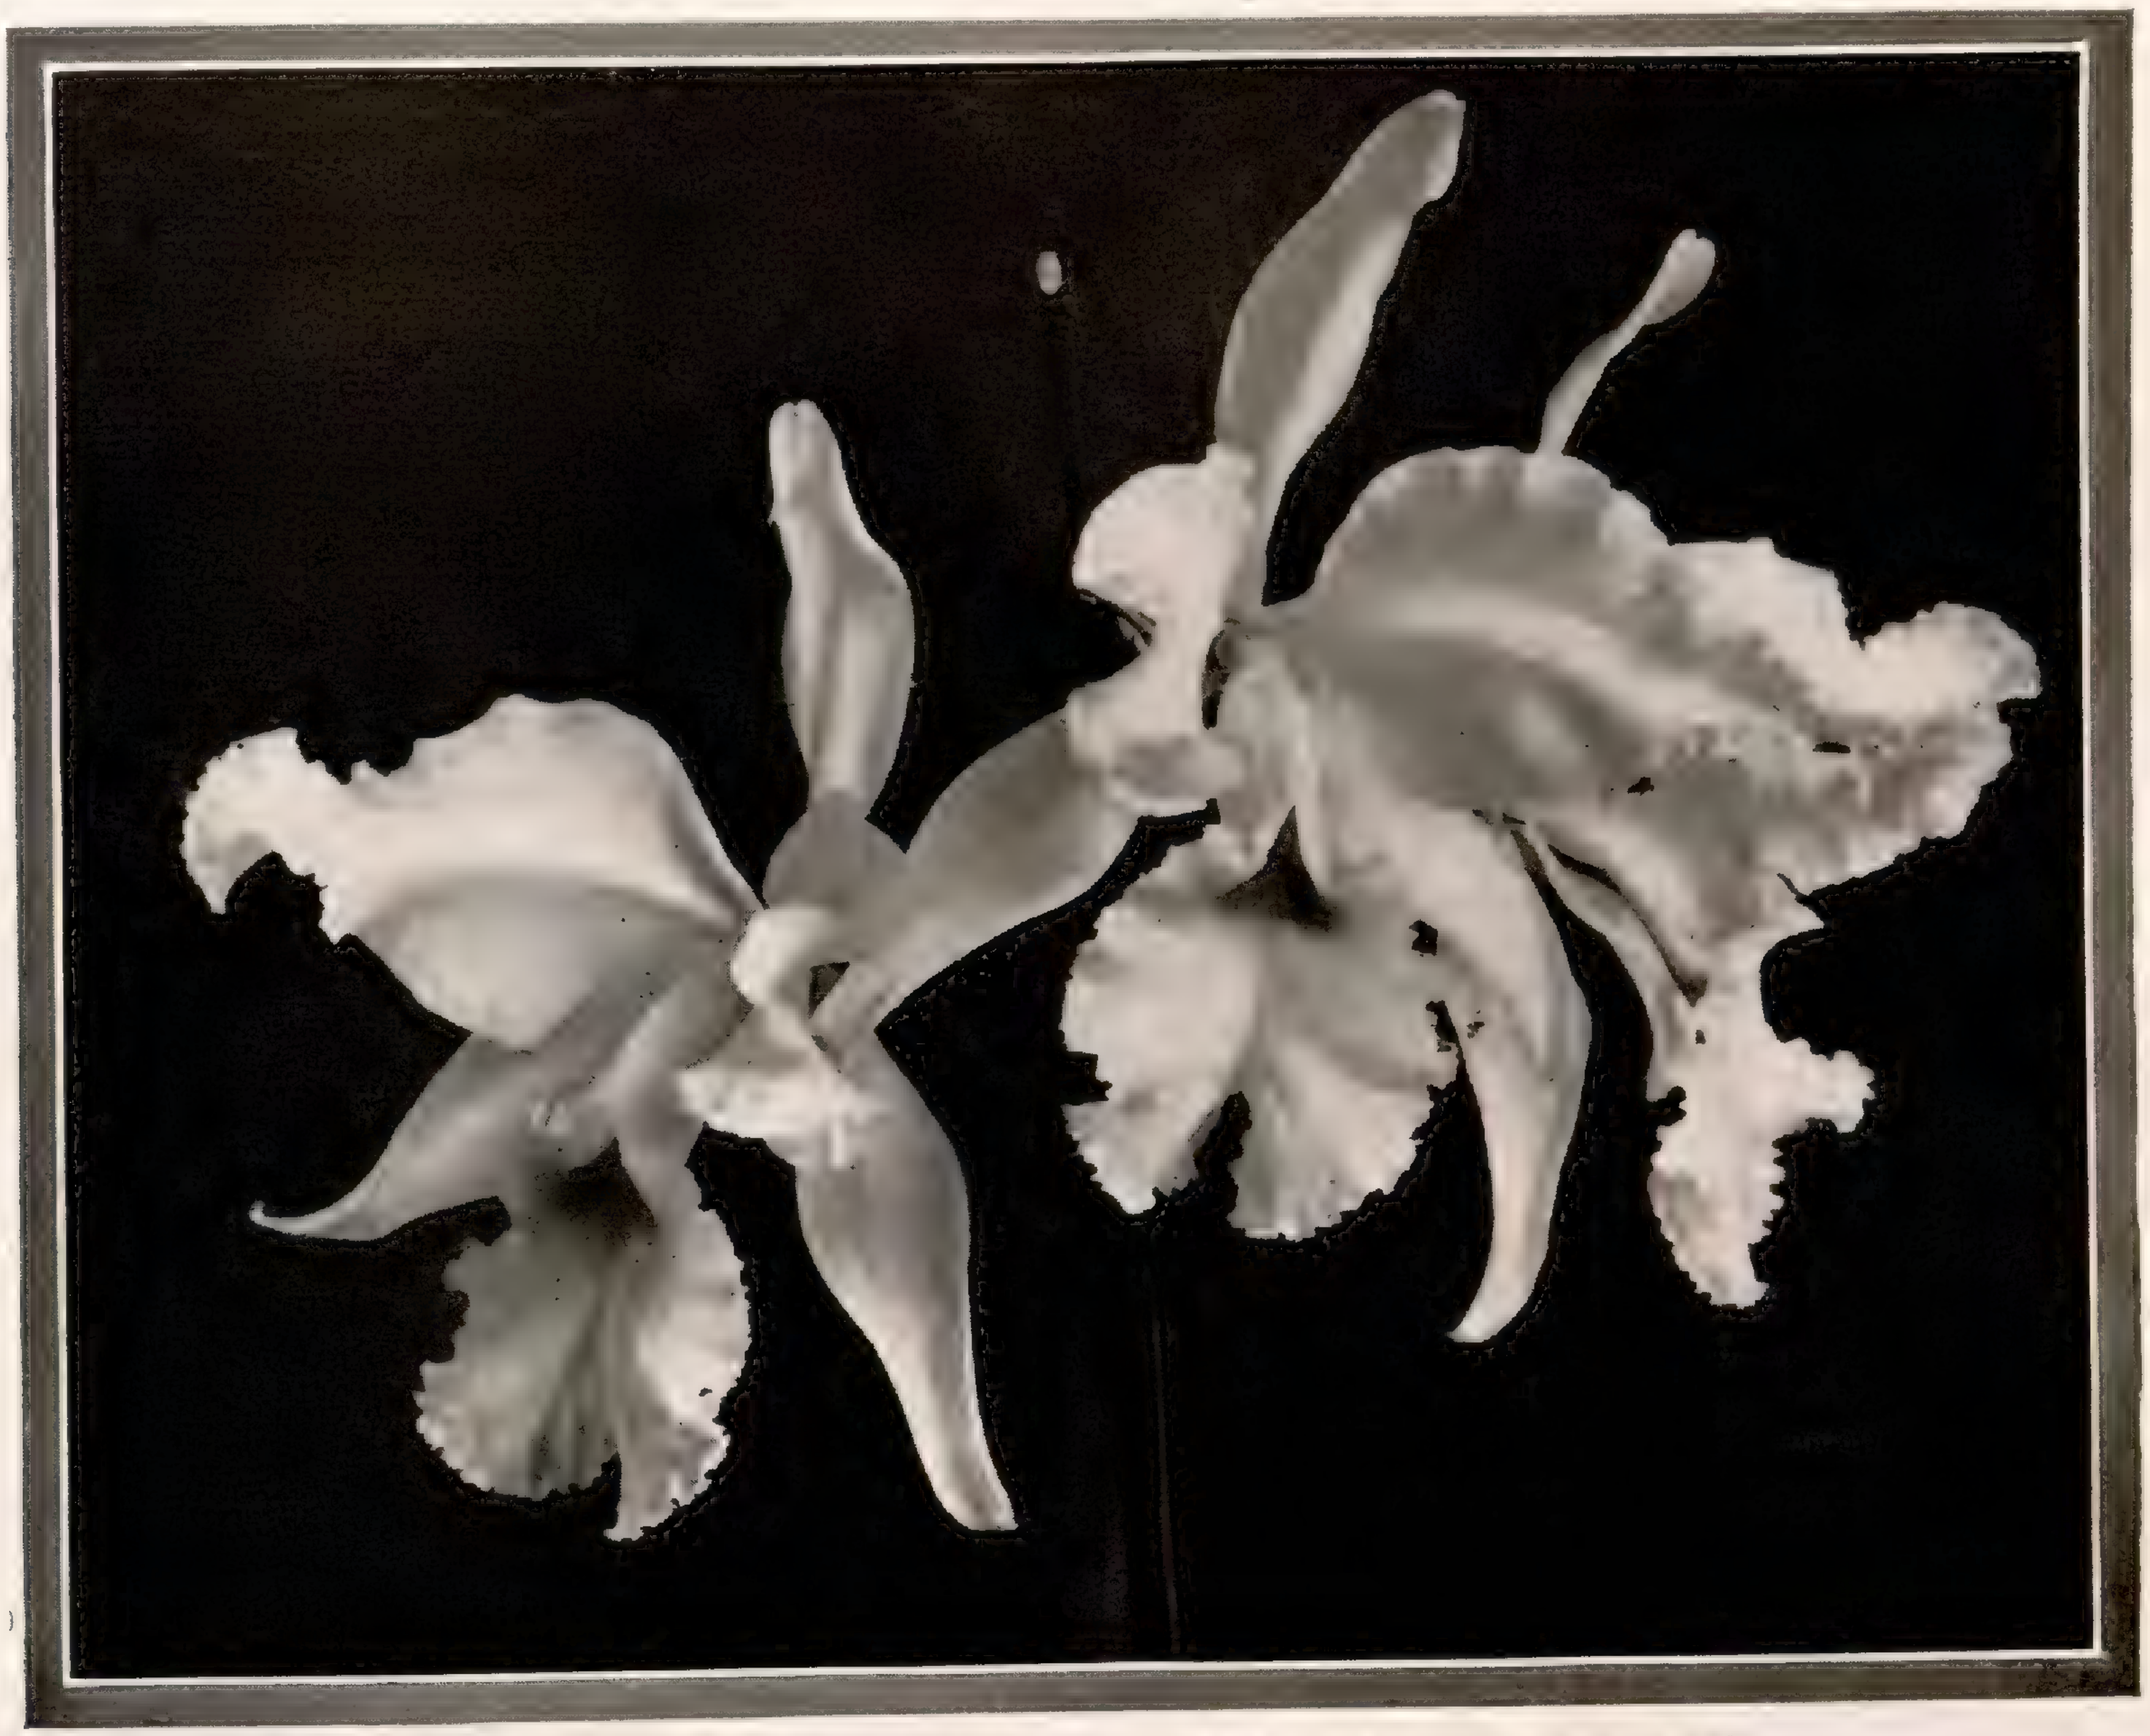
**Proposed Park for Shadwell.**—The Corporation of the City of London have been considering a proposal to sell their Shadwell Market property to the King Edward Memorial Committee, with a view to its preservation as a public park. To assist in bringing the project to a successful conclusion the London County Council, who are lessees of a portion of the site, are prepared to redeem for £14,000 their liability under the lease. The Fish Markets Committee have recommended the Corporation to accept from the Memorial Committee a net payment of £70,000, on condition that the property be converted into a public park, for the use of the public for ever, as a memorial of King Edward, and that due provision be made for laying out the park. The purchase and conversion of the site will cost about £100,000, and as £75,000 has been received by the Memorial Committee in cash or promises, a sum of about £25,000 remains to be collected.

**Presentation to Mr. and Mrs. Barnett.**—Advantage was taken of the opportunity that the judges' luncheon on the occasion of the Wolverhampton Show afforded to make a presentation to the late secretary, Mr. W. E. Barnett, and Mrs. Barnett, for the purpose of giving practical expression to the esteem in which he was held by both judges and exhibitors. The Mayor, who presided, called attention to the fact that those who had been associated with the show since its commencement were desirous of showing their appreciation of Mr. Barnett's ability and courtesy during the long period he occupied the position of secretary. Mr. Owen Thomas then, on behalf of the subscribers, asked Mr. Barnett's acceptance of a silver tea and coffee service, with a set of vases for Mrs. Barnett, together with an address. The address was as follows: "The news of your retirement from the position of secretary of the above great show, after the successful service of 21 years, was received by the exhibitors and judges with very sincere regret. Many of them have been associated with you in the service to the society during the whole of this time. That regret was felt the more keenly by the knowledge that the cause of your giving up your position was due to ill-health. It is earnestly hoped that your strength may soon be restored to you in full measure. The exhibitors and judges feel that they could not let the opportunity pass without offering you, as a mark of their respect and sympathy, some small, tangible token of their appreciation of the extreme courtesy and unostentatious, helpful kindness you had always extended to them during this long time. They ask your acceptance therefore of the accompanying present of a silver tea and coffee service, with four silver vases for Mrs. Barnett, with their sincere wishes that you may both long be spared to enjoy them." Mr. Barnett suitably acknowledged the gift and the many kind things said of him.

**Finchampstead Ridges.** — The committee which was recently appointed, with powers to negotiate with the trustees of the Bear Wood estate for acquiring several acres of Finchampstead Ridges, and to appeal for funds to carry out the scheme, has secured an option of purchase for £3,000 of 60 acres of the most elevated and beautiful part of the property. This will preserve an uninterrupted view over Eversley as far as Highclere Beacon 26 miles away, and to the south or south-east as far as Hindhead; while the pretty valley of the River Blackwater, with the village of Yateley in the foreground, will not be hidden from view if any houses are built upon the intervening ground. Not only have the vendors treated the committee generously in the matter of price, but Mr. John Walter has himself promised a donation of £500, and the committee announce that £2,400 has been promised. On the completion of the purchase, the land acquired will be vested in the National Trust for Places of Historic Interest or Natural Beauty.

**British Association at Dundee.**—As previously announced in these pages, the annual meeting of the British Association will this year be held at Dundee, and it is creating so much interest as to suggest that it will, in every way, be a great success. The dates of the meeting are September 4 to 11, and the president-elect is Professor E. A. Schäffer, F.R.S., who, we understand, will devote his address to a consideration of the nature, origin, and maintenance of life. Professor F. Keeble, D.Sc., will be the president of Section K (Botany), and will take as the subject of his address, "Mendelism as an Aid to Physiological Research." His chief object will be to show that the Mendelian method of plant rearing is an indispensable adjunct to physiological research; and the need for this alliance between Mendelism and physiology will be illustrated by a summary of the results of the researches carried out by Dr. E. F. Armstrong and himself on the mode of pigment formation in plants. It is intended to devote one morning session to papers on genetics and allied subjects, and it is hoped that a semi-popular afternoon lecture will be given by Mr. J. H. Burkill on the botany of the Abor Exhibition illustrated by lantern slides. In the Geological Section Dr. Gordon will read a paper on the Fossil Flora of the Pettycur limestone, Fife, and its bearing on botanical evolution. It is anticipated that the paper will form the basis of a discussion in which several leading palæo-botanists will take part. At a joint meeting with the botanists, fixed for Friday, September 6, several papers arranged by the Chemistry Section will be read and discussed. Dr. J. V. Eyre will deal with the enzymes of flax and the variations of the flax plant with locality; Mr. A. Compton, of the Pasteur Institute, will give an account of some of the recent French work on plants,and Prof. Keeble and Dr. E. F. Armstrong will deal with plant pigmentation. Numerous excursions have, as usual, been arranged, and the botanists will pay a visit to Clova and Glen Esk for the purpose of studying the Alpine flora associated with the name of George Don. Garden parties will be given by Lord Moray at Kinfauns Castle, Lord Strathmore at Glamis Castle, Lord Camperdown, Camperdown House, and Lord Kinnaird at Rossie Priory.

**Mr. Lewis Smith.**—The high position to which hardy flowers have attained, both in the garden and at the exhibition, had further proof at the recent exhibition of the Norwich Horticultural Society, when our able contributor, Mr. Lewis Smith, of Shotesham Park, Norwich, was awarded for his fine collection of hardy flowers the Royal Horticultural Society's silver medal which was offered for the best exhibit in the show. This is not the first time by many that he has obtained distinction, for in 1910 he was awarded at Norwich a similar medal of the R.H.S., also offered for the best exhibit, for hardy flowers. At the spring show at Norwich in April last he obtained the R.H.S. silver medal for the best exhibit for a fine collection of orchids. He has also obtained much distinction as a cultivator and exhibitor of fruits. We learn that Mr. Lewis Smith, who has been head gardener at Shotesham Park Gardens during the past eleven years, has resigned his charge, and will leave early in August. He should not be long in finding further opportunities for the exercise of his abilities.



CATTLEYA WARSCEWICZI ALBA, VAR. FIRMIN LAMBEAU.
Flowers pure white, with lemon-yellow throat to the lip. F.C.C., R.H.S., July 15. M. Firmin Lambeau, Brussels.

## CELL GROWTH.

To anyone who devotes a little study and thought to the matter the fact must appeal with reverential forcefulness that every living thing we see, whether plant or animal, microscopically minute or comparatively gigantically large, not only commences its existence as a tiny little sac, containing a tiny quantity of liquid, which sacs are practically indistinguishable as to form and composition, but is also eventually constructed entirely by a succession of such cells. From the bacterium to the whale or the colossal redwood trees of Colorado is this the case, as well as with all the infinitely diverse forms of life which lie between these dimensional extremes as plants or animals. Furthermore, if we take intelligent stock of our surroundings we shall find that the vast majority of the substances with which we deal are derived from organic sources, and hence have been built up at some period, remote or recent, by the operation of these little constructive sacs or cells.

Probably, to the lay observer, the fern spore presents one of the easiest objects by means of which we may be better enabled to grasp from start to finish the nature of the work of which a simple cell is capable. The spore is merely such a cell protected by a shell, and with a microscope of moderate power it is fairly easy to watch its operations from the moment when, under the influence of moisture and warmth, it swells and bursts this shell and emerges to the light. No sooner does this occur than a very wonderful process begins, to understand which we must for a minute or two consider that no mere sac of jelly could do anything at all, unless within it were contained some impulsive and directing power. Neither the skin or the jelly possesses such power, but within the latter there is always, in a living, active cell, a truly wonderful little body, a bundle of fibres, called the nucleus, and it is in this that the life principle lies which eventually determines, guides, and controls all the future operations which result in the production of a new organism. Such a "nucleus" is in the cell enclosed in the spore husk, and it is this which, on the liberation of the cell, immediately sets to work to perform its functions. The observation of this stage is probably beyond the scope of the lay or unscientific observer, but it may be taken for granted as being of the following nature. The "nucleus" in the primary spore cell consists, as we have said, of a minute fibrous bundle. This unravels itself, so to speak, and its component fibres split up and arrange themselves into two groups. These two groups separate themselves, and between them, by some inconceivably subtle influence a thin wall is formed, dividing the cell into practically two, each one now with a nucleus of its own. The second cell thus engendered increases in size, and again the nucleus divides, another dividing wall is created, and so on, until a little chain of cells is seen with the spore husk at one end.

No building can continue without building materials; and it will soon be seen that from the tiny chain of cells, minute hair-like rootlets have protruded, anchoring the incipient "prothallus" to the soil, and providing it with material from that soil in the shape of water and earthy salts, while the green portion is absorbing the carbonic gas of the air as further material for construction. Under the influence of light, from the issue of the first cell from the spore husk, there has been engendered within the cell walls a number of tiny green bodies, known as "chlorophyll," or leaf green, and it is this chlorophyll which, alone in this world is capable of being so influenced by light that it can break up the earthy salts of the sap provided by the roots, decompose the carbonic acid gas into its components of carbon and oxygen, throw off the oxygen, and utilise the solid carbon to form starchy and innumerable other substances for constructive or other purposes.

With the aid, therefore, of this marvellous substance, the cell-work now goes actively on, and the designing work ordained by the parental influences which have been incorporated from the first in the "nucleus" of the spore cell, now commences to be apparent. The mere chain formation of the first cells is abandoned in favour of lateral multiplication on definite lines, until presently we see a heart-shaped green scale, perhaps a quarter of an inch across when completed. We may now loosen such a scale from the soil, reverse it, and place it on the field of our microscope for further investigation. We now find that it was attached firmly to the soil by a bunch of many hair-like roots, and that where the heart is indented is clearly much thicker than elsewhere, forming a sort of cushion. On this cushion, close to the indentation, is a little cluster of teat-like bodies, the "archegonia" or female parts of the prothallus, at the base of each of which is an embryo seed. Elsewhere, scattered irregularly among the root-hairs, is a number of short, round pimple-like bodies, the antheridia, or male portions, and from these, if water be present, we may see issue little swarms of antherozoids (each one an animated cell) which swim actively about in the water, and eventually reach the "archegonia," penetrate them, and fertilise the embedded seeds beneath them Now to form a fair parallel to all this wonderful cell-work, we must imagine a vitalised brick being laid on a clear space of ground, and, all by itself, breaking up into other bricks which spontaneously arrange themselves, construct laboratories in which complex materials of, other kinds are chemically fabricated, make little chambers, and engender living organisms to occupy them, and in short do an infinity of wonderful things until a colossal edifice is erected (the adult fern), which is endowed with the faculty of scattering broadcast a few millions of equally gifted bricks, each one capable of doing the like if called upon.

All this, and far more, can be partly seen and partly conceived by anyone who will take the trouble to sow a pinch of fern spores, and follow through these performances with the aid of a microscope and an intelligent imagination. Having done this, and thereby gripped to a slight degree a sense of the marvels of cell growth, look around, as suggested at the outset, and study the work accomplished by the cell in other directions. Leaving unsophisticated Nature on one side, study the contents of every shop we see, save those of metal ware, jewellery, and other inorganic products, and a little thought will show us that all such contents are, or have been, primarily the work of busy cells, while the infinite diversity of such work is all determined at the outset by invisible and inconceivably subtle potencies innate in that minute bundle of vital fibres in the cell which we term the nucleus, the absolute embodiment of all vitality. Then we may go a step further, and consider that our own appreciation of all these wonders is solely due to the action of the innumerable brain cells which, as the writer of these lines progresses, are working up his memories, and simultaneously actuating the mechanism which drives his pen and enables him to transfer his intangible ideas into words for his readers.

Chas. T. Druery, V.M.H., F.L.S.

## "THE GARDENERS' MAGAZINE" GOLD MEDAL.

As our readers have been informed we offered a handsome gold medal as a special award for the most meritorious exhibit in the competitive classes at the recent exhibition of the National Hardy Plant Society at the Royal Horticultural Hall. The offer of the medal greatly stimulated competition in the principal classes, and induced the exhibitors to do their best in staging their collections. The judges who combined for the purpose of making the award, did not find it a particularly easy task to determine the relative merits of the several collections that ranked high for the first place. They, however, surmounted any difficulty that was met with, and awarded the medal to Messrs. F. Smith and Co., of Woodbridge, for their collection of hardy flowers arranged in vases. We heartily congratulate the firm on their success.

The Gardeners' Magazine Prize Medal

AWARDED TO
F. SMITH & Co
FOR
BEST EXHIBIT AT
N.H.P.S. SHOW
JUNE 19th 1912

**The River Route to Kew.**—During the hot weather many visitors to Kew take advantage of the river route to the famous gardens, and certainly the journey is more pleasant by water than by road. It is estimated that no fewer than 13,000 people patronised the steamboats from London to Kew during a recent week-end period, while 12,000 travelled by river to Greenwich in the same three days.

## THE CULTURE OF EARLY SMALL CABBAGES.

Every spring demonstrates the value of the cabbage, when it is produced early and of good quality, and, though I have nothing to say against larger and later varieties, for home supplies there is no question whatever but that the small, early forms are of most value. Each year those who have to rely upon market supplies know that there is always a dearth of good early cabbages, and no matter what the season, this want is always felt, and I think those who supply the markets would find the early small cabbages a profitable and valuable crop.

There is little rest for the grower who wishes to secure the best results. It is always difficult to recover lost time, and those who study vegetable culture must be in time to obtain the best returns. July may appear full early for sowing the earliest varieties, but I have, after a long experience, never found it too early; of course, as regards the north and south, ten days or a fortnight difference may be allowed. Much depends upon the season, so it is impossible to give a fixed date for all places and under diverse conditions. In the north I always made it a point of sowing from July 15 to July 20; and in the south from the 20th to 30th of the month. Soils alter conditions, and a heavy clay soil means greater difficulty in germination, though this can be met by improving the surface soil by additions. Again a few weeks' hot weather without moisture makes a considerable difference to the welfare of the seedlings in their early stages of growth, so that, to be successful, the seed-bed should, for a short time, be shaded from hot sunshine, and then moisture given will readily be retained.

Many good growers make two sowings according to locality, one early as advised (a small one), and another two or three weeks later, and where a number of plants are required it is an excellent plan. Years ago, with only the older varieties to rely upon, it was courting failure to sow at an early date, as almost invariably a large percentage of the early sowing bolted, that is, run to seed, and time and labour were lost, but this, so far as my experience goes, does not now apply to the early small forms of which the newer Harbinger is a fine type. For years I grew a small cabbage of my own, a cross between Ellam's Early Dwarf and Sutton's Favourite. This never bolted. I have so much faith in these small early varieties, and frequently, when sown at the early date named, I have been able in a mild winter to cut perfect heads in abundance quite early in February.

A cabbage I grew for many years on a stiff clay soil, though small, was most valuable. This, I should add, was the Imperial; indeed there is no lack of splendid varieties. The newer Harbinger I consider a great acquisition for small gardens, and if sown at the time noted there should be no difficulty in having good heads very early in the year. For large supplies it may be well to make a sowing of an early larger kind, say April or Flower of Spring, but much depends upon the demand, and the supplies must be regulated thereby.

I should say that invariably I planted on land that had given us a main crop of onions; this was well enriched for the onions, and it gave an excellent site for the cabbages. A point that should not be overlooked is that these small, sturdy varieties do not suffer nearly so much in severe weather, being closer to the soil than the larger growers.

G. Wythes.

## MENDELISM.

### Inheritance of Characters.

(Continued from page 538.)

On the formation of the sexual cells, the opposing characters of each pair will separate. Consequently, no pollen grain or ovule will be found containing the factors for yellowness and greenness, nor roundness and wrinkledness. But there is nothing to prevent the association in the same pollen grain or ovule of yellow with either round or wrinkled; or green with round or wrinkled. We thus get in approximately equal numbers four sets of pollen grains, and four sets of ovules, carrying the factors YR, Yw, gR, and gw. The chances that any one pollen grain will mate with one or other of each of the four types of ovule are equal, i.e., the union of YR with YR is just as likely to occur as its union with either Yw, gR, or gw. The constitution of the sixteen plants of the second generation can therefore be found by combining each of the pairs in the series with itself, and the others in turn. The diagram shows the result, the letters at the side and top representing the factors present in the pollen grains and ovules respectively; the letters in each square representing the constitution of each of the sixteen plants.

| Pollen Grains | Ovules YR | YW | GR | GW |
|---|---|---|---|---|
| YR | YY RR 1 | YY RW 2 | YG RR 3 | YG RW 4 |
| YW | YY RW 5 | YY WW 6 | YG RW 7 | YG WW 8 |
| GR | YG RR 9 | YG RW 10 | GG RR 11 | GG.RW 12 |
| GW | YG RW 13 | YG WW 14 | GG.RW 15 | GG WW 16 |

### Dominant and Recessive Characters.

Examination of this table will show that only one plant of each of the four forms obtained will breed true. Thus of the nine plants containing both dominant characters (Nos. 1, 2, 3, 4, 5, 7, 9, 10 and 13), only one, YY.RR, is pure, i.e., both dominants have paired. Of the remainder, four are hybrid in regard to one pair of characters, four hybrid in regard to both pairs. Segregation of these characters must follow in the third generation.

Only one plant has both recessive characters, gg.ww, and this plant will breed true.

Now examine the two types of plants where the characters of the original parents have been rearranged, i.e., the yellow wrinkled and green round.

Taking the yellow wrinkled first, we see that No. 6 has the dominant characters paired and the recessive characters paired. Its constitution is YY. ww. This plant will therefore breed true to these characters. Of the other two, No. 8 is hybrid in regard to colour (Yg), but pure in regard to the outline of the seed (ww). The same is true of No. 14. The yellow and green characters will therefore segregate in the next generation. Similarly in regard to the green round forms. No. 11 is pure in regard to both characters, but Nos. 12 and 15 are hybrid in regard to outline of seed. No. 11 will breed true, Nos. 12 and 15 will segregate.

Now suppose that our original intentions was to obtain a green round form from our cross. In the first generation, the type desired is not present. It appears, however, in the second generation, and further, one out of every three will be pure.

We have then to separate the pure forms from the impure. The older hybridists obtained this end by selection, which if continued for a number of years would probably be successful. The Mendelian, however, can tell his pure type in the following year, for he keeps and sows the seed of each plant separately. All the plants from the seed of the pure types will be identical, the plants from the seed of the impure forms will exhibit segregation.

In any cross, therefore, every possible combination of characters will appear in the second generation, provided we have a sufficient number of individuals. A certain number of these combinations will consist of a rearrangement of the characters of the original parents, and a definite proportion of each of these new forms will be "pure" and give rise in future generations to identical offspring.

### Reversion.

Recent Mendelian work has thrown much light on the puzzling phenomenon known as "throwing back" or reversion. On crossing certain varieties we get a hybrid which shows neither simple "dominance" nor "blending,' but can best be described as exhibiting the characters of the wild "ancestral" form from which the parental varieties are supposed to have descended. The colour of the flower of the culinary pea is an instance.

Three colours are known—white, which is the commonest; pink, which is found in several varieties; and so-called purple, which is almost identical to the colour of the wild ancestral type. On crossing white with pink, purple flowered plants result.

When self-fertilised, the purple flowered plants produce the three forms, purple, pink, and white in the proportion of 9: 3: 4. Now this proportion at once suggests that we are dealing with a case of dihybridism, similar to the cross between a yellow round and a green wrinkled. But in that instance the proportion was as 9:3:3:1. How do we get 4 in place of 3:1?

Each parent must contain two factors, which in this case are supposed to be "blue" (B), and absence of "blue" (b), "pink" (P), and "absence of pink" (p). A pink flower will therefore have the constitution P.b. (i.e., "pink" and "absence of blue.") A white flower has the constitution Bp (i.e., "blue" and "absence of pink.") But why is this flower not blue? For the simple reason that "blueness" only manifests itself when the pink character is also present. That this is so becomes clear when we examine the following generation.

The plants of the first generation are purple. They contain both colour factors, blue and pink, which gives purple. In the second generation we have 9 purple, 3 pink, 4 white. These nine purple, though not identical, all contain the blue and pink factors. Hence all are purple. The three pinks contains the pink factor, but not the blue. Hence all are pink. But of the four white, three contain the blue factor but not the pink, and since blue cannot be seen in the absence of pink, they remain white. The fourth white contains neither colour factor, and is therefore a pure white.

We now understand why reversion takes place when the pink flower is crossed with the white. Each parent possesses one of the necessary factors for the production of the purple colour. In the hybrid, the two factors are once more combined, and purpleness results. The facts also suggests how the pink and white varieties arose. In the course of evolution each of these forms must have lost one of the factors. Thus the pink flower lost the blue factor, and the white flower the pink. It is also probable that the "loss" of these factors was due to imperfect segregation. If this suggestion be correct, both these forms must have appeared suddenly, just as the "Shirley" poppy is known to have done.

### Present and Absent Factors.

A somewhat similar instance is to be found in the sweet pea. The white flowered variety "Emily Henderson" has two forms, which are outwardly indistinguishable. The cross between these, results in a purple, recalling the appearance of the wild species of Europe. Self fertilisation of these hybrids gives 9 coloured to 7 white. The explanation is similar to the previous case. Each form contained certain of the necessary factors for colour, and the cross resulted in a re-combination of these factors. In the following generation segregation in the proportion of 9:3:3:1 took place. The nine plants were coloured because they all contained the colour factors. The remaining seven are white, because they contained either half the factors or none of the factors. The analysis of the nine coloured forms is of special interest to the horticulturist. They were not identical, but consisted of six forms occurring in definite proportions:—

1. Purple bicolor ("Purple Invincible.")
2. Deep purple (colour deeper than No. 1).
3. Dilute purple ("Picotee.")
4. Red bicolor ("Painted Lady.")
5. Deep red (Miss Hunt).
6. Dilute red or Tinged white.

It will be seen at a glance that these forms constitute a series. The purples were to the reds as 3: 1. Purple is therefore dominant to red, and each red differs from the corresponding purple by the absence of the purple factor. Further, each of the series of purples and reds appeared in the proportion of 9: 3: 4. Two factors must therefore be concerned, these factors being stated to be (1) a light wing factor, making bicolor dominant to the dark-winged form; (2) an intense colour factor.

If purple be represented by B, light wing by L, and intense colour by I, the purple bicolor has the constitution BLI. The other forms may be derived from this by the omission of each factor in turn, representing the absence of each factor by the corresponding small letter, we get

| | |
|---|---|
| 1. Purple bicolor | BLI. |
| 2. Deep purple | BlI. |
| 3. Dilute purple | BLi. |
| 4. Red bicolor | bLI. |
| 5. Deep red | blI. |
| 6. Dilute red | bLi. |

This again suggests that the various varieties now in cultivation arose by the loss of one or other of the factors in turn.

Professor Punett has an interesting historical note on the subject. To quote his own words, "The wild sweet pea first reached this country in 1699. . . . Somewhat later we hear of two new varieties, the red bicolor or Painted Lady, and the white, each of which may be regarded as having 'sported' from the wild purple by the omission of the purple factor, or of one of the two colour factors. In 1793 we find a seedsman offering also what he called black and scarlet varieties. It is probable that these were our deep purple and Miss Hunt varieties, and that somewhere about this time the factor for the light wing (L) was dropped out in certain plants. In 1860 we have evidence that the pale purple or Picotee, and with it doubtless the Tinged white, had come into existence. This time it was the factor for intense colour which had dropped out. And so the story goes on until the present day, and it is now possible to express by the same simple method the relation of the modern shades of purples and red, of blues and pinks, of hooded and waved standard, to one another and to the original wild form. The constitution of many of these has now been worked out, and to-day it would be a simple, though perhaps tedious, task to denote all the different varieties by a series of letters indicating the factors which they contain, instead of by the present system of calling them after kings and queens, and famous generals, and ladies more or less well known."

In these cases of "reversion" the factors concerned have been dscribed as "present" or "absent." This idea of "presence and absence" has been formulated to explain the phenomenon of dominance.

The dominant character is believed to be due to the presence of something. The recessive character is due to its absence. Thus the tall pea is tall because it contains the factor for tallness. When this factor is absent the pea is a dwarf. All peas therefore are dwarf, but some are dwarf plus a factor which converts them into tall.

Take the case of the yellow and green seeded plants already dealt with. Yellow is dominant over green. On this theory, the yellow seed must contain something which is absent in the green. But what? It has been shown that in both types there is a yellow and a green pigment. The green pigment at first masks the yellow colour, but as they ripen and dry the green colour disappears in the case of the "yellow" seeds, thus exposing the underlying yellow pigment. In the "green" forms no change takes place, and consequently the underlying yellow pigment remains invisible. The yellow seed must accordingly contain something which causes the green pigment to fade. This "something" is absent in the green pea.

## THE FRAGRANCE OF FLOWERS.

Next to their beauty, one of the greatest charms possessed by flowers is the pleasant scent or fragrance they emit. We speak of the smell of the woods in autumn or spring, especially after rain, but this is rather collective fragrance, due to the characteristic odour of many trees, their bark, etc. Rain, moreover, has a great effect upon vegetation, causing the dried-up herbage to become fragrant again. A meadow, especially in summer, has its own characteristic aroma, and so, too, has a lake, a wood, the sea, or high hills. In each case, the scent is due to an aggregation of plant scents which fill the air, and are disseminated by water vapour and other agencies, in a sort of concentrated essence if one may so term it. It is, to a large extent, this atmospheric perfume that constitutes one of the most beneficial effects of country air, for the essential oils upon which many of the individual scents are based are extremely salubrious. Judging alone from the sturdiness of the Scot and the health-giving character of the Bournemouth district (where the pine walk is especially advocated), we may attribute much of this to the terebinthine odours in the far north disseminated by the pine forests, a remark which applies equally to Norway and Sweden, Canada, and other large tracts where conifers grow on a big scale. Apart from this regional effect, there is the special local influence of the odour of the individual flower. To speak of the numerous kinds would lead one to speak of some five hundred different flowers, and the matter is further complicated by the fact that some flowers possess more than one distinct type of scent.

The scent resides in epidermal cells, which are situate not only in the root, stem, and leaves, in which case the scent is usually unpleasant, or in the flowers, when it is usually delicious and pleasant. It rarely happens, however, that there is, as in the common woodruff, a decided scent residing in every part of the plant. Here it may be that what is perceived in the stem acts as a deterrent to grazing cattle, and that the odour of the flower serves the main object of flower fragrance—to attract insects. The scent of the leaves and flowers is usually different, as in garlic and many umbelliferous plants, where the leaves are malodorous, and the flower smells of honey. More striking cases of the last are those of the coriander, whose root smells of bugs, and the hemlock, which smells like mice, while in each case the flower smells like honey.

The origin of the scents is usually the possession of essential oils, usually volatile, accompanied by resin in some cases.

As is well known, some flowers smell especially at night, e.g., honeysuckle, night-flowering stock, catchfly, evening primrose, a feature connected with the period of flying of the moths that are long-tongued enough to pollinate them. The colour of the flowers of such plants is usually white, as in White Campion, or yellow or brown, tints which are more visible in twilight or dusk of summer when the light is diffused than blue, green, or red. But most flowers emit their scent by day, some at special periods, and this is again often restricted to the time when the two parts of the flower are mature, the scent being emitted just at the time when pollination is about to take place by means of the insects required to bring the pollen of a different flower to the stigma of the one just ready for this act. And, of course, this means that scents are largely given off only when the flower is open. Since insects again play so great a part in pollination to ensure cross fertilisation, it is natural that colour and scent are, to a great extent, connected, and orange-coloured flowers yield much the same scent, e.g., wallflower and orange-yellow flowered chrysanthemum.

As a rule, white flowers give off the most fragrance. But, contrary to the usual notion that the rose order possesses the most fragrant species, the water lily order is the most fragrant order of plants. At the same time roses yield a very large number of different odours, which it is possible for a blind person to distinguish. On the other hand, the same kind of scent occurs in widely different orders, e.g., that of lemon and of camphor. Moreover, the scent of new-mown hay is common to several plants of widely different orders, e.g., sweet-scented vernal grass, woodruff, melilot, and an orchid, and it is especially in evidence when the plants are dry.[*] Amongst orchids, moreover, a great diversity of scents is to be noticed, viz., honey, musk, citron, allspice, cinnamon, noyau, angelica, aniseed, pomatum, violets, wallflower, fresh hay, coco-nut milk. And, as remarked already, flowers may possess more than one odour, e.g., that of honey in the flower, and the characteristic valerian smell also. Plants closely allied may have widely different scents, e.g., orchids (as above), daphnes, limes, elders, roses, and in the same genus you may find some species scentless along with others that smell strongly.

The diversity of scents in allied species and in different orders is correlated with the fact that insects are attracted to special flowers (a fact probably also connected with colouration). Probably their olfactory nerve is specially sensitive to such, and is not like the human olfactory nerve—sensitive to all scents; but often the human apparatus cannot detect an odour insects can. And then certain scents attract certain types of insects, thus indoloid scents attract certain flies and beetles, while aminoid scents attract other beetles and hymenoptera, while honey scents attract butterflies and moths. Hymenoptera with paraffin scent fly to paraffinoid scents in flowers. Some scents are more noticeable at a distance, perhaps, because the oxygen acts on them after diffusion, e.g., lime and vine, chiefly paraffinoids. It is certain that the Humming Bird Hawk Moth can detect honeysuckle 300 yards away, and fly straight up to a plant from that distance in the dark.

Wrapped up with this acute sense of smell of insects is the existence of nauseous smells coupled with warning colours in some poisonous plants, which are poisonous to us and to grazing animals, but not always to insects. Doubtless a smell we can only detect by rubbing the stem, e.g., in Fool's Parsley, is noticed without by animals, as, too, is that of hemlock and henbane by other animals, the nightshade scent of nightshade. Cattle rarely, if ever, touch hemlock or nightshade, but in extreme drought (of 1911) have done so with accompanying signs of madness or vertigo.

Scents have been divided into odorous and malodorous scents. Of the first we may distinguish the camphorous, citronous, myrtilloid, anisoid, rhodoid (rose), anthemisoid (chamomile), volatile oils, and others due to resins, e.g., balsamoid (balm); others, e.g., nardosmoid (Tussilago or Coltsfoot), ambrosoid, moschoid (Stork's Bill), narcissoid (Narcissus Lily), violet (violet, wallflower stock, mignonette), meliosmoid (Lady's Bedstraw, lime), jasminoid (jasmine), amygdaloid (almond), cyamoid (acacia), maloid (apple), tannoid. Of the malodorous group, with strong disagreeable smell due to volatile oils with resin, are terebinthoid (conifers), peganoid (rue); due to sulphurous acids, allioid (garlic) and fetid (Datura, Nicotiana, Solonaceæ), mecanoid opium (poppies), cicutoid (hemlock), hircoid, goat odour (Hypericum hircinum), cuminoid (coriander), pteridosimoid (like fern).

Other modes of distinguishing them are according to the type of essential oil forming the base or the hydro-carbons that supply them. The indoloid group, which contains leucin, tyrosin, skatol, indol, contains aroids; and plants which have a smell like rotten flesh, or excreta, aristolochia, smelling like old tobacco, calycanthus, like fermenting wine; and these flowers have livid spots, red-brown veins, and green background. The aminoid group, which includes those producing amine, in some combination with ammonia, include hawthorn, medlar, mountain ash, dogwood, wayfaring tree, chestnut, elder, Travellers' Joy, barberry, evening primrose, and ivy which has a smell like pickled herring. Then there is the benzoloid group, including scents in which benzole is replaced by alcohol and acid, with the occurrence of eugenol in pinks and cloves, cinnamyl alcohol occurring in hyacinths, salicylic in meadow sweet, corumarin in woodruff, and here we may mention lilac, lily of the valley, mignonette, jessamine, honeysuckle, acacia, violet, etc.

A paraffinoid scent is characteristic of numbers of plants. Valerianic acid occurs in valerian, pelargonic acid in rose scents, oil of rue in rue, œnanthic acid in vine plant, lime scent in limes, nightshade scent in thorn apple, mandrake, elder scent in elder, hircine scent in Lizard orchis, honey scent of beeswax in sloe, apricot, cherry, almond, some orchids, buckthorn, rather different in Bird Cherry, bedstraws, forget-me-nots, phlox, wall fumitory, spurges, willows, some composites, some umbellifers, e.g., angelica, cow parsnip, Burnet saxifrage, crucifers, alyssum, erysimum, tulips, garlics, clovers.

The terpenoids are derived from ethereal oils without oxygen in capitate-like hairs, or on special parts, as in the orange flower, which contains oil of neroli, gardenia, magnolia, and the citron scent, which occurs in citron, thyme, lavender scent in Lavandula.

A study of the scents of wild flowers of the countryside cannot fail to yield many interesting facts, not only connected with the life history of insects and other animals, as well as the connection between soils and scent—an untouched field—but there is a world of interest awaiting exploration regarding the immediate economic value and use of the numerous oils secreted, of which we have mentioned but a few.

A. R. Horwood.

Leicester Museum.

---

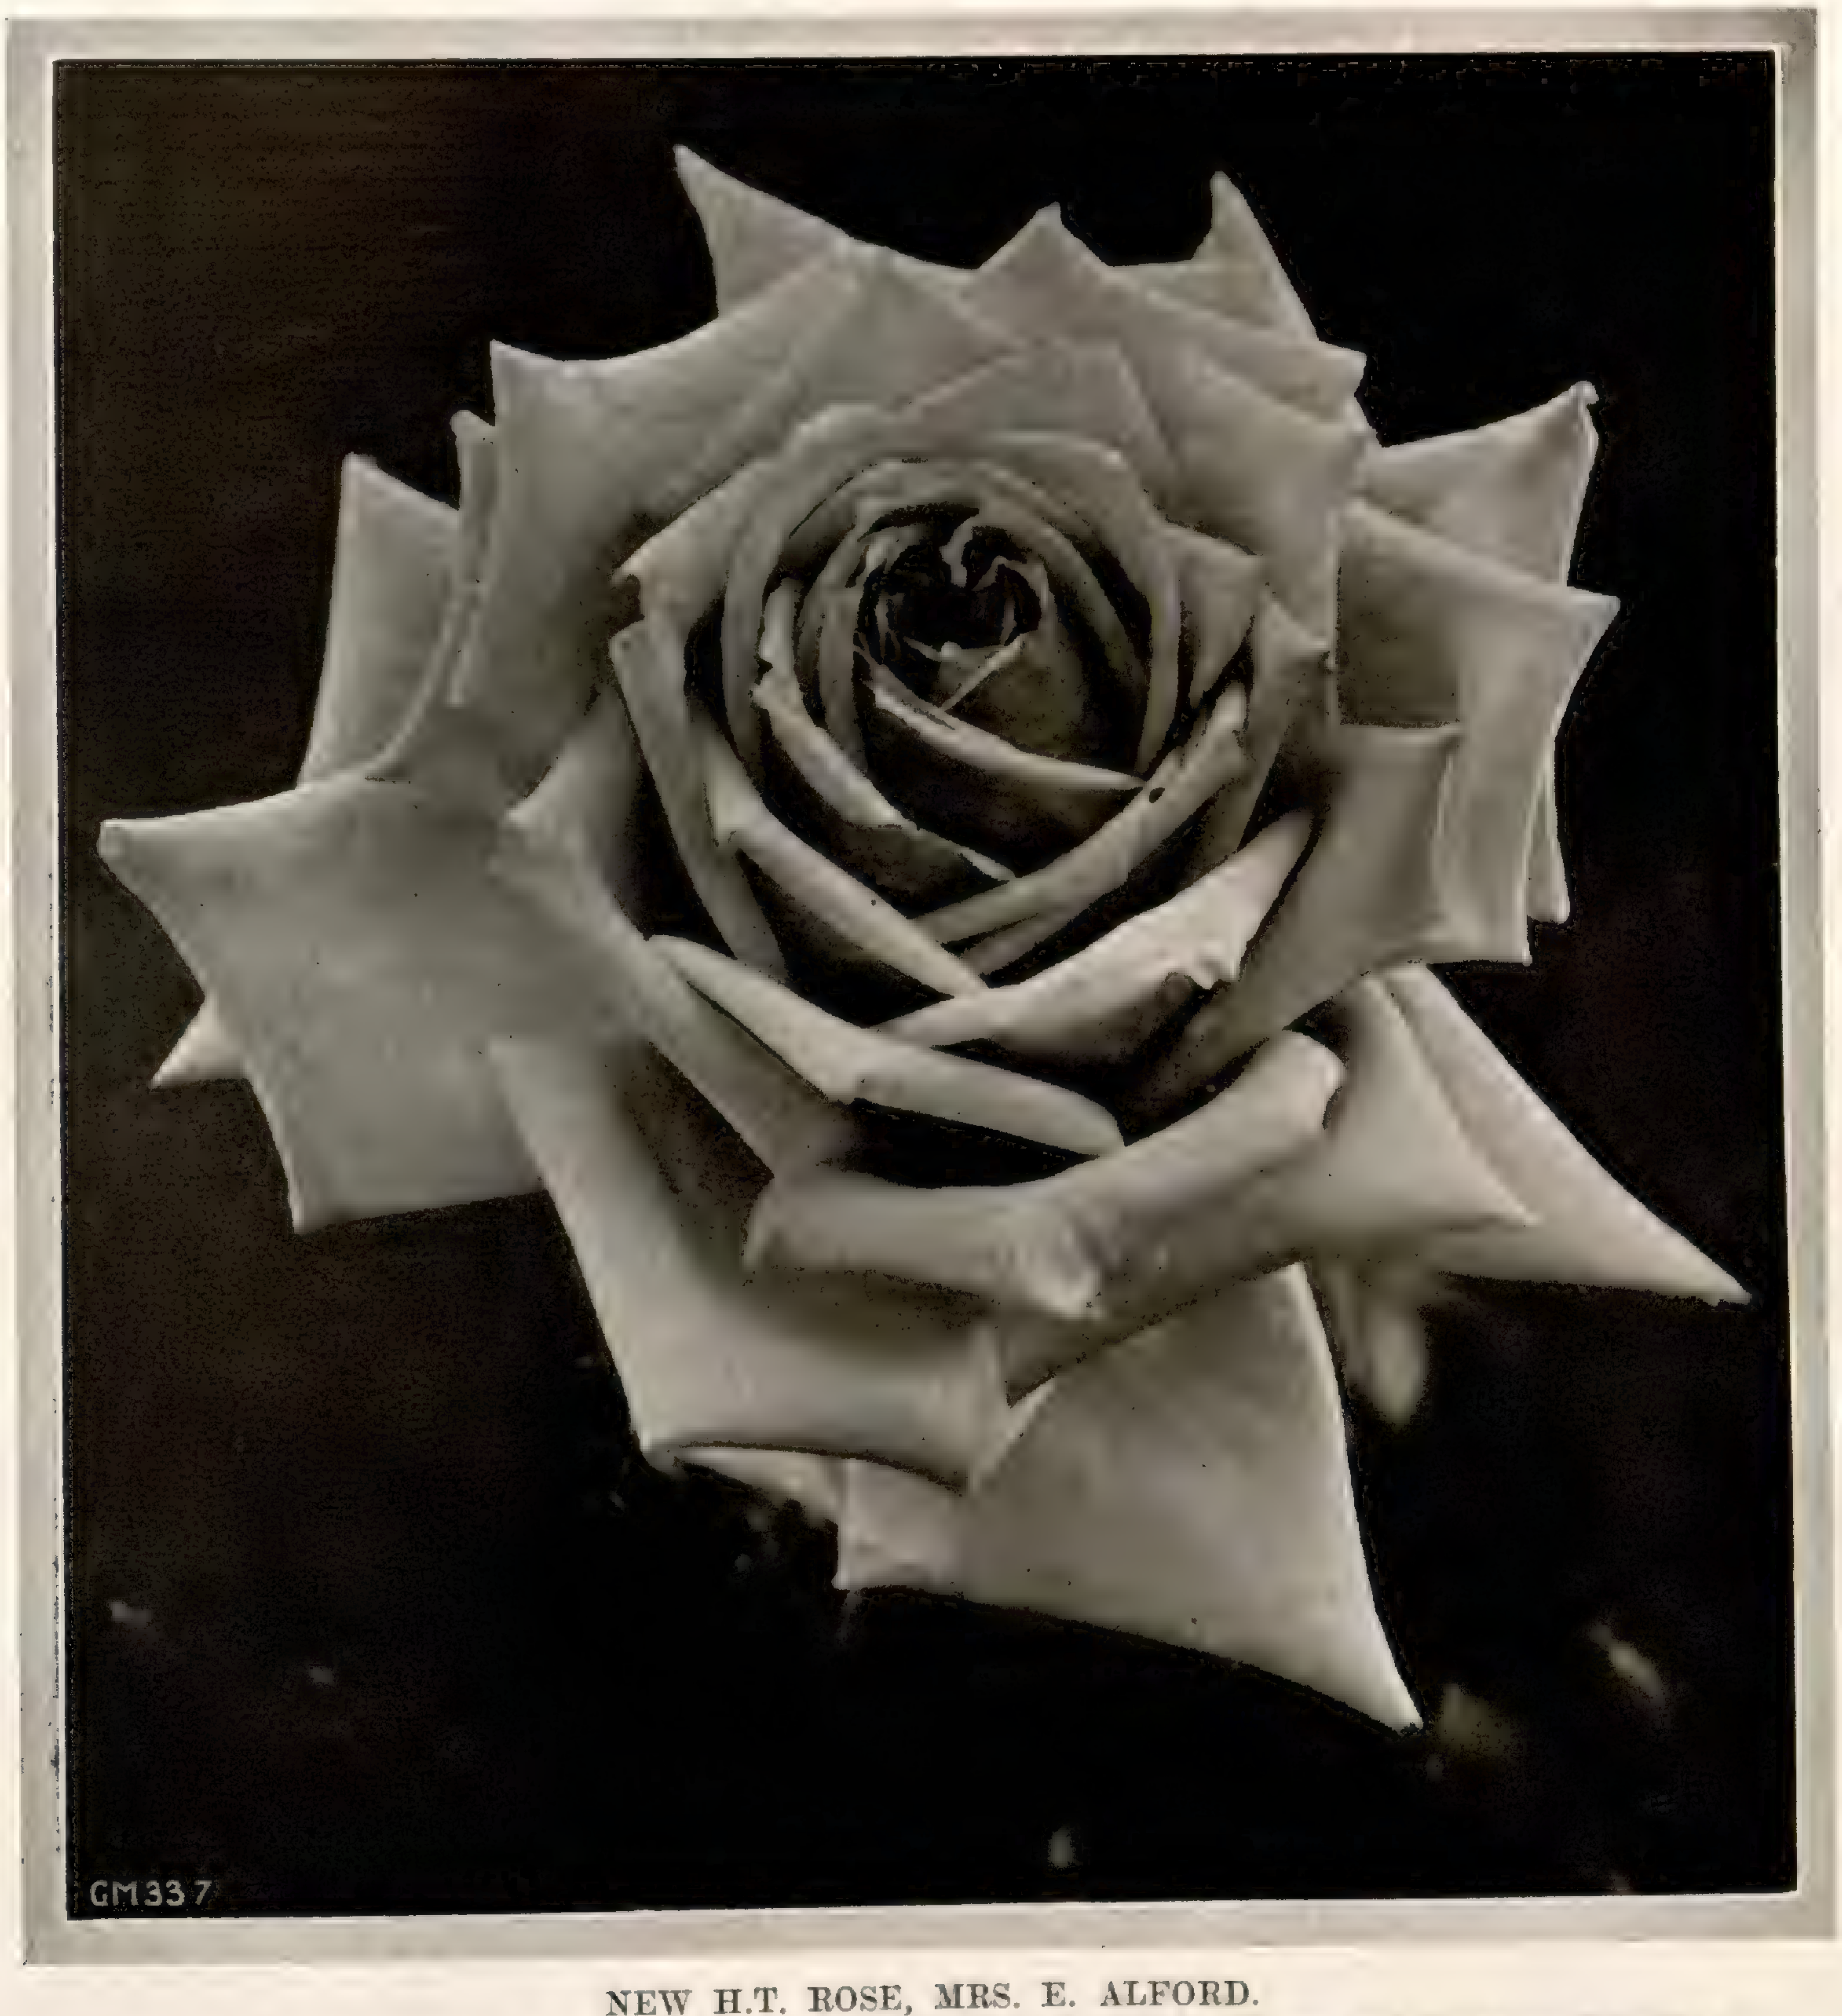
[*] This is said to cause hay-fever, which may be due rather to the wide dissemination of myriads of minute pollen grains.

## NEW PLANTS, ETC.

◆

### ROSES.

Mrs. Andrew Carnegie, H.T.—A distinct, beautiful, and fragrant rose that should attain to a high degree of popularity for exhibition, and prove of much value in the garden. The flowers are of large size, and in form suggests Frau Karl Druschki, which is said to have been one of its parents, but they possess greater refinement than the blooms of that variety, and this has been derived from Niphetos, its other parent. The colour is lemon-white, deeper in the centre. In our illustration of this fine variety the bloom is shown considerably below its natural size. Gold medal, National Rose Society, July 9. Messrs. J. Cocker and Son, Aberdeen.



NEW H.T. ROSE, MRS. E. ALFORD.

Flowers bright pink. Silver-gilt Medal, N.R.S., July 9. Messrs. Lowe and Shawyer, Uxbridge.

Old Gold, H.T.—A vigorous-growing and free-blooming decorative rose that marks a great advance in colour development in the yellow orange section. The blooms are rather small, and are of a rich old-gold hue with bright copper-red in the centre, and will be found of much value in a cut state for floral arrangements and button-holes. The leaves are bright bronze-green, and form an effective contrast to the richly-coloured flowers. Gold medal, N.R.S., July 9. Messrs. S. McGredy and Son, Portadown.

Mrs. F. W. Vanderbilt, H.T.—A distinct and attractive variety with medium-sized, large-petalled blooms; the colour bright yellow with orange-red centre. Silver-gilt medal, N.R.S., July 9. Messrs. S. McGredy and Son.

Lady Mary Ward, H.T.—An effective rose that should prove of much value, for in colour it is quite distinct from all the roses that as yet have been presented to public notice. The blooms are of medium size with large petals, and are rich orange, deep orange-red in the centre. Silver-gilt medal, N.R.S., July 9. Messrs. S. McGredy and Son.

Mrs. E. Park, H.T.—A bright and attractive rose of excellent quality for exhibition, and of value in the flower garden. The blooms are rather large, and of a brilliant red hue. Silver-gilt medal, N.R.S., July 9. Messrs. S. McGredy and Son.

Queen Mary, H.T.—A surprisingly beautiful rose that is perfectly distinct in form and colour from all the roses at present known, and should prove of immense value for decorative purposes, both in the garden and in a cut state. The flowers are rather large and quite full, but not closely-packed with petals, the lower half of these being bright clear yellow, and the upper half brilliant rose pink with mauve suffusion. In its style of colouring this variety is quite unique. Silver-gilt medal, N.R.S., July 9. Messrs. Alex. Dickson and Sons, Newtownards, co. Down, Ireland.

Mrs. E. Alford, H.T.—A beautiful rose that will strongly appeal to those who fully appreciated La France in its best days. While reminding one of that fine old rose, this variety is quite distinct from it, both in form and colour, and is a fine addition to the bright pink varieties adapted for exhibition. Silver-gilt medal, N.R.S., July 9. Messrs. Lowe and Shawyer, Uxbridge.

Mrs. Charles S. Hunting, H.T.—A large rose of fine form, and with excellent petal; colour, blush suffused salmon, the centre bright apricot. Silver-gilt medal, N.R.S., July 9. Messrs. Hugh Dickson, Lim., Belfast.

Mrs. C. Reed, H.T.—An attractive flower, rather large in size, and of high quality, the colour light pink, salmon-pink in the centre. Silver-gilt medal, N.R.S., July 9. Messrs. Lowe and Shawyer.

William Cooper, H.T.—A rather large flower, borne on long, stiff stalks, the colour rose-red. Silver-gilt medal, N.R.S., July 9. Messrs. Hugh Dickson, Lim.

Moonlight.—A beautiful decorative variety bearing large clusters of small single white flowers with the fragrance of the musk. Silver medal, Rev. J. H. Pemberton, Havering.

## AGAVE MARMORATA.

A handsome Mexican species collected by Roezl in the Province of Tehuacan many years since, but has long been rare in English gardens. It has glaucous, nearly white leaves, and bears bright yellow flowers, which are borne on erect stems, rising to a height of about twelve feet. "Bot. Mag.," t. 8,442. "Bot. Mag.," t. 8,443.

## STYRAX WILSONI.

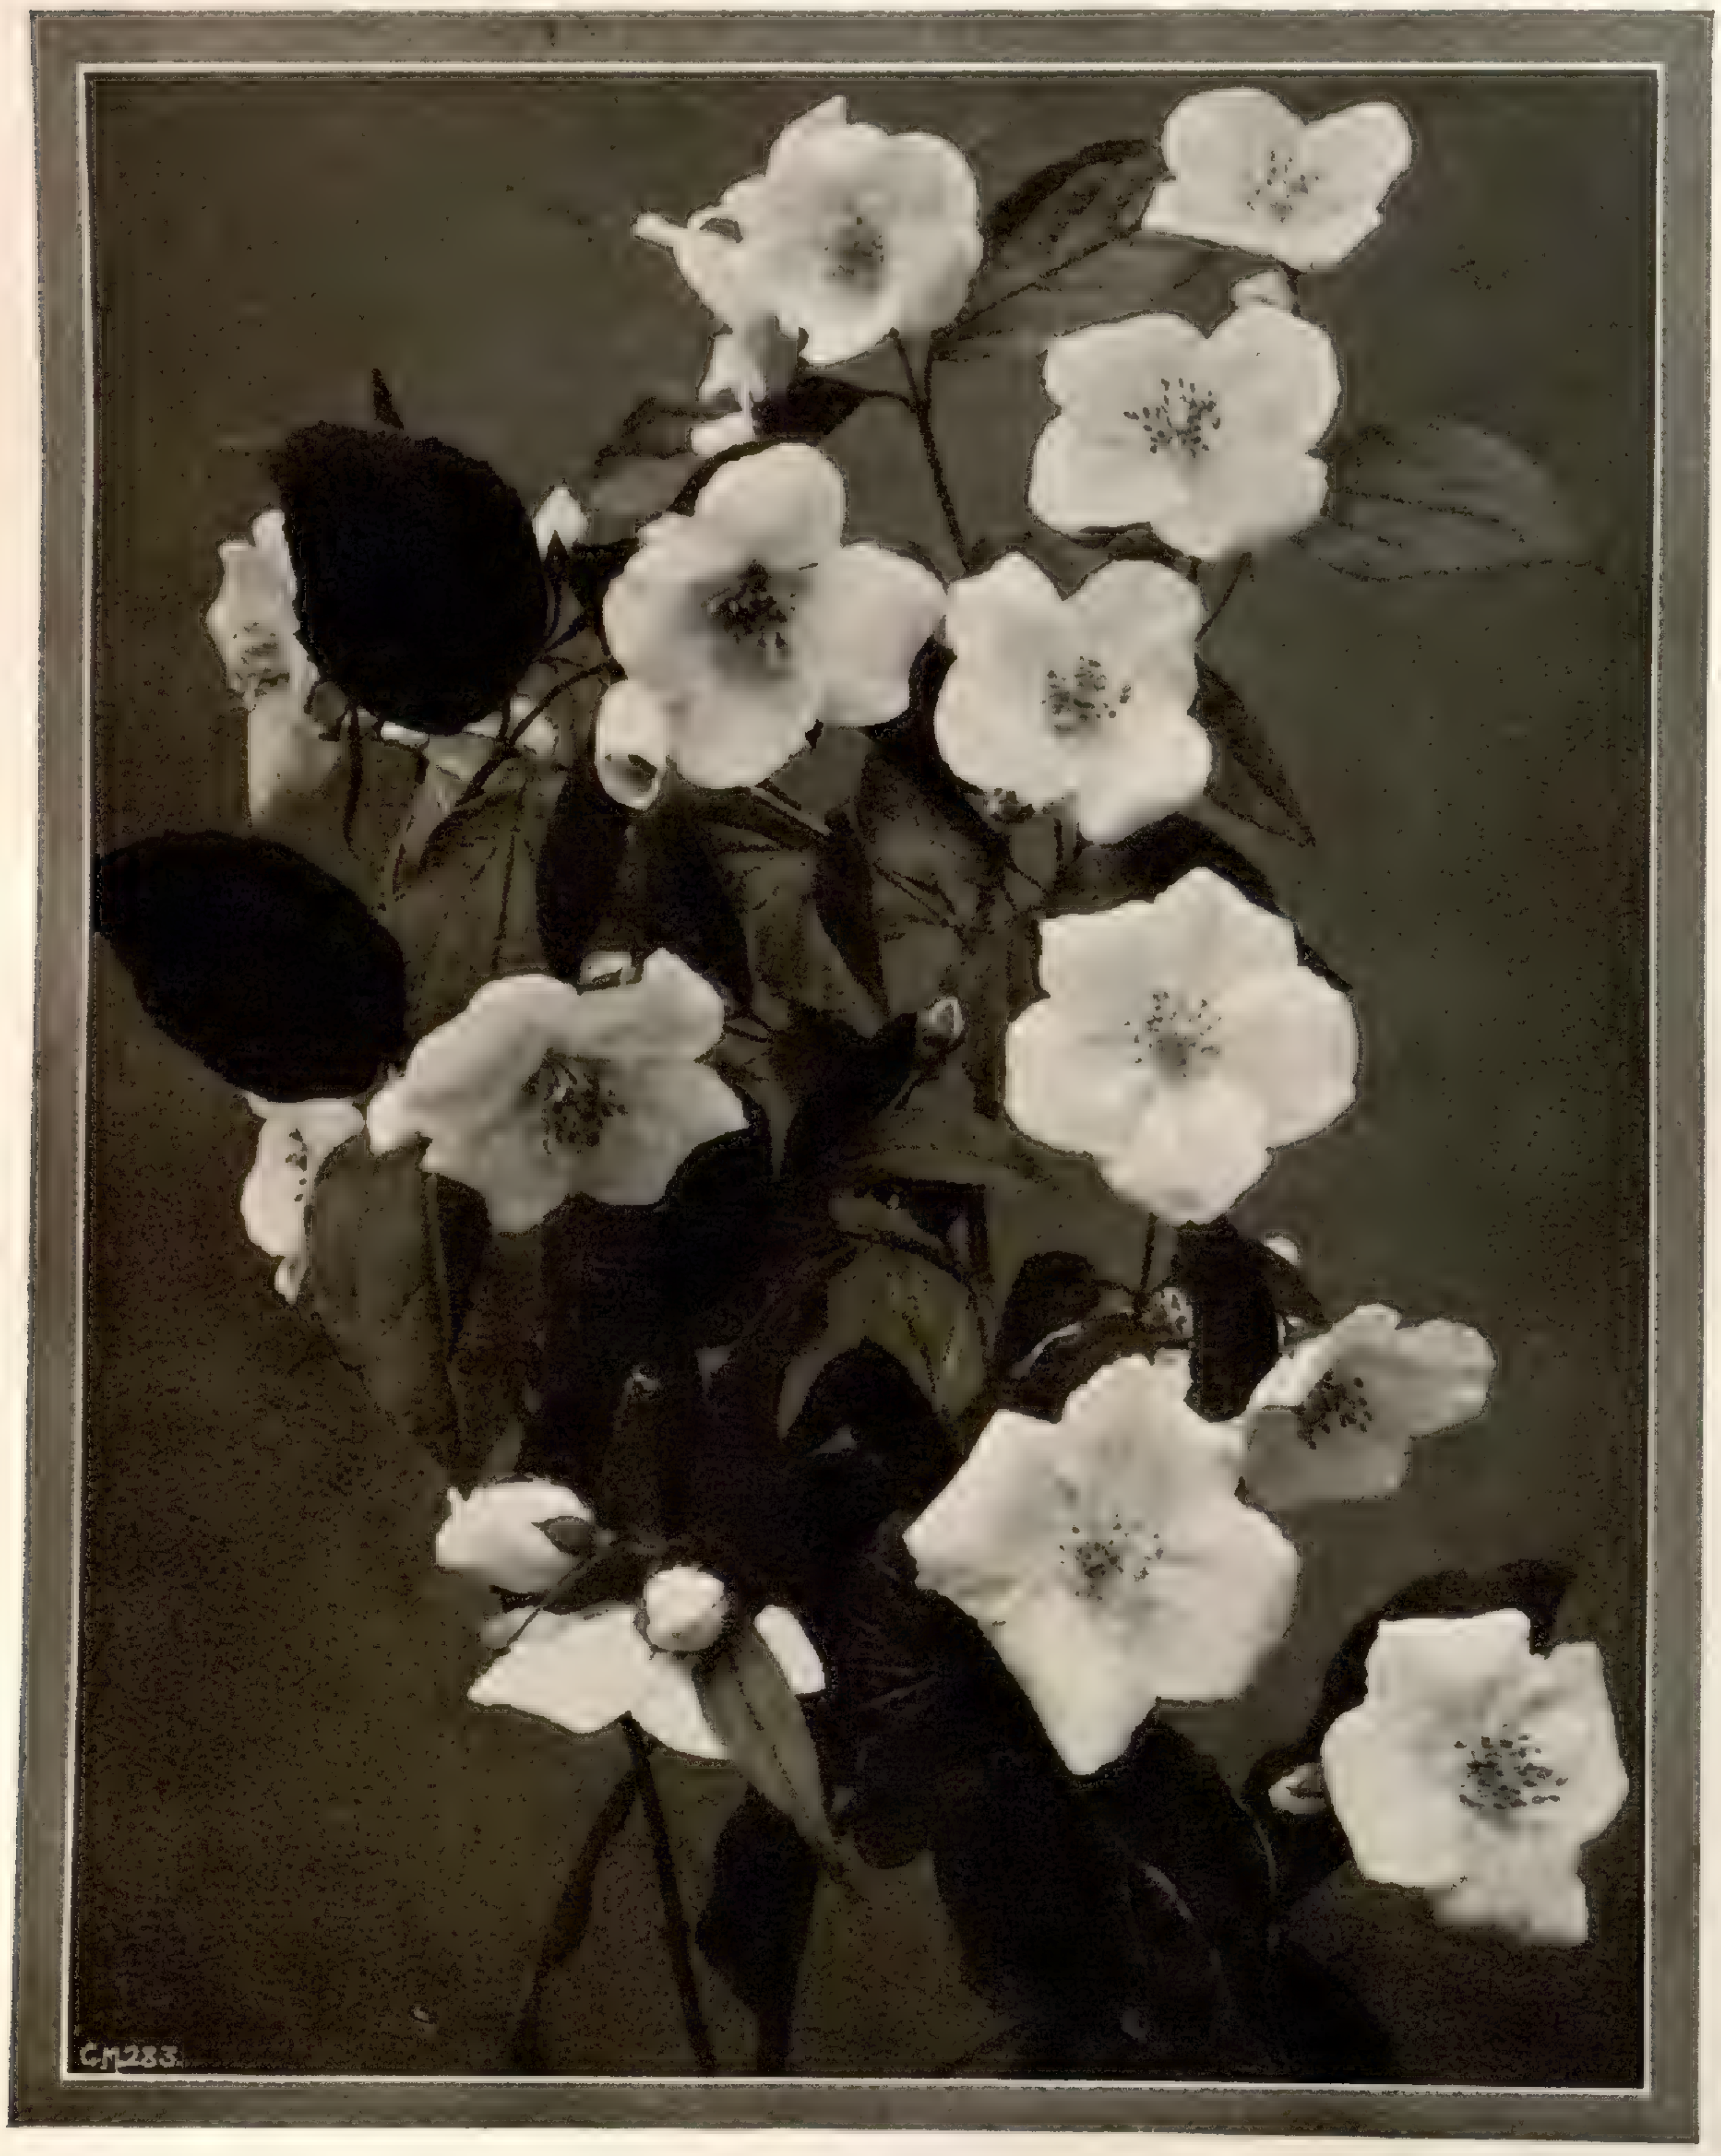
A compact-growing shrub bearing a profusion of small white flowers, which was collected in China by Mr. E. H. Wilson in 1905. Its hardiness in this country is not yet satisfactorily determined, but in the winter of 1911-12, when on one occasion 20 degrees of frost were registered at Kew, only the tips of the shoots were injured. It is, therefore, full of promise as a useful addition to the shrubs remarkable for the beauty of their flowers. "Bot. Mag.," t. 8,444.

## PEROVSKIA ATRIPLICIFOLIA.

A handsome labiate, which is met with on the Karakoram Range in the Western Himalaya at elevations up to 10,000ft. above the sea level, and is described by Dr. Aitchison as plentiful in some parts of the Kuram Valley. It was obtained for Kew from Messrs. Bees, Lim., in 1906. The lavender-blue flowers are produced in large panicles during August and September, and present a very pleasing appearance. Much of the upper part of the growth is soft and dies off during the winter, and it is suggested that the plants should be pruned back to the woody portion of the stem in the spring. "Bot. Mag.," t. 8,441.

## PSEUDERANTHEMUM LILACINUM.

A distinct and handsome species, and bearing erect spikes of comparatively large lilac-coloured flowers. It is a native of Selangoa, and perhaps also of other parts of the Malay Peninsula, and was sent to Kew in 1910 by Mr. H. N. Ridley, who was then director of the Singapore Botanic Garden. This species is a useful addition to the stove plants grown for their flowers, and being closely allied to the eranthemums, may be successfully cultivated under the same conditions. "Bot. Mag.," t. 8,446.



PHILADELPHUS VOIE LACTEE.

A beautiful variety remarkable for its finely-formed milk-white flowers. It received an Award of Merit at the R.H.S. meeting on June 18, when it was exhibited by Messrs. Paul and Son, Cheshunt, and Messrs. J. Veitch and Sons, Chelsea.

## COTYLEDON SUBRIGIDA.

A handsome succulent, which is described as very distinct from any other species of Cotyledon now in cultivation. This species was discovered in Mexico in 1892 by Mr. C. G. Pringle, growing on ledges of cliffs in the Tultenango Cañon. It has glaucous leaves, and bears its flowers in erect racemes that rise to a height of about eighteen inches. The corolla is pink with red lobes. "Bot. Mag.," t. 8,445.

## BRACHYCHITON ACERIFOLIUS.

A handsome species, commonly known a the Flame Tree in Queensland and New South Wales, and attaining in its native forests a height ranging from sixty to one hundred and twenty feet. This species was introduced to this country in 1824, and there is a drawing in the collection at Kew made from a plant growing in the Royal Garden in 1826. At Kew it can only be grown under glass, and in the temperate house there is a specimen about forty feet high. The bright green leaves are palmate, and the bright pink flowers are borne in large panicles. "Bot. Mag.," t. 8,437.

## RUPICOLA SPRENGELIOIDES.

An interesting epacrid, discovered near the southern edge of the King's Tableland in the Blue Mountains of New South Wales in 189, and introduced to this country by Mr. J. H. Maiden, who sent seeds to Kew in 1906. The species forms a neat shrub between two and three feet high, and bears along the slender growths a profusion of white flowers. Rupicola is closely allied to Epacris, and the plants belonging to the same genera thrive under much the same conditions. "Bot. Mag.," t. 8,438.

## IXORA LUTEA.

A handsome yellow-flowered form, which has been in cultivation at Kew about twenty years, it having been originally received from the Royal Botanic Garden, Peradeniya, Ceylon, as Ixora coccinea var. lutea, and it is found in some trade catalogues under that name. The flower trusses are more lax than are those of Ixora coccinea. "Bot. Mag.," t. 8,439.

## LYCIUM PALLIDUM.

A distinct and handsome shrub, which was first discovered by Fremont in 1844 on the Rio Virgen, one of the tributaries of the Colorado river. It has been grown in the open at Kew since 1886, and has flowered annually from about the middle of May until the middle of June, its slender spreading branches being gracefully wreathed from base to tip with pendent pale-greenish, purple-tinged flowers. Although flowering freely annually, none of the shrubs at Kew fruited until 1911, when an abundant crop of berries was produced. These are bright-red, and considerably enhance the attraction of the shrubs during July and August. "Bot. Mag.," t. 8,440.

## ERICA CILIARIS.

The plant figured is the geographical form of Erica ciliaris found in Portugal which, although it cannot be discriminated by any salient morphological character as a variety, is far superior for the garden to the species. This heath produces its comparatively large, bright, rose-coloured flowers in great profusion from July to October, and is highly attractive when grown in large masses. "Bot. Mag.," t. 8.442.

## SWEET PEAS.

R. F. Felton.—A remarkably fine variety, the flowers large, the colour lavender suffused rose. A.M., N.S.P.S., July 9. Mr. Bolton, Warton, Carnforth.

Decorator.—A pleasing variety, the blooms large, the colour cherry-red. A.M., N.S.P.S., July 9. Messrs. Dobbie and Co., Messrs. G. Stark and Son, and Mr. A. Malcolm.

Lady Miller. — An exquisitely beautiful variety; the flowers large, the colour rich cream, suffused with pink. A.M., N.S.P.S., July 9. Mr. A. Malcolm, Duns.

Agricola.—A charming variety, the flowers of large size and of a pleasing lilac-mauve hue. A.M., N.S.P.S., July 9. Mr. R. Bolton.

Bertrand Deal. — A charming mauve-coloured variety with large, finely-formed blooms. A.M., N.S.P.S., July 9. Mr. B. Deal, Brooklands, Kelvedon.

King White.—A large finely-formed white flower. A.M., N.S.P.S., July 9. Messrs. Alex. Dickson and Sons, Newtownards, Ireland.

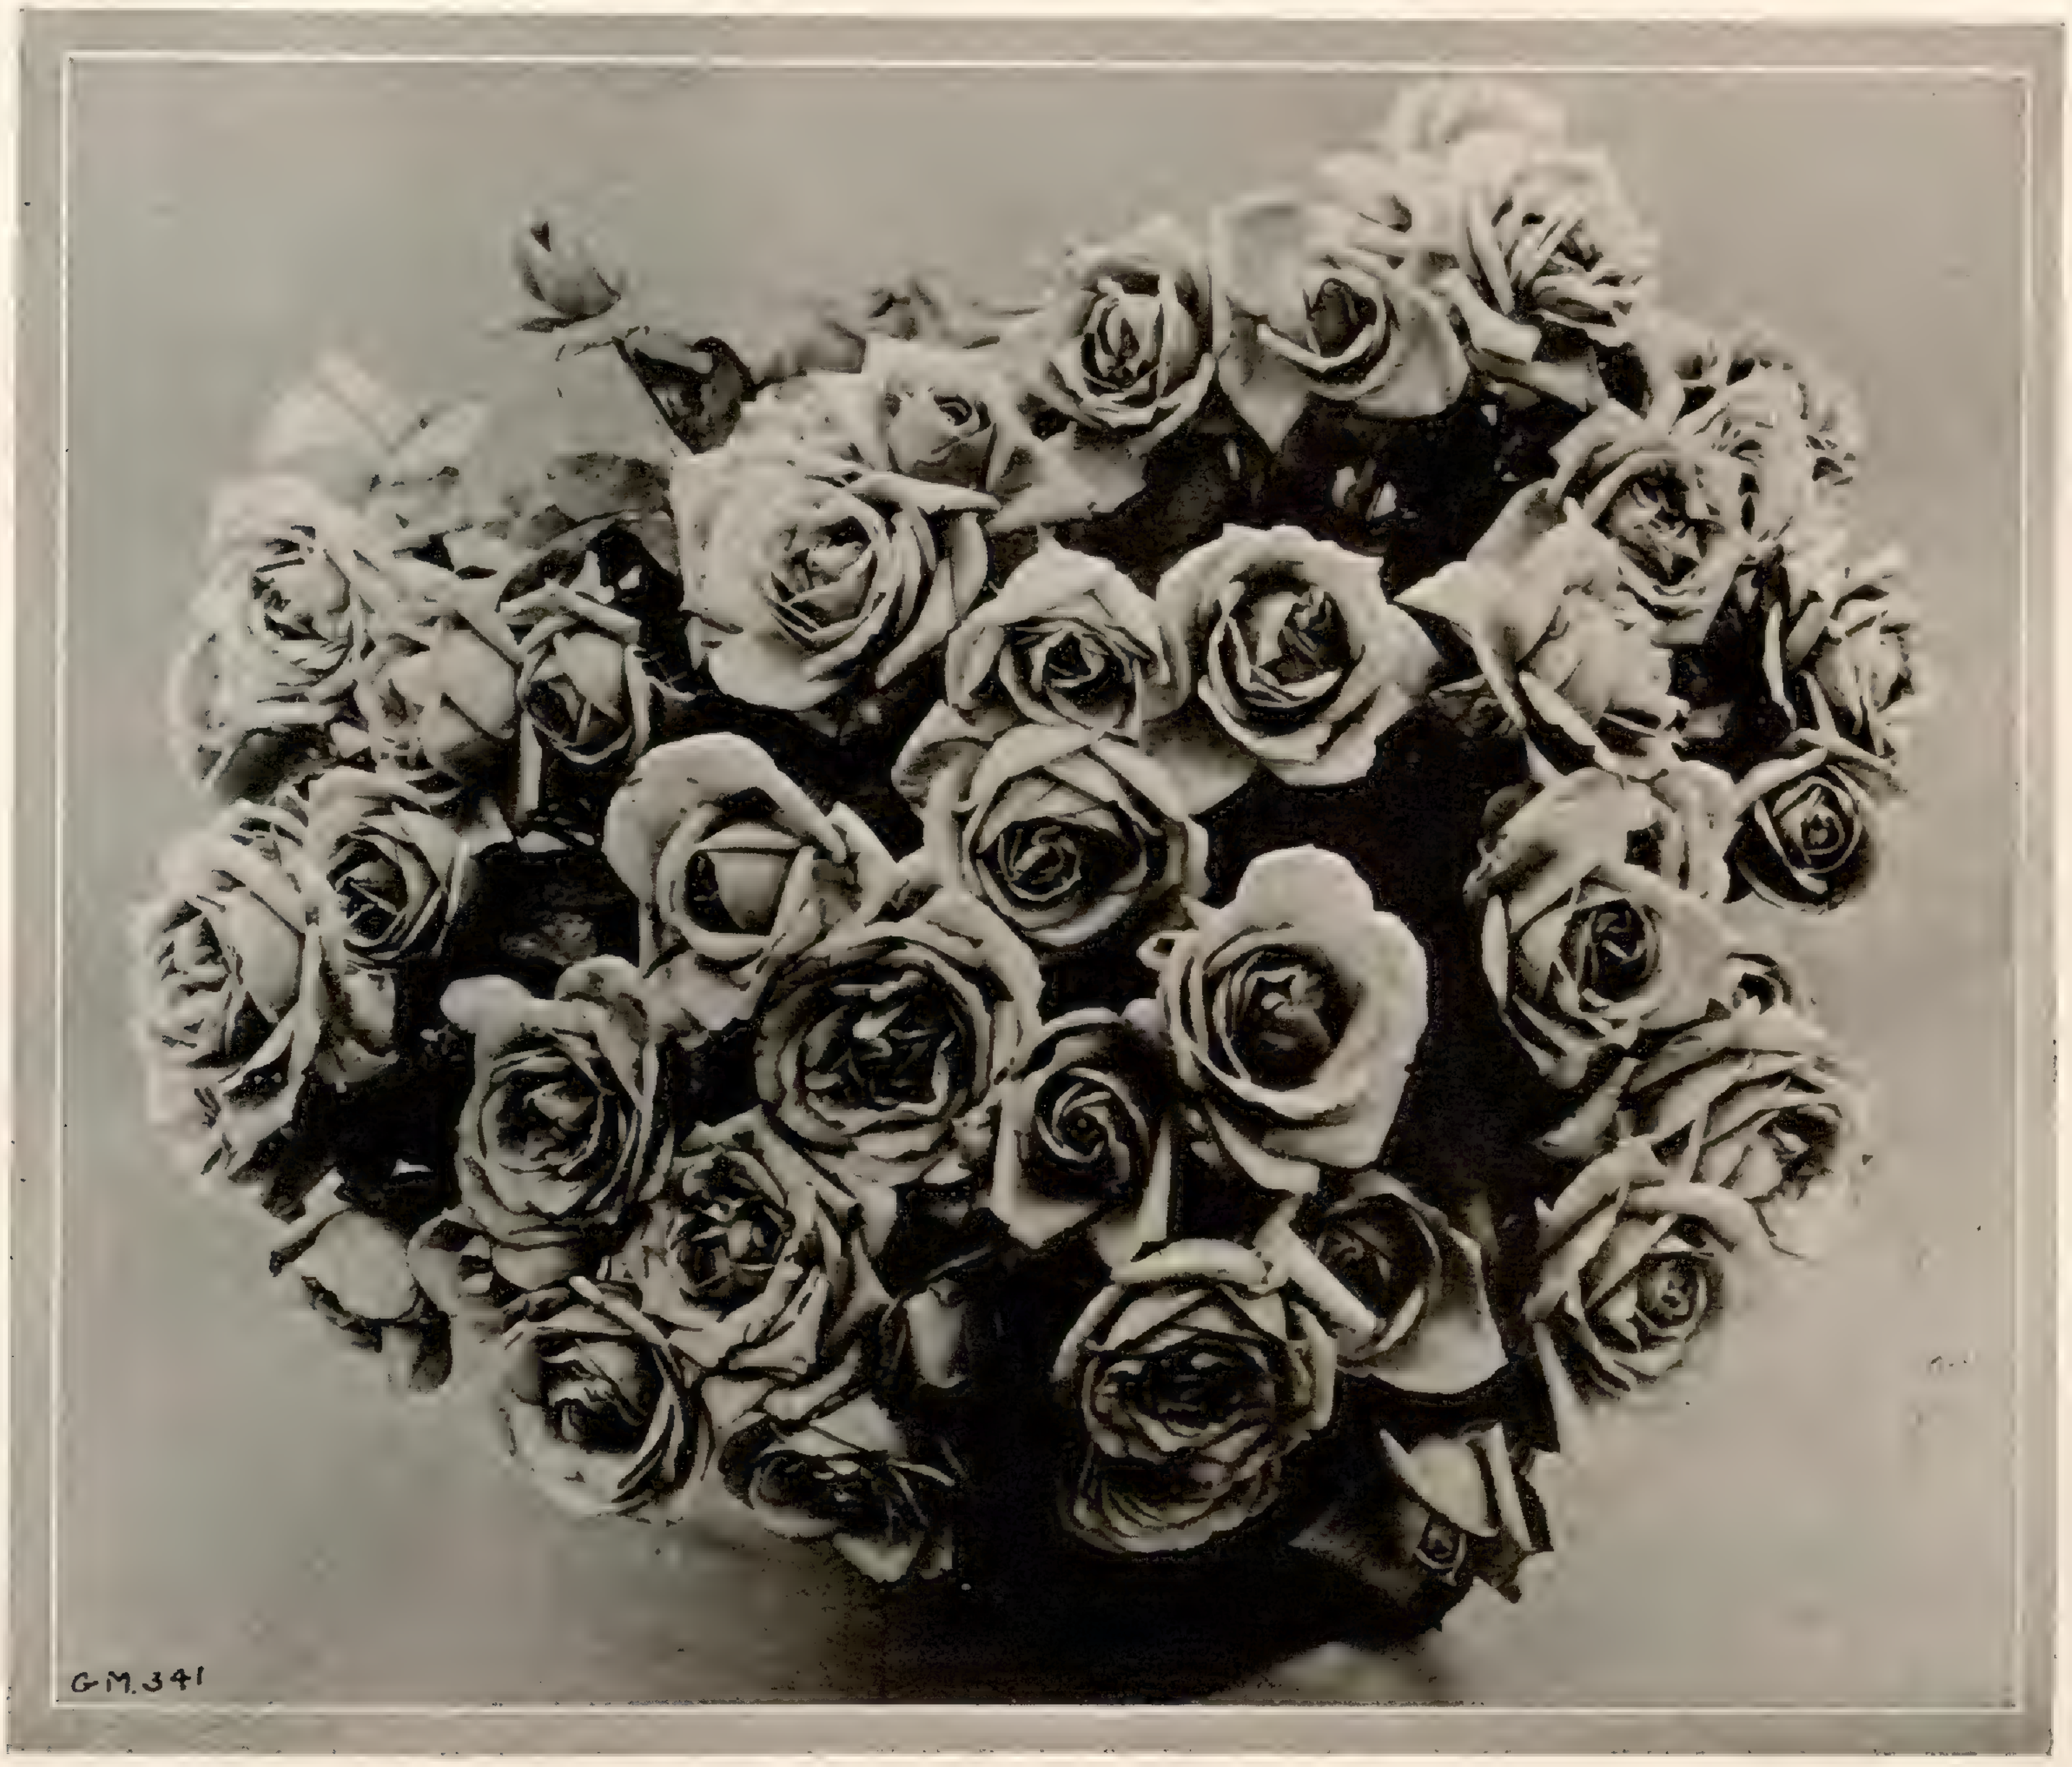
## BASKETS OF ROSES.

Within the past ten years or so the Council of the National Rose Society has, with commendable wisdom, devoted special attention to the introduction of new methods of staging roses with a view to improve the exhibitions, and to ensure the blooms being presented to public notice in as varied and interesting a manner as possible. There has, from the first, been a general agreement among the members of Council that in the case of exhibition blooms there is really no method of staging to surpass the long-existing practice of presenting them to the notice of both judges and visitors in boxes with sloping tops. This manner of exhibiting roses is characterised by a greater degree of formality than some authorities would wish, but it is acknowledged by all who have had experience in competing at exhibitions that in no other way can roses in a high state of development be carried long distances with the same degree of safety, and that the orthodox exhibition boxes afford the fullest possible opportunity for enjoying the distinctive claims of the individual blooms. These facts having been admitted it was seen that the sameness which characterised the older exhibitions should be avoided by breaking up the long lines of tables with arrangements of roses of a quite different style to the exhibition boxes.

Bamboo stands were requisitioned for the twelve blooms shown in distinct colours, and if these were not quite so satisfactory as one could wish they served a most useful purpose. Then came vases of various kinds for both exhibition and decorative roses, and the entries in the classes for roses staged in vases form a pleasant feature, and are of special interest for the diversity of charm they afford. The Council have also greatly developed the decorative side of the society's exhibition, and the large marquee devoted to the decorated dinner tables, ornamental baskets, bowls of roses, and other arrangements, is an endless source of attraction to the visitors.

It is not, however, the ornamental baskets of roses that are to be found on the occasion of the annual exhibitions within the Metropolis in the tent devoted to the various examples of decorative art, that we have now in view, but the plain baskets that have been brought into use within the past few years. The introduction of these baskets has been one of the most praiseworthy changes the Council has yet made in their endeavour to obtain as great a diversity as is practicable in the society's shows. It has proved popular with both exhibitors and visitors. The use of plain round baskets is extending at various exhibitions in the provinces as the result chiefly of the illustrations we have given of the winning baskets at the National Rose Society's shows. Such baskets are light to carry, and really not difficult to arrange, and when placed on the exhibition stage the blooms can be readily seen provided they are not overcrowded.

For the first two or three years the exhibitors of roses in baskets were very careful to avoid overcrowding, but for some reason, not easy to understand, they have not this season shown a full appreciation of so arranging the blooms that they stand quite clear of each other. This year the basket classes were considerably increased, and the competition was keen throughout, but unfortunately, in the classes in which there was no limit to the number of blooms, overcrowding was rather prevalent, and it would be interesting to know the cause. With a view to demonstrate the desirability of moderation in filling baskets of this description we selected one for illustration that contained too many flowers. Finer specimens of the Lyon Rose have not been staged, and the colour effect, as seen from a distance, was such as not to be readily forgotten; but, unfortunately, the blooms were too closely arranged to admit of their individuality being seen, and when close under the eye the basket suffered in consequence. G.



A BASKET OF THE LYON ROSE.
Shown at the National Rose Society's Exhibition. The blooms are finely developed, but too crowded.

---

**Euphorbia Jacquiniæflora.**—Like the poinsettias, this euphorbia requires great care in watering, and resents much disturbance at the root. Neither must it be subjected at any time to such cool treatment as the poinsettias. When growing vigorously, however, later on in the summer, a buoyant atmosphere must be maintained in conjunction with warmth in order to ripen the wood before flower buds appear. A light house should be chosen for growing this euphorbia in, and if one can be devoted to it where bottom as well as top ventilation can be given, so much the better. Artificial manures, if used at all, must be applied in a weak state. In my opinion, there is nothing safer, or more beneficial, than liquid sheep or cow manure.—H. T. Martin.

# PHLOXES IN THE ROCK GARDEN.

Few classes of flowering plants can excel a selection of dwarf phloxes in the beautifying of the rock garden during the spring and early summer months. There is a diversity of form and colour, which is indeed charming when viewed among the bronze and grey hues of weathered rocks. There is much to commend this race of plants. Ease of culture, extreme hardiness, a sturdy, effective habit of growth, and a glorious prodigality of blossom are points which testify to the value of the dwarf phloxes in the rock garden.

It is worthy of note that phloxes are very easy of propagation, and readily respond to a little attention on this point. Cuttings may be rooted at any time during the summer months under a handlight, using a sandy loam for the rooting medium, and keeping them shaded from direct sunshine until rooted.

PHLOX CANADENSIS LAPHAMI.

A remarkably beautiful variety, comparatively tall in growth, and bearing bright lavender-blue flowers.

In the matter of planting, I prefer early spring for the operation, as ofttimes, if autumn planting is followed the plants have no chance to establish themselves before the rains early in the winter saturate the soil, and seriously endanger the chances of the alpine phloxes. This danger of root deterioration through damp is greater in a heavy soil than a light one; thus, it is well for the cultivator to make his planting compost as gritty and open as possible. Another point worth noticing is that the close growing forms of the subulata type suffer more than their lighter-foliaged relatives of the stellaria group.

The colours of phloxes (at least those grown in the rock garden forms) are invariably good. Yet there is need of discretion in grouping, lest the "lilac" and "rose-pinks" be placed too near those exquisite slaty and turquoise blues, which are so charming if shown to advantage.

Phlox divaricata and its varieties should be in the garden of every lover of hardy plants. Growing from nine inches to a foot in height, these beautiful forms give a dainty display during the spring months. P. divaricata itself is lavender-blue in colour, while the form canadensis is rather purer and brighter in its colouring. Alba is a good white variety, far too rarely seen en masse, while the newer forms, such as Laphami, a deep, almost indigo, blue, and Perry's variety, a soft plumbago blue, with a good free habit, are delightful in every way. It is a good plan to place these blue-shaded phloxes in close proximity to white-flowered subjects, thereby gaining in colour, tone, and clearness against the surrounding white.

P. ovata, an evergreen, rosy-flowered species, calls for attention. It is dwarf in habit, and attractive when in blossom, though hardly to be compared with its variety Carolina, which is taller in growth and more floriferous.

One of the showiest is P. reptans, a wonderfully free-flowering gem, with a pronounced creeping habit. Its colour is usually described as rose-pink, but there is a distinct shade of pale purple in it.

P. amœna is pleasing, with hosts of rosy blossoms, which last well into summer. P. verna, the Spring Phlox, usually regarded as a natural hybrid form, follows amœna closely in colouring, while procumbens, a dainty little purple gem, lifting its blossoms in numerous panicles above its prostrate growths, is decidedly a plant to secure. It has been regarded as a natural hybrid between amœna and subulata, though it seems unknown in a wild state.

Good though the foregoing phloxes are, they cannot excel in beauty the dainty stellaria group, which, unfortunately, are too often confused with the subulata varieties. The typical form, P. stellaria, I have noted in the past for its light spreading habit of growth and white blossoms with a misty blue shading. It is delightful when spreading forward over the rock face, and is indeed one of the charms of an alpine garden.

Its varieties—Annulata, with bluish-white flowers, having a purple ring; Bridesmaid, a dainty white, shading to lilac at the centre; Eventide, a delicate milky shade of pale blue; Seraph, a white variety with a clear blue centre; Newry Seedling, a delightful starry gem in palest mauve; Lilacina or G. F. Wilson, a beautiful clear mauve-blue, light, yet softening in tone; and Atro-lilacina, its replica in a deeper tone of colouring—embrace a group of ethereal moonlight shades that are charming beyond measure, a galaxy of perfect beauty portrayed in clear, exquisite hues.

Of P. subulata, one need not write in detail, as its rose-pink blossoms crowding over the close, dense growths are a feature in a host of gardens during the days of spring, but many of its varieties are indeed worthy of note. Among the best of them are Nelsoni, an exceedingly fine white, with a sturdy habit of growth; Brightness, a very effective bright rose, with a scarlet eye; Daisy Hill, a rosy-hued, crimson-zoned variety, with blossoms of extra size; Fairy, a pretty rosy-lilac, which is more continuous in blossom than many; grandiflora, a large-flowered pink, of decided value; Nivalis, a charming white of rather lighter habit than Nelsoni; Leila, a distinct rosy-grey; Sprite, a bright rosy-pink, with carmine centre; and Pallida, with attractive mauvy shadings.

Many others are almost equally good, such as Perfection, pink; Model, rose; Mabel, rosy-lilac; Aldboro'ensis, rose and crimson; Atro-purpurea, purplish-rose; and the bright-hued Vivid, which, unfortunately, is not nearly so hardy in constitution as its kindred varieties.

Certain it is that in the hardy phloxes we possess a wealth of decorative material for the rock garden. P. S. Hayward.

# NATIONAL SWEET PEA SOCIETY'S OUTING.

Following the custom of the past few years, the committee of the National Sweet Pea Society arranged for visits of its members to inspect sweet peas. Previously there has been one visit to the Times Experimental Station at Sutton Green, near Guildford, and one to some private or trade establishment where sweet peas are a feature. This season the society has a duplicate set of trials at Burbage Experimental Station, near Hinckley, and so the second visit was to this new and interesting place. The attendance at Sutton Green was scarcely so large as usual, but the attendance at Burbage was well up to, and probably rather above, the average for a distant trip.

Those who are so ready to find fault, and seem never happy unless acting as prophets of evil to come, might urge that the smaller attendance (there were forty-nine at Sutton Green, and forty-three at Burbage), is a sign of decadence; but the truth is the Floral Committee must visit the trials and finish their work before the Outings take place, and until the weather permits the work of the committee to be accomplished, no arrangements can be made for the Outings. This year the notice given was unusually short, and scores of members could not, as a consequence, make their plans fit with the occasion.

It must be said at once that the trials at Sutton Green were never seen to better advantage than on July 11, and Mr. Harry Foster is to be congratulated upon the wonderful display of bloom on each of the two hundred and fifty-six rows. Traders and amateurs were both well represented on this date, and distinguished representatives from overseas were Mr. Lester Morse (C. C. Morse and Co., San Francisco), Mr. Howard Earl (Messrs. Atlee Burpee and Co., Philadelphia), and Mons. Shoetel (Messrs. Vilmorin and Co., Paris). These added their meed of praise, and expressed their satisfaction at the good work the society is doing.

Reference has already been made to the varieties the Floral Committee have given Awards of Merit to, but it may be as well to mention again that these are King White (row No. 2), Messrs. A. Dickson and Sons, Newtownards; Lady Miller (row No. 22), from Mr. A. Malcolm, Duns; Decorator (rows Nos. 60, 61, and 83), respectively from Messrs. Dobbie and Co., Edinburgh; Messrs. G. Stark and Son, Great Ryburgh; and Mr. A. Malcolm; and we understand the name of Decorator will be used in each case—deep cerise or cherry-red about indicates the colour; Agricola (row No. 135), from Mr. Robt. Bolton, Carnforth; Bertrand Deal (row No. 136), from Mr. Bertrand Deal, Brooklands, Kelvedon; and R. F. Felton (row No. 162), from Mr. R. Bolton. No First Class Certificate was awarded this year, and there was certainly no variety of superlative merit or distinction that seemed to warrant such an award.

Unfixed stocks are by no means things of the past, but the work progresses in this direction, and the trials made it quite evident that raisers are striving hard after a white to eclipse Etta Dyke, a large, rich blue, a striking novelty of the Helen Pierce type, and new shades of colour in various directions. Judging from the trials, varieties akin to Edrom Beauty, Elfrida Pearson, Hercules, and King Edward have cropped up in many places. Constance Hinton, white; Scarlet Emperor, red; Edith Taylor, salmon-rose; Orion, a rich cerise-crimson; and Minnie Furnell, shrimp-pink, are varieties of considerable merit. There are others of note, but until senders use provisional names for their stocks it is almost useless to discuss a variety which may have neither title or description in the Trials List. Everybody took copious notes, and nearly all the men-folk worked through the trials from 1 to 256, coatless and perspiring.

Lady Northcliffe very kindly provided tea, but time did not permit of an inspection of the charming gardens at Sutton Place. Mr. R. Sydenham and Mr. T. Stevenson tendered thanks to Lady Northcliffe and Mr. Harry Foster and Mrs. Chas. Foster—thanks well deserved and heartily endorsed by all present.

Burbage is a hundred miles north of Sutton Green, and so the duplicate set of trials conducted there by Major Hurst were not so forward on July 12, as those inspected the day previously. In ten days' time there should be a fine display of bloom on the strong, healthy plants at this station. It was generally agreed, however, that the bright colours were brighter here than further south, and that these trials formed an admirable control to those near Guildford. To this inspection came members from Sheffield, Manchester, Leicester, Birmingham, Coggeshall, Addlestone, Folkestone, and other places widely apart, and the party was severely critical. Major Hurst's own trials, in which he is endeavouring to prove the origin of Countess Spencer, to breed certain unfixed varieties true from single plants on Mendelian lines, to discover the particular rogue that crops up in a given variety, and the reason for it, and to show the range of variation in various stocks of what may be termed standard varieties, proved of unusual interest and great educational value. Major Hurst is doing a great work, and one that sweet pea raisers and seedsmen cannot fail soon to appreciate.

At tea time the very necessary and well-deserved votes of thanks were accorded to Major Hurst and to Mr. Robt. Sydenham. A short but heavy thunderstorm followed close after tea-time, and so cooled the air that the inspection of Major Hurst's trials of poultry, homing pigeons for military use, etc., was carried out in comfort, and the homeward journey was far less trying and tiring than the one to Burbage was in the morning of this most sultry July day.

C. H. Curtis.

PHLOX STELLARIA LAVENDER.

As shown by the specimen, herewith illustrated, in the rock garden at Kew, this variety is free in growth and profuse in flowering, and, as indicated by the varietal name, the flowers are of a lavender colour.

**Cochliostema Jacobianum.**—A large-growing member of the Spider Wort family, with bold, strap-shaped leaves, disposed in a vasiform manner, as in some of the Bromeliads, but in this cochliostema they are soft instead of harsh in texture. The flowers, which are borne in short spikes at the axils of the leaves, are of a pleasing shade of blue and sweetly scented.—W. T.

# HORTICULTURAL EDUCATION.

## Its Advantages and Disadvantages.

At the present day the subject of horticultural education is being very freely discussed by the younger, and, if I may be allowed to say so, the more progressive, generation of gardeners. The latter are, no doubt, distinct, and in a class by themselves. Their progressive tendency must, however, not be misunderstood. If we assume it to mean that they are better cultivators of plants than those gardeners of a former generation, I am afraid we shall be somewhat in the wrong, or at least there will be a considerable element of doubt attached to such an assumption. Nevertheless, the systematic training that was made a compulsory matter in the days of the apprenticeship system, has proved a great boon to many gardeners. No doubt, it has been the means of instilling the tenets of discipline and attention to detail in the minds of many raw youths who, if they had been allowed to take their own course without guidance of any kind, would probably have drifted onwards with no definite object of any kind in view.

In nearly every walk of life, this age we live in is an age of cramming—an age of effect. Everything must be made to move as rapidly as possible, and the culmination of our desires must be attained in the shortest possible space of time; otherwise the desire itself is apt to vanish from our minds altogether. To take a comparison from the work of our friend the farmer, it is well known that present-day competition does not admit of the slow fattening of beasts for the butcher—or of chickens for the poulterer. Early maturity is the watchword here. Similarly, specimen plants, whose extraordinary growth represented the highest skill in the plant cultivator's art, and which were the pride of the mid-Victorian gardener, seem to have disappeared for all time, with only a few exceptions here and there.

The gardener of old was, indeed, ofttimes a patriarchal figure, slow to change, and antagonistic to what we now term modern progress. He paced his ground with measured tread; he observed everything; thought of a multitude of things; and solved all the problems that came his way with a very sound knowledge and sense of understanding. Maybe he was somewhat philosophically inclined, and cultivated a long grey beard and an absent-minded expression—two characteristics which are invariably, and often wrongly, accepted as the hall-marks of ability and power to undertake responsibility.

How customs have changed since those days! Now the youthful and budding gardener is crammed with as much knowledge and theory as he can possibly assimilate in a short space of time. The cramming process completed, more or less satisfactorily, he immediately hies him away to get twelve months' practical experience, first at one establishment and then at another. Finally, when remuneration and other attractions are such as impede his further progress, he comes to a dead stop. It cannot be said that his education is complete. As a matter of fact, it has only just commenced, for he may now have the opportunity to put a few of his own methods or theories to a practical test.

### The Educated Gardener

has existed since the days of Adam, so that it appears unnecessary to quote names from the long list of illustrious men who have done honour to the profession. Many bright intellects have, however, been lost to it. I can recall a number of cases involving men of unquestionable ability, who, through no fault of their own have squandered the best of their lives as foreman or journeyman, and at mature ages have had to confine themselves in that usually undesirable abode known as a bothy, wherein no home comforts are known.

Undoubtedly, the principal reason why so many able men have been disappointed in their attempts to obtain posts of distinction elsewhere, is that they waited for promotions which never came until the best of their lives had been spent in an unhappy existence on twenty or thirty shillings a week. Given the opportunity, it has been proved that the large majority of educated and well-trained foremen or gardeners have experienced little difficulty in rising to positions of great trust. It speaks well for the profession that many of them have ultimately become managers of estates.

Employment for competent gardeners has, however, been somewhat scarce of late, owing no doubt to the breaking up of so many large estates. The younger generation of gardeners must therefore turn their attention to other branches of the profession, especially commercial horticulture. A great many more opportunities exist "in the trade" than in any other branch of horticulture, for a man who possesses exceptional ability. His position is invariably secured as soon as he can demonstrate his worth satisfactorily, and from a commercial point of view; and it is not unimportant to note that remuneration progresses in keeping with achievements or successes.

The educated gardener is, or should be, a comprehensive being—boasting a higher school education than his fellow workmen, possessing a sound commercial knowledge of his work, and endowed by nature with the power of organising and controlling the work of others.

### Horticultural Instructors

are now becoming fairly numerous. Often, one is asked how it is possible to become eligible for the post of County Instructor in Horticulture. It may be said that up to the present no definite qualifications have been required of candidates who aspire to these positions. At the same time, however, the obvious fact remains that few, if any, County Committees would appoint a man who is unable to testify as to his knowledge of the scientific aspect as well as of the practice of horticulture. Unfortunately, of course, this combination of science and practice is difficult to secure, with the result that the scientist makes a pitiable impression when he commences to demonstrate to his class of students how some important operation should be performed.

The life of an average county instructor is by no means an enviable one. He is supposed to be a veritable encyclopædia of horticulture, available for reference by anyone who has the most out-of-the-way question to ask, or the most difficult problem to solve. If he has a home he can only think of it as a blessed memory at most times, for he can seldom enjoy its comforts. The best part of his time is spent in the joys of railway travelling, or in the doubtful delights of cycling along country lanes.

As for remuneration, the average salary paid, say, £150 a year, is altogether inadequate for the position he is called upon to occupy. Anyone who has had travelling experience knows only too well the heavy drain that is made on the pocket in the shape of incidental expenses. One cannot legally charge these expenses as being incurred in the execution of duty, although as a matter of fact, they really are. Consequently a fifty pounds increase in salary actually possesses nothing more but a fictitious value, and I am constrained to mention this fact because so many people are apt to regard it in an entirely different light.

Much comment has been made by so-called authorities on the work of the teachers and lecturers who were created by the County Councils some years ago. Now, these instructors were, for the most part, practical and experienced, and if their knowledge of chemistry, botany, and zoology did not come up to the high standards set by the colleges, it is at least certain that they gained the complete confidence of those people whom they were sent out to teach, by the very reason of their practical experience. It was this which enabled them to advance rural horticultural education more than any other class of worker at that time.

### A National Diploma in Horticulture

is by no means a new idea. I suggested it myself some fifteen years ago, when I realised the advantages yielded by similar diplomas to young men taking up agriculture as a profession, or even dairying. But if the syllabus of the proposed National Diploma of Horticulture is drawn up as it should be, the task of securing such a coveted distinction will be no easy one.

Certificates for proficiency in the theory and practice of horticulture, as now issued, are all too easy to acquire, with the result that they have a very low value as compared with the distinction to be secured in the sister science, namely, the National Diploma of Agriculture. Those who are desirous of entering upon a teaching career should obviously aim at the National Diploma of Horticulture, or it may also serve as a stepping-stone to the agricultural degree of B.Sc.

There are, of course, both advantages and disadvantages connected with any new innovation of this kind. We may, for example's sake, seek a comparison in the agricultural world. Suppose we examine for a moment the careers of many who have succeeded in gaining the National Diploma of Agriculture, it is often found that they are disappointed in not finding suitable openings on leaving college. Posts as instructors in agriculture are very few indeed, and so the college-trained youth has to offer his services to the farmer, who, by the way, has more use for the practically-trained youth than the one who possesses college distinctions. May we not experience something of a similar nature in the case of the National Diploma in Horticulture? Assuming that it will take a youth two years to qualify for his diploma at college, commencing at the age of sixteen, what are his prospects on leaving? Is it to be imagined that he will be perfectly contented to occupy a subordinate position in a garden, perhaps commencing right at the bottom of the ladder, as he must needs do if he is to master the many practical operations connected with gardening? On the other hand, if a youth works for two years in a garden, then goes to college for two years, he will find himself handicapped just in the same way on returning to practice.

That there will be a few good posts here and there cannot be doubted, but I am inclined to question very much whether bona fide gardeners will prove successful in obtaining them. Their position is this: they are in competition with men who assume a practical knowledge of gardening, and who possess a college training. The

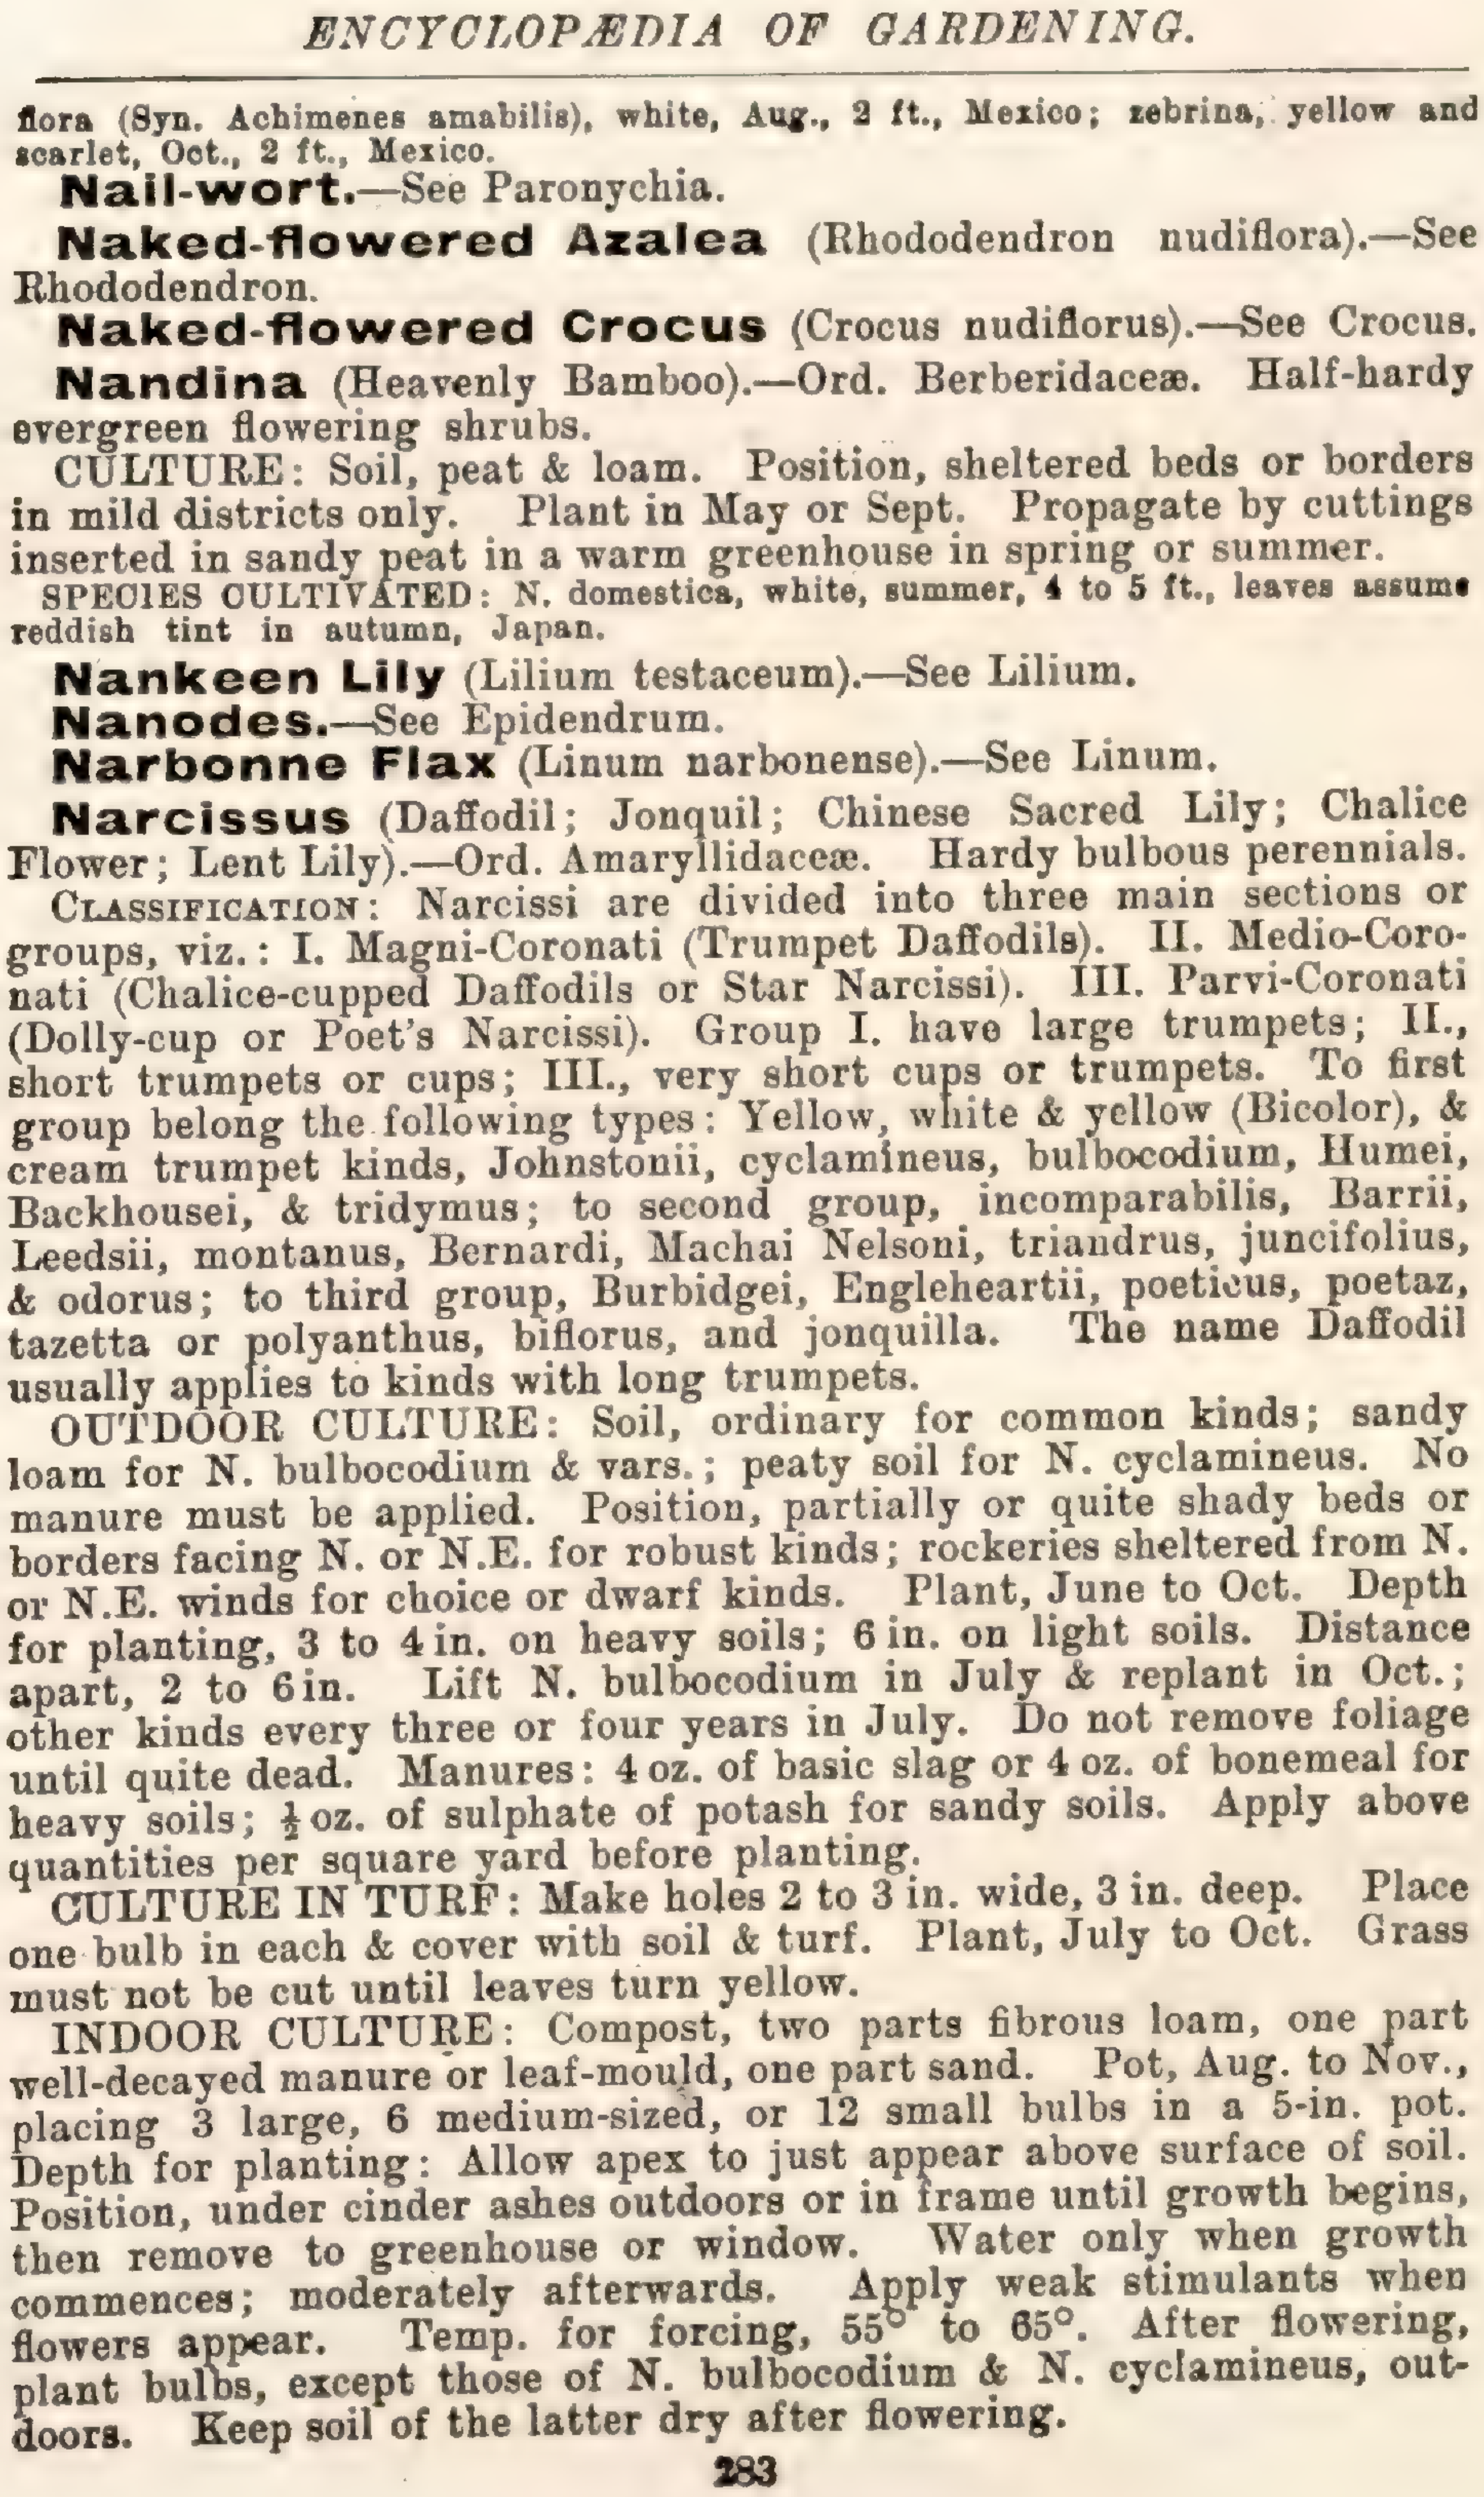
E.C.

***SPECIMEN PAGE.***



*ENCYCLOPÆDIA OF GARDENING.*

flora (Syn. Achimenes amabilis), white, Aug., 2 ft., Mexico; zebrina, yellow and scarlet, Oct., 2 ft., Mexico.

**Nail-wort.**—See Paronychia.

**Naked-flowered Azalea** (Rhododendron nudiflora).—See Rhododendron.

**Naked-flowered Crocus** (Crocus nudiflorus).—See Crocus.

**Nandina** (Heavenly Bamboo).—Ord. Berberidaceæ. Half-hardy evergreen flowering shrubs.

CULTURE: Soil, peat & loam. Position, sheltered beds or borders in mild districts only. Plant in May or Sept. Propagate by cuttings inserted in sandy peat in a warm greenhouse in spring or summer.

SPECIES CULTIVATED: N. domestica, white, summer, 4 to 5 ft., leaves assume reddish tint in autumn, Japan.

**Nankeen Lily** (Lilium testaceum).—See Lilium.

**Nanodes.**—See Epidendrum.

**Narbonne Flax** (Linum narbonense).—See Linum.

**Narcissus** (Daffodil; Jonquil; Chinese Sacred Lily; Chalice Flower; Lent Lily).—Ord. Amaryllidaceæ. Hardy bulbous perennials.

CLASSIFICATION: Narcissi are divided into three main sections or groups, viz.: I. Magni-Coronati (Trumpet Daffodils). II. Medio-Coronati (Chalice-cupped Daffodils or Star Narcissi). III. Parvi-Coronati (Dolly-cup or Poet's Narcissi). Group I. have large trumpets; II., short trumpets or cups; III., very short cups or trumpets. To first group belong the following types: Yellow, white & yellow (Bicolor), & cream trumpet kinds, Johnstonii, cyclamineus, bulbocodium, Humei, Backhousei, & tridymus; to second group, incomparabilis, Barrii, Leedsii, montanus, Bernardi, Machai Nelsoni, triandrus, juncifolius, & odorus; to third group, Burbidgei, Engleheartii, poeticus, poetaz, tazetta or polyanthus, biflorus, and jonquilla. The name Daffodil usually applies to kinds with long trumpets.

OUTDOOR CULTURE: Soil, ordinary for common kinds; sandy loam for N. bulbocodium & vars.; peaty soil for N. cyclamineus. No manure must be applied. Position, partially or quite shady beds or borders facing N. or N.E. for robust kinds; rockeries sheltered from N. or N.E. winds for choice or dwarf kinds. Plant, June to Oct. Depth for planting, 3 to 4 in. on heavy soils; 6 in. on light soils. Distance apart, 2 to 6 in. Lift N. bulbocodium in July & replant in Oct.; other kinds every three or four years in July. Do not remove foliage until quite dead. Manures: 4 oz. of basic slag or 4 oz. of bonemeal for heavy soils; ½ oz. of sulphate of potash for sandy soils. Apply above quantities per square yard before planting.

CULTURE IN TURF: Make holes 2 to 3 in. wide, 3 in. deep. Place one bulb in each & cover with soil & turf. Plant, July to Oct. Grass must not be cut until leaves turn yellow.

INDOOR CULTURE: Compost, two parts fibrous loam, one part well-decayed manure or leaf-mould, one part sand. Pot, Aug. to Nov., placing 3 large, 6 medium-sized, or 12 small bulbs in a 5-in. pot. Depth for planting: Allow apex to just appear above surface of soil. Position, under cinder ashes outdoors or in frame until growth begins, then remove to greenhouse or window. Water only when growth commences; moderately afterwards. Apply weak stimulants when flowers appear. Temp. for forcing, 55° to 65°. After flowering, plant bulbs, except those of N. bulbocodium & N. cyclamineus, outdoors. Keep soil of the latter dry after flowering.
